Knox returned to Scotland in May, 1559, and entered upon his triumphant course as a reformer. Political necessities had driven the Queen Regent (Mary of Guise, q.v.) to temporize with the "lords of the congregation" or the reforming nobles. Having somewhat re-established her power, she sought to withdraw her concessions (May, 1559); but the reforming impulse had gathered a strength that could no longer be resisted. The heads of the party, assembling at Dundee, under Erskine of Dun, proceeded to Perth. There the pent-up enthusiasm which had been long collecting was roused into furious action by a sermon of Knox on the idolatry of the mass and of image worship (July, 1559). A riot ensued. The "rascal multitude," as Knox himself called them, broke all bounds and destroyed the churches and monasteries. Similar disturbances followed at Stirling, Lindores, St. Andrews, and elsewhere. The flame of religious revolution was kindled throughout the country, aggravating the civil war already raging. At length the assistance of Elizabeth and the death of the Queen Regent (June, 1560) brought matters to a crisis; a truce was proclaimed, and a free Parliament summoned to settle differences. The result of the Parliament, which met in August, 1560, was the overthrow of the old religion, and the establishment of the Reformed Kirk in Scotland. In all this Knox was not only an active agent, but the agent above all others. The original *Confession of Faith* of the Reformed Kirk and the *First Book of Discipline* bear the impress of his mind.

The arrival of the youthful Queen Mary, in the course of 1561, brought many forebodings to the reformer; he apprehended dangers to the reformed cause from her character and her well-known devotion to the Catholic church. The reformer's apprehensions scarcely permitted him to be a fair, certainly not a tolerant, judge of Mary's conduct. She summoned him into her presence, and Knox relates, with a somewhat harsh bitterness, his several interviews with her. At length he came to an open rupture with the Queen's party, including Murray and Maitland, and many of his former friends. He took up an attitude of unyielding opposition to the court and in his sermons and prayers indulged freely in the expression of his feelings. The result was his temporary alienation from the more moderate Protestant party, who tried to govern the country in the Queen's name, and for a while, from 1563 to 1565, he retired into comparative privacy. In 1560 his first wife had died, and on Palm Sunday, 1564, he married Margaret Stewart, daughter of Lord Stewart of Ochiltree, a girl of 16.

The rapid series of events which followed Mary's marriage with Darnley served once more to bring Knox into the field. He was reconciled with Murray and strongly abetted him in all his schemes of policy during his regency. Further reforms were effected by the Parliament which convened under his sway in the close of 1567. Some provision, although still an imperfect one, was made for the support of the Protestant clergy. Knox seemed at length to see his great work accomplished and is said to have entertained the idea of retiring to Geneva. But the bright prospect on which he gazed for a

little was soon overcast—Murray's assassination (Jan. 23, 1570) and the confusion and discord which sprang out of it plunged the reformer into profound grief. He once more became an object of suspicion and hostility to the dominant nobles, and misunderstandings even sprang up between him and some of his brethren in the General Assembly. He retired to St. Andrews (1571) for a while, to escape the danger of assassination, with which he had been threatened. There, although suffering from extreme debility, he roused himself to preach once more, and, in the parish church where he had begun his ministry, made his voice heard again with something of its old power. Assisted by his servant, the "good, godly Richard Ballenden," into the pulpit, "he behoved to lean upon it at his first entry; but ere he was done with his sermon, he was so active and vigorous that he was lyke to ding the pulpit in blads and fle out of it." In the end of 1572 he returned to Edinburgh to die; his strength was exhausted; he was "weary of the world," he said; and on November 24 he died.

Knox's character was distinguished by firmness and decision, and a plain, severely harsh sense of reality. He was a man of strong and even stern convictions, and he felt no scruples and recognized no dangers in carrying out his aims. He was shrewd, penetrating, inevitable in his perceptions and purposes, and his language is always plain, homely, and often harsh. He had learned, he himself says, "to call wickedness by its own terms—a fig, a fig; a spade, a spade." Above all, he was fearless; nothing daunted him; his spirit rose high in the midst of danger. In Scotland Knox was the leading spirit in the Reformation. To him, above all others, may be attributed this result. His violent methods and his mediæval type of thought are natural in a man of that age with his temperament.

Knox wrote his own biography in his *History of the Reformation of Religion in the Realme of Scotland*, begun about 1560 and covering the history as far as 1564. The fifth book was compiled from his notes after his death. The first three books were printed in London in 1584; the entire five in 1664; the "modernized" edition by Guthrie (London, 1898) is abridged and incomplete. His *Works* have been well edited by Laing (Edinburgh, 1846-64), and his life written by M'Crie (Edinburgh, 1811; 7th ed., 1872). Both Laing and M'Crie give full bibliographical data concerning his writings. Consult his life by P. H. Brown (London, 1895); Carrick, *John Knox and his Land* (Glasgow, 1902); James Stalker, *J. Knox: His Ideas and Ideals* (New York, 1904); Cowan, *John Knox* (ib., 1905); Andrew Lang, *J. Knox and the Reformation* (London, 1905); Crook, *John Knox* (New York, 1906); J. S. Rait, "John Knox and the Scottish Reformation," in *Quarterly Review*, vol. ccv (London, 1906); A. B. Hart, "John Knox as a Man of the World," in *American Historical Review*, vol. xiii (Lancaster, Pa., 1908). Knox's liturgy, *The Book of Common Order of the Church of Scotland*, has been edited by Sprott (London, 1901).

KNOX, JOHN JAY (1828-92). An American financier, born in Knoxboro, N. Y. He graduated at Hamilton College in 1849 and entered the banking business. Because of his vigorous support of the national banking plan of Secre-

tary Chase, he was given a position in the Treasury Department in 1866, serving as Deputy Comptroller of the Treasury from 1867 to 1872. From 1872 until 1884 he held the position of Comptroller of the Treasury. In the latter year he resigned in order to become president of the National Bank of the Republic, of New York City, which position he filled until his death.

In 1870 he prepared a bill codifying the mint and coinage laws, and a report on the subject of coinage. The bill was transmitted to Congress by Secretary Boutwell and with few amendments became law in 1873. This was the famous Coinage Act of 1873, which dropped the silver dollar from the coinage (See MONEY.) Mr. Knox was the author of numerous reports and articles and of a book on the *United States Notes* (New York, 1887).

KNOX, PHILANDER CHASE (1853-). An American lawyer and statesman, born at Brownsville, Fayette Co., Pa. He graduated from Mount Union College (Ohio) in 1872 and studied law in the office of H. B. Swope, of Pittsburgh. He was admitted to the bar in 1875 and in the next year was made assistant United States district attorney for the western district of Pennsylvania. From 1877 to 1902 he was in partnership with James H. Reed. The firm of Knox and Reed almost immediately established a lucrative practice, representing such corporations as the Carnegie Steel Company, but its clients were not limited to corporations. Knox became familiar with the organization of great industrial combinations and established a reputation for legal ability of a very high order. In 1897 he was tendered the appointment as Attorney-General in the cabinet of President McKinley, but he declined to leave his practice. In 1901, however, on the resignation of John W. Griggs, the offer was renewed and this time was accepted. He was continued in office under President Roosevelt. Although criticized because of alleged inactivity in prosecuting corporations and trusts supposed to be doing business in contravention of the Sherman Anti-Trust Act, he was more active in this regard than any of his predecessors. Under his administration suits were undertaken against the Northern Securities Company and the so-called Beef Trust. Also, while Attorney-General, he made a report to Congress (Sen. Doc. 73, 57th Cong., 2d Sess.) which was an exceedingly thorough and painstaking exposition of law regarding trusts and unlawful combinations. His administration was generally thought efficient and able. In 1904 he was appointed by Governor Pennypacker of Pennsylvania to fill the unexpired term of Senator Quay, and in the following year was elected for a regular term. As Senator, he served on the Judiciary Committee and took a prominent part in the debates concerning the Panama Canal. For a portion of the time he was chairman of the "steering committee." In 1906 he was put forward as the favorite son of Pennsylvania for the Republican nomination for President and received considerable attention throughout the country. After the election of Taft he was offered the position of Secretary of State, which he accepted. In this office Knox was not considered to be so conspicuously successful as he had been as Attorney-General; but during his incumbency many important diplomatic matters were handled, such as American relations with

Japan and the South American states. In 1912 Knox made a tour of the Latin-American countries with the avowed purpose of fostering a closer and more cordial commercial and political relationship between them and the United States. Everywhere he was warmly received and lavishly entertained. In 1913 he retired from public life to take up again his legal practice. He was the author of *Future of Commerce* (1908); *International Unity* (1910); *Speeches* (1912), made during his Latin-American tour.

KNOX, ROBERT (c 1640-1720). The first English writer on Ceylon. He was a prisoner there among the natives from 1659 to 1679, the ship on which he and his father were homeward bound from India having put into Cottiar Bay for safety in a storm. Robert Knox, senior, a Scottish employee of the East India Company, died after three years' captivity; but his son finally made his escape from the interior of the island to a Dutch colony on the coast, whence he reached England (1680). As mate or master of vessels, Knox made later voyages to India and the South Seas, but he is chiefly noted for *An Historical Relation of the Island of Ceylon in the East Indies, Together With an Account of the Detaining in Captivity the Author and Diverse Other Englishmen Now Living There, and of the Author's Miraculous Escape. Illustrated with Figures and a Map of the Island* (London, 1681). This has been translated into French, Dutch, and German.

KNOX, THOMAS WALLACE (1835-96). An American journalist and traveler, born in Pembroke, N. H. He was educated there and in Pittsfield, taught for a time in Kingston, N. H., but went gold hunting in 1860, to Colorado, where he entered into journalistic work. He was a correspondent during the Civil War and also saw active service. He traveled round the world as a special correspondent, in 1866 and again in 1877, and his varied experiences formed the basis for his numerous works. They include: *Camp-Fire and Cotton Field* (1865); *Overland through Asia* (1870); *Underground Life* (1873); *Backsheesh* (1875); *Voyage of the "Vivian" to the North Pole* (1884); *Robert Fulton and Steam Navigation* (1886); *Life of Henry Ward Beecher* (1887); *Decisive Battles since Waterloo* (1887). A long series of books of travel and adventure, written for young people and deservedly popular, include: *The Young Nimrods in North America* (1881), *The Boy Travellers in South America* (1885), and *The Boy Travellers in the Russian Empire*.

KNOX, WILLIAM (1732-1810). A British official and pamphleteer, born in Ireland. At the age of 25 he was sent to Georgia as provost marshal under Governor Ellis and remained there four years. Afterward he was Colonial agent in England for Georgia and East Florida. His defense of the Stamp Act, contained in two pamphlets, written in 1764 and 1765, brought about his dismissal from office, but he was made Undersecretary of State for America (1770-82). He inspired Lord North's attempt at compromise (1776) and was also the instigator of the separation of New Brunswick (Canada) into a distinct province (1784), to be settled by Loyalists from the States. His publications include: *The Controversy between Great Britain and her Colonies Reviewed* (1769); *A Defence of the Quebec Act* (1774); *Considerations on the State of Ireland* (1778); *Merits of the Commercial Treaty with France* (1788);

Considerations on the Present State of the Nation (1789); *Observations upon the Liturgy* (1789); *Considerations on Theocracy* (1796).

KNOX COLLEGE. A coeducational institution of collegiate grade at Galesburg, Ill., chartered in 1837 as the Knox Manual Labor College, in pursuance of a plan adopted in Whites-town, N. Y., in 1836. It was opened in 1841 and was renamed Knox College in 1857. The original plan contemplated the subscription of \$10,000 and the purchase of lands in the Mississippi valley at the government price. The college had, in 1914, 576 students in two departments, a college and a conservatory of music, established in 1883; 34 instructors; and a library of 13,712 volumes. The amount of productive funds, including endowment, is about \$400,000. The institution is undenominational. On its grounds in 1858 was held the Lincoln-Douglas debate, the fortieth anniversary of which was celebrated on Oct. 7, 1898. President McKinley and his cabinet were present and took part in the exercises. The president in 1914 was Thomas McClelland, D.D.

KNOX-LITTLE, WILLIAM JOHN (1839-). An English clergyman of the Established church, born at Stewartstown, County Tyrone, Ireland. He was educated at Trinity College, Cambridge, and after graduation became an assistant master at Sherborne School. Later he held a number of curacies; from 1875 to 1885 was rector of St. Albans, at Cheetwood, Manchester, and thereafter until 1907 vicar of Hoar Cross; and after 1881 was canon of Worcester. During part of the South African War he was acting chaplain to a brigade of Guards and subsequently to the Household Cavalry. Among his publications are: *Meditations on the Three Hours' Agony of Our Blessed Redeemer* (1877); *Characteristics and Motives of the Christian Life* (1880); *The Journey of Life: The Light of Life* (1888); *The Perfect Life* (1899); *Sketches and Studies in South Africa* (1899); *The Warf from the Waves* (1890); *Sketches and Studies in South Africa* (1899); *Holy Matrimony* (1900); *The Conflict of Ideals in the Church of England* (1906).

KNOXVILLE. A city and the county seat of Marion Co., Iowa, 35 miles by rail southeast of Des Moines, on the Chicago, Burlington, and Quincy and the Chicago, Rock Island, and Pacific railroads (Map Iowa, D 3). It has a State Hospital for Inebriates, a Carnegie library, and a fine courthouse. The city carries on a considerable trade as the centre of a farming, stock-raising, and coal-mining district, and has flouring mills, etc. There are municipal water works. Pop., 1900, 3131; 1910, 3190.

KNOXVILLE. A city and the county seat of Knox Co., Tenn., 160 miles east of Nashville, on the Tennessee River, at the head of steam navigation, and on the Southern, the Knoxville and Bristol, the Knoxville, Sevierville, and Eastern, and the Louisville and Nashville railroads (Map: Tennessee, F 3). It has a site of great natural beauty among the foothills of the Clinch Mountains. There are State asylums for the insane and for the deaf and dumb, a fine government building, a city hospital, courthouse, city hall, city market, Lawson McGhee Memorial Library, the building which served as the first capitol of Tennessee, the University of Tennessee (q.v.), the Agricultural College, and Knoxville College (for colored students). Other features of interest are the iron bridge across

the river, Gray Cemetery, Chilhowee Park (where expositions were held in 1910, 1911, and 1913) United States Weather Bureau Station, and the National Cemetery, in which are 3261 graves, 1047 of unknown dead. In commercial importance Knoxville ranks with the chief interior cities of the South. It is located in a productive marble, copper, zinc, coal, and iron region, carries on a large trade in marble and coal, has extensive wholesale interests, and ships considerable agricultural produce. Its manufactures also are important, including furniture, cotton and woolen goods, flour, lumber, foundry products, electric signs, cars and car wheels, wagons, and many other articles. The government is vested in a mayor and four commissioners, the new form having been adopted in 1912. The municipal budget in 1912 balanced at \$1,262,000, the principal items of expense being \$100,000 for schools, \$63,000 for street expenditures, \$75,000 for the fire department, and \$48,000 for the police department. The city's income was \$1,366,000. The water works are owned by the city. Pop., 1880, 9693; 1890, 22,535; 1900, 32,637; 1910, 36,346; 1914 (U. S. est.), 37,924.

Settled in 1787, Knoxville was laid out and named (after Gen. Henry Knox) in 1791 and became organized as a town in 1794. It was the capital of the "Territory South of the Ohio" from 1792 to 1796 and of the State from 1796 to 1811, and again in 1817. During the Civil War it was held by the Confederates until September, 1863, when General Burnside took possession. From November 10 to November 30 a Confederate force besieged it unsuccessfully, and on the 29th made a desperate assault on Fort Sanders, losing about 600 killed and wounded and 300 prisoners. Knoxville was chartered as a city in 1815 and was enlarged in 1888 and 1889 by the addition of West and North Knoxville. Consult L. P. Powell (ed.), *Historic Towns of the Southern States* (New York, 1900), and Rule, Mellen, and Wooldridge, *Standard History of Knoxville, Tennessee* (Chicago, 1900).

KNOXVILLE COLLEGE. An institution for the higher education of colored youth, founded under the auspices of the United Presbyterian church in 1885. Its original site was at East Knoxville, Tenn., but in 1876 it was removed to Knoxville in the same State. The college has classical, scientific, literary, normal, theological, musical, mechanical, agricultural, domestic-science, nurse-training, and common-school departments. The college property consists of 75 acres, on which stand 10 buildings. About 10 acres of this is set apart for the campus. The most important buildings are the Reception Hall, McCulloch Hall, Elnathan Hall, McDill Home, Wallace Hall, McMillan Memorial Chapel, Carnegie Library Building, Mechanical Building, and the Agricultural Building. The enrollment in 1913-14 was 474, and the faculty numbered 18. The college has no endowment, with the exception of \$10,000 for the library. The value of the grounds, including buildings, is \$180,000. The library contains about 5000 volumes. The president in 1914 was Ralph W. McGranahan.

KNUDSEN, knyd'sen, KNUD (1812-95). A Norwegian philologist. He is best known as the leader in the so-called Danish-Norwegian language movement, as opposed to the Norse movement headed by Ivar Aasen (q.v.). His

aim was to give a more Norwegian coloring to the literary language of Norway by adapting the orthography and syntax to Norwegian usage and by substituting wherever possible Norwegian words for foreign derivatives. The most comprehensive treatment of the subject is in his *Unorsk og norsk, eller fremmedords avløsning* (1879-81). While Knudsen was extreme in his views and frequently erred through a lack of thorough philological training, he exercised a decisive influence upon his contemporaries, especially Bjørnstjerne Bjørnson, and the present form of Norwegian Danish is largely the result of his agitation.

KNUDSON, nōōd'son, ALBERT CORNELIUS (1873-). An American Methodist Episcopal theologian, born at Grand Meadow, Minn. He graduated from the University of Minnesota in 1893 and from the Boston School of Theology in 1896, took postgraduate work at Boston in 1896-97, spent a year at Berlin and Jena, and received the degree of Ph.D. from Boston University in 1900. In 1898 he became professor of Church history in Denver University, in 1900 professor of philosophy and the English Bible at Baker University, from 1902 to 1906 was professor of the English Bible and philosophy at Allegheny College, and thereafter was professor of Hebrew and Old Testament exegesis in the Boston School of Theology. He joined the Colorado conference of his church in 1898 and later was transferred to the New England southern conference. He is author of *The Old Testament Problem* (1908) and *Beacon Lights of Prophecy* (1914).

KNUDTZON, knūt'sōn, JORGEN ALEXANDER (1854-). A Norwegian Semitic scholar, born in Trondhjem and educated at Christiania, Berlin, Leipzig, London, and Paris. In 1907 he became professor of Semitic languages at the University of Christiania. He traveled extensively in Egypt, Palestine, and Asia Minor. Besides articles in *Zeitschrift für die Kunde des Semitischen* and other journals on Semitic grammar, especially the use of tenses, he published *Assyrische Gebete an den Sonnengott* (1893), *Die zwei Arzawa-briefe* (1902), and *Die El-Amarna-tafeln* (1908).

KNURR (nūr) AND **SPELL** (knur, nur, ODutch knorre, Dutch knor, MHG. knorie, Ger. Knorren, knob, and spell, from Dutch spil, spindle). A game which originated on the moors of Yorkshire and is still played chiefly in that locality and the neighboring Lancashire. It has been called collier's golf. It is played with a pommel or club, and a knurr or ball, which is mechanically released from the spell or trap by a spring, somewhat after the manner of the shooter's clay pigeon. Each player plays his own game, without interference, and any number can enter a competition. The knurr is of boxwood or porcelain (called a pottie), the regulation weight being half an ounce and the size about an inch in diameter. It is placed on the spell or trap by the player, who, by means of a thumbscrew, adjusts the spring of the trap according to the velocity at which he wants the ball released. He then releases it and hits the ball on the rise with his pommel, a stick or stout cane varying from 4 to 5 feet in length. It has a flat, hardwood, oblong-square end. The upper end of the pommel, which the player grasps with both hands, is bound with waxed thread, like the handle of a cricket bat, and the blow is made by striking the ball with all possible force. The longest hit or series of hits

wins. In ordinary contests, hits of from 150 to 200 yards are common, and there are records of 300 yards, 14 feet with a pottie, and 360 yards, 37 feet, 8 inches with a wooden knurr. These very long strokes are, however, usually due in part to favoring wind. On a large moor and where the game is general, the ground is marked out with wooden pins driven in every 20 yards. In matches each player takes his own knurrs and pommels and has five rises of the ball to a game. The stroke is made by a full swing round the head, not unlike the drive at golf.

KNUT, knøt, or **CNUT**. A king of England, Denmark, and Norway. See **CANUTE**.

KNUTSFORD, nūts'fōrd, **HENRY THURSTAN HOLLAND**, first VISCOUNT (1825-1914). An English statesman. He was born in London; was educated at Harrow, at Durham University, and at Trinity College, Cambridge; and was admitted to the bar in 1849. He served as legal adviser to the Colonial Office (1867) and as Assistant Undersecretary from 1870 till 1874, when he was elected to Parliament for Midhurst. From 1885 to 1888 he represented Hampstead. He served also as Financial Secretary to the Treasury (1885), Vice President of the Council on Education (1885, 1886-87), and Secretary of State for the Colonies (1887-92). He was made Baron in 1888 and Viscount in 1895. His publications include *Notes on Common-Law Procedure Acts* (1852-54).

KNYPHAUSEN, knip'hou-zen, **WILHELM, BARON VON** (1716-1800). A German soldier, born at Lützelburg (now Luxemburg). He entered the Prussian military service, distinguished himself under Frederick the Great, and became lieutenant general in 1775. In 1776 he came to America in command of the Second Division of Hessian troops. In 1777 he became commander in chief of all the Hessian forces. He took part in the battle of White Plains. He showed great bravery in the capture of Fort Washington, which was renamed in his honor. He was in the battles of Brandywine, Germantown, and Monmouth. During the absence of Sir Henry Clinton (1779-80) he was in command of the city of New York and during this time made a raid into New Jersey and plundered Hackensack. Later he was in the expedition which burned Springfield, N. J. He was an able soldier and after his return to Germany he was made military governor of Cassel.

KOALA, kô-ā'la (Australian name), or **NATIVE BEAR**. An Australian-marsupial (*Phascolarctos cinereus*), regarded as the type of the family Phascolarctidae or as forming a subfamily of the Phalangeridae. It closely resembles the phalangers in dentition, but has the molar teeth much larger. The toes of the forefeet are in two opposable groups of two and three, a character not found in any other quadruped, but well adapted to grasping the branches of trees, on which the koala often hangs with its back undermost like the sloth, which it also resembles in its lethargy. There is scarcely any rudiment of a tail. The general form is not unlike that of a young bear. (Cf. **WOMBAT**.) The female has but one cub at a time, which she carries on her back for a long time after it is capable of leaving her pouch. The koala is rather more

TEETH OF KOALA.

than 2 feet long, and the body is stout and clumsy. The covering is a very dense coat of short gray wool. The animal has no means of defense and is killed with clubs by the natives of Australia, where it is found. It is nocturnal in its habits and feeds exclusively on eucalyptus leaves. In *Marsupials and Monotremes*, W. Saville-Kent, writing of the group of which the Australian native bear is the head, describes the species as an "essentially droll and in many respects abnormal form. . . . Its little podgy tailless body, short thick-set head, and round tufted ears lend some countenance perhaps to the ursine analogy; but there the likeness ends." See Colored Plate of **MARSUPIALS** and Plate of **PHALANGERS**.

KOB. See **WATER BUCK**.

KOBÉ, kôb'bâ, **GUSTAV** (1857-). An American music critic and author, born in New York. When 10 years old, he was sent to Wiesbaden, Germany, to study composition and the piano with Adolf Hagen. After five years with that teacher he completed his musical studies with Mosenthal in New York and in 1877 graduated from Columbia College and two years later from Columbia Law School. He wrote for newspapers, becoming music critic of the *New York Herald*, and for magazines, contributed to the first edition of the *NEW INTERNATIONAL ENCYCLOPEDIA*, and published: *The Ring of the Nibelung* (1889); *Wagner's Life and Works* (2 vols., 1890); *New York and its Environs* (1891); *Plays for Amateurs* (1892); *My Rosary, and Other Poems* (1896); *Miriam* (1898); *Wagner's Music-Dramas Analyzed* (1904), with which were later combined his other Wagner books; *Opera Singers* (1905; 6th ed., rev., 1913); *Famous American Songs* (1906); *Portrait Gallery of Great Composers* (1911).

KOB'DO. A plateau of western Mongolia, 4000 feet above the level of the sea; also the chief town of that region (Map: China, F 2). The town lies north of the eastern branch of the Tien Shan, or Celestial Mountains, about 40 miles from the frontier of Sungaria. It is inhabited chiefly by Kalmucks, by whom, as well as by the Mongols and Russians, it is called Sankinhoto. It is supposed to be the Chingintalas of Marco Polo. It suffered much during the Dungan Rebellion of 1865, but is recovering and now sends great flocks of sheep to Kansu every year. There is also a small trade with Russia. Kobdo has an open trading quarter and a group of government buildings inclosed by a mud wall. Pop., about 6000, including about 1600 garrison troops.

KOBE, kô'bâ. A seaport of Japan, in the southern part of the island of Hondo, adjoining and lying to the northeast of the prefectural city of Hiogo, on the west shore of the bay of Osaka, and distant 22 miles by rail from the city of Osaka (Map: Japan, D 6). When Hiogo was opened in 1868 to foreign residence and trade, Kobe became the foreign residential quarter and the centre of trade, its municipal affairs being managed by a council consisting of the prefect, the foreign consuls, and three elected members. It continued to be a separate town until 1892, when it was united with Hiogo. The city is situated along a fine sandy beach, at the base of a high coast range, and at the entrance to the far-famed Inland Sea. It has a deep and safe harbor and is connected by rail with all parts of the Hondo, or main island. It is in

direct steam communication with China, Formosa, Hongkong, Australia, Europe, and America, as well as with the other treaty ports. It has docks, railway shops, a fine wharf 450 feet long for ocean-going vessels, an Imperial ship-building yard (with patent slip accommodating vessels of 2000 tons' burden), a paper mill, and other manufactures, two foreign banks, two foreign and several native newspapers, hotels, churches, and clubs. It is within easy distance of Osaka, Kyoto, and numerous places of picturesque beauty and historic interest; it is considered the most attractive of the treaty ports, as it probably is the most healthful. The bund or water front of the settlement is faced with stone; the streets are wide, well kept, and lighted by electricity. Though opened much later than Nagasaki and Yokohama, Kobe has now taken first place in shipping as in volume of trade. In 1913 the value of the foreign trade was \$172,611,271 for imports and \$84,894,079 for exports. In 1913 about 2800 vessels (7,100,000 tons) entered port, by far the largest number being British. Pop., 1898, 215,780; 1908, 378,197.

KOBELL. A German family of painters, engravers, and etchers, all descended from Johann Heinrich Kobell, of Frankfurt, who settled at Mannheim in 1720.—His grandson FERDINAND (1740–99), a landscape painter and etcher, was born at Mannheim, where, after studying at the University of Heidelberg, he became the pupil of Peter Verschaefelt. In 1768–69 he continued his studies in Paris, after his return was appointed court painter and later professor at the Academy, and in 1793 removed to Munich. His oil paintings, in the style of Berchem, are represented in the galleries of Karlsruhe, Darmstadt, Stuttgart, and Augsburg, but he is more important as an etcher, his 242 plates marking a distinct advance in the treatment of landscape etching in Germany. Consult his biography by Baron Stengel (Nuremberg, 1822).—His brother FRANZ (1749–1822), landscape and architectural painter and draftsman, was born in Mannheim, where he studied at the Academy before spending nine years in Italy (1776–85), chiefly at Rome. On his return he settled in Munich and was made court painter. His oil paintings, on which Goethe bestowed high praise, are rare, numbering scarcely a dozen, one of the finest being a "Rocky Landscape with Waterfalls," in the Bamberg Gallery. Endowed with an exuberant fancy and extraordinary facility of production, he afterward confined himself entirely to drawings, of which he is said to have produced more than 10,000.—HENDRIK (1751–99), a marine and landscape painter, born at Rotterdam, cousin of Ferdinand and Franz, studied in Amsterdam under Jacob de Vos and Cornelis Ploos van Amstel. He settled afterward at Rotterdam and is especially esteemed for his marine subjects in oil and his numerous drawings executed with the pen, heightened with India ink, and his water colors.—JAN (1756–1833), engraver, born at Rotterdam, brother of Hendrik, engraved anatomical plates and in 1787 a series of historical portraits.—JAN, the elder (1778–1814), animal and landscape painter and etcher, was the son of Hendrik and a pupil of Willem Rutgaert van der Wall at Utrecht. He studied diligently from nature and took Paul Potter for his model. In 1812 he went to Paris, where he won the gold medal and high praise from

art critics. His popularity increased rapidly until his premature death, at Amsterdam. Of his cattle pieces, remarkable for their sterling technique and precision of drawing, there are good specimens in the museums of Amsterdam and Rotterdam.—JAN, the younger (1800–38), landscape and cattle painter, born at Rotterdam, son of Jan the engraver, pupil of Rotterdam Academy, painted his principal work, a life-size cattle piece, in 1830.—His sister ANNA (1795–1847) was also an esteemed artist.—WILHELM VON KOBELL (1766–1855), landscape and battle painter and etcher, born at Mannheim, son and pupil of Ferdinand; studied afterward the works of the old Dutch masters in the Düsseldorf Gallery and was especially attracted by Wouverman. In 1778 he went to Rome, was made court painter at Mannheim after his return, and afterward followed his father to Munich, where he became professor at the Academy in 1808. He painted at first landscapes, rural genre scenes, and animal pieces, of which the galleries of Bamberg, Weimar, Mannheim, Karlsruhe, Berlin, Darmstadt, Frankfurt, and Wiesbaden contain fine specimens. In 1809 he visited Vienna, and in 1810 Paris, to make studies for his battle pieces, which contain many portraits of famous contemporaries. The New Pinakothek in Munich contains "The Third Day of the Battle of Hanau" (1808) and the Banquet Hall of the Königsbau the "Surrender of Brieg," "Cavalry Skirmish at Arnhofen," and the "Battles of Eckmühl and Wagram." He became most widely known through his etchings and aquatint engravings after Wouverman, Berchem, Roos, Ruysdael, and others, in which he reproduced the peculiar style of each master with uncommon success.

KOBELL, FRANZ VON (1803–82). A German mineralogist and poet, born in Munich and educated at Landshut. He became professor of mineralogy in Munich in 1826 and in 1849 was appointed first curator of the state collection of minerals. To mineralogy his greatest contributions were new methods in crystallography and the valuable invention of the stauroscope to determine the optical properties of a crystal. His scientific publications include: *Charakteristik der Mineralien* (1830–31); *Skizzen aus dem Steinreich* (1850); *Mineralogie: Populäre Vorträge* (1862); and, above all, the *Tabellen zur Bestimmung der Mineralien* (1833, 16th ed., 1912); *Galvanographie* (1842; 2d ed., 1846), describing a method of his own invention; and *Geschichte der Mineralogie* (1864). Kobell's popular poetry, in the dialects of Upper Bavaria and of the Palatinate, shows true humor and the possession of rich fancy. Among the works of this class mention should be made of *Schnadahupfn und Spruchln* (2d ed., 1852), *Gedichte in pfälzischer Mundart* (1839–41), *Jagd- und Weinlieder* (1899). Consult Luise von Kobell, *Franz von Kobell* (Munich, 1884).

KÖBERLE, KEBERLE, GEORG (1819–98). A German author and dramatist, born at Nonnenhorn. He studied at the Gymnasium at Augsburg, was sent to the Jesuit Collegium Germanicum at Rome, but ran away from that institution and studied philosophy and law at Munich. At Leipzig (1846) he published his *Aufzeichnungen eines Jesuitenzöglings im deutschen Kolleg in Rom*, which created a sensation, and which he followed up (1870) with *Deutsche Antwort auf welsche Projekte: Enthüllungen über die Palastrevolution im Vatikan*. He is better

KOCH, JOHAN PETER (1870-). A Danish captain and explorer of the Arctic dependencies of Denmark, born at Vestenskov. He participated in Amdrup's expedition to east Greenland in 1900 and was one of the general staff of the surveying expeditions to Iceland in 1903-04. In 1906-08 he was a member of the Mylius Erichsen expedition to the northeast coast of Greenland, on the death of his chief succeeding to the command. He led a sleigh expedition on Greenland north to 83° 30' (1907); with the Englishman Tobias searched

for Mylius Erichsen (1908); and in 1912-19 led an expedition over the inland ice of Greenland. Koch received, among other honors, the Vega medal of the Swedish Anthropological and Geographical Society. He became a member of the International Polar Commission. Consult *Meddelelser om Grönland*, xxvi, xlvii.

KOCH, JOHANNES. See COCCIIUS, JOHANNES.

KOCH, JOSEPH ANTON (1768-1839). An Austrian landscape painter and etcher, born at Obergiebeln, Tirol. In 1795 he made his way to Rome, where he became a follower of Carstens (q.v.), at the same time modeling his style in landscape after Poussin and Claude Lorraine. Among his earlier works were etchings for Carstens's *Les Argonautes, selon Pindare, Orphée, et Apollonius de Rhode* (1799), a series of 20 Italian landscapes, 36 illustrations to Ossian and 14 to Dante; also American landscape views for portions of Humboldt's works (1805). During the years 1812-15 he was in Vienna, and some of his best oil paintings date from this period. Afterward he went to Rome and became a conspicuous figure in the German artists' colony there. He was the first to paint "heroic" or "historical" landscape, and his influence upon his associates was very great. His landscapes, chiefly Italian subjects, are found most frequently in German museums, especially at Berlin, Frankfurt, Hamburg, Munich, and Leipzig. In the Dante room of the Villa Massimo in Rome he painted four frescoes (1824-29). His *Moderne Kunstchronik oder die rumfordische Suppe, gekocht und geschrieben von J. A. Koch* (1834) is an attack upon unfair art criticism. Consult Strauss, *Kleine Schriften* (Bonn, 1877), and Frimmel, in Dohme, *Kunst und Künstler des neunzehnten Jahrhunderts* (Leipzig, 1884).

KOCH, KARL (1809-79). A German botanist, born near Weimar. He studied at the universities of Würzburg and Jena and then undertook a scientific journey to southern Russia (1836-38). He completed his researches in a second journey, in 1843-44. The fruit of this second trip, in which he also visited Asia Minor, Armenia, the Caspian Sea, and the range of the Caucasus, was his *Wanderungen im Orient* (1846-47). In 1836 he was appointed professor of botany in the University of Jena, and in 1847 became professor in the agricultural Hochschule at Berlin, where he remained until his death. Besides several books on travel, Koch wrote the well-known work *Dendrologie* (1869-73).

KOCH, MAX (1855-). A German literary critic. He was born at Munich and was educated there and at Berlin. In 1880 he qualified as docent at Marburg, in 1890 became assistant professor at Breslau, and in 1895 professor. Besides editions of Shakespeare, Chamisso, Goethe, Schiller, Von Arnim, Brentano, F. Schlegel, Hoffmann, Lessing, Platen, Schulz, and Lenau, he wrote: *Helferich Peter Sturz und die schleswigschen Literaturbriefe* (1879); *Ueber die Beziehung der englischen Litteratur zur deutschen im achtzehnten Jahrhundert* (1883); *Shakespeare* (1885); *Gottsched und die Reform der deutschen Litteratur* (1886); *Frans Grillparzer* (1891); *Nationalität und Nationallitteratur* (1891); and, with Vogt, *Geschichte der deutschen Litteratur* (1900; 7th ed., 1911); *Richard Wagner Biographie* (3 vols., 1907-14). He founded in 1886 the *Zeitschrift für vergleichende Litteraturgeschichte*.

KOCH, ROBERT (1843-1910). A famous German physician and bacteriologist born at Clausthal, Hanover. He studied medicine at Göttingen, then practiced in Langenhagen, Rackwitz, and Wollstein. It was at Wollstein from 1872 to 1880, that he began the researches in bacteriology upon which his fame chiefly rests. Koch's researches on the history of anthrax were published in 1876, and two years later followed his study on the history of traumatic infective diseases. These works placed bacteriology upon a firm scientific basis. Appointed in 1880 a member of the Imperial Board of Health in Berlin, he continued the unwearied study of the communicable causes of anthrax, cholera, and tuberculosis, isolating the tubercle bacillus in 1882. To do this it was necessary to invent new appliances for microscopical work, and new methods of staining specimens to render visible these special microorganisms. In this way Koch led advances in bacteriology which are of inestimable value to medical science.

Koch and his supporters have shown that many diseases are caused by specific germs. In experiments upon animals Koch discovered that the injection of diseased blood produced septicæmia in house mice, discovering also that the microorganisms found in the blood of these animals were identical in form and character with those in the blood used for injection. At the site of the injection of the infected fluid abscesses developed. The pus from these abscesses, full of the bacteria, when injected in a diluted form into a healthy animal, invariably produced the disease. Koch produced erysipelas in the same way. The infectious character of tuberculosis of the lungs had been suspected for many years, but to him belongs the credit of discovering its specific germ, which he demonstrated in the sputum of sufferers from the disease. In 1883 Koch became chief of the German commission sent to Egypt and India to investigate cholera, with the result of discovering the cholera spirillum or comma bacillus, and in the same year he published a method of inoculation to prevent anthrax. Returning to Germany in 1884, he received 100,000 marks from the government, and was appointed (1885) professor in the University of Berlin and director of the new Hygienic Institute. In November, 1890, through the premature report by a student, it became generally known that Dr Koch had discovered a substance which, when administered by injection hypodermically, was destructive of the tubercle bacilli, and hence presumably a swift and certain cure for tuberculosis. Physicians from all countries flocked to Berlin, and consumptives traveled thither in the hope of certain cure. Amid all this clamor Koch remained for a long time silent as to the method of preparing the "lymph" and singularly conservative in the claims that he made of its efficacy. In January, 1891, while not giving all the details of its preparation, he made it evident that his lymph was itself prepared from the bacilli. Billroth, Schrotter of Vienna, and Crocq of Brussels promptly stated their doubt of its safety. Subsequent experience has shown that tuberculin (q.v.) is useful as a test, and a help in the cure, of tuberculosis. The lymph, or, as he preferred to call it, the *paratuberculin*, is a poison and must be used with great caution and in minute doses.

In 1901, before the British Congress on Tuberculosis, held in London, Koch called attention

to the fact that even at his first publication of the aetiology of tuberculosis he expressed himself with reserve regarding the identity of the disease in man and animals, announcing his belief that bovine tuberculosis and human tuberculosis were distinctly different diseases, confirming the belief of Theobald Smith, of Washington, stated a year previous. In 1903 Koch began the study of blood infections in East Africa. He demonstrated within the body of ticks, through whose bites "African relapsing fever" is transmitted, the spirochetæ of the disease. In the body of the tick he also found the piroplasma which causes "Texas fever"; he proved that the tsetse fly transmits the trypanosomata in the fluid exuded at the moment of biting, confirming the suggestions of previous investigators. He also demonstrated the parasites of "coast fever."

In 1905-06 Koch was commissioned by the German government to investigate West African "sleeping sickness" (q.v.), which in recent years has caused the death of several hundred thousand people. It was in 1905, also, that he was awarded the Nobel prize for medicine. Among his published works are: *Untersuchungen über die Aetologie der Wundinfektionskrankheiten* (1878, Eng. trans. by Cheyne, 1880); *Ueber die Milzbrandimpfung. Eine Entgegnung auf den von Pasteur in Genf gehaltenen Vortrag* (1882); *Beitrag zur Aetologie der Tuberculose* (1882; Eng. trans. by Boyd, 1886); *Ueber die Cholera-bakterien* (1884, Eng. trans. by Laycock, 1886); *Ueber Naturheilung und medizinische Kunst* (1885); *On Disinfection*, abstracted and translated by Whitelegue (1886); *Weitere Mittheilungen über ein Heilmittel gegen Tuberculose* (1890); *Ueber bakteriologische Forschung* (1890; Eng. trans., 1891); *Ergebnisse der vom deutschen Reich ausgesandten Malaria-Expeditionen* (1900); *An Investigation of Pathogenic Organisms* (trans. by Horsley, 1886); *Aerztliche Beobachtungen in den Tropen* (1898); *Diagnosis, Treatment, and Prophylaxis of Tropical Malaria* (trans. by Shakespeare, 1898). His last paper, "The Epidemiology of Tuberculosis," was read before the Academy of Sciences of Berlin, April 7, 1910, only six weeks before his death. In accordance with his request his body was cremated. Consult: H. M. Biggs, "Robert Koch and his Work," in *American Review of Reviews*, vol. xxiv (New York, 1901); Bernhard Fischer, "Robert Koch," in *Deutsche Rundschau*, vol. xxxvii (Berlin, 1910); J. A. Wyeth, *Memorial Address* (New York, 1911). See TUBERCULOSIS and TUBERCULIN.

KOCHANOWSKI, kô'kâ-nô'f'skê, JAN (1530-84). A famous Polish humanistic poet. He was born on the family estate, Sycyna, in the Government of Radom. In 1544 he entered the University of Cracow, and in 1552 he continued his studies at the University of Padua. He traveled for some time in Italy, and in 1553 he went to Paris, where he met Ronsard, who encouraged him to write in verse, in which art he soon became famous. On his return home he was appointed royal secretary at the court of King Sigismund Augustus. Soon afterward he was presented with two benefices. In 1568, however, he retired to his estate, Czarnylas, where he devoted himself to writing poetry, taking at the same time keen interest in all political changes of his country. He later refused the post of poet laureate at the court of King Stephen Báthory. Kochanowski is the most im-

portant Polish poet of his century. He wrote in Polish and in Latin. In the former the most famous of his works are the *Treny* (Cracow, 1580); elegies on the death of his daughter Ursula, which are considered masterpieces in form and style; the tragedy *Odprawa posłów greckich* (The Dispatch of the Greek Ambassadors; 1578), in commemoration of the marriage of Zamojski with the Princess Báthory; *Proorzec albo hold pruski* (Homage to the Prussian Banner; 1569), brought out by the Lublin union; and the satire *Z goda* (1564). In his *Fraszki* (Epigrams), miscellaneous poems and anecdotes (3 vols., 1584), he appears at his best. His translation of the Psalms (1579), stamped with vividness and simplicity, is considered the best in existence. In the Latin language he wrote *Lyricorum Libellus* (1580), *Elegiarum Libri Quatuor* (1584), and many occasional poems which have been translated into Polish by Brodzinski in 1829 and by Kondratowicz Syrokomla in 1851. Kochanowski welded the classical and Polish elements and largely contributed to the development and refinement of his native language. His writings were for the first time published collectively at Cracow in 1584-90, but the last and best edition, the so-called jubilee publication, appeared in Warsaw (1884). Many of his poems were also translated into German by H. Nitschmann (1875). For biographies of Kochanowski, consult Von Przybowski (Posen, 1857), also Lowenfeld, *Jan Kochanowski und seine lateinischen Dichtungen* (ib., 1878).

KOCHER, kôc'êr, EMIL THEODOR (1841-) A Swiss surgeon, born at Bern. He studied medicine at Bern and surgery at Berlin, Paris, and London and then returned to his native city. There he was connected with the university after 1866, becoming professor and director of the surgical clinic in 1872. In 1909 he was awarded the Nobel prize for medicine. His especial field was in operation on the thyroid gland, and he first described and studied *cachexia thyreopriva* (1883). His later work included transplanting the thyroid gland, study of the blood in exophthalmic goitre, study of cancer of the thyroid, and curability of cancer of the stomach; more recently he described tumors of the hypophysis (pineal gland) and the prevention of cretinism. He wrote: *Die antiseptische Wundbehandlung* (1881), *Vorlesungen über chirurgische Infektionskrankheiten* (1895), with Tavel, *Encyklopädie der Chirurgie* (1901), with Quervain, *Kocher's Chirurgische Operationslehre* (2d ed., 1894), which is to be had in English as *Text Book of Operative Surgery* (new ed., revised and enlarged, 2 vols., 1911), is considered a classic.

KÖCHLY, kô'k'lê, HERMANN (1815-76) A German classical scholar and educational reformer. He was born in Leipzig and was educated there. He taught in a school at Saalfeld, near Meiningen (1838-40), and in another at Dresden (1840-49). He published *Ueber das Princip des Gymnasialunterrichts der Gegenwart* (1845) and *Zur Gymnasialreform* (1846). The scheme set forth in these pamphlets stressed the natural sciences and, in Latin and Greek, urged emphasis on content, rather than on grammar and style, and the gradual abolishment of speaking and writing those languages. In February, 1849, Köchly was elected to the Lower House of the Kingdom, but after taking part in the revolutionary struggle in May was

forced to flee. He went to Brussels; in 1850 he became professor at Zurich and in 1864 at Heidelberg. He was a member of the German Reichstag from 1871 to 1873. He wrote: *Quintus Smyrnaeus* (1853); *Hesiodus* (1870), *Arati, Manethome, Maximi et Aliorum Astrologica* (1851); *Nonni Dionysiaca* (1858), seven dissertations *De Iliadis Carminibus* (1850-59); *Iliadis Carmina XVI.* (1861); *De Diversis Hesiodæ Theogoniæ Partibus* (1860); three dissertations *De Odysseæ Carminibus* (1862-63); *Geschichte des griechischen Kriegswesens* (1852); *Griechische Kriegsschriftsteller* (1853-55); *Einleitung zu Caesars Kommentarien über den Gallischen Krieg* (1857); *Onosandri de Imperatoris Officio Liber* (1869). He worked also on Greek tragedy, on Caesar, and on Cicero. Consult Hug, *Hermann Kochly* (Basel, 1878); Büchel, *Hermann Kochly ein Bild seines Lebens* (Heidelberg, 1904). Sandys, *A History of Classical Scholarship*, vol. in (Cambridge, 1908).

KOCH'S LYMPH. See TUBERCULIN.

KOČIAN, kō'tsē-ān, JAROSLAV (1884-). A Bohemian violinist, born at Wildenschwert from 1899 to 1901 he was a pupil of Sevcik at the Prague Conservatory. Thereafter he concertized with phenomenal success throughout Europe and America. He cultivated with evident predilection the bravura style of playing, of which, with the single exception of Kubelik (q.v.), he came to be the foremost exponent of his time.

KOCK, kōk, CHARLES PAUL DE (1794-1871). A popular French novelist, son of a Dutch banker who was guillotined in the year of his son's birth. Kock, born at Passy, May 21, 1794, began life as a banker's clerk, but at 20 he entered upon the publication of melodramas and farces, from which he turned in *Georgette* (1820) to fiction and achieved in *Gustave le mauvais sujet* (1821) a success which he extended in *Frère Jacques* (1822). *Le barbier de Paris* (1826; translated into many languages), *André le Savoyard* (1824), *La laitière de Montfermeil* (1827), *Monsieur Dupont* (1825), *Un tourlourou* (1837), *La femme, le mari et l'amant* (1829), *Le cocu* (1831), and *La pucelle de Belleville* (1834) are typical of his work. *Le monsieur* (1842) marks the beginning of his decline. Kock's books deal with the social sphere of shopgirls and clerks and the democratic bourgeoisie. The stories are full of observation at first hand and of spicy humor. They are rather vulgar, but not immoral. They were extraordinarily popular. A 56-volume edition of his works came out in 1884. An English translation was begun in 1903 and completed in 1904. It appeared in *Masterpieces of French Literature in English* (20 vols., Philadelphia, 1903-04), translated by George Burnham Ives. *Complete Works* (Boston, 1902) were translated by Mary Hanford Ford. Consult Trimm, *La vie de Charles Paul de Kock* (Paris, 1873).

KODAK. See PHOTOGRAPHY

KODAMA, kō'dā-mā, GENTARO, VISCOUNT (c.1852-1906). A Japanese soldier, born in Choshu. He fought on the Imperial side in the rebellion of 1874 and the Satsuma rebellion of 1877, studied military science in Europe, and became Assistant Minister of War in 1892. In 1900 he became Governor-General of Formosa and in 1902 received in addition the portfolio of the Interior, which he held till October, 1903. In October, 1903, he became vice chief of the general staff, in which capacity he carried out

the first mobilization of troops for Manchuria in 1904. Later in the year he went to Manchuria as chief of staff to Marshal Oyama (q.v.). His was the master mind which sent the Japanese armies to unbroken victory in the Russo-Japanese War of 1904-05; the army commanders Kuroki, Oku, Nodzu, and Nogi (qq.v.) were his instruments, and the commander in chief Oyama merely lent sanction to Kodama's orders. After the war he was created Viscount, returned to Formosa as Governor-General, but was recalled to Tokyo and made chief of the general staff shortly before his death, which occurred on July 23, 1906.

KODIAK, kōd-yāk', or **KADIAK**. The largest island of Alaska, having an approximate area of 36,000 square miles, situated to the south of Cook Inlet (Map. Alaska, H 7). In 1910 the population of its three largest towns were: Karluk, 549, Kodiak, 438; Akhiok, 106. Its chief product is salmon, the Karluk River being the best salmon stream of Alaska. The rainfall of 61 inches is well distributed, and the temperature mild, ranging from a mean of 28.8° in December to 55.2° in August. In late years the United States Department of Agriculture has introduced cattle farming, with promising results. Church and school facilities for the communities, mostly native, are ample. The Kodiak bear is the largest species in the world.

KO'DOK, or **FASHODA**, fā-shō'dā. A town and headquarters of a province of Egyptian Sudan, situated in an unhealthy region on the upper or White Nile, in lat 9° 53' N. and long 32° 7' E., 460 miles by river from Khartum (Map: Egypt, C 6). It was founded by the Egyptian government in 1865 and was almost entirely deserted during the Mahdist uprising which broke out in 1881. A French expedition under Captain Marchand occupied Kodok in July, 1898. After the victory of Omdurman by Lord Kitchener in September of the same year the British government demanded the evacuation of Kodok by the French—a demand complied with in consideration of commercial concessions in the upper Nile region and the extension of French rule in central Sudan, so as to include the territories of Wadai, Baghirmi, Kanem, Tibesti, Borku, and part of the desert. The Anglo-French convention of March, 1899, fixed the boundary line between the British and the French possessions in north Africa and provided for commercial equality for all nations in the region between Lake Chad and the upper Nile.

KOEHLER, kē'lēr, ROBERT (1850-). An American genre painter, born at Hamburg, Germany. He was brought to the United States in 1854, was apprenticed to a lithographer in Milwaukee in 1866, and later practiced his profession in New York, where he studied drawing in the night classes of the National Academy of Design. He also studied at the Art Students' League and in Munich, Germany, under Loefftz and Defregger. His works are in the style characteristic of the Munich school; they are: "Her Only Support" (1882); "The Artist" (1883); "The Strike" (1886). "The Holiday Occupation" is in the Pennsylvania Academy, Philadelphia. He became director of the Minneapolis School of Fine Arts in 1893.

KOEHLER, SYLVESTER ROSA (1837-1900) An American art critic. He was born in Leipzig, but came to America when he was 12 years

old and from 1868 resided in Boston. He is chiefly known for his important part in the development of the graphic arts in America; by his original publications, translations, and magazine articles; and by his lectures, delivered at Lowell Institute, Boston, the National Museum, Washington, and elsewhere. His most important publications are: *Original Etchings by American Artists* (1883); *American Art* (1886); *Etching: An Outline of its Technical Processes and its History* (1885); *A Chronological Catalogue of the Engravings, Dry-Points, and Etchings of Albrecht Durer* (1887). In 1880-81 he edited the important *American Art Review*. In 1887 he was appointed director of the cabinet of engravings at the Boston Art Museum, and he served as director also of the department of graphic arts in the National Museum, Washington.

KOEHNE, kē'ne, BERNHARD, BARON (1817-86). A German numismatist and armorer, born in Berlin and educated at Berlin, where he was docent for many years, and at Leipzig. In 1845 he went to St Petersburg as curator of coins. There he edited *Mémoires de la société d'archéologie et de numismatique de Saint Pétersbourg* (1847-52), containing the work he had begun in the *Zeitschrift für Münz-, Siegel- und Wappenkunde* on the archaeology of the Middle Ages. He wrote also *Beiträge zur Geschichte und Archäologie von Chersonesus in Taurien* (1848) and the splendidly illustrated *Description du musée du feu prince B. Kotchoubey* (1857).

KOEKKOEK, kōōk'kōōk, BAREND CORNELIS (1803-62). A Dutch landscape painter, born at Middelburg, Holland. He studied under his father, Jan Hermann Koekkoek (1778-1851), a marine painter, and at the Amsterdam Academy under Schelfhout and Van Oos. His paintings, very popular in their day, show correct drawing, but are dry in color and niggling in execution. He took gold medals at Amsterdam in 1840, at the Paris Exposition in 1855, and at The Hague. In 1841 he removed to Cleves, in Rhemish Prussia, where he founded an academy of design. There are many examples of his landscapes in the museums of Holland, Germany, and the United States.

KO'EL (Hind. *kōyal*, *kōklā*, Prak. *kōēla*, Skt. *kōkīla*, cuckoo; onomatopoeic in origin). A cuckoo of the genus *Eudynamis*. Four species are known, two in the East Indian region and two in Australasia. They are cuckoo-like in form, but rather stout, and are remarkable for a sexual difference in coloration, the male being glossy black and the female rufous, with black bands. Still more unusual is the fact that the young resemble the males in plumage and not the females. The koels are parasitic, depositing their eggs singly in the nests of other birds, as do several other members of the family (see CUCKOO), but seem to look after their offspring to a certain extent, for they have been seen feeding them after they have left the nest of the foster parents. One species (*Eudynamis honorata*) is numerous and familiar in India, where it is known as rain bird. A common species of the Philippines (*Eudynamis mindanensis*) is there called phow. The blue-headed koel (*Eudynamis cyanocephala*) is a native of Australia. Consult Dewar, *Birds of the Plains* (Calcutta, 1909). See Plate of CUCKOOS.

KOENEN, kōō'nen, TILLY (c.1880-). A celebrated Dutch Lieder singer, born of Dutch

parents on the island of Java. Until her sixteenth year she devoted her entire attention to the piano, but then, upon her mother's advice, had her voice cultivated at the conservatory in Amsterdam and later by Cornelie van Zanten, of Berlin. Her début took place in London in 1899. In 1909 she made a most successful tour of the United States. The extraordinary natural beauty of her voice and her emotional intensity amply counterbalance some slight shortcomings of mere technical manipulation.

KOENIG, kē'nīk, HEINRICH JOSEPH (1790-1869). A German novelist, born at Fulda and educated there. He held offices in Fulda and Hanau. His earlier works, the dramas *Die Erfüllung* and *Wyatt*, were followed by *Rosenkranz eines Katholiken* (1829) and *Der Christbaum des Lebens* (1831). Because of these books he was excommunicated by the Catholic Bishop and entered the Protestant church. He became a member of the Diet of Hesse-Cassel in 1832 and was an opponent of the reactionary Minister Hassenpflug. In 1860 he moved to Wiesbaden. Among his dramas may be mentioned *Die Bussfahrt* (1836). His historical novels are now little read. The best are *Die hohe Braut* (1833), *Die Klubbisten in Mainz* (1847), and *König Jeromes Karneval* (1855). He wrote once more on theological matters in *Was ist die Wahrheit von Jesu?* (1867), and the autobiographical sketches: *Auch eine Jugend* (1852), *Ein Still-leben* (1861), and *Eine Fahrt nach Ostende* (1845). His collected works appeared in 20 volumes (1854-68).

KOENIG, ROBERT (1828-1900). A German educator and author, born at Danzig. He studied philology and theology in Berlin, Edinburgh, Bonn, and Halle, was rector of a young women's seminary at Oldenburg, edited the home journal *Daheim* at Leipzig from 1864 to 1899, and then settled at Potsdam. He is best known through his popular but not very trustworthy *Deutsche Literaturgeschichte* (29th ed., 1903); and besides a number of popular and juvenile books, such as *Der grosse Krieg von 1870* (2d ed., 1872) and *Der alte Nettelbeck* (1873), wrote *Zur Charakteristik der Frauenfrage* (1870), and other works on women's rights, and *Deutsches Frauenleben im deutschen Liede* (2d ed., 1891). He also translated several of Walter Scott's novels.

KOENIG, kē'nīk, RODOLPHE (1832-1901). A French physicist, born at Königsberg in Prussia. He went to Paris in 1851, worked in the factory of Vuillaume at the construction of musical instruments, and in 1858 established a manufactory of acoustic instruments for the scientific excellence of which he enjoyed a unique reputation. He made valuable studies of graphic representation of sound, invented a manometric flame, and, following an idea originating with Scott de Martinville, constructed a phonograph, by which the vibrations of sound are recorded. Koeng improved Seebeck's siren, repeated Reis's early experiments with the telephone, and exhibited at Philadelphia in 1876, with many other acoustic instruments, a tonometer with 670 forks. His tuning forks were especially fine and became the standard among physicists. His important writings were *Quelques expériences d'acoustique* (1882, reprinted from Poggendorff's *Annalen*) and a *Catalogue raisonné d'appareils d'acoustique* (1859-69).

KOENIGS, kē'nīks, GABRIEL (XAVIER PAUL) (1858-). A French mathematician, born at

Toulouse. He received the degree of doctor of sciences in 1882 and the following year was appointed to the faculty of Besançon, then to that of Toulouse (1885). He later became professor of physical and experimental mechanics at the University of Paris. His original treatises upon geometry, mechanics, and like subjects were published in different journals of mathematics, in the records of the Academy of Sciences and of the Normal School, and he issued independently: *Leçons de l'agrégation classique de mathématiques* (1892); *Sur les lignes géodésiques* (1893), which was crowned by the Academy of Sciences; *Leçons de cinématique* (1895); *La géométrie réglée et ses applications* (1895); *Leçons de cinématique professées à la Sorbonne* (1897); *Introduction à une théorie nouvelle des mécanismes* (1905).

KOENIGSBERGER, kē'niks-bēr'gēr, LEO (1837-). A German mathematician, born in Posen. Educated at the University of Berlin, he taught mathematics and physics in a military school in Berlin from 1860 to 1864 and became professor at Greifswald in 1864, at Heidelberg in 1869, at the Dresden Polytechnic in 1875, at Vienna in 1877, and again at Heidelberg in 1884. Besides technical papers in mathematical periodicals, he wrote a valuable biography of Hermann von Helmholtz (1902), of which there is an English version (1906) by F. A. Welby, and a sketch of C. G. J. Jacobi (1904) and *Die Prinzipien der Mechanik* (1901).

KOEPPING, kēp'ing, KARL (1848-). A German copperplate engraver. He was born in Dresden and studied painting at the Munich Academy and later etching and engraving under Waltner in Paris. In 1890 he was appointed director of the chief atelier for copperplate engraving and etching connected with the Berlin Academy. He particularly excels in his faithful and powerful reproductions of Rembrandt; among his finest plates after this master are the portrait of an old man (Dresden Gallery), the "Syndics of the Clothiers' Guild," "Joseph Accused by Potiphar's Wife," and "The Minister Anselmo Comforting a Woman." Fine examples of the versatility of his talent are the plates of the "Banquet of the Officers of St. George's Shooting Company," after Frans Hals; "Frou-frou" after Clairin; and "Morning," after Jules Breton. He received the Grand Prix at Paris in 1889 and 1900 and gold medals at Berlin, Munich, Vienna, Paris, Dresden, and Leipzig. His best-known original engraving is "Girl at a Pond."

KOERBER, kēr'bēr, ERNST VON (1850-). An Austrian statesman, born in Trent. After studying law he received a post in the Ministry of Commerce (1874), where he became expert in railway administration. He was made chief of section in 1893 and manager of the state railways in 1895. In 1897-98 he was in the Gautsch cabinet as Minister of Commerce and in 1899 in the Clary cabinet as Minister of the Interior. In January, 1900, he became Premier and Minister of the Interior, and after October, 1902, held also the portfolio of Justice. During his premiership the strife of nationalities led to extraconstitutional methods of government. He resigned Dec. 31, 1904.

KOESTER, kēs'tēr, HANS LUDWIG RAIMUND VON (1844-). A German naval officer, born in Schwerin, the son of a poet. He was educated at the Werder Gymnasium in Berlin,

entered the navy as a "cadet aspirant" at 15, and became a lieutenant before he was 20. He was chief of staff in 1884-87, then chief director of docks at Kiel, rear admiral in 1889, vice admiral in 1892, chief of the manœuvre squadron in 1893 and of the Baltic marine station in 1896, admiral in 1897, inspector general of marine in 1899, and chief of the active battle fleet from 1903 to 1906, when he retired. In 1900 he had been made a hereditary noble and in 1905 received the rank of Grossadmiral (corresponding to army field marshal) and was made a member of the Prussian House of Lords. After leaving active service he was prominent in the "greater navy" movement, becoming president in 1908 of the German Navy League (Flottenverein). Consult the chapter on Koester in F. W. Wile, *Men around the Kaiser* (Philadelphia, 1913).

KOETSVELD, kōōts'vêlt, CORNELIS ELIZA VAN (1807-93). A Dutch novelist, born at Rotterdam. He studied for the ministry at Leyden and obtained his first charge in 1830. Afterward he was pastor at Berkel and Schoonhoven and in 1849 was appointed court preacher at The Hague. His numerous theological writings are little known, but his novels and descriptions of country life in his own villages have a place in Dutch literature. The best of these sketches is *Schetsen uit de pastorij te Mastland* (1843; 13th ed., 1902), translated into English by Thomas Keightley as *The Manse c.* (1860). His collected tales, sketches, etc., were issued in 10 volumes (Arnhem, 1897-98). Consult Jan ten Brian, *Geschiedenis der noord nederlandsche Letteren in de 19e Eeuw*, vol. 1 (Rotterdam, 1904).

KOFOID, CHARLES ATWOOD (1865-). An American zoologist, born at Granville, Ill. He graduated from Oberlin College in 1890 and from Harvard University (Ph.D.) in 1894; until 1900 taught at the universities of Michigan and Illinois; and thereafter was connected with the University of California, becoming professor of zoölogy in 1910. At various times he was identified with the San Diego Biological Station, the Agassiz expedition to the tropical Pacific (1904-05), and the Scripps Institute of Biological Research; and he served on the editorial staffs of various scientific journals. His investigations and contributions deal particularly with plankton, the embryology of Mollusca, and the morphology and taxonomy of Protozoa.

KOFU, kō'fū. The chief town of the Province of Kai, Yamanashi ken, Japan, about 80 miles southwest of Tokyo (Map: Japan, F 6). It stands in a mountainous region and is one of the most progressive towns in Japan. It has many fine buildings in European style. Its chief industry is silk weaving. The thin sarsenet-like fabric called kai-ki and used for linings is its most celebrated product. Here are cut and polished many objects of rock crystal, which is quarried in the neighboring mountains. The province is also noted for its fine grapes, and a most excellent wine is produced from them. Pop., 1898, 37,561; 1903, 44,188; 1908, 49,882.

KOGEL, kō'gel, GUSTAV FRIEDRICH (1849-). A German musical conductor, born at Leipzig. He received his first musical education from his father, who was a trombone player in the Gewandhaus Orchestra. From 1863 to 1867 he attended the Leipzig Conservatory, and then settled in Alsace as a music teacher. At the outbreak of the Franco-Prussian War he re-

turned to his native town, where he became connected with the publishing house of C. F. Peters, for whom he edited a large number of operatic scores. In 1874 he began his career as conductor at Nuremberg, subsequently filling similar positions at Dortmund, Aix-la-Chapelle, Cologne, and Leipzig. From 1887 to 1891 he conducted the Berlin Philharmonic Orchestra, proving himself a symphony conductor of extraordinary ability. In 1891 he assumed the direction of the Museum Concerts at Frankfurt, which under him became events of prime importance. As a guest conductor, he made extensive tours of Germany, Spain, and Russia. In 1906 he appeared with the Philharmonic Society of New York.

KOGEL, kē'gel, RUDOLF (1829-96). A German theologian and famous preacher, born at Birnbaum in the Province of Posen. He studied theology and philosophy at the universities of Halle and Berlin. After teaching and preaching for a number of years he was appointed court preacher at Berlin in 1863, and the following year was made counselor of the consistory of Brandenburg and counselor to the Minister for Public Worship. In 1880 he advanced to the rank of royal chaplain in chief, and in 1884 he became a member of the State Council; but between 1891 and 1894 ill health compelled him to relinquish all his posts. By dint of his great influence with the Emperor William, he defeated Falk's Church policy (see FALK, ADALBERT), and thus gave the spiritual development of Prussia a conservative direction. His works include: *Der erste Brief Petri in Predigten ausgelegt* (3d ed., 1890), *Die Seligpreisungen der Bergpredigt* (2d ed., 1869), *Kirchliche Gedenkblätter aus der Kriegszeit* (1871), *Das Vaterunser in Predigten ausgelegt* (3d ed., 1889), *Der Brief Pauli an die Römer in Predigten ausgelegt* (2d ed., 1883), *Vaterländische und kirchliche Gedenktage, Reden und Ansprachen* (2d ed., 1892), *Die vier Evangelien in Predigten und Homilien ausgelegt* (1889). In 1880 Kögel was made coeditor of the poetical yearbook *Neue Christoterpe* (Bremen).

KOGIA, kō'jī-ā (Neo-Lat.). The name often used as an English denomination of the genus including as its typical species the "pygmy" sperm whale of the south Pacific.

KOH-I-NOOR, kō'é-nōor', or **KOH-I-NUR** (Pers., mountain of light). One of the largest known diamonds, now among the British crown jewels. It is said to have been found in the Golconda mines and originally weighed about 900 carats. It was long the property of the Indian rulers and came into the possession of the English in 1849, through the conquest of the Punjab. Its weight was reduced by poor cutting to 279 carats, then to 186, 106, and in 1852 to 102½ carats. Its value is estimated at about \$600,000. A model of the Koh-i-noor is exhibited in the Tower of London. See Plate of DIAMONDS.

KOHL, köl, JOHANN GEORG (1808-78). A distinguished German writer on travels and history, born in Bremen. He studied law in Göttingen, Heidelberg, and Munich, for six years was tutor in a family in Courland, and, having traveled in Russia, made his home in Dresden in 1838. The favorable reception accorded to the accounts of his travels in Russia as, e.g., *Petersburg in Bildern und Skizzen*, induced him to visit nearly every country of Europe and to publish a series of interesting descriptions of

those parts, during which period he also wrote: *Der Verkehr und die Ansiedelungen der Menschen in ihrer Abhängigkeit von der Gestaltung der Erdoberfläche* (1841); *Der Rhein* (1851); *Skizzen aus Natur und Volkerleben* (1851); *Die Donau* (1854). He next spent four years (1854-58) in North America, traveling and making geographical and historical researches, which resulted in the publication of *Reisen in Canada, New York und Pennsylvania* (1856); *Reisen im Nordwesten der Vereinigten Staaten* (1857); *Kitschi-Gami oder Erzählung vom Oberen See* (1859); *Geschichte der Entdeckung Amerikas* (1861); *Geschichte des Golfstroms und seiner Erforschung* (1868); *History of the Discovery of the East Coast of North America, particularly the Coast of Maine* (1869); and other works. On his return to Europe he settled in Bremen, where he was appointed city librarian in 1863. The more important of his other numerous works are *Nordwestdeutsche Skizzen* (1864; 2d ed., 1873); *Die Völker Europas* (2d ed., 1872); *Die geographische Lage der Hauptstädte Europas* (1874); *Geschichte der Entdeckungsreisen und Schiffahrten zur Magellansstrasse* (1877), *Die natürlichen Lockmittel des Völkerverkehrs* (1878).

KOHLER, kō'ler, JOSEF (1849-). A German jurist, author, and poet, born at Offenburg, Baden. He studied law at the universities of Freiburg and Heidelberg, was judge at Mannheim, and became professor at Würzburg in 1878 and in Berlin in 1888. In his special field, the comparative history of law, he became one of the great authorities. On civil law in Germany he wrote: *Beiträge zur germanischen Privatrechtsgeschichte* (1883-88); *Forschungen aus dem Patentrecht* (1888), *Das Autorrecht* (1880), *Aus dem Patent- und Industrie-recht* (1889-92); *Das literarische und artistische Kunstwerk und sein Autorschutz* (1892); *Der Prozess als Rechtsverhältnis* (1888); and others. Among his numerous contributions to the history of comparative jurisprudence may be mentioned: *Moderne Rechtsfragen bei islamischen Juristen* (1885), *Das chinesische Strafrecht* (1886), *Rechtsvergleichende Studien über islamisches Recht, das Recht der Berbern, das chinesische Recht, und das Recht auf Ceylon* (1889), *Altindisches Prozessrecht* (1891). The philosophical aspect of law he treated in *Shakespeare vor dem Forum der Jurisprudenz* (1883), *Das Recht als Kulturerscheinung* (1885), and *Das Wesen der Strafe* (1888); and he also made excursions into the realm of art history with the essays *Aus dem Lande der Kunst* (1882), *Aesthetische Streifereien* (1889), and *Zur Charakteristik Richard Wagners* (1893). His poetical efforts comprise: *Lyrische Gedichte und Balladen* (1892), *Feuermythus oder Apotheose des Menschengesistes nach Motiven der polyestischen Sage* (1893); *Der Liebestod: nach Motiven der mexikanischen Ueberlieferung* (1898); *Neue Dichtungen* (1894); *Melusine* (1896), a dramatic poem. He was one of the editors of the journal *Zeitschrift für vergleichende Rechtswissenschaft*, edited the sixth edition of Holzdorff's *Enzyklopaedie der Rechtswissenschaft*, and founded in 1888, with Viktor Ring, the journal *Archiv für bürgerliches Recht*. Further works include: *Zur Urgeschichte der Ehe* (1897); *Dantes heilige Reise* (1900-02); *Vom Lebenspfad* (1902), essays, and other very numerous works, amounting in 1903 to over 500. Among the later titles are: *Aus vier Weltteilen*,

Reisebilder (1908); *Kunstwerkrecht* (1908); *Lehrbuch der Rechtsphilosophie* (1909); *Grundriss des Strafrechts* (1912).

KOHLER, KAUFMANN (1843-). An American Jewish clergyman and theologian, born at Fürth, Bavaria, Germany. He was educated at the universities of Munich, Berlin, Leipzig, and Erlangen (Ph.D., 1867), but as early as 1869 came to the United States to be pastor of the Beth El congregation in Detroit. He was elected rabbi of the Sinai congregation at Chicago in 1871, and was minister of Temple Beth El, New York, from 1879 to 1903, when he became president of the Hebrew Union College, Cincinnati. In 1885 he called the Rabbinical Conference at Pittsburgh, Pa., at which the platform for Reform Judaism in America was adopted. He edited the *Sabbath Visitor* (1881-82), the *Jewish Reformer* (1886), and was one of the editors of the *Jewish Encyclopedia*. He is author of *Der Segen Jacobs* (1868); *On Capital Punishment* (1869); *On Song of Songs* (1877); *Ethical Basis of Judaism* (1877); *Backwards or Forwards—Lectures on Reform Judaism* (1885); *Church and Synagogue in their Mutual Relations* (1889); *A Guide to Instruction in Judaism* (1899); *Systematische Theologie des Judenthums auf geschichtlicher Grundlage* (1909).

KÖHLER, kô'ler, REINHOLD (1830-92). A German literary critic and folklorist, born at Weimar. He became head of the Archducal Library in his native city in 1857, after studying at Jena, Leipzig, and Bonn. Among his works are the following: *Vier Dialoge von Hans Sachs* (1858); an adaptation of *The Taming of the Shrew*, under the title *Kunst über alle Künste, ein böses Weib gut zu machen* (1864); *Dantes Göttliche Komödie und ihre deutschen Übersetzungen* (1865); *Herders Cid und seine französische Quelle* (1867); *Wielands Oberon* (1868); *Schillers ästhetische Schriften* (1871). From his posthumous papers were published *Aufsätze über Marchen und Volkslieder* (1894).

KÖHLER, ULRICH (1838-1903). A German archaeologist, appointed professor of Greek history at the University of Berlin in 1886. He was born at Klein-Neuhausen in the Grand Duchy of Weimar, and after studying at Jena and Göttingen was secretary of the German Archaeological Institute at Athens (1875-86). His publications include two standard works on Attic inscriptions, *Urkunden und Untersuchungen zur Geschichte des Delisch-attischen Bundes* (1870) and the second volume of the *Corpus Inscriptionum Atticarum* (1877-88), containing the inscriptions from the time of the Archon Euclides to the days of Augustus. Till near the close of his life he made contributions to the learned periodicals on subjects connected with Greek archaeology and Greek history.

KÖHLER, WALTHER (1870-). A German Church historian. He was born in Elberfeld and was educated at Halle, Heidelberg, Strassburg, Bonn, and Tübingen. In 1900 he became docent and in 1904 professor at Giessen, whence in 1909 he went to Zurich, which university had given him the honorary degree of doctor of theology in 1907. His special field the Reformation, among his writings are: *Luther und die Kirchengeschichte* (1900); *Reformation und Ketzerprozesse* (1901); *Die Entstehung des Problems staat und Kirche* (1903); *Luthers Thesen mit Gegenschriften* (1903); *Alfred*

Hegler (1906); *Die Anfänge des Pietismus in Giessen* (1907); *Katholicismus und moderner Staat* (1908); *Der Gnostizismus* (1911); *Luther* (1911); *Ulrich Zwingli* (1911); *Ausgewählte Schriften des Erasmus von Rotterdam* (1914).

KOHLMANN, kôl'mân, ANTHONY (1771-1836). A German Jesuit educator and missionary, born in Kaiserberg, Alsace, and educated at Kolmar and Freiburg. He won the title Martyr of Charity through attendance upon plague-stricken citizens of Hagenbrunn, Austria. In 1804 he was sent to Georgetown in the United States; four years afterward he settled in New York, where he established a school for boys and an Ursuline school for girls. It was his refusal to disclose the secrets of the confessional in New York law courts that caused the exemption of priests from that particular form of evidence to become a State law (1828), and he was instrumental in the building of the Mulberry Street Roman Catholic Cathedral (1815). In 1817 he became superior of the Order of Jesus in the United States, but resigned the position in 1821, and from that time until 1824 had charge of the seminary in Georgetown. The result of his controversy with Jared Sparks was published in *Unitarianism Philosophically and Theologically Examined* (2 vols., 1821). He had previously issued *A True Exposition of the Doctrine of the Catholic Church Touching the Sacrament of Penance* (1813); *Centennial Jubilee to be Celebrated by All the Reformed Churches throughout the United States* (1817); and *The Blessed Reformation: Martin Luther Portrayed by Himself* (1818). Father Kohlmann was professor of theology in the Gregorian University at Rome (1824-29).

KOHL-RABI, kôl'râ'bê, or, more properly, **KOHL-RÜBE** (Ger., kale turnip). A cultivated variety of *Brassica oleracea* distinguished by the globular swelling of the stem just above the ground, to the size of a man's fist or larger. Leafstalks spring from the swollen part and add to the peculiarity of its appearance. The part used is the swollen stem, and its uses are similar to those of the turnip. In quality it more nearly resembles the Swedish than the common turnip. It is cultivated like cabbage and in Europe is grown to a considerable extent, but in America it has not become widely popular. For illustration, see Plate of CABBAGE.

KOHLRAUSCH, kôl'roush, FRIEDRICH (1840-1910). A German physicist, born at Rinteln, the son of Rudolf Hermann Arndt Kohlrausch. His education was obtained at Erlangen and Göttingen. In 1866 he became professor at Göttingen, and subsequently was appointed to chairs at Zurich (1870), Darmstadt (1871), Würzburg (1875), and Strassburg (1888). In 1895 he was appointed president of the Imperial Physico-Technical Institute (*Reichsanstalt*) of Charlottenburg, near Berlin, and under his direction the work of this bureau was widely extended and developed. He retired in 1905 and lived in Marburg until his death. Professor Kohlrausch made a brilliant record as an experimental physicist and devised new apparatus and methods for measurements. His researches embraced all departments, but those dealing with electricity and magnetism are of special importance. He investigated most thoroughly the subject of electrolysis and brought out new methods for the absolute measurement of re-

sistance. The elasticity of solids and various problems in light also were investigated by him, and he was the author of *Leitfaden der praktischen Physik*, which, published in 1872, has been issued in many editions and translated into English, being considered a standard work on physical laboratory methods and measurements. An eleventh edition, enlarged and revised, was published in 1910 with the title of *Lehrbuch der praktischen Physik*. A more elementary work based on the above, *Kleiner Leitfaden der praktischen Physik*, appeared in 1900 (2d ed., 1907). Professor Kohlrausch was, besides, the author of *Ueber den absoluten Leitungswiderstand des Quecksilbers* (1888) and of many papers contributed to the *Annalen der Physik und Chemie* and other scientific journals.

KOHLRAUSCH, HEINRICH FRIEDRICH THEODOR (1780–1867). A German historian and educator, born at Landolfshausen. He studied at Göttingen and afterward at Berlin, Kiel, and Heidelberg. After teaching at Düsseldorf and at Münster he was made general inspector of education of the Kingdom of Hanover in 1830. His most important work is *Deutsche Geschichte für Schulen* (10th ed., by Kentzler, 1875). Mention should also be made of the following *Kurze Darstellung der deutschen Geschichte* (15th ed., 1894), *Chronologischer Abriss der Weltgeschichte* (15th ed., 1861); *Die Geschichte und Lehre der heiligen Schrift* (1811). Consult his biographical *Erinnerungen aus meinem Leben* (Hanover, 1863), and articles in the *Allgemeine deutsche Biographie*, vols. xvi, xvii (Leipzig, 1882, 1883).

KOHLRAUSCH, RUDOLF HERMANN ARNDT (1809–58). A German physicist, born in Göttingen. He spent the greater part of his life as a teacher of science and as an experimentalist. He was professor of physics at Marburg and Erlangen and was associated with Wilhelm Weber (q.v.) in making the first measurements of the electric current using absolute units. These experiments formed the foundation of the modern absolute system. The original paper was reprinted in No. 142 of Ostwald's *Klassikern der exakten Wissenschaften* (Leipzig, 1904).

KOHL-RÜBE. See KOHL-RABI.

KOHLSAAT, kôl'sât, HERMAN HENRY (1853–). An American newspaper editor and publisher, born at Albion, Edwards Co., Ill. He was early in business life, and in 1883 bought the bakery lunch business of the firm he had been a junior member of. This business, enlarged as H. H. Kohlsaas & Co., eventually owned several large establishments and conducted a wholesale bakery business. Kohlsaas owned a part interest in the Chicago *Inter-Ocean* in 1891–93, became editor publisher in 1894 of the Chicago *Times-Herald* (amalgamated in 1901 with the Chicago *Record* into the Chicago *Record-Herald*), and also published and edited the Chicago *Evening Post* from 1894 to 1901. In 1910 he became editor of the Chicago *Record-Herald*, and in 1912 he bought the bankrupt *Inter-Ocean*, carried it through a receivership in 1914, and then amalgamated it with the *Record-Herald* under the new name of the Chicago *Herald*.

KOHN, kôn, SALOMON (1825–1904). An Austrian novelist, born in Prague, the son of a Jewish merchant, whose partner in business he became, after having devoted himself to mathematical studies at the university. His novel

Gabriel first appeared anonymously in 1852, became widely known through various translations—in Germany, curiously enough, first in its English version—and was not reissued under its author's name until 1875 (3d ed., 1897). His other novels and tales, mostly descriptive of Jewish life, include. *Der Retter, Bilder aus dem Prager Ghetto; Ein Spiegel der Gegenwart* (1875); *Die silberne Hochzeit* (1882); *Neue Ghetto-bilder* (2d ed., 1886); *Der Lebensretter und andere Erzählungen* (1893); *Furstengunst* (1894); *Ein deutscher Handelsherr* (1896); *Judith Lohrath* (1897). One of his best short stories is *Joseph Singer* (1903).

KOI. See BOGHAZ-KIEUI.

KOIL, kô-êl'. The native name for Aligarh (q.v.), a city of India.

KOILEN, koi'len, LUDOLPH VAN. See CEULEN, LUDOLPH VAN.

KOIMBATUR. See COIMBATORE.

KOKAN. See KHOKAND.

KOKLASS, kô'klas. An Indian pheasant. See PUCRAS.

KO'KOMO. A city and the county seat of Howard Co., Ind., 54 miles by rail north of Indianapolis, on the Wildcat River, and on the Pittsburgh, Cincinnati, Chicago, and St. Louis, the Toledo, St. Louis, and Western, and the Lake Erie and Western railroads (Map: Indiana, E 3). It is primarily a commercial and manufacturing city, the leading manufactures being plate and opalescent glass, lumber products, rubber, steel, and brass goods, automobiles, wood pulp and paper, bits, wire nails, rods, stoves and ranges, electrical goods, pottery, trunks, gates, mittens, heaters, etc. The surrounding region has agricultural and lumbering interests. Kokomo contains a Carnegie library and the Good Samaritan Hospital, while adjoining the city on the south is a beautiful park. Kokomo was first incorporated in 1865 and is governed by a mayor, elected every four years, whose appointive power extends only to committees of the council, and by a unicameral council which elects all administrative officials, except the city judge, treasurer, and clerk, chosen by popular election. The school system is in charge of a board of three resident freeholders who are elected by the city council. There are also boards of works, police, and parks. Pop., 1900, 10,609, 1910, 17,010; 1914 (U. S. est.), 19,694.

KO'KO NOR'. Another spelling for Kuku Nor. 1. A lake in Tibet. See KUKU NOR. 2. A region of Tibet. See TIBET.

KOKOVTSOV, kô-kôf'tsôf, VLADIMIR NIKOLAYEVITCH (1853–). A Russian statesman, born in Korlo, Novgorod. He was educated in St. Petersburg at the Alexander Lyceum and entered the employ of the Ministry of Justice. In 1878 he was sent abroad to study foreign prison systems and in 1882 became an assistant in the Imperial prison administration. He was appointed an assistant to Witte, then Minister of Finance, in 1896, and became Minister of Finance, succeeding Pleske, in 1904. From 1911 to February, 1914, when his health failed, he was head of the Russian Ministry.

KOLA, kô'lâ. One of the most northern settlements of European Russia, situated in lat. 68° 53' N. and long. 30° 40' E., on the peninsula of Kola, in the Government of Archangel (Map: Russia, D 1). Pop., 1911, 649, mostly fishermen. Kola is mentioned as early as 1264 and was fortified in the sixteenth cen-

tury. Near Kola, but farther north, are Alexandrovsk, a naval station founded in 1895, and opposite it is Katharinenhafen, which, though well within the Arctic circle, is an ice-free port from May to the end of August.

KOLA NUT. A brown bitter seed used in medicine. See COLA NUT.

KOLA PENINSULA. A large peninsula of European Russia, extending southeastward from north Finland between the Arctic Ocean and the White Sea (Map: Russia, E 1). It is oval in shape, about 250 miles long and 160 miles wide, being almost cut off from the mainland by a series of lakes and streams. It is mountainous in the southwest, and its coasts are rocky and steep. It is watered by numerous streams and lakes and covered with pine forests, but very sparsely inhabited. A number of Russians live in the small villages along the coast, and a few Lapps inhabit the interior.

KOLAPUR, kô'la-poor'. A city of British India. See KOLHAPUR.

KOLÁR, kô'lär, JOSEF JIRÍ (1812-96). A Bohemian actor, dramatist, and novelist, born in Prague. He was for a time traveling tutor to a noble Hungarian youth, but went on the stage in 1837, became famous in Shakespearean rôles, and by 1869 was director of the Czech theatre at Prague. Besides his translations of Shakespeare, Goethe, and Schiller, he produced half a dozen volumes of prose fiction (1854-61), several comedies such as *Miavenci* (1870) and *Dejte mi čamaru* (1871), and the tragedies *Monika* (1847), *Zižkova smrt* (1850), *Magelona* (1851), *Pražský žid* (1871), *Smíruti* (1881), *Primátor* (1883), *Králůvna Barbora* (1884), *Umrlík hlava* (1885), and *Mistr Jeronym* (1886).—His nephew FRANTIŠEK (1830-95) was an actor of great talent.

KOLARIAN PEOPLES. A group of East Indian tribes, numbering between 2,000,000 and 3,000,000, who inhabit the jungle and mountains of the country west and southwest of Calcutta in the Presidency of Bengal, and the regions adjoining. The principal Kolarian tribes are the Munda-Kols of Chota Nagpur, the Larka-Kols (or Ho, as they call themselves) of the Singbhum District in Chota Nagpur, the Bhumij in western Bengal, the Santals (who inhabit a stretch of country from the mouth of the river Mahanadi in northern Orissa to Bhagalpur on the Ganges in northern Bengal), the Karia of Lohardaga in Chota Nagpur, the Juang or Patun of the Cuttack country about the mouth of the Mahanadi in Orissa, etc. The Savaras of Saoras, inhabiting parts of western Bengal, Orissa, and Madras, are by some authorities classed with the Kolarians and by others with the Dravidian peoples; linguistically they would seem to be more allied to the former and physically, perhaps, more to the latter. A few other smaller tribes are practically in the same condition. The physical type of the Kolarians is probably best preserved in the Juang, about the most primitive tribe of this stock, who are short-statured, dolichocephalic, with prominent zygomatic arches and rather flat faces. The Munda-Kols are the most dolichocephalic and the Larka-Kols (who have some admixture of Aryan blood) the tallest, both these and the Kols of the Northwest Provinces and Oudh being above the average height. Physically the Kolarians are not absolutely distinct from the Dravidians, and many ethnologists class both as subdivisions of one and the same somatic race.

Others, however, think that the Dravidian type differs little from the Hindu, except where it has been modified by contact with the Kolarians and dark aborigines. The "negroid" characteristics of the Kolarian have been much exaggerated, and such as may exist are perhaps due to pre-Dravidian and pre-Kolarian aborigines of negroid stock. The Kolarians have never reached the height of culture attained by the Dravidians, nor have they distinguished themselves in architecture or religion. The Juang represent the lowest stage of the Kolarians, being hunters and gatherers of fruits, roots, etc., and making only the most primitive attempts at agriculture; the Kharia are partly civilized, and some of them use the plow; some of the Santals are at a stage beyond this, as are also some of the other Kols or Mundas. The Kolarians have largely retained their old animistic religion with an overcast of polytheism, although with some of them a rude form of Hinduism prevails. The Kolarian languages are about 10 in number. Unlike the Dravidian tongues, they possess a dual for nouns, but lack a negative verb form. They are rich in inflection by suffixes and in conjugation. The best studied of these is the Santal, a grammar by Skeelsrud was published in 1873, and an edition of *Esop's Fables* in 1886. There is also a *Grammatik der Kolh-Sprache* (Gutersloh, 1882), by Nottrott, and a *Mundari Grammar*, by Hoffmann (Calcutta, 1903).

Bibliography. Man, *Sonthalia and Sonthals* (London, 1867); Hunter, *Annals of Rural Bengal* (ib., 1868-72); Dalton, *Descriptive Ethnology of Bengal* (Calcutta, 1872); Caldwell, *Comparative Grammar of the Dravidian Language* (3d ed., London, 1875); Cust, *Modern Languages of the East Indies* (ib., 1878); Rowney, *Wild Tribes of India* (ib., 1882); V. A. Smith, *The Early History of India* (2d ed., Oxford, 1908). See MUNDAS, SANTALS.

KOLB, kôlp, GEORG FRIEDRICH (1808-84) A German politician, publicist, and statistician. He was born at Speyer in Rhenish Bavaria, where for more than 20 years he conducted a liberal journal until its suppression by the government in 1853. Later, as a member of the Bavarian Parliament, Kolb strenuously opposed the federal union of Germany and was finally forced to take up his residence in Zurich to escape the persecutions of the Bavarian government. He returned in 1860, again to become the editor of a liberal journal. His chief works are *Handbuch der vergleichenden Statistik* (8th ed., 1879) and *Kulturgeschichte der Menschheit* (3d ed., 1884). Under the pseudonym Broch he wrote *Italien und die jetzige politische Lage des übrigen Europas* (1859).

KOLBE, kôl'be, ADOLPH WILHELM HERMANN (1818-84). A German chemist, born at Elliehausen, near Göttingen. He studied chemistry under Wöhler at Göttingen and was assistant to Bunsen and to Playfair. He was professor of chemistry at Marburg (1851-65) and at Leipzig (1865-84). Kolbe carried out many original researches in the field of organic chemistry. He investigated the electrolytic decomposition of organic acids and discovered (1860), jointly with Lautermann, a method of making salicylic acid (q.v.) by the combination of carbolic and carbonic acids. Kolbe edited Liebig and Wöhler's *Handwörterbuch der Chemie* and was for many years editor of the *Journal für praktische Chemie*. His publications in book form include *Ausführliches Lehrbuch der organischen Chemie*

(1855-78 and a later edition), *Kurzes Lehrbuch der anorganischen Chemie* (2d ed., 1884), etc. One of Kolbe's chief titles to fame was his work as a scientific critic, many important researches published during his life having been subjected by him to the most careful scrutiny. However, he was altogether too conservative. Thus, he adhered stubbornly to the older theories of chemical constitution and refused to accept the modern structural theory in spite of the triumphs achieved by it. The theories of stereochemistry, too, were received by him with pointed animosity. (See *CHEMISTRY, History*) Consult Hoffmann, "Nekrolog auf H. Kolbe," in the *Berichte der deutschen chemischen Gesellschaft* (Berlin, 1884), and the "Obituary," in the *Journal of the Chemical Society* (London, 1885).

KOLBERG, kôl'bêrk, or **COLBERG**. A seaport of the Province of Pomerania, Prussia, on the Persante, near its mouth, 95 miles northeast of Stettin (Map: Prussia, F 1). Kolberg has a well-protected harbor at its suburb of Munde, which is a favorite sea-bathing resort. Its industries include iron foundries, machine works, and it also makes pharmaceutical preparations, lumber, and tobacco. Its former strong fortifications have been demolished. The church of St. Mary is a handsome red-brick Gothic edifice dating from the fourteenth century, with richly decorated ceiling. The town hall was built by Zwirner, the architect of the Cologne Cathedral. It has a Gymnasium, a school of navigation, and new government buildings. Pop., 1900, 20,241, 1910, 24,768. Kolberg had its origin in an old Slav fortress. It received municipal rights in 1255 and joined the Hanseatic League in 1284. In 1807 it held out, under Gneisenau and Schill, for six months against the French.

KÖLBING, kôl'bîng, **EUGEN** (1846-99). A German scholar, born at Herrnhut, Saxony, Sept. 21, 1846. After teaching at several Gymnasias he became a lecturer at the University of Breslau in 1873 and in 1880 was appointed there to the professorship of the English language and literature, which he retained until his death. Kolbing edited a large number of works in Old Norse and Middle English; his special interest being in the mediæval romance. His works comprise: *Untersuchungen über den Ausfall des Relativpronomens in den germanischen Sprachen* (1872), *Ueber die nordischen Gestaltungen der Partonopeussage* (1873); *Beiträge zur vergleichenden Geschichte der romantischen Poesie und Prosa des Mittelalters* (1876); *La chanson de Roland* (1877), *Amis und Amiloun zugleich mit der altfranzösischen Quelle* (Heilbronn, 1884); *Flore und Blancheflore* (1896). Kolbing translated from the Icelandic *Die Geschichte von Gunnlang Schlangenzunge* (1878). From 1877 he published *Englische Studien* and founded the equally important *Altenglische Bibliothek* in 1883. He had also begun (1893) an elaborate critical edition of Byron, only two parts of which, containing the *Steege of Corinth* and *The Prisoner of Chillon*, and *Other Poems*, have appeared. All Kölbing's work is characterized by extreme care and accuracy; in all his investigations he was filled with the scientific spirit. He died at Herrenalb, Aug. 9, 1899. A posthumous article, "Zur Entstehungsgeschichte von Byrons Childe Harold," appeared in the *Englische Studien* (1902). Consult: for a biography, the necrology in the *Englische Studien*, vol. xxvii (Leipzig, 1900); for a bibliography, *Chronologisches Verzeichnis der*

von Eugen Kolbing veröffentlichten Schriften, in the same number.

KÖLCSEY, FERENCZ (1790-1838). A Hungarian literary critic and poet, born at Széde-meter in Transylvania. He studied at Debreczen, and became a royal law officer at Pest in 1809. His early verse was published in the *Transylvanian Museum*; he wrote, besides, criticism for various literary magazines. From 1826 to 1829 he was coeditor with Paul Szemere of *Elet és irodalom* (Life and Literature), a connection in which he won his reputation as a critical writer. A member of the Hungarian Diet in 1832-36, he became well known also as an orator and as a parliamentary leader of the Liberal party. His journal of the Diet was published in 1848 and republished in 1874. The Hungarian national hymn was written by Kölcsey. A second edition of his complete works appeared in 1863.

KOLDE, kôl'de, **THEODOR** (1850-). A German theologian, born at Friedland in Silesia. He studied at the universities of Breslau and Leipzig. In 1876 he commenced lecturing on theology at the University of Marburg, where he became professor extraordinary in 1879. In 1881 he was appointed professor of Church history at the University of Erlangen. His principal publications include: *Luthers Stellung zu Konzil und Kirche bis zum Wormser Reichstag* (1876); *Die deutsche Augustinerkongregation und Johann von Staupitz* (1879); *Friedrich der Weise und die Anfänge der Reformation* (1881); *Martin Luther. Eine Biographie* (1884-93); *Die Heilsarmee nach eigener anschauung und nach ihren Schriften* (1885), *Der Methodismus und seine Bchämpfung* (1886), *Luthers Selbstmord: Eine Geschichtslüge Majunkes* (3d ed., 1890); *Ueber Grenzen des historischen Erkennens* (1890); *Die kirchlichen Bruderschaften und die religiöse Leben im moderne Katholizismus* (1895); *Die Augsbürgische Konfession, lateinisch und deutsch, kurz erläutert* (1896, 2d ed., 1911); *Das religiöse Leben in Erfurt beim Ausgange des Mittelalters* (1898); *Die Heilsarmee, ihre Geschichte und ihre Wesen* (1899); *Der Katholizismus und das 20. Jahrhunderts, kritische Betrachtungen* (1903); *Der Staatsgedanke der Reformation und die römische Kirche* (1903); *Die Anfänge einer katholischen Gemeinde in Erlangen* (1906), *Historische Einleitung in die symbolischen Bücher der evangelischlutherischen kirche* (1907; 3d ed., 1913). He also edited the *Beiträge zur bayerischen Kirchengeschichte* (20 vols., 1895-1913) and *Die Universität Erlangen unter dem Hause Willelsbach, 1810-1910* (1910).

KOLDEWEY, kôl'de-vî, **KARL CHRISTIAN** (1837-1908). A German navigator and polar explorer, born at Bucken in Hanover. He made several voyages in his youth, studied navigation at the Polytechnikum in Hanover, and astronomy at the University of Göttingen. Owing to his ability, as set forth by Dr. Petermann, Koldewey was given command of the first German Arctic expedition in 1868, a summer cruise. In 1869-70 he commanded the second expedition, during which he discovered Franz Josef and other fiords and explored the coast of east Greenland to lat. 77° 1' N., the most northerly point reached to that time by any explorer of the region. From 1874 to 1908 he was superintendent of the Imperial German Maritime Observatory, distinguishing himself especially by researches on ship compasses, principally set forth in *The Compass on Board Ship*. He pub-

lished: *Die erste deutsche Nordpolar-Expedition 1868* (1871), *Die zweite deutsche Nordpolar-fahrt* (1873-74). His scientific works are published in the *Annalen der Hydrographie und maritimen Meteorologie*, and the publications of the Naval Institute.

KOLDING, kól'ding. A seaport of the County of Vojst, Jutland, Denmark, where the Kolding River meets the Kolding Fiord, 40 miles east of Esbjerg (Map: Denmark, C 3). The town possesses the ruins of the castle of Koldinghus, built in the thirteenth century and formerly a residence of the Danish kings. It has an electric-light plant, a good harbor, and a flourishing trade in grain and provisions, timber, catgut, lard, and hides. Pop., 1901, 12,516; 1911, 14,210. Kolding has many times during its history suffered from the ravages of war; in 1849 it was the scene of a Danish defeat by the Schleswig-Holstein insurgents.

KOLETTIS, kô-lét'tés, JOANNIS (1788-1847) A Greek patriot and statesman, born at Syrakos, near Janina. In 1821 he was one of the first leaders of the revolution and subsequently took a prominent part in the government. When Capo d'Istria became President (1827), Kolettis was chosen a member of the Panhellenion and Minister of the Interior, but opposed the government in the latter part of Capo d'Istria's presidency. He became a member of the provisional government on the murder of the President, and later of the commission of seven which offered the crown to Prince Otho of Bavaria. On his accession to the throne King Otho made him Minister of the Marine (1833) and President of his cabinet. In 1835 he was Ambassador at Paris, but he was recalled in 1843 after the revolution of September and made head of the ministry in 1844.

KOLGUYEV, kól-gú'yév, or **KALGUYEV**. A Russian island in the Arctic Ocean, situated between lat. 68° 4' and 69° 30' N. and long 48° 4' and 49° 38' E., 75 miles northeast of the Kanin Peninsula (Map: Russia, G 1). Area, 1350 square miles. The surface is mostly level, and a large part is occupied by frozen tundras. The vegetation is extremely meagre, peat bogs are common, and the climate is very severe. Wild fowl abound, and the streams and lakes are rich in fish. The island forms a part of the Government of Archangel and is uninhabited. Only in the summer is the island visited by Samoyed hunters. The coast regions are in some places covered with layers of guano.

KOLHAPUR, kô'lá-poor', or **KOLAPUR**. A native state, feudatory to Bombay, India. Area, 3217 square miles (Map: India B 6). Pop., 1901, 910,011; 1911, 883,441, composed of Maharrattas and Ramusis. The surface is of a rugged character, the western part being crossed by a section of the Western Ghats. In the east the fertile plain of Deccan is watered by the Kistna and other streams and produces largely of cereals, cotton, sugar cane, tobacco, and vegetables. Manufactures include cotton and woolen cloth, hardware, rosba oil, perfumes, glass trinkets, and pottery. It is rich in forest lands. The rulers are lineal descendants of Sivaji, the founder of the Maharratta Empire. Capital, Kolhapur.

KOLHAPUR, or **KOLAPUR**. The capital of the native state of the same name, Bombay, India, the terminus of a branch railway from Meeruj, 188 miles south-southeast of Bombay (Map: India, B 6). The town is picturesquely

situated on the Panchganga River, since 1878 spanned here by a five-arched bridge. Its excellent modern buildings include the Rajah's new palace, the town hall, the public gardens, treasury, government offices, the British agent's residence, a music gallery at the entrance of the palace square, a college, technical school, high school, and the Albert Edward Hospital. Its ancient structures comprise Buddhist palaces, temples, shrines, cenotaphs, and rock-cut caves. It has an important general trade. Pop., 1901, 54,373; 1911, 48,122.

KOLIN, kô-len'. A town in the Crownland of Bohemia, Austria, situated on the Elbe, 40 miles by rail east of Prague (Map: Austria, D 1). Its chief buildings are the fourteenth-century Gothic church of St. Bartholomew with a fine Gothic choir, the old palace, and the town hall. It has also a Gymnasium, a trade school, and a school for drawing. Sugar is the chief product of the town, but it also manufactures machinery, vehicles, spirits, chemicals, roofing paper, lumber, and art goods. In the outskirts are profitable fruit and vegetable farms. Kolin is noted for the battle fought here on June 18, 1757, between 54,000 Austrians under Daun and 31,000 Prussians under Frederick II, in which the former were victorious. As a result of the victory, the siege of Prague was raised and Bohemia evacuated by the Prussians. Pop., 1900, 15,025; 1910, 16,470.

KOLLÁR, kól'lár, JAN (1793-1852) A celebrated Czech poet and scholar. He was born in the County of Turóc, Hungary, studied at Pressburg and Jena, where he met Goethe, and in 1819 became a preacher in an Evangelical church in Pest. Sorrow at separation from a sweetheart of his student days was the immediate stimulus of his first poetic production, *Básně* (Poems, 1821), consisting of 76 sonnets. In 1824 the collection had become 150, published under the title *Slávy Dcera* (Daughter of Slava), and the final edition (1851) contained 645 sonnets, divided into five parts. The first three are superior to the others. This is a glorification of the Slavic race (*Sláva*), between whom and his "Mina" his heart is divided. Though uneven in composition, the work in many parts rises to heights of passionate enthusiasm. It was written in Czech with a considerable admixture of Middle Slovenian peculiarities, which laid the foundations of the present Slovak literary language. His love for the Slavs impelled him to devote himself to collecting folk songs, at first (1822 and 1827) in collaboration with Safarik (qv) and later (1834-35) alone. The results of his labors appeared under the title *Popular Songs of the Slovaks in Hungary*. After years of efforts, with the help of the Austrian government, Kollár obtained for his native Slovaks from the Magyars the independence of their schools in 1820 and the church in 1833. In 1837 he published his work *Ueber die litterarische Wechselseitigkeit zwischen die verschiedenen Stammen und Mundarten der slavischen Nation* (2d ed., 1884). In 1852 he published a work, *Staroitalia Slavjanská*, in which he upheld the fantastic theory that Italy was originally populated by Slavic tribes. After continuous annoyances he removed from Pest to Vienna. Here he was a confidential adviser of the government, and the Slovaks of Hungary hailed him as their literary spokesman. In 1849 he was appointed professor of Slavic archaeology in the University of Vienna, which position he held

until his death. A posthumous edition of his works appeared in Prague (4 vols., 1862-64). It is incomplete, but it contains an autobiography dealing with the earlier part of his life. Consult Novák, *Die českische Litteratur der Gegenwart* (Leipzig, 1907), and Jagić, *Istoriia Slavianskoi Filologii* (St Petersburg, 1910).

KÖLLIKER, kō'li-kēr, RUDOLPH ALBERT VON (1817-1905). A celebrated Swiss anatomist and physiologist, born in Zurich. He studied at the universities of Zurich, Bonn, and Berlin. Rarely equaled in versatility, as a young man he was noted as an athlete, hunter, and mountain climber, at 22 he was attending the Latin clinical lectures of Nasse, and at 27 he became professor of comparative anatomy at Zurich. In 1847 he was invited to the corresponding chair at Würzburg, a position which he held until 1902. He was a great linguist and a wide traveler, well known from Scotland to the Mediterranean as he searched for and studied the tissues of man and of other animals. He revolutionized the histology and microscopy of his day, demonstrated the independence of the sympathetic nervous system, showed that the nerve fibres are continuations of nerve cells, wrote on the tissues of the tadpole and the embryology of man and chick, and studied the action of poisons. Although always a teacher, Kölliker was also always a learner; at 70 he went to Pavia to study Golgi's new methods of nerve staining. When 80 years old, he had published 245 papers in English, German, and Italian. Among honors from the learned societies of the world, in 1897 he received the Copley medal of the Royal Society, London. Prince Leopold of Bavaria bestowed on him the title Excellenz. Greatly beloved in Würzburg, it was there that Kölliker died of pneumonia, Nov 13, 1905. Among his principal works are: *Mikroskopische Anatomie* (1850-54), a *Handbuch der Gewebelehre des Menschen* (1852, 6th ed, 1889-96), which has been translated for the Sydenham Society by Bush and Huxley, under the title of *A Manual of Human Histology* (2 vols., 1853-54); *Die Siphonophoren oder Schwimmpolypen von Messina* (1853), *Entwicklungsgeschichte des Menschen* (1861). Kölliker was appointed one of the editors of the *Zeitschrift für wissenschaftliche Zoologie*, the most important scientific natural-history journal of Germany. Consult his *Erinnerungen aus meinem Leben* (Leipzig, 1899).

KOLLONTAJ, kō'lōn-toi, HUGO (1750-1812). A Polish politician, born at Niecislawice in Sandomir and educated at Pinczow and Cracow. He was ordained a Roman Catholic priest in 1770. After studying at Rome he engaged in educational reform in Poland, serving as rector of the University of Cracow in 1782-85. Turning his attention to politics, he was appointed *referendarius* of Lithuania in 1786 and was one of the most earnest leaders of the party of constitutional reform during the Four Years' Diet (1788-92). Under the new constitution of 1791 he was appointed Vice Chancellor. When the conservatives triumphed in 1792, he left the country, but returned to take part in Kosciuszko's insurrection. His radicalism was so pronounced that he even quarreled with Kosciuszko and was regarded by some Poles as a second Robespierre. After the failure of the insurrection he was imprisoned in Austria from 1795 to 1802. His writings (in Polish) include *Political Speeches as Vice-Chancellor* (6 vols.,

1791); *On the Erection and Fall of the Constitution of May* (1793); *Correspondence with T. Czacki* (1854); *Letters Written during the Emigration, 1792-1794* (1872).

KOLMAR, kōl'mär. The capital of the District of Upper Alsace in the German Reichsland of Alsace-Lorraine (Map: Germany, B 4). It stands on a plain near the Vosges, about 10 miles west of the Rhine, with which it is connected by the Rhine-Rhone Canal, and 41 miles south-southwest of Strassburg. Among the principal buildings are the cathedral of St. Martin, begun in the thirteenth century, a fine Gothic building, with interesting sculptures and a rare painting of the Madonna in a rose arbor, by Martin Schongauer; the old Dominican convent and church of Unterlinden, now used as a museum and containing the town library of 80,000 volumes, the courthouse and town hall. There are fine schools and monuments to the town's distinguished citizens. Vegetables, tobacco, and the vine are grown extensively around Kolmar, and it is a chief seat of the cotton and woolen manufacturing in Alsace. Other manufactures are silk, jute, cloth, thread, pottery, vehicles, sugar, starch, paper, leather, machinery, soap, candles, pipes, ribbons, and hosiery. The sculptor F. A. Bartholdi was a native of Kolmar, as was also the artist Martin Schongauer. Pop., 1900, 36,844, 1910, 43,808. Kolmar is probably the town known to the Romans as Columbarium. It was made a free Imperial city in 1226 and under a democratic form of government rapidly became one of the most prosperous cities in Upper Alsace. Fortified in 1552, its fortifications were razed in 1673 by Louis XIV. In 1678 it was ceded to France by the Peace of Nimwegen, but was restored to Germany in 1871 by the Peace of Frankfurt. Kolmar became French again for a short time, when Alsace was overrun in the first French offensive movement of the European War of 1914. In less than three weeks' time the German counter attack drove the invaders back into France. See WAR IN EUROPE. Consult *Annalen und Chronik von Kolmar* (Leipzig, 1897).

KOLO, kō'lō. A town in Russian Poland, located on an island in the Warthe River. It is 34 miles from the Prussian border (Map: Russia, A 4). In the last two decades various manufacturing industries have sprung up. Pop., 1910, 11,655. Kolo played an important strategic part in the European War, which began in 1914. The Germans reached the Warthe in their first drive on Warsaw and fortified it strongly, Kolo being the centre base and the point at which reinforcements crossed on their way to later drives on Warsaw. See WAR IN EUROPE.

KO'LOKOTRONIS, THEODOROS (1770-1843). A Greek general, born at Karytena, Arcadia. He fought successfully against the Turks at Tripolitza, Nauplia, Corinth, Patras, Argos, and in several other engagements, as a leader of the Klephts (q.v.). He became commander in chief in 1823 and Vice President of the Executive Council in 1825 under Capo d'Istria. After the latter's assassination he was elected (1831) provisional member of the government, but under Russian influence he turned against the existing régime. He joined in a conspiracy against the regency established during the minority of King Otho and was condemned to death for high treason in April, 1834. This sentence was commuted by Otho to imprisonment at Nauplia;

and when Otho began his reign (June 1, 1835) Kolokotronis received a full pardon and was restored to his rank as general. He lived thenceforth at Athens until his death. His autobiography was published in 1846 (in an English version, *Kolokotronis, the Klepht and the Warrior*, London, 1891).

KOL'OMAN, or **COLOMAN** (Hung. **KÁLMÁN**, kál'mán). An Hungarian king, who reigned from 1095 to 1116, and one of the most prominent members of the royal house of Árpád. Although illegitimate, he ascended the throne on the death of his uncle, Ladislas the Holy, and two years afterward suppressed an insurrection of the Croats. In 1102 he had himself crowned King of Croatia and Dalmatia. He spent the three following years conquering the Dalmatian seaport towns and also carried on a successful war against Galicia. His brother Almos, the legitimate heir, made repeated attempts to revolt, and in 1113 Koloman caused his brother and the latter's son Béla, later King Béla II, to be blinded. He was succeeded by his son, Stephen II. Consult Michael Horváth, *Geschichte Ungarns* (Ger. trans., 2d ed., 2 vols., Budapest, 1876).

KOLOMEA, kó'ló-má'a. A town in Galicia, Austria, situated on the Pruth, 42 miles by rail northwest of Czernowitz (Map: Austria, J 2). It has a town hall, a Gymnasium, and a forestry school. Pottery is the chief manufacture; it also makes textiles, refines petroleum, and there is a large trade in farm products. Pop., 1900, 34,188; 1910, 42,676, chiefly Jews and Poles.

KOLOM'NA. A river port and chief town of a district in the Government of Moscow, situated 75 miles southeast of the city of that name, on the river Moskva (Map: Russia, E 3). It has an ancient church of the Resurrection, two monasteries, two Gymnasias, hospitals, and a number of charitable institutions. In its vicinity are extensive copper and iron works, manufactures of engines, cars, steamers, etc. Weaving, ropemaking, silk spinning, and cotton printing are also carried on. The trade in grain is declining. Pop., 1912, 26,324. Kolomna is first mentioned in 1177, and the walls of the kremlin, built by Ivan the Terrible in 1533, can still be traced, while the Piatnitski Gate alone remains perfectly preserved. It was restored in 1825. The cathedral of the Assumption (1872) is the seat of an Orthodox bishop.

KOLOSH, kó-lósh'. See TLINKIT.

KOLTSOV, kól-tsóf', **ALEKSEY VASILEVITCH** (1808-42). An eminent Russian lyric poet. He was the son of a Voronezh tradesman and received little education. The first verses that came to his hands he sang to improvised tunes, believing that all verse ought to be sung. The study of Lomonosov, Derzhavin, Zhukovsky, and Pushkin had as its immediate result a number of imitations, which were severely criticized by Serebriansky, himself a gifted young poet. The latter was Koltsov's real instructor in literature. When about 20, he passed through an unfortunate love affair with a serf girl, whom his father immediately sold to a Cossack for fear of a misalliance. In 1831 his first published poems brought him many admirers, but with a volume of verse published in 1835 his fame suddenly assumed national proportions. About this time he visited St. Petersburg and Moscow, and met the great writers of the period. In 1837 Zhukovsky introduced him to Nicholas I

as a poet with a national reputation. After 1838 he was under the immediate guidance and protection of the celebrated Belinsky, who thought him superior even to Pushkin in some respects. After another love affair Koltsov fell sick and died in domestic neglect in 1842.

Aside from his first imitative lyrics, his work was entirely original. His songs of the second group, though simple in form, tone, and language, describe with wonderful art the beautiful southern nature of the steppes and the hard life of the Russian peasant. The themes and the facts are the same as in the "popular" songs, but the treatment is different, there are always the strong individuality of the poet, and a feeling of sincerity and spontaneity that is altogether wanting in the earlier ballads. Koltsov's poetry at that time showed no traces of oversentimentalism or pessimism. Even the hardships of serfdom did not disturb him in the least. Indeed, few other poets—not even Pushkin or Lermontov (qq v.)—infused their poems with such a hearty optimism and such winning courage as did this unschooled poet of the people—this Russian Burns, as he is sometimes called. The *Dumas* (Meditations), forming the third group, which deal with questions of faith, the universe, science, man and his moral destiny, are inferior to those of the preceding group. Though displaying the same external qualities and the same earnestness and depth of feeling, they raise all these great questions only to leave them unsolved; the poet had had very little philosophical training.

A complete edition of his poems, with a biography of the author, was published by Belinsky in 1846 (4th ed., 1863); the latest edition of his works is by Liashchenka (St. Petersburg, 1909), with letters to various people. Excellent German translations of most of his poems, by Fiedler, appeared in 1885 (*Universal-Bibliothek*, No 1971). Consult Rosa Newmarch, *Poetry and Progress in Russia* (London, 1907); Peter Schalfjew, *Die volkstümliche Dichtung A. Kol'covs und die russische Volkslyrik* (Berlin, 1910); and, for poems in English, Wiener's *Anthology* (New York, 1903).

KOLTZOFF-MASSALSKY, kól-tsóf'-má-sál'ski, PRINCESS. See DORA D'ISTRIA.

KOLUP, TILE. See HOLZSCHUH.

KOL'USHAN. See TLINKIT.

KOLYMA, kó-lé'má. A river of east Siberia, rising in the Stanovoi Mountains in the Territory of Yakutsk. It flows in a northeasterly direction and falls by three arms into the Arctic Ocean, about 1000 miles west of Bering Strait. Its total length is 1230 miles, navigable for over 700. It is ice-free from the end of May to the middle of September.

KOM, kóm. A town of Persia. See KUM.

KOMAROV, kó'má-róf', **ALEXANDER VISIONOVITCH** (1830-1904). A Russian general. He was educated at the St. Petersburg Military Academy, served as ensign in a regiment of chasseurs in the Hungarian campaign (1849), and went to Caucasia (1856) as état major of the Imperial Guard. Three years afterward he was made Governor of the Province of Derbent, then Governor of southern Daghestan, and at the close of the Russo-Turkish War was intrusted with the duty of restoring order in the districts of Kars and Batum, ceded by the Turks in 1878. From 1882 to 1890 he was in command of the troops engaged east of the Caspian Sea and in Central Asia. He subjugated the wild

tribes, occupied the Zulfikar Pass leading to Herat, and attacked the Afghans on the Kushk (March, 1885). The Russian advance led to concessions by the British government with respect to the boundary between Turkestan and Afghanistan. Komarov wrote several historical monographs and devoted considerable time to numismatics.

KOMENSKY, kô-mên'ski, J. A. See COMENIUS, JOHANN AMOS.

KOMORN, kô'mörn (Hung. **KOMÁROM**, kô'mä-róm). A royal free town with municipal rights, capital of the county of the same name, Hungary. It is situated on a small island at the confluence of the Waag with the Danube, 85 miles southeast of Vienna. It also includes the town of Új-Szony on the mainland (Map: Hungary, F 3). It is an irregularly built town, with a number of interesting churches, public buildings, and a considerable trade in grain, wine, wood, and fish. It is the seat of a Reformed bishop. The fortress, originally constructed under King Matthias Corvinus in the fifteenth century and considerably extended during the nineteenth, lies about a mile from the town. In the Hungarian Revolution it was brilliantly defended by Klapka against the Austrians and held out long after the surrender of the Hungarian army at Világos. Finally, on Sept. 27, 1849, Klapka capitulated, and on October 4 the fortress was handed over to the Austrians. Pop., 1900, 19,996; 1910, 22,337, mostly Catholic Magyars. Maurice Jókai, the novelist, was born here in 1825.

KOMPERT, kôm'pért, LEOPOLD (1822-86). An Austrian novelist, born at Munchengrätz, Bohemia, of Jewish parentage. He studied at the universities of Prague and Vienna, was in the meanwhile tutor in the family of Count Andrásy at Pressburg, and, drifting into journalistic work during the revolutionary movement of 1848, became editor of the *Oesterreichischer Lloyd*. From 1857 he devoted himself exclusively to literary work, making his home in Vienna. His tales, which are limited to the life of the Jews in their seclusion, are characterized by a poetic atmosphere and subtle delineation of character. They are embodied in the collections *Geschichten aus dem Ghetto* (1848, 3d ed., 1886), *Bohmische Juden* (1851), *Am Pfug* (1855); *Neue Geschichten aus dem Ghetto* (1860); *Geschichten einer Gasse* (1865); *Verstreute Geschichten* (1886), besides which he wrote the novels *Zwischen Ruinen* (1875) and *Franzi und Heini* (1880). A new edition of his collected works, *Gesammelte Schriften*, in eight volumes, was published at Leipzig in 1887. Consult article in *Allgemeine deutsche Biographie*, vol. li, pp. 750 et seq.

KOMUL. See HAMI.

KOMUNDUROS, A. See KUMUNDUROS, A.

KOMURA, kô'mû'râ, JUTARO, MARQUIS (1855-1911). A Japanese statesman and diplomat, born at Hyuga. He graduated at Harvard University in 1877, took a post in the Department of Justice, but was transferred to the Foreign Office in 1884. He was chargé d'affaires at Peking at the outbreak of the Chino-Japanese War in 1894, was later active in Korea, and from 1896 to 1898 was Assistant Foreign Minister. In the latter year he became Japanese Minister at Washington, in 1900 he went to St. Petersburg, and after the Boxer uprising he represented Japan at Peking. In November, 1901, he became Minister for Foreign Affairs in

the Katsura cabinet. He was senior Japanese Plenipotentiary at the Portsmouth Peace Conference in 1905. In his stand for the imposition of severe terms upon Russia he was overruled from Tokyo. Returning to Japan, he resumed his post as Foreign Minister, but retired with the rest of the cabinet in January, 1906. From August, 1906, to 1908 he served as Ambassador to Great Britain; he then returned to Japan to assume again the portfolio of Foreign Affairs, a post which he held until his death.

KONDRATOWICZ, kôn'drà-tô'vich, LUDWIK WLADYSŁAW (1823-62). A Polish poet and prose writer, who wrote under the nom de plume Syrokomla. He was born in Lithuania and hardly left his native village during his life, which was one of poverty. His first original volume of verse, *Bawardages* (1853), was characterized by easy, flowing rhythms, quiet humor, sincerity, and patriotism. *Margier* (1855) is considered his best poem and *Kaspar Karliński* his best play. He published also: *Urodzony Jan Dehoróg* (1854), full of reminiscences of the author's own life; *Zgon Acerna* (1856); *Janko Cmentarnik* (1856); *Nocleg hetmański* (1857); *Dzieje literatury w Polsce* (3 vols., 1852). His shorter poems, dealing with matters of everyday life, are especially noteworthy, his dramas being inferior. Kondratowicz rendered service to Polish literature by his translations from Polish authors who had written in Latin. A complete edition of his works (10 vols.) was published at Warsaw in 1872. He has been called the Polish Burns.

KONG. An important city in the French colony of Ivory Coast, Africa, capital of the district of the same name, in lat. 8° 53' N. and long 3° 30' W. (Map: Africa, D 4). It manufactures cotton goods and has a large trade in gold, salt, and cola nuts. Its population is estimated at 15,000, chiefly Mohammedans. It was first visited by Binger, a French captain, in 1888.

KONGO, kô'gô. A Bantu people of Congo-land, Angola, West Africa, whose territory extends from the lower Congo southward to about the parallel of Ambriz and from the coast inland to the Kwango River. Collectively they are known as the Ba Fiot or Ba Kongo and consist of nine tribes of varying degrees of culture, from the savage Mushi Kongo to the semicivilized Eshi Kongo. These tribes descend from the dominant race of the ancient Kongo kingdom and have preserved their historic traditions and customs, thus developing a nationality. Their language, which is the Mishi-Kongo, a Bantu idiom, is still used over a vast extent of country comprised in the former Kongo Empire. Towards the close of the eighteenth century, after the expulsion of the Jesuit missionaries, the Empire fell to pieces and is now a Portuguese dependency. Consult: Monteiro, *Angola and the River Congo* (London, 1875); Pechuel-Loesche, *Die Loango-Expedition*, vol. iii (Stuttgart, 1907); Struyf, *Uit den Kunstschat der Bakongos* (Amsterdam, 1908); Johnston, *George Grenfell and the Congo* (London, 1908).

KONGSBERG, kô'ngs'bär-y'. A mountain town in the County of Buskerud, Norway, situated on the Laagen, 52 miles southwest of Christiania. The town was founded in 1623 by Christian IV, owing to the discovery of a silver mine. The mines are owned and operated by the state, which also has a smelter, a mint, and a manufactory of arms and powder. About 180,000

ounces of fine silver are produced annually. Pop., 1901, 5585; 1911, 6132.

KONI, kō'ně, FEDOR ALEXIEVITCH (1809-79). A Russian playwright, born in Moscow. Beginning with *Zenikh po Dovernosti* (A Bridegroom by Proxy; 1833), he adapted, translated, or composed about 50 vaudevilles, which were collected in two volumes (1870-71). He published also translations and books for young people.

KO'NIEH, kō'nī-e, or **KONIAH**, kō'ně-ā. The capital of the vilayet of the same name in Asiatic Turkey, situated on the west edge of the plain of Lycaonia, at an altitude of over 3300 feet, about 150 miles south of Angora (Map: Turkey in Asia, B 3). The town has little to attract in its appearance except its irrigated gardens. It possesses several fine mosques and a famous monastery of the Mawlawi (dancing) dervishes, with the tomb of the founder of the order. It produces carpets and leather and carries on a considerable trade in minerals, in which the surrounding country is rich. It is connected by railway with Smyrna and Scutari (Constantinople). Its population is estimated at 50,000, chiefly Turks, Armenians, and Greeks. Koniah is the ancient Iconium. Under the Persian Empire it was considered the frontier city of Phrygia (cf. Xenophon, *Anabasis*, i, 2, 19). The Romans joined it to Lycaonia and made it the centre of that district. Paul and Barnabas preached there, and at that time it seems to have had a considerable Jewish population (Acts xiii 51 et seq; cf. 2 Tim. iii. 11). It became the centre whence Christianity spread throughout south Galatia. In Byzantine times it was the seat of the Archbishop of Lycaonia. A Church council was held there in 235. The Seljuk Turks captured the city about 1063, and under them it became the capital of the Sultanate of Iconium, or Brun, which lasted until 1283. The most important remains of Seljuk architecture are found there. The city was captured by Frederick Barbarossa in 1190. It fell into the hands of the Ottoman Turks under Mohammed II in 1472. In 1832 it was occupied by Ibrahim Pasha, who administered a severe defeat to the Turkish general, Reshid Pasha, not far from its walls.

KÖNIG, kē'nīk, EWALD AUGUST (1833-88). A German novelist, whose pseudonym was Ernst Kaiser, born at Barmen, where he was for a time engaged in mercantile pursuits. Afterward he settled at Elberfeld, Neuwied, and in 1882 at Cologne. Of his numerous novels, for the greater part dealing with criminal incidents, the following are the most noteworthy: *Durch Kampf zum Frieden* (1869), which was awarded a prize by the *Belletristisches Journal* in New York; *Auf der Bahn des Verbrechens* (1876); *Schuldig?* (1878); *Schuld und Sühne* (1880); *Ein verlorenes Leben* (1882); *Ein moderner Vampyr, socialer Roman* (1883); *Va banque!* (1884); *Um Glück und Dasein* (1885); *Die Tochter des Kommerzienrats* (1886); *Seines Glückes Schmied* (1888); *Unter schwarzem Verdacht* (1888); besides which he also wrote a number of humorous sketches of military and mercantile life, as *Humoresken und Erzählungen* (1877).

KÖNIG, FRIEDRICH (1774-1833). A German printer, born at Eisleben. He devoted himself to the means of printing by machinery, and after various disappointments Thomas Bensley, a printer in London, came to his support (1807),

a company was formed, and a patent obtained (1810) for a press, which, like the hand press, printed by two flat plates. It was first used in 1811 to print part of the *Annual Register*. A second patent was obtained (1811), for a cylinder press, and in 1813 and 1814 other patents were obtained for additional improvements. This improved machine was soon adopted by the proprietors of the London *Times*, whose number for Nov. 29, 1814, was the first to be printed upon it. In the latter part of his life König was a partner in a company for making steam printing presses at Oberzell, near Würzburg, in Bavaria. Consult the life by Goebel (Stuttgart, 1883).

KÖNIG, FRIEDRICH EDUARD (1846-). A German Semitic scholar. He was born in Reichenbach and was educated at the University of Leipzig, where he became docent in 1879 and professor in 1885. In 1888 he became professor at Rostock and in 1900 at Bonn. He attempted to apply the phonetic and physiological methods of modern philology to Hebrew and Ethiopic in such works as *Gedanke, Laut, und Akzent als die drei Faktoren der Sprachbildung* (1874), *Neue Studien über Schrift, Aussprache, und generelle Formenlehre des Aethiopischen* (1877), and *Historisch-kritisches Lehrgebäude der Hebraischen* (1881-97). Among his more general books are: *Religious History of Israel* (1885); *Neue Prinzipien der alttestamentlichen Kritik* (1902); *Geschichte des Reiches Gottes bis auf Jesus Christus* (1908); *Hebraisch-aramaisches Wörterbuch zum alten Testament* (1910), *Geschichte der alttestamentlichen Religion kritisch dargestellt* (1912).

KÖNIG, JOHAN GERHARD (1728-85). A Danish botanist. He was born in Livland, studied pharmacy and medicine, and afterward was a pupil of Linnæus, and in Denmark studied under Rottböll. He traveled in Iceland (1764-65) and wrote a *Flora Islandica*, but his greatest botanical labor was on Indian, and more especially Malabar, flora. In 1767 he went to Tranquebar, India, as a Danish medical missionary and died there. The genus *Koempfia* was named in his honor by Linnæus.

KÖNIG, OTTO (1838-). A German sculptor. He was born in Meissen, Saxony, and studied at the Dresden Academy and under Hähnel. In 1868 he was appointed professor at the School of Industrial Art at Vienna. His small statuette groups, which are especially popular, include many original and graceful designs for fountains and table services, such as the allegorical group "Water and Wine," modeled for the Austrian Emperor. Among his larger works are the funeral monument for his wife and three children, in the Evangelical Cemetery at Vienna, reliefs and a mourning "Victory" for the monument to the Emperor Maximilian of Mexico, at Pola; a life-size marble group, the "Love Secret," in the Museum of Historical Art, Munich; relief heads for the new City Hall and decorative sculptures for the Court Museum and Theatre, all in Vienna. His portrait busts include those of the Emperor Francis Joseph I (Austrian Museum) and Professor Leschetizky. He received the great gold medal at Munich in 1869 and a gold medal at Chicago in 1893.

KÖNIGGRÄTZ, kē'nī-gräts (Czech, *Hradeo Králové*). An old episcopal town and former fortress of Bohemia, Austria, situated in a fertile region at the confluence of the Adler with

the Elbe, 74 miles east of Prague (Map: Austria-Hungary, E 1). Its Gothic cathedral dates from the beginning of the fourteenth century, and the episcopal residence contains a fine library and a collection of portraits. The educational institutions of the town include a Gymnasium, founded in 1642, a theological seminary, an institute for teachers, a school of commerce, an industrial school, and a theatre. The town hall contains the municipal museum. Königgrätz has extensive manufactures of musical instruments, organs, roofing, soap, gloves, machinery, candles, and paints. It was a fortified town as far back as the eleventh century and suffered greatly during the Hussite and the Thirty Years' wars. Königgrätz is famous on account of the battle of July 3, 1866, in which the Austrians were overwhelmingly defeated by the Prussians, and which brought the Seven Weeks' War (q.v.) to a close. This is better known, however, in English as the battle of Sadowa (q.v.). Pop., 1900, 9800, 1910, 11,065.

KÖNIGINHOF, kē'nē-gīn-hōf'. A small manufacturing town of Bohemia, Austria, on the left bank of the Elbe, 20 miles by rail northeast of Königgrätz (Map: Austria-Hungary, E 1). It has several old churches, a Gymnasium, and a textile school. Linen and jute weaving and manufactures of cotton and print goods, leather, and beer are the principal branches of industry. Pop., 1900, 10,601; 1910, 15,051, mostly Czechs.

KÖNIGIN VON SABA, kē'nē-gīn fōn zā'bā, DīE (Ger., The Queen of Sheba). An opera by Goldmark (q.v.), first produced at Vienna, March 10, 1875, in the United States, Dec. 2, 1885 (New York).

KÖNIGSBERG, kē'nīks-bērk. A city of Prussia, capital of the Province of East Prussia, and a fortress of the first rank, situated on the Pregel, about 5 miles from its entrance into the Frisches Haff, in lat. 54° 43' N. and long. 20° 30' E. (Map: Germany, J 1). It lies on both banks of the Pregel and on a small island in the river and is composed of the three quarters of Altstadt and Löbenicht on the right bank and Kneiphof on the island and of several former suburbs on both banks of the river. The fortifications, begun in 1843 and completed in 1905, consist of an inner wall connected with an outlying system of works, 12 detached forts (six on each bank of the river), and in addition two great forts, that of the Kaserne Kronprinz, on the east, and that of Friedrichsburg, on an island at the western end of the city. The chief public buildings are mainly in the old quarters on the right bank of the river. The Kneiphof is the best-laid-out portion of the city and contains the town hall and the residences of the wealthy merchants. The Gothic cathedral, also in this section, was begun in the fourteenth and completed in the sixteenth century and contains a fine choir; the cathedral was restored in 1856. In the adjoining Stoa Kantiana is the grave of Kant, who was a native of the town. The Schlosskirche (1592) is interesting as the place where Frederick I and William I were crowned. Above the church is the immense Moskowitzer-saal, one of the largest halls in Germany. Among the most prominent secular buildings is the castle (Schloss), situated in the Altstadt. It was begun in 1255 and is an extensive building containing government offices, the archives, and the Prussia Museum. The government buildings,

the exchange, and the university are modern buildings of architectural merit. Königsberg has a fine statue of Frederick I and a bronze monument to Kant. The university was founded in 1544, by Albert, first Duke of Prussia, and in the seventeenth century had 2000 students. The number in 1914 was about 1700. Its library contains 318,000 volumes. The frescoed Aula is noteworthy. The other educational institutions of the city include the royal Gymnasium, founded in 1698; the municipal Gymnasium of the Altstadt, founded in 1335 as a parochial school, the Kneiphof municipal Gymnasium, dating from 1304; the Wilhelmsgymnasium, two realschulen, a seminary for female teachers, and a number of art and special schools.

Königsberg is administered by a chief burgo-master, a burgomaster, and a board of magistrates of 25 and a municipal council of 102 members. The city owns the water works, a gas and an electric-light plant, and an abattoir. The manufactures comprise various iron products, including machinery and locomotives, wood products, spirits, tobacco and cigars, matches, pianos, amber goods, flour, cement, mineral waters, chemicals, toys, sugar, and marchpane. Königsberg is a very important centre in the commerce between Russia and Germany. The approach by water having been found inadequate for heavy ships, the important Königsberg Ship Canal, from the city to Pillau, 20 miles distant on the Bay of Danzig, was opened in 1901. The chief articles of trade are agricultural products, amber, tea, wood, spirits, petroleum, coal, colonial wares, leather products and chemicals. Königsberg is the centre of the Prussian amber trade. Pop., 1890, 161,666, 1900, 189,483 (chiefly Protestants, the Roman Catholics numbering 8465 and the Jews 3975), 1910 (census of December 1), 245,994. The area of the city at the 1911 census was 17 square miles.

The Altstadt of Königsberg owes its foundation to the Teutonic Knights. Destroyed by the Prussians in 1263, it was built on its present site and obtained municipal rights in 1286. Löbenicht and Kneiphof became cities in 1300 and 1327 respectively. In 1457 the castle of Königsberg became the residence of the Grand Masters of the Teutonic Order and from 1525 to 1618 was the residence of the dukes of Prussia. The three towns were united in 1724. In 1758 Königsberg was occupied by the Russians and in 1807 by the French. It was invested and bombarded by the Russians during the first Prussian campaign of the European War of 1914. They were forced to retire by the counter German offensive movement. See WAR IN EUROPE.

KÖNIGSHÜTTE, kē'nīks-hūt'e. A town in the Province of Silesia, Prussia, 35 miles east-northeast of Ratibor and about 7 miles from the Russian frontier (Map: Prussia, H 3). It has extensive smelting works and the largest coal mines in Silesia, with manufactures of car wheels, glass, and bridge materials. Pop., 1900, 57,919; 1910, 72,640, half of whom are Poles. Königshütte was formed in 1869 by consolidating various townships.

KÖNIGSKINDER, kē'nīks-kīn'dēr, DīE (Ger., The Royal Children). An opera by Humperdinck (q.v.), first produced in New York, Dec. 28, 1910; in Germany, Jan. 14, 1911 (Berlin).

KÖNIGSMARK, kē'nīks-märk. A Swedish family of German origin, whose members achieved

fame and notoriety in equal measure during the seventeenth and early eighteenth centuries.—**HANS CHRISTOPH**, Count Königsmark, field marshal in the Swedish service, was born at Kötzlin, Brandenburg, March 4, 1600. On the outbreak of the Thirty Years' War he served in the Imperial forces, but in 1630 entered the Swedish army, attaining the rank of colonel in 1635. In the following year he defeated the Imperialists and for a long time commanded the Swedish army in Westphalia. He was with Torstenson in 1642 and commanded the left wing at the battle of Breitenfeld (q.v.), November 2. He drove the Imperialists from Pomerania and captured Bremen and Verden in 1644; defeated the Saxons at Zeitz and forced the Elector to a truce. He supported Wrangel in Franconia (May, 1648) and commanded the Swedish forces in the final battle of the war at Prague. He was made a field marshal and hereditary count and appointed Governor of Bremen and Verden. He was taken prisoner in the war between Sweden and Poland (1656) and remained in captivity until the Peace of Oliva (1660). He died in Stockholm, March 8, 1663.—**PHILIPP CHRISTOPH**, Count Königsmark, a grandson of the preceding, born 1662, entered the service of the Elector of Hanover and became the lover of Sophia Dorothea, wife of the Crown Prince (afterward George I of England). This attachment was discovered, and Königsmark, as is supposed, was assassinated July 1, 1694. The mystery of this murder was never cleared, owing to the opposition of the Hanoverian court. Consult: Bulau, *Geheime Geschichten und ratzelhafte Menschen*, vol. xii (1864); Palmblad, *Briefwechsel des Grafen Königsmark und der Prinzessin Sophia Dorothea* (1847); W. H. Wilkins, *The Love of an Uncrowned Queen*.—**MARIA AURORA**, sister of the preceding, born at Stade, Sweden, about 1668, was a brilliant and beautiful woman, well acquainted with life in the courts of northern Germany. After her brother's mysterious disappearance she went to Dresden to enlist the aid of the Elector Augustus II of Saxony in rescuing her brother, if alive. She became the mistress of the Elector and the mother, by him, of Maurice of Saxony (q.v.). She afterward retired to the abbey of Quedlinburg, Prussian Saxony; lived at Berlin, Dresden, and Hamburg; and undertook a mission to Charles XII of Sweden at Narva, in behalf of Augustus II (1702). Voltaire considered her "the most famous woman of two centuries." She died at Quedlinburg in 1728. Consult: Pöllnitz, *La Saxe galante* (1734); Cramer, *Denkwürdigkeiten der Gräfin Maria Aurora von Königsmark* (2 vols., Leipzig, 1836); Palmblad, *Aurora Königsmark und ihre Verwandten* (6 vols., ib., 1848-53); Corvin-Wiersbitzky, *Maria Aurora, Gräfin von Königsmark* (ib., 1848); Heseckel, *Nachrichten zur Geschichte des Geschlechts der Grafen von Königsmark* (Berlin, 1854).

KÖNIGSTEIN, kō'nīk-stīn. A town of Saxony, Germany, on the Elbe, 22 miles by rail southeast of Dresden. It has a monument to the composer Julius Otto and is commanded by an old fortress, the only one in Saxony, situated at an altitude of nearly 800 feet above the Elbe, on a precipitous rock. It formerly afforded an asylum to the Saxon priors, with their treasures, in times of danger. The present fortifications were erected during 1589-1731. The fortress of Königstein was formerly considered impregnable and the town has often been called

the key to Bohemia. The town has manufactures of lumber, cellulose, paper, machinery, vinegar, and buttons. It also builds ships. Pop., 4274.

KÖNIGSWART, kō'nīks-vārt. A watering place of Bohemia, 2350 feet above the sea, 5 miles from Marienbad (Map: Austria, C 1). It has an old castle which has belonged to the Metternich family since the seventeenth century; it contains a valuable library of 30,000 volumes and numerous art treasures. There are five mineral springs, chalybeate and mud baths, and a Kurhaus. Pop., 2039.

KONINCK, or **CONINGH**, kō'nīnk. The name of several important Dutch and Flemish painters, more or less related.—The most important was **PHILIPS DE KONINCK** (1619-88), a Dutch landscape painter, born at Amsterdam. He was one of the most notable pupils of Rembrandt and painted portraits and landscapes; the landscapes are remarkable for their truth to nature, broad perspective, and striking treatment of light. It is believed he was a wide traveler, but the details of his life are not known. Lingelbach, Dirk van Bergen, and A. van der Velde sometimes painted the figures in his landscapes. A "Landscape" (1676) and "Entrance to a Forest," in the Amsterdam Museum, are fine examples of his work, and a "View of the Mouth of a River," in The Hague, with a replica in the National Gallery, London, and fine landscapes in the Berlin Gallery and the Metropolitan Museum, New York, should also be mentioned. His works have been frequently confused with those of his brother Jacob (1616-c.1708), a greatly inferior painter.

His fellow townsman, **SALOMON KONINCK** (1609-56), a genre, historical, and portrait painter, was a pupil of David Colyns and Nicolaas Moyaert, but afterward became an imitator of Rembrandt. Some of Koninck's best works have been attributed to this master, among them "Joseph Explaining Pharaoh's Dream," in the Schwerin Museum. He also left some excellent etchings in the manner of Rembrandt, notably the head of an old man.

DAVID DE KONINCK (1636-c.1699), a Flemish animal and still-life painter, was born at Antwerp. There he studied with Peter Boel and entered the Painter's Guild in 1663. After traveling in Germany and France, in 1670 he settled at Rome, where the frequent introduction of a rabbit in his paintings made him known as Ramelaer. He did not die at Rome, as is commonly stated, but returned to Antwerp in 1687 and removed to Brussels in 1699. His work resembles Jan Fyt's, but there is no proof of his being a pupil of that master, as is frequently stated. He is well represented in the museums of Amsterdam and Vienna.

KONINCK, **LAURENT GUILLAUME DE** (1809-87). A Belgian chemist and paleontologist, born at Louvain, where he studied medicine at the university. After studying chemistry in Paris, Berlin, and Giessen, he taught that subject at Ghent and Liège. At Liège University he was appointed professor of chemistry in 1856 and of paleontology in 1876. He became especially known for his investigations of the Paleozoic rocks and the Carboniferous fossils and limestones of Belgium. He was awarded the Wollaston medal of the Geological Society of London in 1875. His publications include: *Éléments de chimie inorganique* (1839); *Descriptions des animaux fossiles qui se trouvent dans le terrain carbonifère de Belgique* (2 parts,

1842-51); *Recherches sur les animaux fossiles* (2 parts, 1847-73).

KONINCK, PIERRE DE (also DE CONINCK and DECONING). A Flemish popular leader of the fourteenth century. He is described by Guizot as "a simple weaver, obscure, poor, undersized, and one-eyed, but valiant and eloquent in his Flemish tongue." He became the leader at Bruges of a revolt against the oppression of Philip IV (the Fair) of France. The other communes of Flanders assisted the movement, and about 20,000 troops were collected. Near Courtrai this force totally defeated the French army of about 50,000 commanded by Robert, Count d'Artois (July 11, 1302). The French loss was between 12,000 and 15,000. Koninck was lavishly rewarded and treated with distinction. French prestige in Europe was seriously affected by this reverse, and Philip fought an unsuccessful war of revenge, which culminated only in his acknowledgment of Flemish independence in 1305.

KONKAN. See CONCAN.

KONKOLY, kôn'kô-li, NIKOLAUS THIEGE VON (1842-). A Hungarian meteorologist and astronomer. He was born in Budapest and was educated in the university there and at Berlin. In 1871 he established the astrophysical observatory at O'Gyalla (near Komorn), known by his name and since 1899 a royal observatory. From 1879 to 1883 he edited the *Beobachtungen* of this observatory. Among Konkoly's important studies were some on the spectroscopic lines of meteors. He wrote: *Praktische Anleitung zur Anstellung astronomischen Beobachtungen* (1883), *Praktische Anleitung zur Himmelsphotographie* (1887), *Handbuch für Spektroskopiker* (1890).

KONOTOP, kô'nô-tôp'. A town in the government of Tchernigov, Russia, situated about 85 miles east-southeast of Tchernigov. It is a railroad junction and has a technical school, three fine Orthodox churches, and one Lutheran church. It carries on some trade in grain, honey, and wax. Pop., 1897, 19,406; 1912, 28,160.

KONOW, kô-nôw', STEN (1867-). A Norwegian philologist, born in Aurdal, Valdres, the son of a clergyman. He was educated at Christiania and at Halle, where he obtained the doctorate (1893), was assistant librarian in Berlin in 1894-97; became docent at Christiania in 1899, and in 1900 entered the Linguistic Survey of India as an assistant to G. A. Grierson, declining a call from Harvard University to become assistant professor of Sanskrit. He was government epigraphist of India in 1906-09 and then returned to Christiania, where he became professor of Indian philology in 1910. Konow carried on important excavations at Sârânâth (near Benares) in 1907 and 1908 and edited *Epigraphia Indica* from 1907 to 1913. He wrote on the relation of Prakrit dialects, edited various texts and versions, contributed to Grierson's *Linguistic Survey of India* five volumes on the Tibeto-Burman groups, and on the Munda, Dravidian, Bhil, and Marathi languages (1903-08), and published *Orken og oase, det inderside Asien* (1912) and a *Bashgali Dictionary* (1913).

KONRAD, kôn'rât. The name of several German emperors. See CONRAD.

KONRAD DER PFAFFE (the priest). A mediæval German poet, who flourished in the first half of the twelfth century. He was a priest in the service of Duke Henry the Proud of Bavaria

and wrote about 1131, probably at Ratisbon, the *Rolandslied*, a poetic paraphrase of the French *Chanson de Roland*, which he had first translated into Latin prose. It was edited by W. Grimm (Göttingen, 1838), with a valuable introduction, and by Bartsch (Leipzig, 1874). The adaptation of the *Kaiserchronik* about 1150 is also attributed to him. Consult Golther, *Das Rolandslied des Pfaffen Konrads* (Munich, 1887); W. Walt, *Der Pfaffe Konrad* (Wandsbeck, 1879); and an article in the *Allgemeine deutsche Biographie*, vol. xvi (Leipzig, 1882).

KONRADIN (kôn'râ-dên) OF SWABIA. The last of the Hohenstaufen. See CONRADIN.

KONRAD VON HOCHSTADEN, fôn hōg'-stâ-dên, or **HOSTADEN** (?-1261). A German ecclesiastic and statesman of the thirteenth century, under whom, as Archbishop of Cologne (1238-61), the cathedral of that city was begun (1248). He sided with Rome against Frederick II and attempted open opposition, but in 1242 was beaten, wounded, and captured. But he escaped, and crowned William of Holland as Emperor (1248), and after his death caused the selection of Richard of Cornwall, whom he crowned in 1257, as leader of the forces opposed to the Hohenstaufen party. His long quarrel with the city of Cologne came to an end in 1259, when he gained control of the town. His monument, of the fifteenth century, is in the St. John's Chapel of the Cologne Cathedral. Consult Carstairs, *Konrad von Hochstaden* (Cologne, 1880).

KONRAD VON MARBURG, mâr'burk (?-1233). A German Dominican priest, confessor to the wife of Louis IV of Thuringia, who was afterward canonized and is known as St. Elizabeth of Thuringia. Pope Gregory IX made him the archinquisitor for Germany, and his severe and indiscriminate treatment of heretics at last aroused the bishops and called forth the intervention of the Pope. He met his death by assassination near Marburg. Consult Kaltner, *Konrad von Marburg und die Inquisition in Deutschland* (Prague, 1882).

KONRAD VON MEGENBERG, mäg'en-bêrk (1309-78). A German author, born near Schweinfurt, Bavaria. He was rector of a school in Vienna in 1337, then lived at Ratisbon from 1342 first as parish priest, later as canon, and is best known as the author of *Das Buch der Natur* (c.1349), the first German natural history, based upon the *Liber de Naturis Rerum* of Thomas de Cantimpré. It was newly edited by Pfeiffer (Stuttgart, 1861) and in a High German version by Schulz (Greifswald, 1897).

KONRAD VON WÜRZBURG, vûrts'burk (died c.1287). A Middle High German epic poet, representing the latter stages of the court epic. Himself a burgher, he represents also the rise to prominence of that class and reaches over, as it were, from the Minnesingers to the Mastersingers. As an epic poet, he was the most brilliant of the pupils of Gottfried von Strassburg (q.v.). He lived on the upper Rhine, alternately at Strassburg and Basel, and wrote voluminously. Konrad owes much to Benoit de Sainte-More and Chrestien de Troyes. The more noteworthy of his epics are: *Der Schwanritter* (ed. by Roth, 1861, used by Wagner in the opera *Lohengrin*); *Die goldene Schmiede* (ed. by Grimm, 1840); *Der Welt Lohn* (ed. by Roth, 1843); and 40,000 verses on the Trojan War (*Trojanerkrieg*, ed. by Roth, Keller, and Bartsch, vol. lxxvii of the *Stuttgarter Literaturarischer Verein*, 1858), which, even then incom-

plete, was finished by an inferior poet; *Engelhart und Engeltrat* (ed. by Haupt, 1844; 2d ed., 1890). Consult: K. J. Petelenz, *Leben und Bedeutung Konrads von Würzburg* (Cracow, 1881); Joseph, *Konrads von Würzburg Klage der Kunst* (Strassburg, 1885); Franz Pfeiffer, in *Germania*, vol. xii (Vienna, 1867); Scherer, *History of German Literature*, translated by Conybeare, vol. i (New York, 1906); Walther Leppelt, *Der Titulierungsgebrauch in den Redesenen der Werke Gottfrieds von Strassburg und Konrads von Würzburg* (Glatz, 1912).

KONTA, kōn'tā, ALEXANDER (1862-). An American publicist. He was born at Budapest, Hungary, and graduated from the College of the Pius Brothers. He started a literary weekly in Budapest; traveled in Egypt, India, and Japan; came to the United States in 1887 and there engaged in business and literary undertakings. He founded the Modern Historic Records Association; translated and adapted several plays for the American stage, of which the best known was *The Devil*; and became known as a frequent contributor to the Hungarian-American press. In 1914 he was chairman of the Primary Law Committee of New York.

KONTI, kōn'tā, ISIDORE (1862-). An American sculptor. He was born in Vienna and studied there at the Imperial Academy and the Meisterschule of Professor Karl Kundmann. A scholarship enabled him to continue his studies for two years in Rome, and he came to the United States in 1890, establishing himself in New York. He was elected to the National Academy in 1909 and received a gold medal at the St. Louis Exposition in 1904. Konti became best known by his monumental decorative works in staff for the great American expositions. His first work was done for the Chicago World's Fair in 1893. For the Pan-American Exposition (Buffalo, 1901) he executed four colossal groups for the Temple of Music,—“Heroic Music,” “Lyric Music,” “Sacred Music,” and “Dance Music”; also “The Despotism Age,” a very spirited piece of work. For the St. Louis Exposition (1904) he modeled two grand cascade fountains, typifying the Atlantic and Pacific oceans, and numerous small decorative groups. Other examples of his decorative work include: two groups, “West Indies” and “North and East Rivers,” for the Dewey Arch, temporarily erected in New York; the McKinley Memorial, Philadelphia; and two groups for the International Bureau of American Republics Building (Pan-American Union), Washington. Of his many ideal figures, the best known are: “Pan and Cupid,” “Awakening of Spring,” “Inspiration,” “The Brook,” a fountain (1902), “Orpheus” (1908), “The Witch” (1910), “Young Mother” (1912). Konti's work is characterized by refinement of conception and charming decorative qualities, the composition being good, the execution spirited. In 1914 he was president of the National Sculpture Society.

KONZE, kōnz. See HARTBEEST.

KOO-CHAH-BEE, kōō-chā'bē. A food made by the Indians about Mono Lake and other alkaline lakes of the western United States from the pupæ of certain flies of the family Ephydride. See FLY.

KOO'DOO, or **KUDU** (African name). One of the largest and most numerous of African antelopes (*Strepsiceros strepsiceros*, or *kudu*). The general form is not so light and elegant as

that of many of the antelopes. The height is about 4 feet, and the length fully 8 feet, exclusive of the tail, which is moderately long and terminates in a tuft like that of an ox. The male is furnished with great horns, nearly 4 feet long and beautifully twisted in a wide spiral of two turns and a half, very thick at the base and there wrinkled and ringed. The female is smaller than the male and hornless. The general color is grayish brown, with a narrow white stripe along the middle of the back, and 8 or 10 similar stripes proceeding from it down the sides. The koodoo lives in small families of four or five, inhabiting chiefly the wooded parts of Africa from Abyssinia to Cape Colony, though it is now nearly exterminated in South Africa. It is easily domesticated, and it is one of the animals which probably man might with further efforts reduce to his service. Its flesh is highly esteemed. Consult: *Proceedings of the Zoölogical Society of London* (London, 1890); *The Field* (ib., Sept. 1, 1894); Roosevelt and Heller, *Life-Histories of African Game Animals* (New York, 1914). For full description, consult the authorities mentioned under ANTELOPE.

KODOO.

KOOKABURRA, kŭk'ā-bŭr'ā or kŭk'ā-bŭr'ā. See DACELO.

KOORDS. See KURDS.

KOOSO, kōōs'sō (Abyssinian name), **KOUSSO**, **KOSSO**, or **CUSSO**. A medicine used to expel the tapeworm. It consists of the dried flowers and unripe fruit of *Brayera anthelmintica*, a tree which is a native of Abyssinia. The product reaches the market in the form of compressed, greenish-yellow bunches, with a balsamic odor and an acrid, repulsive taste. Koosso contains a resin (koossin or tæniin), a volatile oil, and tannic acid. The resin is crystallizable, white or light yellow, soluble very sparingly in water, though freely in alcohol. It is the active principle of the drug, which yields 3 per cent of it. It is an efficient drug against the tapeworm. In ordinary doses it causes nausea, some abdominal pain, and purging. The worm is usually discharged dead with the last passages. See ANTHELMINTIC.

KOOTENAY, kōō'tā-nā. A tributary of the Columbia River, rising in the Rocky Mountains in British Columbia (Map: British Columbia, E 5). It flows south, passing through the states of Montana and Idaho, and then, turning north, reenters British territory. It passes through Kootenay Lake and joins the Columbia River after a course of about 400 miles through a wild and picturesque district. Owing to the tortuousness of its course and numerous rapids, its navigable importance is insignificant; steamers ply on Lake Kootenay between Kaslo and Lando. Rich deposits of iron and other minerals through the region give promise of future industrial development, and a railroad now parallels the entire length.

KOOTENAY, or **KOOTENAI**. A North American tribe of the Kitunahan Indian stock. See KUTENAI.

KOPEK. See COPECK.

KÖPENICK, kə'pe-nik. A town of Prussia. See CÖPENICK.

KÖPFEL, kēp'fel. See CAPITO.

KOPISCH, kō'pish, AUGUST (1799–1853). A German painter and poet, born at Breslau. He was an art student at Prague (1815), Vienna, and Dresden (1819–22); but an accident to his right hand prevented his painting and he turned his attention to poetry. A protracted sojourn in Italy, where skill in swimming enabled him and Ernst Fries to discover the famous Blue Grotto of Capri, resulted in his translation of Dante's *Divine Comedy* (1837) and of other Italian selections, published the following year. His own *Gedichte*, which are distinguished by a delightful humor, were issued in 1836. *Allerlei Geister*, in 1848; *Die Schlösser und Garten zu Potsdam*, in 1854, and his complete works in five volumes, in 1856. Many of his songs are still sung, as, e.g., *Als Noah aus dem Kasten war; Wenn man beim Wein sitzt*.

KOPITAR, kō'pē-tār, BARTHOLOMÆUS, or JERNEJ (1780–1844). A Slavic philologist of Slovene nationality. He was born in Carniola and was educated at the German Gymnasium at Laibach and also at Vienna, where he soon became a member of the staff of the Imperial Library, and finally its curator. In 1814 he was sent to Paris with the commission to recover the Slavic manuscripts taken by the French in 1809, and afterward traveled in Germany, England, and Italy. His fame as a philologist rests on his works: *Grammatik der slawischen Sprache in Krain, Kärnten und Steiermark*, the first scientific Slavic grammar (1808); an edition of the *Glagolita Clozianus* (1836), in which, by adducing older forms, he attempts to prove the greater antiquity of the Glagolitic as compared with the Cyrillic alphabet, a theory which subsequent studies of Jagić (q.v.) confirmed, *Hesychii Glossographi Discipulus Rusus* (1839), an edition of a Glagolitic text of the eleventh or twelfth century; and the *Prolegomena Historica* to the edition of the *Texte du sacre*, which was published under the auspices of Czar Nicholas I (Paris, 1843). Kopitar made many enemies among the Czechs by his denial of the authenticity of the Kralove-Dvor (Königinhof) manuscript, and by his disapproval of the Panslavist idea. A great admirer of Slavic folk songs, he exercised a profound influence on Vuk Karajitch (q.v.). A collected edition of his minor writings was undertaken by his pupil Miklosich (vol. i, 1857). Consult Jagić, *Briefwechsel zwischen Dobrowsky und Kopitar* (Berlin, 1885), and id., *Istorna Slavonskoj Filologiji* (St. Petersburg, 1910).

KOPP, kōp, GEORG (1837–1914). A German cardinal, born at Duderstadt and educated at Hildesheim. He entered the priesthood in 1862 and rose rapidly. In 1881 he was appointed Bishop of Fulda and actively inaugurated a policy of friendly relations between the church and the state. So successful was the programme that in 1886 and 1887, after his entrance into the Prussian House of Lords, "peace measures" were passed abating the severity of the famous May Laws. In 1887 he was appointed Prince-Bishop of Breslau, in which capacity he was also entitled to a seat in the Austrian Upper House. He was made a cardinal in 1893. In 1912 he celebrated his fiftieth anniversary as a priest and his twenty-fifth as a bishop. His *Hirtensbriefe 1887–1912* appeared in the latter year.

KOPP, HERMAN FRANZ MORITZ (1817–92)

A German chemist, born at Hanau. He studied at Marburg and Heidelberg, was appointed in 1853 professor of physics and chemistry at the University of Giessen, and was professor of chemistry at Heidelberg from 1864 until his death. Kopp was one of the earliest investigators in the field of physicochemistry, especially in regard to specific volumes. His writings include: *Geschichte der Chemie* (7 parts, 1843–75); *Die Entwicklung der Chemie in der neuern Zeit* (2 parts, 1871–73), *Die Alchimie in alterer und neuerer Zeit* (2 vols., 1886).

KOPF, JOSEPH EUTYCHIUS (1793–1866). A Swiss historian, born at Beromünster in the Canton of Lucerne. He studied philology in Freiburg (Baden), was professor of Greek at the Lyceum of Lucerne from 1819 to 1841, and was president of the Swiss Council of Education from 1841 to 1845, when he retired on account of the opposition excited by his hostility to the Jesuits. He devoted much labor to the study of the history of the Swiss Federation and is the founder of scientific investigation concerning Swiss history. It was through his careful study of early documents that the story of William Tell was first shown to be legendary. His *Geschichte der eidgenössischen Bünde* (1845–49; last ed., 1882) is considered his most valuable work. He also published *Ämtliche Sammlung der altern eidgenössischen Abschiede* (1839). Consult Lüttolf, *Joseph Eutychnus Kopp* (Lucerne, 1868).

KÖPPEN, kēp'pen, PETER IVANOVITCH (1793–1864). A Russian statistician and archaeologist, born at Kharkov. He was educated at the university of his native city, made numerous journeys to investigate the ethnology, archaeology, and history of Russia, and, aided by the ancient manuscripts collected during his travels, he began soon after 1818 to publish the results of his researches in German. While most of these are included among the memoirs of the Academy of St. Petersburg, of which he was a member, mention should be made of his *Kulturgeschichte Russlands* (1825) and his *Geschichte des Weinbaues und Weinhandels in Russland* (1832). He is probably best known, however, for his *Ethnographische Karte des europäischen Russlands*, published (4 vols., 1851) by the Russian Society of Geography, and by his memoir on the ninth census of Russia (1856).

KÖPPEN, VLADIMIR PETER (1846–). A Russian-German meteorologist, born at St. Petersburg and educated there, at Heidelberg, and at Leipzig. After a year in the Central Physical Observatory at St. Petersburg, he became connected with the German Naval Observatory at Hamburg, of which he was appointed meteorologist in 1875. In 1906 he was appointed counselor in the German Admiralty Office. His writings have appeared mainly in technical journals, especially the *Meteorologische Zeitschrift*, of which he was editor from 1884 to 1891. In 1891 he was made editor of the *Annalen der Hydrographie und maritimen Meteorologie*. His *Meteorologen II* appeared in 1912.

KOPRILI, KÖPRÜLÜ. See KIUPRILI.

KOPTOS (Gk. Κοπτός, Lat. *Coptos*). The Greek name of the modern Koft (better Quft), a town of Upper Egypt, on the right bank of the Nile, 27 miles north of Luxor. It is now an unimportant town of about 2500 inhabitants, but in Greek and mediæval times it was a city of considerable importance as the starting point of the caravan routes to the ports on the Red Sea.

(Berenice and Myos Hormos), and therefore a centre of the trade with Arabia, India, etc. It was also famous for its quarries and gold mines. The siege and destruction of Koptos by Diocletian after a revolt in 292 A.D. were followed by a rapid revival of the city, which for a time was officially called Justinianopolis. Its decline began when Keneh took the traffic to the Red Sea. Excavations conducted near Koptos by Flinders Petrie in the winter of 1893-94 proved that this was a very old town. Monuments from all periods of Egyptian history were found in the temple of the ithyphallic local god Min—even statues from the prehistoric age. Consult Petrie, *Koptos* (London, 1896).

KORANĖS, or **CORANĖS**, *kô-rân's*, *Ger. pron.* *kâ'rēs*, *ADAMANTIOS*. See *CORAY*, *ADAMANTIOS*.

KORAN, *kô-rân* or *kô-rân'* (Ar. *kur'ân*, lesson, from *kara'a*, to read; cf. the later Heb. *Mikra*, the written Book, i.e., the Bible). The sacred book of the Mohammedans. The name was given by Mohammed himself to a single revelation, or a collection of revelations, and was afterward applied to the body of his utterances as gathered together in one book, forming the basis for the religious, social, civil, commercial, military, and legal regulation of Islam. The Koran is also known under various other names, such as *Furkân* (salvation), *Al-Muḥaf* (the volume), *Al-Kitâb* (the Book, in the sense of Bible), *Al-Dhikr* (the reminder, or the admonition).

According to the Orthodox views, the Koran is coeval with God, uncreated, eternal. Its first transcript was written from the beginning in rays of light upon a gigantic tablet resting by the throne of the Almighty, and upon this tablet are also found the divine decrees relating to things past and future. A copy of it, in a book bound in white silk, jewels, and gold, was brought down to the lowest heaven by the angel Gabriel, in the blissful and mysterious night of Al-Kadr, in the month of Ramadan. Portions of it were, during a space of 23 years, communicated to Mohammed, at both Mecca and Medina, either by Gabriel in human shape, "with the sound of bells," or through inspiration from the Holy Ghost, "in the Prophet's breast," or by God Himself, "veiled and unveiled, in waking or in the dreams of night." Traditions vary with respect to the length of the individual portions revealed at a time, between single letters, verses, and entire chapters (or suras). Setting aside the fanciful and semimystical speculations, there is general agreement among Mohammedans that the earliest revelation is represented by verses 1 to 5 of sura xvi, which begins with the words, "Read [or "proclaim"] in the name of thy Lord, who has created all things."

At the beginning of his career Mohammed did not make any efforts to have his utterances preserved. While it is possible that he was able to read and write, he certainly did not write any of the suras himself. It was only as his movement spread that the importance attached to the Prophet's revelations suggested the necessity of giving them a more permanent form, and in the second part of his career, after the flight to Medina (622), he appears systematically to have dictated his revelations to a scribe; and it would appear that he also revised the form of earlier utterances which had been either orally preserved or written down promiscuously by some of his zealous followers. Within a year of Mohammed's death (632) the first attempt at a

collection of the Prophet's utterances was made by Abu-bekr. He intrusted the task to Zaid ibn Thabit, the last secretary of Mohammed. Copies of these utterances already existed, and it was from these that Zaid prepared an authoritative compilation to be known henceforth as the Koran. This volume passed, after the death of Abu-bekr, into the hands of Omar, and by Omar was intrusted to the keeping of Hafsa, one of the Prophet's wives, the daughter of Omar. Differences of opinion in regard to the text of the Koran still prevailed after Zaid's edition was completed, and accordingly a second redaction was instituted in the thirtieth year of the Hejira by Caliph Othman, not for the sake of arranging and correcting the text, but in order to insure unity. This work was intrusted to four editors of recognized authority, of whom Zaid was one. With respect to the succession of the single chapters, 114 in number, no attempt was made at establishing continuity, but they were placed side by side according to their respective lengths; so that after the introductory exordium follows the longest chapter, and the others are ranged after it in decreasing size, though this principle is not strictly adhered to. They are not numbered in the manuscripts, but bear distinctive, often fanciful, headings; as: the Cow, the Fig, the Star, the Towers, Saba, the Poets, etc., taken from a particular matter or person treated of in the respective chapters. Every chapter or sura begins with the introductory formula, "In the name of God, the Merciful, the Compassionate." It is further stated at the beginning whether the sura was revealed at Mecca or at Medina. Every chapter is subdivided into smaller portions (*Ayah*, Heb. *Oth*, sign, letter), varying in the ancient copies (of Medina, Kufa, Basra, and Damascus, and the vulgar edition) between 6000 and 6036. The number of words in the whole book is 77,639, and an enumeration of the letters shows an amount of 323,015 of these. Other (encyclical) divisions of the book are into 30 *azâ* and into 60 *ahzâb*, for the use of devotional readings in and out of the mosque. Twenty-nine suras commence with certain letters of the alphabet, which are supposed by Mohammedans to be of mystic import, but which are probably monograms of private collectors or authorities.

The contents of the Koran as the basis of Mohammedanism will be considered under that head, while for questions more closely connected with authorship and chronology, consult *MOHAMMED*. Briefly it may be stated here that the chief doctrine laid down in it is the unity of God and the existence of but one true religion, with changeable ceremonies. As teachers and warners of mankind, God, at different times, sent prophets to lead back to truth, Moses, Jesus, and Mohammed being the most distinguished. Both punishments for the sinner and rewards for the pious are depicted with great diffuseness and exemplified chiefly by stories taken from the Bible, the apocryphal writings, the Midrash, and pre-Islamic history. Special laws and directions, admonitions to moral and divine virtues, more particularly to a complete and unconditional resignation to God's will (see *ISLAM*), legends, principally relating to the patriarchs and, almost without exception, borrowed from the Jewish writings (known to Mohammed by oral communication only, a circumstance which accounts for their frequent odd

confusion), form the bulk of the book, which throughout bears the most palpable traces of Jewish influence. Thus, of ideas and words taken bodily, with their Arabicized designations, from Judaism, may be mentioned: *Ḳur'ān* = *mikra* (reading), *furkān* (salvation); the introductory formula, *bismillah* (in the name of God); *taurāt* = *tōrah* (book of law); *jannah* = *gan eden* (paradise), *jahinām* (hell); *darasā* = *darash* (to search the scriptures), *subāt, sabbt* = *shabbāth* (day of rest), *sakinah* (majesty of God). It is especially in the later suras that Mohammed, for the edification of his hearers, introduced (in imitation of Jewish and Christian preachers) stories and legends of biblical personages.

The suras may be divided into three general classes: those delivered during the first years of Mohammed's preaching in Mecca, those delivered during the latter part of his stay in that city, and those delivered in Medina. In the oldest suras Mohammed is concerned mainly with describing the power and unity of God, the resurrection and the judgment day, the blessedness of paradise and the tortures of hell. These subjects are elaborated in the suras of the middle and last period. While in the earlier ones Mohammed claims to be only a preacher sent to warn people, in the later ones he steps forward boldly with the claim of being a divinely sent prophet, whose utterances represent revelations made to him by the angel Gabriel. The duties obligatory upon Moslems are all discussed in the later suras, though the formation into codes was reserved for the Mohammedan theologians. Incidentally his polemics against his personal enemies, and especially against Judaism and Christianity, are introduced into the Koran, the Jews being accused of falsifying the Scriptures, the Christians of running counter to the doctrine of the unity of God by the assumption that Jesus was a son of God. The discourses themselves are of a rambling nature, and numerous social customs are touched upon. In this way the Koran becomes a mirror in which Mohammed's personality is reflected with a clearness which leaves little to be desired. It properly was taken as the basis for the elaboration of a Mohammedan system of theology, for there is scarcely any topic connected with the law upon which it does not touch, though never exhaustively. Its lack of system and its discursiveness make the Koran hard reading, but its interest and value to the student are all the greater because of the assurance these very defects give us that we have in the Koran a work that is in all essential particulars authentic.

The general tendency and aim of the Koran is found clearly indicated in the beginning of the second chapter: "This is the book in which there is no doubt, a guidance for the pious, who believe in the *mysteries of faith*, who perform their *prayers*, give *alms* from what we have bestowed upon them, who believe in the *revelation* which we made unto thee, which was sent down to the *prophets before thee*, and who believe in the *future life*," etc. To present that revelation which had come to him and which had also been sent down to the former prophets was Mohammed's object; hence his attempts to find out what had been sought by the messengers of God who had been before him, and to distinguish between their original message and later additions and corruptions, especially in Judaism and Christianity. As his knowledge of these faiths

was extremely limited and his judgment wholly subjective, the Koran reveals a very arbitrary and vacillating attitude towards these. No less are certain abrogations of special passages in the Koran, made by the Prophet himself, due to the vacillating relation in which he at first stood to the different creeds.

The language of the Koran has become the ideal of classical Arabic, and no human pen is supposed to be capable of producing anything similar—a circumstance adduced by Mohammed himself as a clear proof of his mission. The style varies considerably, in the earlier suras concise and bold, sublime and majestic, impassioned, fluent, and harmonious; in the later ones verbose, sententious, obscure, tame, and prosy. There are passages of great beauty and power suggesting the Hebrew prophets. By means of the difference in style between the earlier and later suras modern investigators have endeavored to form a chronological arrangement. A general consensus has now been arrived at, though questions of detail must always remain in dispute, as many of the suras are composite in character. A great deal depends also upon internal evidence, which fortunately is found in considerable abundance. Mohammed, especially in the later years of his career, was in the habit of making allusions to events of the day, to his relations with Jews and Christians, to his ambitions and aims, into his discourses, and since, in addition to the Koran, we have the copious collections known as Hadith, containing utterances, sayings and doings, and decisions of Mohammed at the various periods of his career, it is in many cases possible to attach utterances in the Koran to specific occasions and thus fix the age of the sura in which a certain expression or opinion occurs, though the recent searching criticism of the Hadith (q.v.), especially by Lammens, has tended to render more uncertain our dependence upon this source. The Koran is written in prose, yet the two or more links of which a sentence is generally composed sometimes rhyme with each other, a peculiarity of speech (called *saj'*) used by the ancient soothsayers (*kuhhān-kōhēn*) of Arabia—only that Mohammed used his own discretion in remodeling its form and freeing it from conventional fetters, and thus the rhyme of the Koran became an entirely distinctive rhyme. Refrains are introduced in some suras, and plays upon words are not disdained.

The outward reverence in which the Koran is held throughout Mohammedanism is exceedingly great. It is never held below the girdle, never touched without previous purification; and an injunction to that effect is generally found on the cover which overlaps the boards, according to Eastern binding. It is consulted on weighty matters; sentences from it are inscribed on banners, doors, etc. Great lavishness is also displayed upon the material and the binding of the sacred volume. The copies for the wealthy are sometimes written in gold, and the covers blaze with gold and precious stones.

The Koran has been commented upon so often that the names of the commentators alone would fill pages. The most renowned are those of Zamakhshari (died 539 A.H.), Beidhawi (died 685 A.H. or 716), Mahalli (died 870 A.H.), and Suyuti (died 911 A.H.). The principal editions are those of Hinkelmann (Hamburg, 1694), Maracci (Padua, 1693), Flügel (Leipzig, 1883), and Fracassi (Milan, 1914), besides many edi-

tions (of small critical value) printed in St. Petersburg, Kazan, Teheran, Calcutta, Cawnpore, and Serampore, and by the many newly erected Indian presses. There is a chrestomathy with notes and vocabulary by Nallino (Leipzig, 1893). The first, but very imperfect, Latin version of the Koran was made by Robertus Retensis, an Englishman, in 1143 (ed., Basel, 1543). The principal translations are those of Maracci into Latin (1698); Sale (1st ed., 1734, one of the best translations in any language ed. by Wherry with additional matter, 1841-46), Rodwell (2d ed., 1876; 3d ed., New York, 1909), Palmer (1880), and Mohammed Abdu'l Hakim Khan (London, 1905) into English; Savary (1783), Garcin de Tassy (1829), Kazimirski (1840) into French; Megerlin (1772), Wahl (1828), Ullmann (1840), Grigull (1901), and Henning, in the Reclam *Universal-Bibliothek*, into German; Reckendorf into Hebrew (1857); Tollens into Dutch (1859); Aquilio Fracassi into Italian (Milan, 1914); besides a great number of Persian, Turkish, Malay, Hindustani, and other translations made for the benefit of the various Eastern Mohammedans. The attempt to reproduce the style and rhyme of the original was first made by J. von Hammer (1811); this was improved upon by A. Sprenger (1861-65), Fr. Rückert (1888), and M. Klamroth (1890). All of these are in German. *The Speeches and Table-Talk of the Prophet Mohammed*, chosen and translated by Stanley Lane-Poole (London, 1882), is a selection from the best that is in the Koran. Similar works are Murdock, *Selections from the Qoran with Introductions and Explanatory Notes* (London, 1902), and Wollaston. *The Religion of the Koran, Selections with an Introduction* (ib., 1904). Of concordances to the Koran may be mentioned that of Flügel (Leipzig, 1842) and the *Nojon-al Fortkan* (Calcutta, 1811); La Beaume, *Le Koran analysé* (Paris, 1878), is a topical index to the French translations of Kazimirski and others. There are Koran lexicons by Penrice (London, 1873) and Dieterici (2d ed., Berlin, 1894). The introduction and notes to Sale's translation contain material that is still of value, though in large measure superseded now by Nöldeke, *Geschichte des Korans* (Göttingen, 1860; 2d ed. by F. Schwally, *Erster Teil Ueber den Ursprung des Qorans*, Leipzig, 1909); Weil, *Historisch-kritische Einleitung in den Koran* (Bielefeld, 1844); Grimme, *Mohammed*, *Zweiter Teil: Einleitung in den Koran; System der koranischen Theologie* (1895); Hirschfeld, *Beiträge zur Erklärung des Korans* (Leipzig, 1886); id., *New Researches into the Composition and Exegesis of the Koran* (Eng. trans. (London, 1902); Tisdale, *Sources of the Qur'an* (London, 1905). Consult also the lives of Mohammed and other works mentioned in the articles MOHAMMED and MOHAMMEDANISM.

KORAT, kō-rāt'. A town of Siam, the capital and army headquarters of the Province of Nakawn Racha Sema, situated 165 miles northeast of Bangkok (Map: Siam, D 4). It is surrounded by a strong stone wall and in its vicinity are several copper mines and sugar plantations. It has a government sericulture office for the improvement of silk. Pop., about 7000, consisting of Burmese and natives of Laos and China.

KORDOFAN, kōr'dō-fān'. A province of the Anglo-Egyptian Sudan (q.v.), situated between the White Nile and the Province of Darfur and extending from long. 28° 30' to 33° E. and from

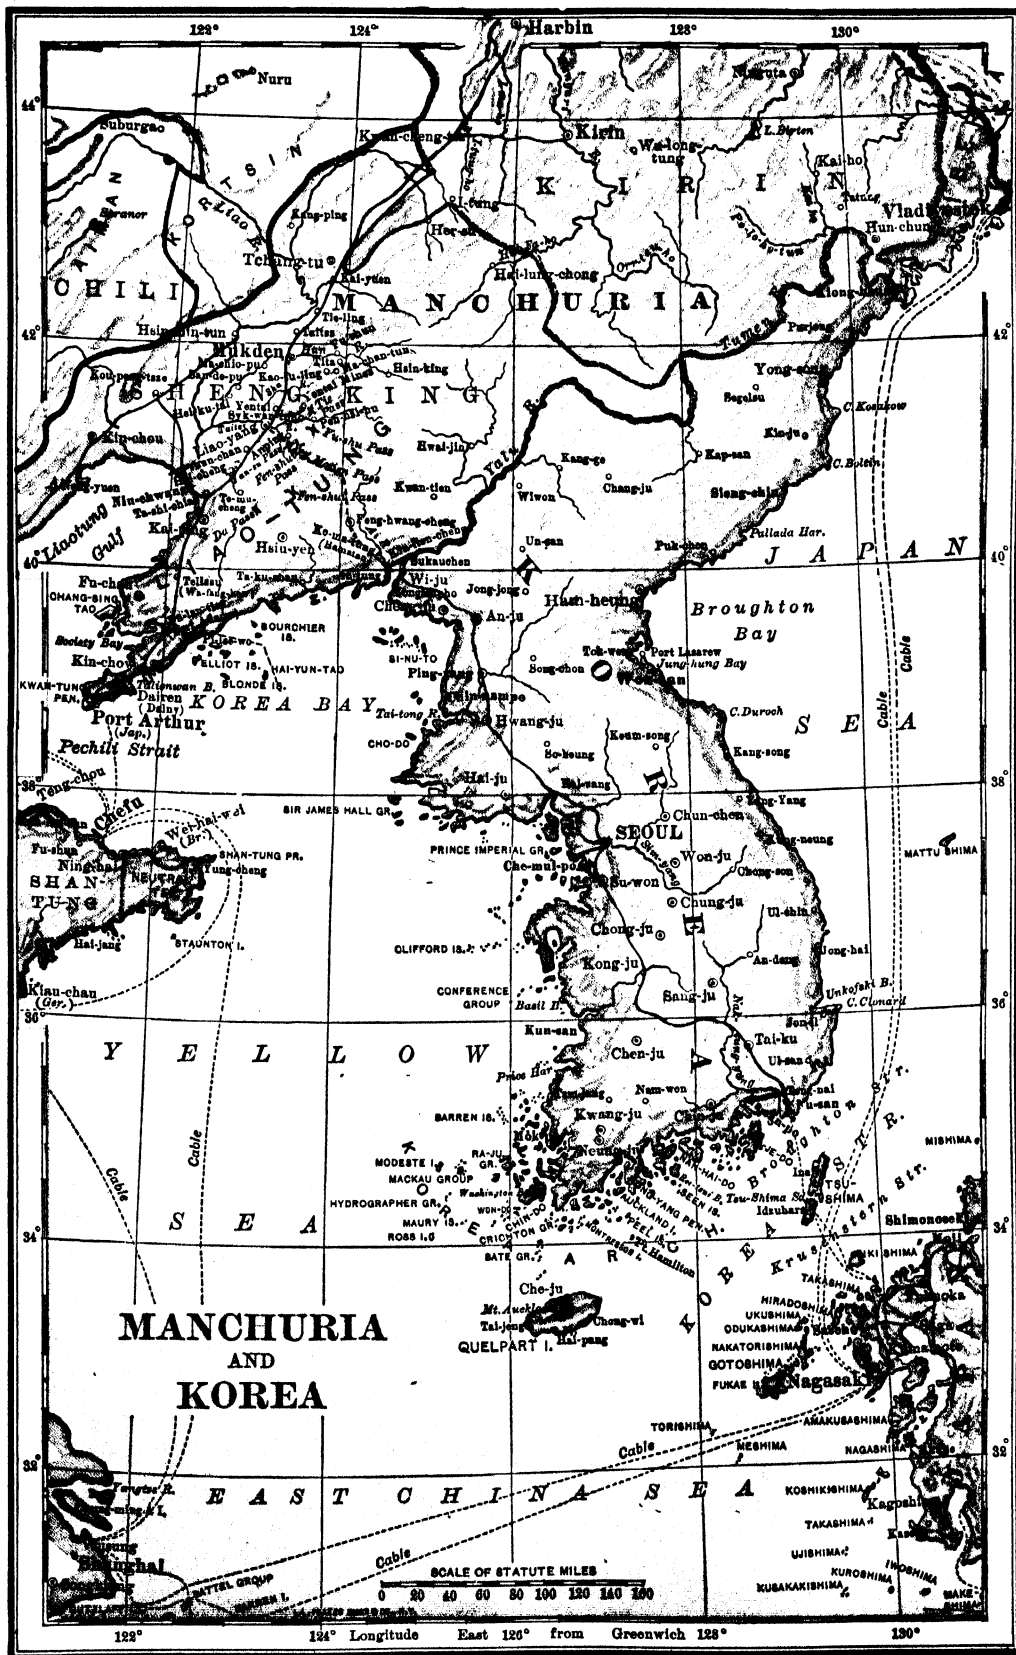

about lat. 12° to 16° N. (Map: Egypt, C 5). Area, about 130,000 square miles. The surface is flat, with a few isolated hills. During the dry season it is mostly barren, but with the advent of the rainy season, which usually lasts from June to October, it is covered with a rich vegetation. There are no rivers, but wells are abundant and generally serve both as centres for permanent settlements and as temporary camps for the nomadic tribes. The principal products are sesame, groundnuts, cotton, tobacco, gum, and a kind of millet. The chief products of commerce are ostrich feathers and gum. Pop., est., about 500,000, chiefly Arabs and Nubas. There are also several pagan negro tribes in the southern part. About one-half of the population is nomadic. Capital, El-Obeid (q.v.).

KOREA, kō-rē'a, **CHOSEN** (Korean Kori, Korye, or Koryū, the local pronunciation of *Kao-li*, the Chinese name of that one of the three kingdoms of the peninsula which became paramount towards the end of the tenth century). A possession of Japan, mostly in peninsular form, lying south and southeast of Manchuria and dividing the Sea of Japan from the Yellow Sea. It is bounded on the south by the Strait of Chosen, on the north by the Oryoku (Yalu), which rises in the Shanalin Mountains of Manchuria and flows southwest into the Yellow Sea, and by the Toman (Tumen), which rises near the same place and flows northeast and east into the Sea of Japan. It lies between the parallels 34° 17' and 43° N., and between the meridians 124° 38' and 130° 33' E. Chosen is about 600 miles in length, 135 miles in breadth, and has an area estimated at 84,420 square miles.

From about 960 A.D. the name of the country was Kori, or Koryū. In 1392, when the last dynasty was founded by one Li-tan, a still older name, Chō-sen, or Chosen (Chin *Chao-sen*, morning freshness or morning calm), was revived. In 1897 it was designated as Dai Han by the Koreans, and continued so until the annexation with Japan in 1910, from which date the official name has been Chosen.

Topography. The northern half of the country is very mountainous and well wooded, with peaks from 4000 to more than 8000 feet in height. The main axis of elevation, which forms the great backbone of the peninsula, lies along the whole eastern seaboard. The southern half is somewhat monotonous, the ridges and spurs thrown out by the main axis dwindling in height as they approach the west and south coasts. Near lat 37° a long chain runs southwest, ending in Hanra-san, an extinct volcano (6700 feet) on the island of Quelpaert. From the main axis the surface falls off abruptly to the east. Towards the west the hills are almost destitute of trees and are scarred with gullies which open out into wide, monotonous, but fertile plains.

Owing to the narrowness of the country, there are no great rivers. The most important are (1) the Amnok (or Apnok), better known as the Yalu, but renamed Oryoku by the Japanese, which rises in the Pei-shan (Paik-tu-san, white head mountain), an extinct volcano, 8900 feet in height, in lat. 41° 59' N., and flows southwest into the Yellow Sea, forming in its course the northwest boundary of the country. It is navigable by seagoing junks for 30 miles from its mouth and by boats as far as Wi-wōn, 145 miles more. (2) The Daido (Korean Tai-dong) in

Heian Province, which is navigable by boats for 75 miles, as far as the important city of Heijo (Ping-yang) (173,273 inhabitants). (3) The Kan (Han), on which the capital is situated, which rises at a point only 30 miles from the Sea of Japan and flows westward to the Yellow Sea. A fleet of small steamers plies on it between Jinsen (Chemulpo), at its mouth, and the capital (55 or 60 miles), and boats ascend some 80 or 90 miles farther. (4) The Rakuto (Nak-dong), which flows from north to south through the provinces of Keishō, and empties into the Korean Strait near Fusan (q.v.) It is navigable for 140 miles by vessels drawing not more than 4½ feet. (5) The Mok-po (now Eisen), a small river which flows through the fertile Province of Zenla, and enters the sea at the open port of the same name in lat. 34° 47' N. and long. 126° 15' E. The only Korean river which flows into the Sea of Japan is the Toman (Tumen). The coast line measures 1740 miles. On the east the shores are steep and almost unbroken by estuaries or harbors. Gensan and Port Lazareff are the best, not only on this coast, but in Chosen. There are few islands on the east coast, but on the west and south the coasts are fringed with innumerable clusters, the largest of which are Quelpaert (Saishuto), off the south coast, and Kang-hwa, famous in Korean history, in the mouth of the Kan (Han) River. The best harbor on the south coast is that of Fusan (or in Korean Pusan). On the east coast the tides seldom rise more than a few feet, but on the west and south they are strong and dangerous, rising frequently to 35 feet, and receding with great rapidity, leaving great mud banks on which vessels are sometimes left high and dry.

Climate. On the whole the climate of Chosen is salubrious. It greatly resembles that of the opposite coast of China. This is especially true of the central and northern parts, where the winters are severe and the rivers freeze over. Snow covers the country from the middle of December until the end of February. In the south the skies are generally bright, and the early winter is as delightful as in Japan. The middle and late summer is rainy and hot. The temperature ranges from 5° F. in winter to 90° F. in July, with a summer average of about 75° F. The average annual rainfall is 36 inches; the average of the rainy season (June to September) 22 inches.

Flora. The flora is not extensive, nor is it brilliant in color. Azaleas, rhododendrons, clematis, and *Ampelopsis vitifolia* are found everywhere. Much timber is grown in the northern mountains, and there is a large lumbering industry. There are several species of pine, fir, oak, and maple. The lime ash, birch, mountain ash, dryandra (or wood-oil tree), willow, hornbeam, and bamboo are common to Chosen, Manchuria, and north China, and the *Broussonetia papyrifera*, or paper mulberry, is much cultivated. The fruits include the plum, peach, apple, pear, etc., of the Chinese varieties. Ginseng (*Aralia quinquefolia*) is a government monopoly, and large fields of it are grown.

Fauna. The animals include the tiger, leopard, bear, antelope, and several species of deer, fox, badger, tiger cat, squirrel, beaver, otter, marten, and sable; a variety of the Manchurian wolf is found in the north. Among birds are the black eagle, peregrine, hawk, kite, egret, crane, kestrel, the white and the pin ibis, heron,

crow, magpie, kingfisher, wood lark, oriole, thrush, and cuckoo, pheasant, goose, teal, mallard, mandarin duck, and turkey buzzard. The native horse is no bigger than a Shetland pony, while the ox is of immense size.

Geology and Mineral Resources. Little is known of the geology of the country. In general it may be stated that overlying the fundamental rocks—gneiss, crystalline and other schists, crystalline limestone, quartzite, etc.—are found strata of Cambrian and Carboniferous age, the repositories of the metallic ores of the country. The prevailing rocks are sandstone, slate, limestone, hornstone, and conglomerates, and among the intrusive eruptive rocks, granite, porphyries, gabbro, diorite, diabase, etc., best exemplified in the Heian provinces. Mesozoic rocks are found in the Province of Kōkai, and the Tertiary formations, which are of little extent, but which contain considerable lignitic coal, in the hill country around Weijo (Ping-yang) and in the Kankyō provinces. Basaltic lavas forming tablelands occur in several places, but the best example is in the Province of Kōgen.

Gold has long been obtained from the sands of the northern rivers, but it is only in recent years that the exploitation of the auriferous rocks has begun. The Japanese are making great efforts to develop the mines of the peninsula. After the annexation an official investigation was begun (April, 1911), which will eventually cover the entire country. Special inducements are offered to engage in the industry. Uniform mining laws and regulations were introduced in September, 1906, mining machinery was exempted from import duty, and in 1908 the export duties were removed from mining products. In 1912 the value of gold mined was \$4,689,285, silver \$16,000, copper \$1531, iron \$155,221, graphite \$82,309, and coal \$166,522. On Jan. 1, 1912, 801 concessions had been granted to different companies in mining proper and placer mining, of which there were 383 Japanese concessions and 324 Korean. The property of the United States concessionaires at Uhsan (Wonsan) covers over 800 square miles. Good anthracite coal has been found, and coal is mined near Heijo (Ping-yang). Foreign concessions are located mainly in the provinces of Kōgen, Heian, and Kankyō.

Fisheries. The seas surrounding the peninsula teem with fish, and fishing is an important industry. Salmon, cod, the delicate muchesteemed tai, haddock, halibut, whiting, ribbon fish, herrings, sardines, are among the varieties most frequently found. Sharks abound on the coast, and in the Sea of Japan blackfish and whales are plentiful. Whale fishing is carried on by Japanese; before the Russo-Japanese War Russians also took part in this industry, but their whaling fleet was seized by the Japanese and the concession was granted to a Japanese company. Whale meat is an article of food and is exposed in the markets for sale. In 1911 the Japanese introduced new fishery laws and regulations, by which the pursuit of fishing was guaranteed to the natives, Japanese fishermen were encouraged to emigrate, fish were protected, and the industry in general was put on a firm basis. Indiscriminate catching was forbidden, also poaching and the use of trawlers. Financial aid is given by the central and provincial governments and the Imperial donation funds. Japanese and Koreans are put on an equality in rights. In 1911 there were 11,111 applications

for fishing permits received, and 8240 were granted. A total of 67,734 yen was appropriated by the government. The total number of Japanese boats, Jan. 1, 1912, was 5029, with 20,723 fishermen and a value of catch of 4,714,562 yen. Of Korean boats there were 10,833, with 118,920 fishermen and a value of catch of 4,320,883 yen, making a total value of marine products (including the Japanese whaling industry, 418,300 yen) of 9,450,000 yen. During 1911 a population of 9236 Japanese fishermen, in 62 villages, were encouraged to come to Chosen. The Chosen Marine Products Association, with its government subsidy (40,000 yen annually), rights, and regulations, is open to both races.

Agriculture. The soil of Chosen is very fertile, especially in the southern and southwestern provinces. Rice is the most valuable crop. The yield is usually large. Periods of drought, however, are frequent, and scant rainfall brings famine. The other agricultural products are barley, millet, and oats in the north, and in the south wheat, maize, beans, tobacco, cotton, hemp, and sesame. Sweet potatoes, the taro, cabbages, turnips, and other vegetables are also grown extensively, and form, with rice and the harder grains, the chief articles of diet. Milk, butter, and cheese are practically unknown to the natives, and until recent years no attention was given to cattle raising. In 1912 the rice crop was 44,348,100 bushels, a decrease of 4,136,000 bushels from 1911 because of severe floods. A superior Japanese rice has been introduced with success. It is estimated that there are 1,280,000 acres available for cotton culture. There is a revival in the cultivation of ginseng, which is highly prized by the Koreans for its supposed medicinal qualities. In 1913 the crop was 352,016 pounds, valued at \$40.86 a pound for the best quality. In 1912, 150,000 bushels of silk were produced. Other crops in 1912 were: beans, 16,727,300 bushels; millet, 22,329,000 bushels; barley, 20,075,800 bushels; wheat, 4,851,800 bushels; turnips, 1,078,254,000 pounds; potatoes, 255,001,200 pounds; cabbages, 516,504,000 pounds, cucumbers, 116,534,200 pounds. Since the protectorate the Japanese have instructed and encouraged the Koreans and immigrants in the use of improved methods of agriculture by establishing model farms, cotton-planting stations, a horticultural garden, seedling stations, and 116 sericulture training stations. Modern machinery is introduced and explained by trained lecturers. Irrigation is receiving much attention. In 1911, 124 per cent of the entire peninsula was cultivated land. Nearly 60 per cent of the total arable area was still waste land. By the Law of 1907 these unused lands will be rented or given to any Japanese, Korean, or foreigner who will utilize them. Live stock has been improved with choice breeds imported from Japan. Cattle raising is becoming an important industry. Government help is offered in all the agricultural pursuits, with favorable inducements to natives and immigrants. Afforestation is already bringing results. April 3 is celebrated every year as arbor day.

Manufactures. Since the Japanese occupation the manufactures of Chosen are being gradually developed. Paper making is the chief industry of the native Korean. Then come mat weaving, woodwork, bamboo screens, and hats. The Law of January, 1911, demands official permission to engage in industry. Since the law has been in force, up to March, 1912, there was

a total registration of 47 new corporations with 19 branch offices and a combined capital of 24,978,500 yen. These include 2 agricultural, 17 commerce, 11 industrial, 9 gas and electric, 6 transportation, and 1 mining company. The government is encouraging various industries by pecuniary assistance and often gives the necessary machines and implements. Among these are weaving, dyeing, and bamboo work, rope, paper, and pottery manufacture, and spinning. An attempt is being made to recover the hemp-tissue industry. Markets are very important in Korean daily life, for there the natives buy almost all of their food, clothing, and cattle. By Jan. 1, 1912, there was a total of 1084 markets, handling agricultural, marine, and textile products, live stock, and miscellaneous articles. Transactions amounted to 56,182,644 yen. Japanese weights and measures are used.

Communication. Before the annexation road making had received no attention in Chosen, and travelers were unanimous in denouncing the highways. Native Koreans traveled chiefly on horseback or in sedan chairs. Commodities were transported almost wholly by porters, pack horses, and oxen. Wheeled vehicles were practically unknown except in the open ports. The rivers, however, were and still are much used. (See *Topography*.) The Japanese have appropriated \$4,980,000 to extend over five years, beginning with 1911, for the improvement of roads and highways. This includes the most important roads in Chosen. At the capital, Keijō (Seoul), paved and macadamized thoroughfares are now being constructed, to replace the former miserable and unsanitary lanes. The estimated cost is \$6,474,000. The first railway in the country was from Jinsen (Chemulpo) to Keijō (Seoul), a distance of 26 miles. It now forms a branch of the Fusan-Keijō line (287 miles), which was completed in 1905 and nationalized in 1906. The line from Keijō to Shin-gishu (Shin-wiju), at the mouth of the Oryoku (Yalu), 300 miles, was completed in April, 1905. Another line, 130 miles long, runs from Keijō to Gensan (Wonsan), the principal port on the east coast. The total railway mileage in 1913 was 914 miles, with 4,399,022 passengers carried. Chosen railways connect with the Russian (Siberian) and Chinese lines. Triweekly train service was established (February, 1912) between Keijō and Changchun, Manchuria, a distance of 673 miles, and connecting at Changchun with the Trans-Siberian system. It is now possible to travel from Keijō to Moscow in 10 days, to Berlin in 11½, and to Paris in 12½ days. This line carries modern trains and first class only. From Keijō to Peking now takes only 2½ days. Keijō has a street railway, which runs in three directions to a total of nine miles outside the capital. In 1913 there were 3785 miles of telegraph, which connect with the Japanese and Chinese systems. Telephone service is established in Keijō and Jinsen. Post offices in 1913 numbered 485. There is efficient steamer and ferry connection between Chosen and Japan.

Commerce. Until the opening of the treaty ports Korean trade was almost exclusively with China, and carried on chiefly at the Korean Gate in Manchuria, where the tribute-bearing mission to Peking passed through Fung-hwang Ch'ing. Seaports now open to trade are Chinampo, Chemulpo, Fusan (Pusan), Gensan (Wonsan), Jōshin (Syong-jin), Kunsan, Mokpo, Seishin (Khyong-jin), and Taiko. Keijō and Heijō (Ping-yang)

are also considered open. Masan (Masampo) was closed to commerce, Jan 1, 1911, except to ships that touch at Japan or Japanese possessions. Most important of the treaty ports are Fusan, which leads in exports, and Jinsen, leading in imports, and situated on the west coast 26 miles by rail from Keijō. In 1912 the trade of Chosen with the world was as follows:

	Imports from, 1912	Exports to, 1912
Belgium	\$103,936	\$923
China	3,501,805	2,020,966
France	44,347	1,132
Germany	792,695	2,782
Japan	20,296,494	7,653,766
Russia in Asia	36,443	620,224
United Kingdom	4,879,186	98,475
United States	3,217,094	47,485
All others	551,493	4,984
Total	\$33,423,493	\$10,450,837

The total trade of Chosen in 1912 was \$43,874,330, as compared with \$11,613,334 in 1901. In 1913 the imports were \$35,932,000 and the exports \$15,288,000. Chief imports are cotton goods, iron ore and wares, liquors, machinery, fruit and nuts, kerosene, salt, sugar, matches, flour, paper, and tobacco; chief exports, rice, beans, cotton, hides, marine products, live stock, gold, iron, ginseng, timber and planks. Trade with the United States consists mainly in flour, iron and steel goods, kerosene, machinery, and meats. Imports from the United Kingdom are mainly cotton goods and metallic articles; from Germany, aniline dyes, machinery, and vehicles. Korean cattle and rice are shipped to Vladivostok. In 1912 the movements of specie and bullion were: exports, \$5,041,867; imports, \$733,760. Customs receipts for 1912 amounted to \$2,523,433, of which the export duties furnished \$210,772, import duties \$2,218,818, tonnage dues \$46,692, other sources \$47,151. In the same year 6052 ships entered the open ports, with 3,798,950 net tonnage. Japanese ships numbered 6001 of 3,688,841 tons, British 22 of 68,337, and German 11 ships of 38,252 tons. A consulate is maintained at Keijō by Belgium, Germany, Great Britain, Russia, and the United States. In addition the British have a consulate at Jinsen; the Chinese, at Fusan, Chinampo, Gensan, and Shingishu; and the Russians, at Jinsen, Masan, and a consulate agency at Gensan.

Banks. The Bank of Chosen was established in 1909. It operates as a central bank and a general institution and has an authorized capital of 10,000,000 yen (\$4,980,000). The head office is in Keijō, with 14 branch offices elsewhere, including one in Osaka, Japan, and another in Antung, China. There are also many agricultural and industrial banks, mainly to furnish loans. In 1911 there were 5 Japanese banks, with 16 branch offices and a paid-up capital of 16,300,000 yen; 3 Korean banks, with 7 branch offices and a paid-up capital of 1,122,813 yen. The Hongkong and Shanghai Banking Corporation and the Russo-Korean Bank are represented at Keijō. The growth in postal savings has been very rapid; in 1912 there were 338,176 depositors and deposits of \$2,406,924. An interesting institution is the Orient Development Company, which received a loan from Paris in 1912 of 20,000,000 yen. This corporation was

established to further industries in Chosen and encourage immigration from Japan. It was founded in 1908, with an authorized capital of 30,000,000 yen.

Government. Chosen is a possession of Japan. Until Jan. 7, 1895, it paid tribute, at least in theory, to China, and its kings always received investiture from the Chinese emperors. The government was based on that of China and consisted of a Grand Council of 3 ministers, and 6 boards, each with its own president and staff of officials, all appointed after examination. In 1895 the government was remodeled, the 6 boards, the examinations, and the privileges of the aristocracy were abolished, and a Grand Council of State was instituted, consisting of the 10 members of the cabinet and 5 councilors to discuss resolutions for the King to sign.

Since the annexation in 1910 Chosen has been administered through the Government-General and its affiliated offices. The staff of the Government-General consists of the Secretariat and the departments of General Affairs, Home Affairs, Finance, Agriculture, Commerce, and Industry, and Judicial. Affiliated to the Government-General are offices such as the Central Council, Old Usage Investigation Bureau, local governments, the law and police courts, prisons, railway, land investigation, customs, etc. The Central Council is chosen mainly from Koreans of ability and reputation, as a sort of consulting body to the Government-General.

As regards local government, in 1911 there were 12 prefectures in the 13 provinces, divided into 317 districts and 4351 villages. The lowest administrative division, as with China, is the village headman; then come the district and prefectural magistrates. Japanese clerks (*Hanjin* rank) of ability and experience are attached to the district magistrates as advisers and to train and guide the native clerks. The local administrations are being encouraged to manage themselves as much as possible, but financial help and advice are still furnished by the Government-General, as many of the localities are not self-supporting as yet.

The estimated revenue of Chosen for the fiscal year 1913 was placed at \$26,116,220. Of this amount, \$13,312,701 was derived from the ordinary revenue sources, \$380,142, the balance from the previous year; loans, \$6,273,077, and \$6,150,300 transferred to Chosen from the Imperial Japanese government. The increase in revenue over 1912 was \$1,957,446. A total of \$12,433,377 was necessary in assistance, as Chosen is not yet self-supporting because of the heavy outlay at present for the army garrison, the civil police and judicial departments, the railways, posts, harbors, roads, education, etc. Total expenditure for 1913 amounted to \$26,116,220. Out of this sum \$155,120 was estimated for communications, \$716,857 for railways, \$76,530 for the encouragement of industry, \$310,290 for land investigation, and \$88,563 for the Keijō water works. The present Korean coinage is divided into 5-sen nickel pieces and 20-sen and 50-sen silver pieces, similar in appearance to the Japanese coins of the same value, but with Korean emblems. The paper money in circulation is furnished by the Japanese Bank of Chosen. Over 40 per cent of the bank notes, Jan. 1, 1912, were of 1-yen denomination, in number 10,501,700. A bank note of small amount best fits the needs of the average Korean. At the end of 1912 the rate of interest

for bank deposits was raised from 4.2 to 5.4 per cent, in order to encourage the Koreans to save.

Law. On March 18, 1912, the Japanese civil code, commercial code, code of civil procedure, bankruptcy, and other laws were applied in their entirety to Chosen. A complete reorganization of the courts was likewise effected. For the time being, the ancient customary or common law remained where both parties were Koreans, but on April 1, 1912, the criminal code of Japan, the code of criminal procedure, and all kindred laws were extended over Chosen, and the ancient Korean criminal laws repealed. On Jan 1, 1912, there were 1 supreme court, 3 appeal courts, 8 local courts with 12 branch courts, and 68 district courts in Chosen.

Population. The official estimate of the population, January, 1913, was given as 14,827,101. Of this number, 14,566,783 were Koreans, 243,729 Japanese, 12,107 Chinese, and 989 of other nationalities, including 573 Americans, 189 British, 100 French, 49 Germans, and 26 Russians. The Japanese are emigrating rapidly to Chosen, but correspondingly a large number of Koreans are leaving the peninsula and settling in the neighboring Russian and Chinese territories. The distribution of the population by provinces is given below, together with the present official Japanese titles of the provinces and the corresponding Korean terms, of which there are many versions.

THE THIRTEEN PROVINCES		POPULATION — 1912				
Japanese	Korean	Korean	Japanese	Chinese	Others	Total
1 Keiki	Kyeng-keni	1,449,344	64,623	4,011	374	1,518,352
2 North Chusei	North Chung-cheng	592,653	3,578	148	17	596,396
3 South Chusei	South Chung-cheng	912,893	10,185	842	42	923,962
4 North Zenla	North Chyen-la	968,929	10,375	414	37	979,755
5 South Zenla	South Chyen-la	1,640,815	12,630	226	44	1,653,715
6 North Keishō	North Kyeng-syeng	1,657,448	12,100	178	39	1,669,775
7 South Keishō	South Kyeng-syeng	1,454,870	50,562	316	51	1,505,799
8 Kokai	H	1,010,782	5,139	431	59	1,016,411
9 South Heian	"	914,469	14,098	1,116	89	929,772
10 North Heian	"	999,022	6,851	3,183	142	1,009,198
11 Kōgen	Kang-won	850,110	2,968	45	12	853,135
12 South Kankyō	South Ham-kyeng	945,046	9,224	571	50	954,891
13 North Kankyō	North Ham-kyeng	435,995	8,346	356	11	444,708
Total,		13,832,376	210,689	11,837	967	14,055,869

Some of the most important towns, with their populations as estimated for 1911, are Seoul, 223,381, Fusan, 72,947, Kwangju, 42,910, Pingyang, 39,769; Haisyong, 38,025; Taiden, 32,822, Taiku, 31,140, Chemulpo, 26,187. Wonsan, 20,093, Chinguampo, 17,546, Luju, 17,391.

Religion. Buddhism entered the country at an early period, and Confucianism soon followed. From Chosen Buddhism spread to Japan, where it took firm root. It was a great power in Chosen for over 1000 years. At present the native Buddhism is ancestor worship, mixed up with astrology and with the worship of goblins and spirits. Its present influence over the people is small, and it is favored mainly by the women. The average Korean believes more in superstition than religion, while the higher classes favor ancestor worship and Confucianism. In the past religion in Chosen almost invariably has been used as a cloak for political purposes, not excluding Christianity. There are many different forms of beliefs, including Shamanism, animism, fetishism, and nature worship. One form of religion worships the Tan-gun, the first Korean King of legendary history. Christianity came

in 1775, through books sent by the Jesuit missionaries at Peking. In 1836 French missionaries made several thousand converts, but a persecution broke out, and in 1866 nine priests were executed at the capital. Chosen's efforts in the middle nineteenth century to remain the Hermit Kingdom were seconded by the interdiction of Christianity. Freedom of religion was finally guaranteed by treaties with foreign powers.

The present government allows complete religious liberty and does not interfere except with sects not purely religious. There are to-day some 13 denominations of Christianity, including the French Roman Catholic, the Russian Orthodox, and various Protestant denominations. The Y. M. C. A. at Keijo, established 1907, receives an annuity of 10,000 yen from the government. On Jan. 1, 1912, there were 2102 Christian churches and halls, with 207 foreign missionaries, 2311 native assistants, and 281,946 Christian converts. In no other Asiatic country has there been so general an acceptance of Christianity, a growth so rapid, or an influence so powerful on the national life. The Japanese are interested mainly in the revival of Buddhism and the introduction of Shintoism. Temples and shrines, Jan. 1, 1912, numbered 215, with 208 preachers and 90,370 converts, of whom 46,707 were Japanese and the rest Koreans. The total adherents of Buddhism and Confucianism cannot be given with accuracy. Religious disputes

are being amicably settled. The authorities are endeavoring to save the old temples and shrines from ruin. Church property as such is not subject to taxation.

Education. Under the old régime education was universally neglected, and not until 1894-95 was a concerted effort made to establish a responsible school system. The present Government-General has made a painstaking study of Chosen's needs in education. As a result, the school system to-day is divided into three classes—common, industrial, and special. The common school aims at knowledge necessary for daily life and for the awakening of national patriotism. In this branch the basis for the Koreans still is the Chinese classics, with as much knowledge as is possible of Japan and Japanese. Industrial education aims at the mastery of some technical trade or handicraft. The special class of schools includes the higher arts and sciences, together with law, medicine, agriculture, etc., and training in the special needs of Chosen. Girls are educated on an entire equality with boys. Statistics, up to March 31, 1912, are as follows:

Schools maintained solely for Japanese students numbered (March, 1912) 195, with 732 instructors and 21,287 students. The Koreans are very fond of private schools; these numbered 1721. There are 677 religious schools, conducted wholly or in part by foreign missionaries. Old-fashioned schools, such as give instruction to boys only, and solely in classics and ethics, are still numerous. The authorities are dealing as sympathetically as possible with these, so as not to offend the people, and worthy literati of the old type are frequently engaged as instructors. The scheme of education advocated by the Government-General retains much of Korean systems, such as the study of

folklore and mythology may be seen from Gale's article on "Korean Beliefs," in *Folk-Lore* (London, 1900), Allen, *Korean Tales*, and Arnous, *Koreas: Marchen und Legenden* (Leipzig, 1893). The extensive ethnological collections from Chosen in the United States National Museum at Washington have been described by Dr. Hough in the *Report* for 1891, while the *American Anthropologist* (Washington) for the same year contains an article by Rockhill, "Notes on Some of the Laws, Customs, and Superstitions of Korea." The very interesting games of the country have been made the subject of a valuable special monograph by Stewart Culin, *Korean Games, with Notes on the Corresponding Games*

SCHOOLS	No of schools	No of classes	INSTRUCTORS			Students	Graduates
			Japanese	Koreans	Total		
Common	306	916	370	888	1,258	32,385	3,150
Industrial	19	37	82	32	114	1,095	374
Special		5	50	19	69	1,000	345

Chinese classics, writing, and the Confucian ethics; these, however, are supplemented and strengthened by a knowledge of history, languages, other literatures, especially Japanese, and industrial and scientific training. The educational system of Chosen is being westernized as much as possible. The Imperial Rescript of Jan. 6, 1912, given to the schools of Japan, has been extended to Chosen and is read on certain days. In this document the Emperor exhorts the students towards filial piety, affection between brothers and sisters, husbands and wives, fidelity to friends, modesty of demeanor, pursuit of learning, cultivation of the arts, loyalty to the Empire, and respect for the laws.

Army. See under JAPAN

Ethnology. The position of Chosen between China and Japan makes its population of special interest to the ethnologist and accounts in part for their mixed racial character. Native traditions speak of two primitive races, the Siemp and the Sanhan—one the other perhaps more Aino-like—the dawn of the Christian era had been subjected by and had merged with the so-called Kaori, or Kaoli, the ruling people, from whom the country has been named. Some anthropologists hold that the Koreans were of more positive Asiatic type than the Japanese, but had sprung from the same stock as the ancestors of the latter. Others group Japanese and Koreans together, believing that the Koreans are intermediate between the continental and insular Mongoloid peoples. Still others regard them as a mixed race from Tungus, Indonesian, and Japanese elements. They are somewhat taller and more robust, with much lighter complexion and far more regular features than the average Mongol. In Chosen three marked types may be recognized: Korean-Manchu (nearer the European than is the real Mongolic) in the north and centre, Malayo-Mongolic in the south, and Aino (traces more or less) in the east towards Japan. Some have sought a Caucasian (white) element in the Koreans, but, unless the Aino represent a sort of proto-Caucasian stock of great antiquity in east Asia, this theory is very weak in evidence. Physically and otherwise the Koreans seem closely related to the people of the Loochoo Islands. The extent and character of Korean

of *China and Japan* (Philadelphia, 1895). Korean civilization undoubtedly owes much to China. Chosen, besides possessing indigenous culture elements, perceptible in mythology, social phenomena, medicine, folk literature, art, etc., has preserved a number of proto-Sinitic characters in an older form than is discoverable in either China or Japan. The Chinese elements in Korean life, also, are more Chinese than in China. Both upon China and Japan, in the matter of pottery especially, Chosen has exercised considerable influence, and Chinese recognition of the ceramic art of the Koreans finds expression in poetry of the Ming dynasty.

History. The beginnings of Korean history are associated with Ki-tse (q.v.), who is said to have founded a nation here some time after 1122 B.C. In 108 B.C. the country was annexed to the Chinese Empire. Soon after the Christian era, it was divided among three petty principalities called the San Han. About 960 one of them, called Kori or Koryu, became paramount and maintained its independence during a brilliant period of progress. In 1392, however, a palace revolution took place, which resulted in the overthrow of Buddhism, the banishing of the priests, and the establishment of the recent and last dynasty. In 1592 Hideyoshi (q.v.), the Japanese Regent, sent a large invading army into Chosen as a first step to the conquest of China. His armies overran the country as far north as Heijo (Ping-yang) and Gensan (Wonsan), but on the arrival of Chinese assistance Hideyoshi's troops were gradually driven southward, and in 1597 they were recalled. In 1627 the Manchus appeared and placed the country under vassalage, and from that date until 1894 a tribute-bearing mission annually visited Peking. In 1864 the King died without having named a successor. Yi-Hyong, then a child of 12, was chosen, and his father appointed Tai Wen Kun as Regent. For nine years he ruled with a rod of iron, persecuted the Christians (leading to a French expedition in 1866, which accomplished nothing), and rigorously enforced the policy of exclusiveness and the doctrine of "Korea for the Koreans." In 1871 a United States expedition, sent to inquire into the fate of a shipwrecked crew, was equally fruitless. It fell to the lot of the Japanese to be the first to

accelerated the absorption of the country into the Japanese Empire. On Aug. 23, 1910, came the end. Chosen was formally annexed, and the name Korea abolished. The Emperor was deposed, shorn of all political power, and given the name of Prince Yi. See JAPAN.

KOREAN LANGUAGE. Korean belongs to the agglutinative class of languages and is intermediate between the Mongol-Tatar languages and the Japanese. It is entirely distinct, in both genius and structure, from Chinese, which has for many centuries been the literary language of the country and that used for governmental documents, correspondence, etc. Chinese has never been a spoken language in Korea, but innumerable words have been borrowed from it and incorporated into the native vocabulary. The sounds, however, differ widely from the sounds of modern Chinese. In grammar Korean is almost identical with Japanese, which stamps them as sister languages. In words, however, they are very dissimilar, barring those which both languages have taken from the Chinese.

In the native Korean there is no proper declension, case being indicated by certain separable particles (which taken by themselves have no meaning) affixed to the stem or root, the particles used for each particular case differing according as the last letter of the root is a consonant, a vowel, or the letter *l*, etc. The root itself is invariable. There is no proper plural, and genuine pronouns are nearly unknown. There is no grammatical gender, and there is no grammatical form by which living beings can be distinguished from things. The verb, however, cannot be surpassed in the variety and deftness of its expressive power. One-fifth of the words of the vocabulary are either verbs or words capable of taking a verbal form. There is no distinction between verb, adjective, and adverb, and even the preposition, which on syntactical grounds becomes a postposition, is a part of a verb. The grammatical variations are very numerous and are said to average 300. Some forms perform the functions of punctuation, and some are used to express emphasis; some are continuatives, expressing unfinished action. There are participial, gerundive, and interrogative forms, and forms expressing condition, hypothesis, etc. The verb has no number, and for the three persons there are three forms of civility (which ramify the verb in all its moods)—a common form used in speaking to inferiors, or of abstractions, or the like; a middle form used in speaking of or to equals; and a higher form used in addressing or in speaking of superiors.

Syntax depends largely on position, as in the Chinese written language. The word which governs is invariably placed after the word which is governed; the prepositions indicating case become postpositions; the adjective precedes the noun it qualifies, and the adverb precedes the adjective or verb; the dependent clause precedes the independent, and the noun precedes the verb which governs it.

The Korean alphabet, known as Onmun (the vulgar characters), consists of 11 vowels and 14 consonants. The letters are very simple and are made almost entirely of combinations of vertical and horizontal strokes. There is no letter *f*, *p* taking its place, and no *v* or *w*, which, however, are in the language and are otherwise provided for; *b*, *d*, *j*, *z*, and *g* are wanting, though discernible in speech in connection with certain euphonic changes, and there is only one letter for *r* and *l*, neither of which can begin a

word, their place being taken by *n*, so that Chinese *liang* (ounce) becomes *nyang*. A word may end with either a consonant or a vowel, differing in this respect from Japanese, in which every syllable is open. These letters are grouped into syllables, arranged in columns, which are read from right to left, as in Chinese. There is a cursive form used in the popular literature,

ㅏ	ㅑ	ㅓ	ㅕ	ㅗ	ㅛ
a	ya	e	ye	o	yo
ㅜ	ㅠ	ㅡ	ㅜ	ㅝ	
u	yu	i	eu	ä	
ㄱ	ㅋ	ㄷ	ㅌ	ㄴ	ㄹ
k	kh	t	th	n	l or r
ㅂ	ㅍ	ㅃ	ㅆ	ㅈ	ㅊ
p	ph	m	ch	chh	s
ㅎ	ㅇ				
h	ng final				

KOREAN ALPHABET.

etc. There is a wide difference in the written and spoken Korean languages, due to Chinese influence. Each has peculiar grammatical forms, and it is impossible to write down a conversation verbatim. There are no dialects in Korean. Each province, of course, has peculiarities in its speech, but, unlike China, a Korean can make himself understood in any part of the peninsula. The language is very musical, full of mimetic words, and the euphonic tendency is strongly marked. It lends itself readily to oratory, and the verb, usually coming last, allows of the proper climax.

Korean literature is mostly written in Chinese and consists of the Chinese classics and books relating to them, Chinese history and philosophy, works on government, ethics, and the like. Many of them are valuable and throw light on the interpretation of Chinese, as they are accompanied by the native syntactical apparatus and sometimes with translations in native Korean. The vernacular has long been despised by the learned as a vehicle of literary expression, and there is little of much value in Onmun. There is no drama, instead, the professional *kwang-da*, or story-teller, recites stories, some of which last for two days. There are no ballads; tales are numerous, history, and stories from the Chinese, moral treatises, and translations from standard Chinese works practically exhaust the list. Korean fiction is not of a high standard, but is read extensively by all classes, especially by the women. Korea has produced a few valuable works, chief among which is the *Pi-go*, an encyclopædia in 112 volumes. Poetry is all lyric. There is no Korean epic. Poetry deals mainly with nature and homely, rather trivial subjects. The native language, however, has already emerged from its obscurity. The new political changes of 1897 were proclaimed in Onmun.

Bibliography. Works on the subject are already quite numerous, but their value to the general reader is minimized by the great diversity of transliteration systems employed. The

appendix to Griffis, *Corea, the Hermit Nation* (9th ed., New York, 1911), gives much bibliographical information. The most useful works are: *Dictionnaire Coréen-français*, by the French missionaries (Yokohama, 1880), and *Grammaire Coréenne* (ib., 1881); Underwood, *Introduction to the Korean Spoken Language*, with a Korean-English vocabulary (ib., 1890). Scott, *Korean Manual* (Seoul, 1893). Gale, *Korean-English Dictionary* (London, 1897). *Han-Yong Cha Työn: A Korean-English Dictionary* (Yokohama, 1897); Allen, *Korean Tales* (New York, 1889); a rich mine of information in the *Korean Repository* (5 vols., Seoul, 1893-98) and its successor, the *Korean Review* (ib., 1901 et seq.), H. B. Hulbert, "The Korean Language," in *Smithsonian Institution, Annual Report*, 1904 (Washington, 1904); id., *The Passing of Korea* (New York, 1906). A. H. Lay, "Study of Korean from the Point of View of a Student of the Japanese Language," in *Asiatic Society of Japan, Transactions*, vol. xxxiv (Yokohama, 1906).

KOREN, kō'rën, JOHN (1861-). An American statistician, born at Decorah, Iowa. He graduated from Luther College in his native town and from the Concordia Seminary at St. Louis and then studied abroad. After 1884 he lived in Boston. For several years he was engaged in religious work; in 1891 he was special expert in Europe for the United States Bureau of Labor, and in 1893 he studied the Gothenburg system of controlling the liquor problem in Europe. He was employed by the Committee of Fifty to investigate the use of liquor in 1894-99 and later was engaged as an expert special agent by the United States Census Bureau. In 1913 he served as president of the American Statistical Association. His publications include: *Economic Aspect of the Liquor Problem* (1899); *The Liquor Problem in its Legislative Aspects*; and various official bulletins.

KO'RESHAN ECCLESIA, THE, or CHURCH ARCHTRUMPHANT. A communistic body, founded by Cyrus R. Teed (born in Utica, N. Y., 1839, and a physician by profession). The terms Koreshan, Koreshanite, etc., are derived from *Kōresh*, the Hebrew form of Cyrus. They have a community at Estero, Lee Co., Fla. They hold that the earth is a hollow sphere, upon the inner surface of which we live and within which the heavenly bodies move. It is claimed that Teed is "the new Messiah now in the world." They have an organ, *The Flaming Sword*, published at Estero. Consult Hinds, *American Communities* (Chicago, 1902).

KO'RIAKS (reindeer people). One of the northeastern members of the Siberian section of the Mongolian race. They inhabit the country (coast and interior) between the Tchukchis and the Kamtchadales and are in part fishermen and in part wandering or semisettled herdsmen, whose reindeer herds the reindeer has raised them above the level of some of the neighboring tribes, both physically and mentally. The Koriaks number some 5000 and are divided into several tribes. Some ethnologists include them in the Paleasiatic group, which consists of races once of more southern range, but now driven to the northeast by advancing peoples from the Asiatic interior. The languages of the Koriaks, Tchukchis, and Kamtchadales seem to be related. Consult: Kennan, *Tent Life in Siberia* (New York, 1870-79); Winkler, *Uralaltaische Völker und Sprachen* (Berlin, 1884); Jochelson, "The Koryak," in *Memoirs of the American Mu-*

seum of Natural History, vol. vi (New York, 1905).

KO'RIN (African name). The common gazelle (q.v.) of north Africa.

KORISTKA, kōr-zhist'ká, KARL VON (1825-1906). An Austrian geographer and technologist. He was born at Brünn in Moravia, studied at Vienna, and at an early age became a student in the school of mining and forestry at Schemnitz. In 1851-93 he was professor of mathematics and geodesy in the German polytechnical school at Prague. He exerted a wide influence in the development of the technical and professional schools of Austria. He was also much occupied in orographical and hypsometrical studies and explored several of the mountainous regions of Europe, where he obtained a large number of levels and heights. From 1867 to 1869 he was a representative in the Diet of Bohemia and in the Vienna Reichsrat. Besides numerous memoirs, mostly written in German and in French, he wrote for many reviews and journals. Among his principal works may be mentioned: *Studien über die Methoden und die Benutzung hypsometrischer Arbeiten* (Gotha, 1858); *Die Markgrafschaft Mahren und das Herzogtum Schlesien in ihren geographischen Verhältnissen* (Vienna, 1860); *Hypsometrie von Mahren und Schlesien* (Brunn, 1863); *Der höhere polytechnische Unterricht in Deutschland, der Schweiz, in Frankreich, Belgien und England* (Gotha, 1863); *Die Hohe Tatra* (ib., 1864); *Das Mittel- und Sandsteingebirge in Böhmen* (Prague, 1869); *Das Iser- und Raxengebirge* (ib., 1877); *Verzeichniss der trigonometrischen Höhen von Böhmen* (ib., 1884).

KÖRMÖCZBÁNYA, kër'mëts-bä'nyö See KREMINTZ.

KORN, kōrn, ARTHUR (1870-). A German physicist, born in Breslau and educated at the universities of Freiburg, Leipzig, Paris, and Berlin. In 1895 he became docent at Munich, where he was professor of physics in 1903-08. He then removed to Charlottenburg. His published writings and experiments cover many branches of physics and related mathematics, but he is probably best known for his work on the potential theory. Besides articles in German and French technical journals (especially the *Berichte der bayrischen Akademie* and *Comptes rendus de l'Académie des Sciences*) he published *Theorie der Gravitation und der elektrischen Erscheinungen auf Grundlage der Hydrodynamik* (2d ed., 1896); *Lehrbuch der Potentialtheorie* (1899-1901); *Freie und erzwungene Schwingungen* (1910); *Elektrische Fernphotographie* (2d ed., 1907); *Handbuch der Phototelegraphie und Telerographie* (1911), of particular importance because Korn devised a telephotographic system known by his name.

KORNEMANN, kōr'ne-män, ERNST (1868-). A German historian, born in Rosenthal and educated at Giessen and Berlin. In 1898 he became docent of ancient history at Giessen and in 1902 professor at Tübingen. With Lehmann-Haupt, of Liverpool, he founded in 1903 *Klio*, a periodical devoted to ancient history. Among his publications mention should be made of *Die historische Schriftstellerei des C. Asinius Pollio* (1896); *Zur Geschichte der Gracchenzeit* (1903); *Die neue Livysepitome aus Oxyrhynchus* (1904); *Kaiser Hadrian und der letzte grosse Historiker von Rom* (1905), in which he deals with the Augustan history and attempts to prove that Lollius Urbicus was a great his-

torian; *Priesterkodes in der Regia und die Entstehung der altromischen Pseudogeschichte* (1912).

KÖRNER, kër'nër, CHRISTIAN GOTTFRIED (1756-1831). A German jurist and friend of Schiller, born at Leipzig. He studied law at Gottingen and Leipzig and in 1783 became chief councillor of the consistory at Dresden, was appointed to the office of judge in the Court of Appeals in 1790, and in 1811 returned to the appellate court. His home was a gathering place for the literary men of the time. He corresponded with Goethe and was very intimate with Schiller, who lived with him much of the time between 1785 and 1787. During the Russian occupation of Leipzig he was Russian government counselor and then entered the Prussian service (1815) at Berlin, where he was state counselor and later Privy Counselor in the new Ministry of Education. His best-known work was the anonymous *Aesthetische Ansichten* (1808), but of greater importance is Schillers *Briefwechsel mit Körner* (ed. by Goedeke, Leipzig, 1874, by Geiger, Stuttgart, 1895-96). He also prepared the first collected edition of Schiller's works (1812-15) and *Poetischer Nachlass Theodor Körners* (1815). His collected works are edited by Stein (Leipzig, 1881). Consult Jonas, *Briefwechsel Wilhelms von Humboldt mit Körner* (Berlin, 1880), and id., *Körner, biographische Nachrichten über ihn und sein Haus* (ib., 1882).

KÖRNER, KARL THEODOR (1791-1813). A German poet, son of C. G. Körner, born in Dresden, Sept. 23, 1791. He studied mining engineering at Freiberg and law at Leipzig. In 1810 he published *Die Buds*, a volume of immature poems that were received with favor. He was appointed court dramatist at Vienna in 1813, but he gave up this career to enlist in the War of Liberation in Lützow's Free Corps. There he served as lieutenant and adjutant, and there he wrote his war songs, *Leier und Schwert* (1814), in which his genius and German patriotism find a high expression. The songs were set to music by Karl Maria von Weber and had much effect in the German warlike spirit. One of them, "Das Schwertlied," was composed but a few hours before his death in battle at Lützow, Aug. 26, 1813. Of Körner's dozen or more comedies and librettos, *Die Braut* (1812) and *Der grüne Domino* (1812) were very successful. *Zriny*, an historical drama, is the most ambitious of his works. His dramas show the influence of Schiller (q.v.) and Kotzebue (q.v.). The best editions of Körner are by Streckfuss (1834), Wolf (1858), Kofahl (1895), Wildenow (1900), and Gensichen (1902). His *Poetischer Nachlass* were edited by his father and published at Leipzig in 1815.

Bibliography. Biographical and critical studies are by Bauer (Stuttgart, 1883), Rogge (Wittenberg, 1891), Kregenbergl (Dresden, 1892), Jaden (ib., 1896), Peschel and Wildenow (Leipzig, 1898), A. Zipper, in *Reclam* (ib., 1900), and Peschel (Dresden, 1901). Consult also Zeiner, *Körner als Dramatiker* (Stockeran, 1900), and Strucker, *Beiträge zur kritischen Würdigung der dramatischen Dichtungen Körners* (no place, 1910).

KORNGOLD, kôrn'gôlt, ERICH (1897-). An Austrian composer, one of the most remarkable cases of musical precocity on record, born

May 29, 1897, at Braunau. He received his entire education from his father, the musical critic of a Vienna paper. When only 11 years of age, he wrote a pantomime, *Der Schneemann*, which was produced at the Royal Opera of Vienna in 1910. The following year Nikisch performed his *Ouverture zu einem Schauspiel*, op. 4, at one of the Gewandhaus concerts. Soon afterward the boy gave a concert in Berlin, which was attended by many noted musicians (Humperdinck, Sinding, Muck, Sembrich), who were unanimous in their admiration. The new works performed for the first time at this concert were a pianoforte sonata in E, a piano trio in D, and a suite for piano, *Märchenbilder*. The reception accorded the youthful composer was nothing short of sensational. In 1912 the New York Philharmonic Society, under Strinsky, played the overture, op. 4. Besides the compositions mentioned Korngold wrote a second pianoforte sonata in A, a sonata for piano and violin in G, a sinfonietta in B flat, and a three-act opera, *Der Ring des Polykrates* (1915). These works exhibit not only genuine inspiration, but also an astonishing skill in the development of the thematic material and the treatment of orchestral instruments. As yet the boy is decidedly under the influence of R. Strauss, but there are unmistakable touches of originality which hold out great promise for the future.

KOROLENKO, kôr'ô-lên'kô, VLADIMIR (1853-). A prominent Russian writer. Born in Zhitomir (Little Russia), of Cossack and Polish ancestry, he inherited the peculiar dreaminess of Little Russians and the perennial optimism of the Poles. The boy lost his father at 15, and at 17 entered the St. Petersburg Technological Institute and after a year the Moscow Academy of Agriculture, where he held a scholarship. For addressing a joint student petition to the director of the academy he was exiled to the Province of Vologda. Allowed to return after two years, he went to St. Petersburg, eking out a living as publisher's assistant. A series of governmental persecutions soon ensued, culminating in 1879 in his exile to Siberia. The six years spent by this most impressionable writer in the wilds of Siberia furnished him precious literary material for his inimitable Siberian sketches. Korolenko's literary career really began in 1885, when his highly original *Makar's Dream* was published. It was followed by *The Sakhalin Convict*; *In Bad Company*, an autobiographical romantic tale; *Memoirs of a Siberian Tourist*, a well-written picaresque novel, and *The Murmuring Forest*, a woodland idyl worthy of Turgenyev. But much as these works increased Korolenko's fame, it was his fascinating psychological novel, *The Blind Musician* (1886), that put him in the front rank of Russian writers of his time. Unfortunately the author did not follow up this artistic performance, and, save his *Prokhor and the Students*, an ambitious novel whose serial publication was interrupted by the censor in 1887, all his subsequent fiction was confined to short stories such as *At Night*, a study of child life; *The Old Bell-Ringer*, a beautiful -pump idyl; *Yom Kippur*, a sympathetic tale of Jewish life; *Easter Night*, a charming little story full of color, and three more recent sketches written in Korolenko's best style—*The Frost*, *The Royal Coachman*, and *The Last Ray*. After 1900, when Korolenko became one of the editors of *Russkoye Bogatstvo*, the

amount of his purely literary work decreased. As a publicist he wrote *The Year of Famine* (1893), prompted by the hard times then afflicting Russia; *Without a Language* (1895), giving his impressions of America; and *Present Customs* (1910), an eloquent plea in favor of the abolition of the liquor trade. His latest longer production is *A History of my Contemporary* (2 vols., 1911-12), an autobiographical work. His sixtieth anniversary was celebrated in 1913 with great enthusiasm throughout Russia.

Korolenko is a notable representative of the older traditions in Russian literature. His art, which has the classical simplicity of Turgenev, is a consummate blending of realism and romanticism, revealing a sympathetic and optimistic soul, and since Turgenev no writer has used better Russian. Korolenko's principal works have long been translated into English, French, and German. Consult J. Mackenzie, "A Contemporary Russian Writer," in *Gentleman's Magazine*, vol. cclxxxviii (London, 1900), and Sergyei Perski, *Contemporary Russian Novelists*, translated from the French by F. Eismann (Boston, 1913).

KÖRÖS, CSOMA DE. See CSOMA DE KÖROS.

KÖRÖS, KÉ'RESH, NAGY, and KIS. Two towns of Hungary.—NAGY, or GREAT KOROS, is a market town in the County of Pest, 56 miles by rail southeast of Budapest (Map: Hungary, F 3). It has steam mills and is in an agricultural, wine-growing, and stock-raising region. It is noted for its melons. There are a higher Gymnasium with a good library, a teachers' seminary, and important local archives. Pop., 1900, 26,638; 1910, 28,575, mostly of the Magyar Reformed faith.—KIS, or LITTLE KOROS, lies in a farming district, about 38 miles southwest of Nagy Körös. Pop., 1900, 9271; 1910, 11,562. It is the birthplace of Petöfi, the Hungarian poet.

KORRIGUM, kör'i-güm. See HARTBEEST.

KORSAKOFF, N. A. RIMSKY. See RIMSKY-KORSAKOFF, NICHOLAS ANDREYEVITCH.

KORSCHULT, kör'shült, EUGEN (1858-). A German zoologist, born at Zittau. He studied in Heidelberg, Leipzig, and Freiburg, where he obtained his degree in 1882. From 1882 to 1884 he was assistant in the Zoologisches Institut in Leipzig. In 1885 he was appointed privatdocent at Freiburg and in 1887 at Berlin; in 1892 he became professor of zoölogy and comparative anatomy in Marburg. His writings include: *Ueber die Entstehung und Bedeutung der vergleichenden Zellenelemente des Insectenovarums* (1886), *Lehrbuch der vergleichenden Entwicklungsgeschichte der urbellosen Thiere* (1890-93; trans. into Eng. as *Text-Book of the Embryology of Invertebrates*, 1895-1900), with K. Heider; *Ueber die Entwicklung von Dreisena polymorpha Pallas* (1891), *Beiträge zur Entwicklungsgeschichte der Kephelopoden* (1892). His later writings were largely in collaboration.

KÖRTE, kör'te, GUSTAV (1852-). A German archæologist, born in Berlin and educated at the universities of Göttingen, Munich, and Berlin. He traveled in Italy and Greece, became docent at Göttingen in 1880 and professor at Rostock in 1881, and in 1905 was appointed secretary of the German Archæological Institute at Rome. In 1907 he succeeded Dilthey at the University of Göttingen. Among his

important works on ancient art are: *Die antike Skulptur aus Boeotien* (1878); *Inlievi delle une etruske* (1890, 1896), continuing Brunn's work; *Etruskische Spiegel* (1884-97), with Klugmann, a continuation of Gerhard's work; a summary (1904) of excavations which he and his brother made at Gordium in 1900.

KÖRTING, kër'ting, GUSTAV (1845-1913). A German philologist, whose special branch is Romance and English. He was born in Dresden and taught there after four years of study at Leipzig (1863-67). He went to Munster in 1876 and in 1892 to Kiel as professor of Romance philology. In 1879 he became editor with Koschwitz of the *Zeitschrift für neufranzösische Sprache und Litteratur* and in the following year of *Französische Studien*. His more important works are: *Ueber die Quellen des Roman de Rou* (1867), *Diktys und Dares: Ein Beitrag zur Geschichte der Troja-Sage* (1874); *Petrarca's Leben und Werke* (1878); *Geschichte der Literatur Italiens* (1878-84); *Boccaccios Leben und Werke* (1880); *Die Anfänge der Renaissance-Litteratur in Italien* (1882), the very useful *Encyklopädie und Methodologie der romanischen Philologie* (1884-88) and *Laténisch-Romanisches Wörterbuch* (3d ed., 1907). *Grundriss der Geschichte der englischen Litteratur* (1887; 5th ed., 1910); *Formenlehre der französischen Sprache* (1893-98).—HEINRICH (1859-90), a brother of Gustav, like him was a Romance scholar. He was born in Leipzig, became privatdocent in 1885, and in 1889 professor in the University of Leipzig. He wrote: *Geschichte des französischen Romans im siebenzehnten Jahrhundert* (2d ed., 1891); *Neugriechisch und Romanisch* (1896), *Bemerkungen über den Begriff und die Teile des grammatischen Satzes* (1905); *Adolf Turols, Roman* (1906); *Etymologisches Wörterbuch der französischen Sprache* (1908), *Etymologisches Lehr- und Fremdwörterbuch der deutschen Sprache* (1910).

KORTUM, kör'tum, KARL ARNOLD (1745-1824). A German physician and author, born at Mülheim-on-the-Ruhr, Rhenish Prussia. He studied and practiced medicine at Duisburg and afterward at Bochum, and besides several medical works wrote *Verteidigung der Alchemie* (1789), also treatises on bee culture and antiquarian subjects. But he is chiefly remembered as the author of *Leben, Meinungen und Thaten von Hieronymus Jobs dem Kandidaten* (1784), a grotesque, comical epic, which subsequently went through many editions under the title *Die Jobsiade* (new ed. by Bierbaum, Leipzig, 1906). Consult Deicke, *Der Jobsiaden-dichter Karl Arnold Kortums* (Mülheim-on-the-Ruhr, 1893), and id., *Des Jobsiaden-dichters K. A. Kortum: Lebensgeschichte von ihm selbst erzählt* (Dortmund, 1910).

KORVEI, kör'vi. An ancient abbey of Germany. See CORVEI.

KORYAKS. See KORIAKS

KOS. See COS.

KOSCHAT, kó'shät, THOMAS (1845-1914). An Austrian composer, born at Viktring, near Klagenfurt. He entered the University of Vienna to study natural science, but his love for music caused him to abandon his scientific studies, and he became a member of the chorus at the Royal Opera. In 1874 he joined the cathedral choir and in 1878 the court chapel. The instantaneous success and immense popularity of his first quartets for male voices in Carin-

thian dialect, published in 1871, determined him to devote himself entirely to this field. Utmost simplicity of musical structure, coupled with genuine feeling, tender pathos, and a roguish humor, impart to these unpretentious compositions the true character of the folk song. Koschat always wrote both words and music. Consult K. Krobath, *Thomas Koschat, der Sanger Karntens* (Leipzig, 1912).

KOSCHWITZ, kôsh'vits, EDUARD (1851-). A Romance philologist, born at Breslau. In 1877 he became docent at Strassburg and afterward was made professor at Greifswald and Marburg. His specialty is French and Provençal. His works include: *Ueber die Chanson du Voyage de Charlemagne* (1875; new ed., 1907); an edition of that *Chanson* (1883); *Les plus Anciens Monuments de la Langue Française* (1879; 6th ed., 1907); *Commentar zu den ältesten französischen Sprachdenkmälern* (1886); *Neufranzösische Formenlehre nach ihrem Lautstande* (1888); *Les parlers Parisiens* (1898; 4th ed., 1911); *Zur Aussprache des Französischen* (1892); *Französische Novellistik- und Roman-litteratur über 1870-71* (1893); *Die provenzalischen Fehber und ihre Vorgänger* (1894); *Grammaire historique de la langue des Félibres* (1894); *Anleitung zum Studium der französischen Philologie* (1897, 3d ed., 1907); *Mirêio, poème provençal de F. Mistral* (1900); *Altfranzösisches Uebungsbuch* (1884, 4th ed., 1911), with Wendelin Förster. Koschwitz was editor of several philological periodicals.

KOSCIUSKO, kôs'i-ûs'kô. A city and the county seat of Attala Co., Miss., 75 miles northeast of Jackson, on the Illinois Central Railroad (Map: Mississippi, F 4). It contains the Central Mississippi College (Baptist), a school for negroes, and has cotton and oil mills, wood-working establishments, and ice plants. It was first incorporated in 1868. Pop., 1900, 2078, 1910, 2385.

KOSCIUSKO, kôs'i-ûs'kô, MOUNT. The highest elevation of the Australian Alps, being 7328 feet high and situated north of the boundary between New South Wales and Victoria and about 75 miles from the Pacific coast (Map New South Wales, E 5). In 1897 a meteorological station was established on its summit.

KOSCIUSZKO, kôs-choosh'kô, TADEUSZ (1746-1817). A Polish patriot. He was born Feb. 12, 1746, at Mereczowszczyzna, near Novogrudok, in Lithuania, being descended from an ancient but impoverished Lithuanian family. He received his military education at Warsaw and at the military academy of Versailles and became a captain in the Polish army. In 1776 he left his native country and embarked for America. Letters of recommendation from Benjamin Franklin obtained for him a colonel's commission, Oct. 18, 1776, and he was attached to General Gates's army operating in northern New York. The excellent strategic position taken by the American army at Bemis Heights, near Saratoga, was largely planned by Kosciuszko. He was engaged as chief engineer in constructing the fortifications at West Point and became adjutant to General Washington. In 1780-81 he served under General Greene in the South and after the conclusion of peace received the thanks of Congress with the brevet of brigadier general and became a member of the Society of the Cincinnati. He returned to Poland in 1786 and three years later was made major general in the Polish army. In the campaign of 1792, follow-

ing on the repudiation by Russia of the constitution of May 3, 1791, and the invasion of Poland, Kosciuszko, as lieutenant general under Prince Joseph Poniatowski, with 4000 Polish troops held at bay a Russian army of 18,000 men at Dubienka (July 17), inflicted a loss of 4000 men on the enemy, and effected his retreat with a total loss of 90. After the submission of King Stanislas, which was followed by the second partition of Poland, Kosciuszko took up his residence in Leipzig. When the Poles rose in arms against their foreign oppressors in 1794, he was made Dictator, and on April 4 with a force of 4000 peasants, mostly armed with scythes, he defeated an army of 6000 Russians, who were marching on Cracow, at Racławice. On April 17 the inhabitants of Warsaw rose and expelled the Russian troops. Kosciuszko instituted a provisional government, but, discouraged by the prevailing anarchy, he soon laid down the dictatorship. He marched against the Russians, but had to encounter a powerful enemy in the Prussians, who advanced to the aid of the Russians. He was defeated at Szczekoczyn, June 6, 1794, and retreated to Warsaw, which he defended successfully against the besieging forces of the enemy. In this hour of trial Kosciuszko was proof against the most tempting proposals on the part of the Prussian King. In the fall he took the field once more with an army of 20,000 regular troops and some 40,000 ill-armed peasants. On October 10 the Poles were decisively defeated at Maciejowice by an allied army of thrice their strength, and Kosciuszko, covered with wounds, fell into the hands of the enemy. He was kept a prisoner till after the accession of the Emperor Paul, who restored him to liberty in 1796, gave him an estate with 1500 peasants, and handed to him his sword, which Kosciuszko declined to receive, saying, "I have no more need of a sword, as I have no longer a country." He afterward gave up the estate and sent back from London the money which he had received from the Emperor. Upon the occasion of a visit to the United States in 1797 he received a pension and a grant of land, but returned to Europe after the passage of the Alien Act by Congress. When Napoleon, in 1806, formed a plan for the restoration of Poland, Kosciuszko felt himself restrained from taking an active part in it by his promise to the Emperor Paul. The address to the Poles published in his name in the *Moniteur* was a fabrication. In 1814 he wrote to the Emperor Alexander entreating him to grant an amnesty to the Poles in foreign countries and to make himself constitutional King of Poland. He released from servitude, in 1817, the peasants on his own estate in Poland. His death took place Oct. 15, 1817, at Solothurn, Switzerland, as a result of a fall from his horse. His remains were removed to Cracow by the Emperor Alexander and were laid by the side of those of John Sobieski. A cairn built up of small stones brought together by his admirers stands upon a hill in the suburbs of Cracow, which commands a wide view of the city, the Vistula, and the distant mountains. Kosciuszko was a convinced democrat and believed in absolute equality before the law, but the aristocratic prejudices of his country compelled him to resort to half measures. He wrote the *Manœuvres of Horse Artillery* (New York, 1808) and a description of the campaign of 1792 (vol. xvi of E. Raczyński's *Sketch of the Poles and Poland*, Posen, 1843).

Bibliography. A biography, with collection of documents relating to Kosciuszko's career, was published by Kornon at Cracow in 1894. Consult also: Rychlicki, *Kosciuszko and the Partition of Poland* (Cracow, 1872); A. W. W. Evans, *Memoir of Thaddeus Kosciuszko, Poland's Hero and Patriot* (Cincinnati, 1883); M. I. J. Griffin, "General Thaddeus Kosciuszko, Father of American Artillery Service of the United States," in *American Catholic Historical Researches*, vol. vi (N. S., Philadelphia, 1910). There are biographies in German by Falkenstein (Leipzig, 1834), in French by Chodzko (Paris, 1837), in Polish by Paszkowski (Cracow, 1872); also a brief monograph by Arnold, *Tadeusz Kosciuszko in der deutschen Litteratur* (Berlin, 1898).

KOSEGARTEN, kō'ze-gär'ten, JOHANN GOTTFRIED LUDWIG (1792-1860). A German Orientalist, philologist, and historian, born at Altenkirchen, island of Rügen, the son of Kosegarten the poet. He studied theology and philosophy at Greifswald, where he became adjunct professor in both these branches after two years in Paris (1812-14) devoted to the study of Oriental languages. He was called to Jena in 1817 and recalled to Greifswald in 1824. On Arabic language and literature he published: *De Mokammede ibn Batuta ejusque Itineribus* (1818); the *Moallaka* of Amr ibn Kolthum (1819); the *Chrestomathia Arabica* (1828) and the editions, unfortunately not completed, of the *Annals of Tabari*, with a Latin translation (1831-37), of the collection of lyrics *Kitāb al-aghāni*, vol. i (1840-46), and of *The Hudsaian Poems*, vol. i (1854). Besides these he produced a German translation of the *Nala* episode in the Sanskrit epic of the Mahabharata (1820), edited the collection of fables *Pantschatantra* (1848-59), and in collaboration with Iken issued a German version of the Persian collection of fairy tales *Tuti nameh* (1822). He edited Kantzow's old chronicle *Pomerania* (1816-17), followed by *Pommersche und rugische Geschichtsdenkmäler*, vol. i (1834), and *Codex Pomeranæ Diplomaticus*, vol. i (1843-62), with Hasselbach. He also wrote a *Geschichte der Universtat Greifswald* (1856), but the completion of his *Wörterbuch der niederdeutschen Sprache* (vol. i, 1856-60) was prevented by his death.

KOSEGARTEN, (GOTTHART) LUDWIG THEOBUL (1758-1818). A German poet. He was born at Grevesmühlen, and studied theology at Greifswald, where he was called to Greifswald as professor of history, which chair he exchanged for that of theology in 1816 and at the same time became pastor in that city. He was most successful in the idyllic epics *Die Inselfahrt* (1805) and *Jucundo* (1808; 7th ed., 1855), an imitation of Voss's *Luise*. Although popular at the time, his poems seem now rather empty and bombastic. Consult his *Das fünfzigste Jahr meines Lebens* (1815) and his biography by Franck (Halle, 1887).

KOSEL, kō'zel. A city of Prussia. See COSEL.

KOSER, kō'zēr, REINHOLD (1852-1914). A German historian, born at Schmarsow in Prussia. He was educated at Berlin, Vienna, and Halle. In 1882 he was appointed keeper of the Berlin archives and in 1884 professor of history. In 1890 he went to Bonn in the same capacity, in 1896 was chosen head of the Prussian archives, and two years later was appointed Prussian historiographer. Frederick the Great was

Koser's especial study. He wrote: *Friedrich der Grosse als Kronprinz* (1886; 3d ed., 1901), *König Friedrich der Grosse*, vol. i (1890-93, coming down to 1756); *Politische Korrespondenz Friedrichs des Grossen* (1879-83); *Unterhaltungen Friedrichs des Grossen mit H. de Catt* (1884). *Briefwechsel Friedrichs des Grossen mit Mittheilungen der preussischen Archivverwaltung* (1900-04).

KOSEREFSKY, kō'sē-rēf'skī. See HOLY CROSS MISSION.

KOSHER, kō'shēr, or **KASHER**, kā'shēr. A Hebrew word, used rarely in the Bible, meaning "fitting, proper" (as in Esther viii. 5). At present it is used especially of food proper to be eaten by Jews. Stores and eating houses furnishing such food often display the Hebrew word כָּשֵׁר, *kosher*. The term is applied especially to meat. Not only must the forbidden animals of the Law (Deut. xiv; Lev. xi) be avoided, but the flesh must be from animals killed according to the traditional rabbinical ritual and, before it is eaten, must be soaked, salted, and washed, in order to remove any possible traces of blood. Another restriction of kosher food is that milk or any of its products must not be used with flesh, so that meat cannot be cooked in butter. This rule arose by inference from the command "not to seethe a kid in its mother's milk" (Deut. xiv. 21). These and other laws make it impossible for a strict Jew to procure kosher food except in a Jewish place. Liberal Jews, however, regard these laws as belonging to the temporary rather than to the permanent elements of the Jewish religion.

KOSKIMO, kōs'ké-mō. See KWAKIUTL.

KÖSLIN, kēs-lēn, or **CÖSLIN**. A town in the Province of Pomerania, Prussia, on the Mühlenbach, 8 miles from the Baltic (Map: Germany, G 1). It has numerous churches, a cadet school, a teachers' seminary, and an agricultural school, several iron foundries and manufactures of paper, silk, machinery, soap, railway signals, and lumber. Köslin dates from 1188 and became a town in 1266. Pop., 1900, 20,418, 1910, 23,236.

KOSLOV, kōz-lōf'. A district town of the Government of Tambov, Russia, 45 miles northwest of the town of Tambov and about 250 miles southeast of Moscow (Map: Russia, F 4). It lies at the junction of two important railway lines and is a centre in the grain and live-stock trade, the district being celebrated for its breed of horses. The manufactured products are machinery, tobacco, leather, tallow, beer, and spirits. In the vicinity is situated the Troitzky Monastery. Pop., 1912, 50,225. Koslov was founded in 1627.

KOSSEL, ALBRECHT (1853-) A German physiologist. He was born in Rostock; studied medicine there and at Strassburg, where he became (1877) assistant to Hoppe-Seyler and (in 1881) privatdocent; went to Berlin in 1883 as director (succeeding Baumann) of the chemical department in the Physiological Institute; and became professor of physiology at Marburg in 1895 and at Heidelberg in 1901. For his researches in biochemistry, especially in the *Zeitschrift für physiologische Chemie*, which he edited, he received the Nobel prize in medicine in 1910. His studies were particularly devoted to the chemical composition of cells, of nuclei, and of albumens; and he discovered the bases adenine and thymine of the nucleic acids. Kossel received honorary degrees from Cambridge, Dub-

lin, Ghent, Greifswald, Geneva, and St. Andrews, became Privy Councillor in 1907, and was prorector in 1908-09. He wrote *Gevebe des menschlichen Körpers und ihre mikroskopischen Untersuchung* (1889-91), with Behrens and Schiefferdecker, and an introduction to medical chemistry (6th ed., 1911).

KOSSINNA, kôs'i-nâ, GUSTAF (1858-). A German archaeologist, born in Tilsit. He was educated at Göttingen, Leipzig, Berlin, and Strassburg, and was in the university library service of Halle and of Berlin (1886), becoming custodian of the Bonn Library in 1887 and going in 1892 to the Royal Library in Berlin, of which he became librarian in 1894. In 1902 he was appointed professor of German archaeology in the University of Berlin. He founded the German Society for Prehistoric Research (*Gesellschaft für Vorgeschichte*) and was its first president (1909). He attempted to prove by arguments from the shape and decoration of early pottery that the original home of the Indogermanic family was in northwestern Germany. He contributed to archaeological and ethnological periodicals and himself edited *Manus*, *Zeitschrift für Vorgeschichte*. Among his books are: *Die Sueben* (1890); *Die vorge-schichtliche Ausbreitung der Germanen in Deutschland* (1896); *Der Ursprung des Germanennamens* (1895); *Die indogermanische Frage archaologisch beantwortet* (1902); *Zur Archäologie der Ostgermanen* (1905); *Der Ursprung der Urfinnen und der Indogermanen* (1909-11).

KOSSO. See Koosso.

KOSSOVO. An elevated plain in European Turkey in the Vilayet of Kossovo (Turkish Servia), drained by the Sitnitsa, a tributary of the Marava. Here, on June 15, 1389, a battle was fought between the Servians and the Turks under Amurath or Murad I, in which the latter were completely victorious, but the Sultan was killed after the battle (according to the common account) by a wounded Servian. In October, 1448, János Hunyady was completely defeated here by the Turks.

KOSSUTH, kôsh'út, FERENCZ (FRANCIS) (1841-1914). An Hungarian political leader, son of Louis Kossuth. He was born Nov. 16, 1841, at Budapest. In his childhood he shared the romantic career of his father, being captured by the Austrians at the age of eight and kept a prisoner in the fortress of Pressburg. When liberated a few years later, he went to live with his father in Kutahia in Asia Minor and then in England, also traveling with him in the United States. He was educated at Paris and London and, after working as engineer for two years in England, went in 1861 to Italy, where he engaged in the practice of his profession till the death of his father in 1894. Returning to Hungary, he was elected to the House of Deputies in 1895 and became the leader of the Independent party, whose programme called for radical concessions to the Magyar nationality. He was one of the leaders of a coalition which in the elections of January, 1905, overthrew the Liberal party after it had long been entrenched in power. There followed more than a year of confusion, Kossuth refusing to form a government unless the demands of the coalition were granted by the Emperor-King. (See HUNGARY) A compromise was finally arranged, and Kossuth became Minister of Commerce in the Wékérle cabinet in April, 1906. In his great desire to establish

Hungarian nationality even more firmly than it is now, Kossuth favored in 1909 the establishment of a separate Hungarian bank. The proposition was vetoed by Emperor Francis Joseph. When Kossuth attempted to modify his programme to suit the interests of Austria, his party refused to follow him and split into two factions.

KOSSUTH, LAJOS (LOUIS) (1802-94). The leader of the Hungarian revolution of 1848-49. He was born April 27, 1802, at Monok in the County of Zemplin in Hungary. His family was of Slavic origin and of noble rank; his father was a lawyer. He studied law at the Protestant college of Sárospatak and at Pest, practiced first in his native county, and in 1831 established himself in Pest. In 1832 he began his political career in the Upper House of the Diet as a proxy of a magnate and edited a Liberal paper, which, owing to the state of the laws, was not printed, but copied by hand and circulated. The subsequent publication of a lithographed paper led, in May, 1837, to Kossuth's imprisonment. He was liberated in 1840 and until 1844 was the editor of the *Pesti Hírlap*, in which he advocated views too extreme for any of the Liberal party among the nobles, but which took strong hold of the people in general, especially of the youth of the country. In November, 1847, he was sent as a deputy from Pest to the Lower House of the Diet and soon distinguished himself as an orator and became the leader of the opposition. He advocated the emancipation of the peasants, the abolition of feudal privileges, the elevation of the citizen class, and the freedom of the press. When Metternich was driven from power in March, 1848, Kossuth openly demanded a separate ministry for Hungary and in the same month became Minister of Finance in the cabinet of Count Louis Batthyányi. In the great patriotic movement of which he was the soul and head, Kossuth by his devotion to the cause of the Magyars aroused the enmity of the other nationalities within Hungary and thus precipitated a conflict with the Slavic peoples of the south, which gave Austria the means of combating the new order of things in Hungary. (See AUSTRIA-HUNGARY; JELLACHICH.) On the dissolution of the ministry in September, 1848, he found himself at the head of the Committee of National Defense, with dictatorial powers, and prosecuted with extraordinary energy the measures necessary for carrying on the war both against Austria and against the invasion of the Ban of Croatia. After advancing almost to the gates of Vienna, the Hungarians were defeated at Schwechat, Oct. 30, 1848. Soon after the Austrian forces invaded Hungary and in January, 1849, entered Pest. The first reverses of the Hungarians were followed by a series of brilliant victories in the spring, which were due in no small measure to Kossuth's restless activity in organizing the national forces for the field. To put an end to all the hopes and schemes of the Moderate party he induced the Diet at Debreczin, April 14, 1849, to declare that the Hapsburg dynasty had forfeited the throne and to proclaim the independence of Hungary. The Hungarian Republic was established with Kossuth as Governor. Kossuth was disappointed in his hopes of intervention on the part of the Western Powers and had to face the overwhelming power of Russia, which Czar Nicholas brought to the support of the Hapsburgs. Finding the dissensions between himself

and Görgey (q.v.) damaging to the national cause, he resigned his dictatorship in favor of the latter Aug. 11, 1849, two days after the defeat at Temesvár. On August 13 Görgey surrendered the Hungarian army to the Russians, and on the seventeenth Kossuth fled into Turkey, where he was kept under restraint by the Turkish government; but though his extradition was demanded both by Austria and Russia, the Porte, supported by England and France, resisted all their demands. In September, 1851, at the intervention of England and the United States, he was liberated and sailed in the United States frigate *Mississippi*, sent for the purpose by the government, to Gibraltar, after having been refused permission to land at Marseilles by the Prince-President Napoleon, whence he sailed to England, where he was received with every demonstration of public respect and sympathy. In December of the same year he landed in the United States. His stay in America was a continuous ovation. His wonderful oratory kindled the enthusiasm of the people, already in sympathy with the cause he represented; but his unwise efforts to draw the United States into a quarrel with Austria cooled the ardor with which he had been greeted at first. He returned in July, 1852, to England, and there he chiefly resided until 1862, when he went to Turin, which he made his permanent home. In the stirring years of 1859 and 1866 Kossuth endeavored to take advantage of the opportunity to bring about new Hungarian risings, but his plans failed. He organized, however, an Hungarian legion, which fought under Garibaldi in 1859 and 1866. When Austria and Hungary became reconciled in 1867, Kossuth refused to accept a seat in the Diet after he had been elected, in order to give public expression to his intransigent attitude, and being deprived of his Hungarian citizenship on a pretext, he continued in his uncompromising hostility to the Hapsburgs to the end. He died at Turin, March 20, 1894. His body was interred at Budapest, April 1, amid a great demonstration of respect and affection.

S., *Hungary and its Revolution, with a Memoir of Ludwig Kossuth* (London, 1854; new ed., ib., 1896); Lajos Kossuth, *Memoirs of my Exile* (ib., 1880, new ed., New York, 1894); Pulszky, *Meine Zeit, mein Leben* (Pressburg, 1880-83), by an intimate associate of Kossuth; W. R. Thayer, "Kossuth," in *Throne Makers* (New York, 1899); James Creelman, *On the Great Highway, the Wanderings of a Special Correspondent* (Boston, 1901); Eugene Pivány, *Sixty Years Ago: An Address Delivered on the Sixtieth Anniversary of Louis Kossuth's Arrival in the United States* (Philadelphia, 1911); also a mass of reports, speeches, and controversial articles occasioned by Kossuth's visit to England and the United States.

KOST, FREDERICK W. (1861-). An American landscape and marine painter, born in New York City. He studied under William Macy at the National Academy of Design, then in Munich and Paris, received medals at the Buffalo (1901) and St. Louis (1904) expositions, and was elected a member of the National Academy in 1906. His "Frosty Morning" is in the Metropolitan Museum, New York; "On the St. John River, N. B.," in the Pennsylvania Academy, Philadelphia; "Smithfield Marshes,

Staten Island," in the Museum of the Brooklyn Institute. His work is excellent in technique and delicate in tone.

KOSTENDIL, kës'ten-dil', or KIUSTEN-DIL, kyus'ten-dil'. A town of Bulgaria, situated in the western part of the country, 43 miles southwest of Sofia, and on the railway line from Kumanova to Sofia (Map: Balkan Peninsula, D 3). It has a high school, barracks, and hot springs. Pop., 1900, 12,042; 1910, 13,748.

KÖSTER, kës'tër, HANS (1818-1900). A German dramatist and poet, born at Kritzw. After studying philosophy at Berlin, Bonn, and Munich, he traveled in Italy and France and lived successively in Berlin, Weimar, and near Neuzelle, Brandenburg. As a member of the North German, and afterward of the first German Reichstag, he manifested the Prussian party spirit, which is also apparent in his political pamphlets and his poetic productions. His early dramas, although favorably commented upon, did not find their way to the stage, but *Ulrich von Hutten* (1846), *Hermann der Cherusker* (1861), and *Der Grosse Kurfürst* (1851; new version, 1865) were repeatedly performed. He also published the stories *Liebe und Leiden* (1862) and *Erlebnisse und Gestaltungen* (1872); two collections of patriotic songs, *König Wilhelm und sein Heer* (1868) and *Kaiser und Reich* (1872), the biblical epics *Hiob* and *Die Bergpredigt* (1885); *Gedichte* (1897); *Ruinen und Scherben* (1900).

KOSTER, LAURENS JANSZON. See **COSTER.**

KOSTER, or COSTER, SAMUEL (1579-1662). A Dutch dramatist. He was born at Amsterdam and studied at Leyden. His excellent plays and his establishment of the Nederduitsche Academie (1617; called, after him, Coster's Academy), a society which gave great encouragement to the earlier dramatic authors of Holland, earned for him the title of "founder of the theatres of Amsterdam." His comedies include *Spel van de rijke man* (1615) and *Boereklucht van Teeuwis de Boer en meijer van Grevelinghuyzen* (1612). His tragedies include *Isabella* (1617), *Itys* (1615), *Iphigenia* (1617), and *Polixena* (1619). Consult the monograph on Koster by Rossing (Leyden, 1875).

KÖSTLIN, kës'tlën, CHRISTIAN REINHOLD (1813-56). A German poet and criminal jurist, born at Tübingen, where he established himself as privatdocent in 1839, after having studied law there and in Heidelberg and Berlin. He acquired his reputation as a writer on criminal law with *Die Lehre vom Mord und Totschlag* (1838). His later publications include: *Der Wendepunkt des deutschen Strafrechts im neunzehnten Jahrhundert* (1849); *Die Geschworenengerichte* (1851); *Geschichte des deutschen Strafrechts* (1859). Under the pseudonym C. Reinhold he wrote poems and stories, which appeared collected in 1847-48 and 1853.—His wife, **JOSEPHINE LONG** (1815-80), was a well-known composer of songs.

KÖSTLIN, JULIUS (1826-1902). A German Protestant theologian born in Stuttgart, where he became vicar in 1850, after having traveled through England and Scotland. Subsequently he was professor of theology at the universities of Göttingen (from 1855), Breslau (1860), and Halle (1870). He retired in 1896. A partial list of his writings includes: *Luthers Lehre von der Kirche* (2d ed., 1868); *Das Wesen der Kirche, etc.* (2d ed., 1872); *Martin Luther, sein*

Leben und seine Schriften (5th ed., 1903); also a popular life of the reformer, *Luthers Leben* (9th ed., 1891); *Der Glaube und seine Bedeutung für Erkenntnis, Leben und Kirche* (1895); and *Christliche Ethik* (1898). After 1873 he edited *Theologische Studien und Kritiken*. Consult his autobiography (Danzig, 1891).

KÖSTLIN, KARL REINHOLD (1819-94). A German theologian and writer on aesthetics, born at Urach, Württemberg. He studied in Tübingen and Berlin, settled in the former city as Privatdocent of philosophy and theology, and was appointed professor of aesthetics and art history in 1857. In this connection he published: *Goethes Faust, seine Kritiker und Ausleger* (1860); *Hegel in philosophischer, politischer und nationaler Beziehung* (1870), *Asthetik* (1863-69), his principal work, combining subtle judgment with lucid exposition; *Richard Wagners Tondrama: Der Ring des Nibelungen* (1877); *Ueber den Schönheitsbegriff* (1879); *Geschichte der Ethik bis Plato* (1887). His theological writings include *Der Ursprung und die Komposition der synoptischen Evangelien* (1853).

KOSTOMAROV, k'ostō-mā'rōf, NIKOLAI IVANOVITCH (1817-85). A famous Russian historian and author, born in the Government of Voronezh. He studied in the universities of Kharkov and Moscow, and after having served in a regiment of dragons was appointed (1846) instructor in history in Kiev. Here he founded the Slavophile Society of Saints Cyril and Methodius and a secret society to revive Little Russian literature. He was deprived of his professorship in 1847 and banished to Saratov, whence he was allowed to go abroad only after the death of Nicholas I. In 1859-62 he held a professorship of history in St. Petersburg, where his lectures attracted throngs of listeners. Kostomarov dropped his professorship, however, to devote himself entirely to historical and literary pursuits. He introduced into Russia the method of treating history as the life of the people and not the growth of the state, while his *North-Russian Commonwealths* (1863) was epoch-making in proving the antiquity of republican institutions in Russia. In accordance with his theory, Kostomarov preceded every historical investigation by an intense absorption in the literature, songs, and folklore of the period he treated, thus rendering incalculable service to Russian historiography. His historical novels, however, of which he wrote several, are in striking discord with his views of history as a science. These abound in anachronisms, and most momentous historical events are often laid to the whims of personages unknown to history. His most important works are *Historical Monographs* (12 vols., 1868) and *Russian History in Biographies of her Chief Men* (1875-76; in 3 vols., 1911), the first volume in German translation by Henckel (Leipzig, 1886).

KOSTROMA, kō'stro-ma'. A government of central Russia, north of the governments of Vladimir and Nizhni Novgorod, with an area of 32,432 square miles (Map: Russia, F 3). The surface is generally level, with a few hills along the courses of the rivers; about 60 per cent of the total area is under forests. The climate is severe, the average annual temperature being about 40° F. The region is watered by the Volga and its tributaries. Agriculture, although the chief occupation, is in a low stage of development, the product being insufficient for

domestic demands. Hemp is cultivated on a large scale, and horses of a high grade are raised. There are manufactures of cotton goods, pottery, linen, wooden, and small metal articles; they are produced mainly in the rural districts as adjuncts to agriculture. The trade is chiefly in forest products and manufactures. The migration of artisans from Kostroma to the industrial centres of the Empire is very considerable. Pop., 1912, 1,745,800, composed principally of Great Russians. Capital, Kostroma (qv).

KOSTROMA. Capital of the government of that name, in European Russia, situated near the junction of the river Kostroma with the Volga, 500 miles from St. Petersburg (Map: Russia, F 3). The most notable building is the cathedral of the Assumption (1272). The monastery of Ipatiev, built in 1330, is intimately associated with Czar Michael Feodorovitch, who was elected and crowned here in 1613. In the centre of the town is a monument to Ivan Susanin, the peasant who saved Michael from the Poles. The cathedral of the Trinity (1586), within the monastery, contains a number of ancient and reputed miraculous pictures also associated with the history of Michael. The educational institutions include a Gymnasium, a high school, a seminary, a technical school, and a theatre. It has considerable manufactures, chiefly of linen, and there is trade in corn, leather, flax, and provisions. Pop., 1912, 67,274. Kostroma was probably founded in 1152 and is therefore one of the oldest of Russian cities.

KÖSZEG, kē'ség. A city of Hungary. See GÜNS.

KOSZTA (k'ostā) AFFAIR. In American history, the name applied to a diplomatic episode, involving the rights in foreign countries of emigrants to the United States as yet not fully naturalized. A certain Martin Koszta, of Hungarian birth, who had taken part in the political movement of 1848-49 for detaching Hungary from the dominion of the Emperor of Austria, and who had fled to Turkey upon the failure of that movement, emigrated to the United States after a short detention in Turkey, and in July, 1852, made a declaration under oath of his intention to become a citizen of the United States, at the same time renouncing all allegiance to any foreign power. After a residence of a year and 11 months he returned to Smyrna, Turkey, on private business of a temporary nature and placed himself under the protection of the American Consul at Smyrna and the American chargé d'affaires ad interim at Constantinople. While waiting to return to the United States, he was taken by force aboard the Austrian brig of war *Huszar* and confined there in chains. The American officials protested in vain both to the Turkish government and to the Austrian officers, and finally on July 2, 1853, Captain Ingraham of the United States sloop of war *St. Louis*, then lying in Smyrna harbor, threatened to open fire if Koszta was not surrendered to him by four o'clock. The Austrian Consul General then agreed that Koszta should be held by the French Consul General until some agreement was reached. On Aug. 29, 1853, Baron Hülsemann, the Austrian chargé d'affaires at Washington, wrote to Secretary of State Marcy, asking that the United States "disavow the conduct of its agents, . . . hasten to call them to a severe account, and tender to Austria

a satisfaction proportionate to the magnitude of the outrage," basing his request on the ground that Koszta had never ceased to be a citizen of Austria, and that Ingraham's threat was in violation of international law. Marcy replied, Sept. 26, 1853, in a ringing letter, known as the Hülsemann letter, in which he defended the position of the United States throughout, on the ground that Koszta had ceased to be a citizen of Austria even by the law of Austria, "that Koszta when seized and imprisoned was invested with the nationality of the United States, and they had therefore the right, if they chose to exercise it, to extend their protection to him, that from international law—the only law which can be rightfully appealed to for rules in this case—Austria could derive no authority to obstruct or interfere with the United States in the exercise of this right, in effecting the liberation of Koszta; and that Captain Ingraham's interposition for his release was, under the extraordinary circumstances of the case, right and proper." This letter, which was written by Marcy with an eye on the next Democratic nomination for President, was received with great enthusiasm throughout the United States, and the stand taken by Marcy with reference to the status of immigrants not fully naturalized has been indorsed by various well-known authorities on international law. Koszta was ultimately released and allowed to return to the United States. Congress showed its approval by a joint resolution thanking Captain Ingraham and conferring on him a medal. Consult *Correspondence between the Secretary of State and the Chargé d'Affaires of Austria Relative to the Case of Martin Koszta* (Washington, 1853). A bibliography of the affair may be found in J. F. Rhodes, *History of the United States from the Compromise of 1850*, vol. i (New York, 1910).

KOTAH, kō'tā. A native Rajputana state, India, with a capital of the same name, situated 120 miles south of Jaipur (Map: India, C 4). The town, on the right bank of the Chumbul, is fortified by a rampart and a ditch. It has manufactures of muslin, table ornaments, and paper. Pop., 1901, 33,657; 1911, 32,753. Near by is the Maharao's new palace with its public library. The state contains 5684 square miles. Pop., 1901, 544,879; 1911, 639,089.

KÖTHEN, kē'ten. A town of Germany. See COTHEN.

KOTLIAREVSKY, kōt'lyä-rēf'skī, IVAN PETROVITCH (1769–1838). A Ukrainian (Little Russian) poet, born and educated at Poltava. He served in the army (1796–1808), was prominent in the charities of his native city, conducted for several years a school for children of the impoverished nobility, and during his last years directed the poorhouse of Poltava. He wrote in the dialect of Little Russia a travesty on the *Aeneid* (1798), which has much satiric power and which very faithfully pictures the life of the peasants of the Ukraine. Among his plays, which also depict Ukrainian manners and customs and which laid the foundation for a national theatre in the Ukraine, *Natalka Poltavka* (1819), which has been turned into a successful opera, and *Moskal' čarivnik* (1841) are the best known. His complete works were published at St. Petersburg in 1862 (2d ed., 1875).

KOTO (Japanese). The Japanese harp, made in the form of a zither and consisting of 13 silk strings stretched over an oblong sounding board.

Each string has a separate bridge, by adjusting which the string is tuned. The koto is played with both hands and has a range of two and a half octaves. See JAPANESE MUSIC.

KOTOTSHIKHIN, kō'tō-shē'kēn, GRIGORIY (1630–67). A Russian writer, civil servant in the Office of Foreign Affairs under Czar Alexis and thus a contemporary of Krizhanitch (q.v.). At the age of 31 his conscience proved too tender for his tasks, and he had to seek an asylum first in Poland and then in Sweden, where he wrote a book about Muscovy (1666–67). Justly or unjustly he was executed for a murder in Stockholm and would have been unknown to posterity were it not for his manuscript giving faithful but most unflattering details of the life and reign of the Czar. In 1837 this book was found in the Upsala Library. It was published in Russia by the Imperial Archaeological Commission and called *O Rossi v Isarstvovame Aleksiya Mikhailovitch* (1859, last ed., 1884).

KOTOW, kō-tou' (Chin. k'ow-t'ow, k'ou-t'ou, from k'ow, to knock, and t'ou, head). To salute, pay respect, homage, or worship by kneeling ceremoniously and then knocking the forehead on the ground. In China schoolboys on entering the schoolroom kneel and knock their heads on the floor before the picture of Confucius; inferiors kotow to superiors; a humble apology is made by kotowing; prisoners kotow before the magistrate; and the kotow is the most respectful way of worshipping the gods, or before the ancestral tablets. The kotow is performed to friends and relatives seen for the first time after the death of one's father and mother, and it was imperative in approaching the Emperor. There were nine steps to the Imperial throne, and thus eight gradations of obeisance, before reaching the top, as follows: (1) joining the hands and raising them before the breast; (2) bowing low with the hands still joined; (3) bending the knee as if about to kneel; (4) actual kneeling; (5) the kotow, in which the suppliant or guest before the Emperor knelt and struck his head on the ground; (6) kneeling and striking the head on the ground thrice, called the *san k'ow*, or three knockings; (7) kneeling knocking the head thrice upon the ground, standing upright, and again kneeling and knocking the head three times more; (8) kneeling thrice and knocking the head to the earth nine times. While some of the gods receive only the kotow, or three knocks, and others the seventh grade of obeisance, the Emperor, with "Heaven," always received full quota of honor, which reaches its climax in the three kneelings and nine knockings of the head. Under the old system of Chinese etiquette and learning, to reject these forms was to reject authority, while to accept them was to acknowledge homage and obedience to the Emperor. No accredited European envoys have made the kotow, as that would have signified their country as inferior to China, except papal emissaries and those from Portugal and Holland, who originally yielded to Chinese etiquette, not understanding the full significance of the act, or for the sake of greater facilities of trade and for direct conference with the Emperor himself.

KOTBUS, kōt'būs. A town of Prussia. See COTTBUS.

KOTZEBUE, kō'tse-būō, ALEXANDER VON (1815–89). A German painter, born at Königsberg, son of August von Kotzebue. Educated in the Corps of Cadets at St. Petersburg, he gave

up the military career in 1838 to take up painting at the Academy, under Sauerweid, and continued his studies there for six years. From 1846 to 1848 he was in Paris, the pupil of Horace Vernet, then traveled in the Netherlands, Italy, and Germany, and in 1860 settled in Munich. His principal works are a long series of battle pieces ordered by the Czar for the winter palace in St. Petersburg. They comprise the principal combats between Peter the Great and Charles XII, notably "The Battle of Poltava," the battles during the Seven Years' War, in which the Russians were victorious, those in the campaign of Suvarov in Italy and Switzerland, and the battles of 1812 and 1813 against Napoleon. His pictures are deft in composition and show skill in the arrangement of scenic accessories, but they are essentially stage scenes, untrue to nature.

KOTZEBUE, AUGUST FRIEDRICH FERDINAND VON (1761-1819). A German dramatist and Russian civil servant, born at Weimar. Kotzebue studied law at Jena (1777) and Duisburg (1778), but was drawn to the stage and organized an amateur theatre at Duisburg. In 1780 he opened a law office at Weimar, but he was induced in 1781 to go to Russia, where he served successively as secretary to the Governor-General at St. Petersburg, assessor of the Upper Court of Appeals, and president of the Magistrates Board of the Province of Esthonia. He married a lady of rank and was ennobled. At his wife's death he resigned the Russian service, visited Paris, and from 1795 to 1798 lived chiefly at Friedenthal, his country seat, near Reval. He had already become known by a series of tales and several sentimental dramas. His first collected works, *Die jüngsten Kinder meiner Laune* (5 vols., Leipzig, 1793-97), belong to this period. In 1798 Kotzebue was summoned to Vienna as court dramatist, but friction arose, and he was permitted to resign in 1800 with a pension. He intended to return to Russia, but on the frontier he was arrested as a spy and sent to Siberia. Czar Paul, pleased at hearing a translation of Kotzebue's little drama *Der alte Lebküchler Peters des Grossen*, recalled him from exile, gave him office and an estate, and made him manager of the German theatre at St. Petersburg. Kotzebue tells all this vivaciously in *Das merkwürdigste Jahr meines Lebens* (2 vols., Berlin, 1801). After Czar Paul's death Kotzebue returned to Germany, lived successively in Weimar, Jena, and Berlin (1803), where he was made a member of the Academy of Sciences and shared in the editorship of *Der Freimütige*, a literary journal. In 1806 he went to Königsberg to make historical researches in the Prussian archives, as a result of which he published *Preussens altere Geschichte* (4 vols., Königsberg, 1809). His stay in Königsberg was short. The Napoleonic invasion obliged him to flee to Russia (1806), whence he kept up a lively journalistic warfare on Napoleon and his policy in *Die Biene* (1808-10) and *Die Grille* (1811-12). During these years he resided on his estate in Esthonia. He returned to Berlin as a Russian State Councilor in 1813 and was made Russian Consul General at Königsberg, whence he was recalled in 1816 as counsel to the Foreign Office at St. Petersburg. In 1817 he was sent as a salaried political spy to Germany, where he founded in the reactionary interest a journal, *Das litterarische Wochenblatt*. In this he attacked especially the German liberal stu-

dent *Burschenschaften* and thus excited a student, Karl Ludwig Sand, to assassinate him at Mannheim, March 23, 1819. Kotzebue as a dramatist was remarkably prolific and successful, and a master of stage effects, but he was superficial and neglectful of literary standards. His plays drew better houses than the classics. Of some 216 recorded plays 98 are printed (28 vols., 1797-1823; 44 vols., 1827-29; 10 vols., 1868). The best known of them in England and America are *The Stranger* (*Menschenhass und Reue*) and *Pizarro* (*Die Spanier in Peru*), noteworthy also are *Die beiden Klingsberg*, *Die Indianer in England*, and *Die deutschen Kleinstädter*. Kotzebue wrote also some weak novels. In addition to the autobiographical work mentioned above, consult Döring, *August von Kotzebue's Leben* (Weimar, 1830); W. von Kotzebue, *August von Kotzebue, Urtheile der Zeitgenossen und der Gegenwart* (Dresden, 1884); J. Minor, *Ueber Kotzebue* (Vienna, 1894); E. Jäckh, *Studien zu Kotzebues Lustspieltechnik* (Heidelberg, 1899). Charles Rabany, *Kotzebue, sa vie, son temps, et ses œuvres* (Paris, 1903); Gerhard Stenger, *Goethe und August von Kotzebue* (Breslau, 1910).

KOTZEBUE, OTTO VON (1787-1846). A Russian navigator, son of August von Kotzebue, born at Reval. He made three voyages round the world, sailing first under Krusenstern to Japan (1803-06). On his second journey, in command of the *Rurik* (1815-18), fitted out by Count Romanzov to discover a practicable northeast passage, he passed through Bering Strait, the first navigator to do so in the nineteenth century. He traced the Alaskan coast from Cape Prince of Wales to Cape Krusenstern, 67° N. He carefully surveyed the great sound that now bears his name and made geological discoveries of importance—the ice cliffs of Escholtz Bay, a subject of discussion even to-day—and obtained therefrom bones and tusks of the mammoth. Subsequently he touched at California and Hawaii and in January, 1817, discovered the Romanzov Island, one of the Marshall group. He brought home specimens of many theretofore unknown plants. He made a third voyage in 1823-26. His description of the second voyage appeared in Russian in 1823-26, in German in 1821, and in English in 1821-23 as *Voyage of Discovery*. In 1830 he published an account of the third journey as *Neue Reise um die Welt*.

KOTZEBUE, WILHELM VON (1813-87). A Russian diplomat, brother of the preceding, and under the pseudonym of Wilhelm Augustsohn, a German dramatist. His earliest literary work was the German translation from Vasile Alecsandri's (q.v.) collection of Rumanian folk poems (1857). His other works were the plays *Ein unbarmherziger Freund*, *Zwei Sünderinnen*, and *Bilder und Skizzen aus der Moldau* (1860), *Laskar Viorescu* (1863), a novel based on Moldavian life; *August von Kotzebue, Urtheile der Zeitgenossen und der Gegenwart* (1884).

KOUMISS. See KUMISS.

KOUSSO, ку́с'о. See KOOSSO.

KOVALEVSKY, ко́ва-льѣв'скі, ALEXANDER (1840-1901). A Russian zoologist and embryologist, born at Düna. After study at Heidelberg and Tübingen, he became professor of zoölogy at the University of St. Petersburg. One of the most distinguished zoölogists of his day, it was he who by his researches in the embryology and structure of ascidians and of *Am-*

phioxus first showed the relationship of these forms to one another and their close alliance to vertebrates. He also discovered the branchial slits of *Balanoglossus* and first placed it in the line of vertebrate ancestry. In the embryology and postembryological development of insects his work was fundamental, and he made important contributions to the knowledge of the development and structure of various annelids, cœlenterates, and other animals. Important among his works are: *Anatomie des Balanoglossus delle Chiaje* (1866); *Entwicklungsgeschichte der einfachen Ascidien* (1866); *Entwicklungsgeschichte des Amphioxus lanceolatus* (1867); *Weitere Studien über die Entwicklung der einfachen Ascidien* (1870); *Embryologische Studien an Würmern und Arthropoden* (1869); *Weitere Studien über die Entwicklungsgeschichte des Amphioxus lanceolatus* (1877); *Cœloplana metschnikovi* (1882); *Beiträge zur nachembryonalen Entwicklung der Musciden*, part i (1887); *Anatomie de l'Archæobdella esmontii* de O. Grimm (1896); *Etude sur l'anatomie de l'Acanthobdella peledina* (1896).

KOVALEVSKY, EGOR PETROVITCH (1811-68). A Russian traveler and writer, born in the Government of Kharkov. As a mining engineer, he made extensive journeys in eastern Siberia, the Kirghiz Steppe, and Montenegro (1841). Six years afterward he was intrusted by Mehemet Ali with a geological mission in Upper Egypt, and he published an account of this journey after his return to Russia (2 vols., 1849). He was next sent upon a religious embassy to China, where he put his name to the treaty favoring Russian pretensions in Mongolia (1851). He was subsequently made director of Asiatic affairs at St. Petersburg (1856). He was a promoter of the Khorasan, Chitral, and other expeditions for scientific research and the author of *Peregrinations* (3 vols., 1843-45); *China* (2 vols., 1853); *The War with Turkey in 1853-54* (1868); *The Crimean War* (1869). His last work was *Eastern Affairs in the Twenties*. His collected works, exclusive of miscellaneous verse and prose, fill five volumes (St. Petersburg, 1871-72; with a biographical account).

KOVALEVSKY, SOPHIA VASILYEVNA, better known under her pen name, **SONYA** (1850-91). An eminent Russian mathematician and author, the daughter of General Korvin-Krukovsky. She was born at Moscow and lived at Palibino, her father's estate, in the Government of Vitebsk. When in 1865 Strannolyubsky began to teach her calculus at St. Petersburg, he was amazed at her quickness. About 1867 she and her sister, later a well-known novelist, resolved to go abroad to study. To obtain independence for the purpose a sham marriage, such as was of daily occurrence among Russian youth at this period, was decided upon. A student, Vladimir Kovalevsky, when asked to act as the fictitious husband to give Sonya's sister the necessary legal status, consented on the condition of marrying Sonya herself. In October, 1868, the ceremony was performed, and the three went abroad the following spring, when Sonya's husband took up geology at Jena. In 1869 she studied mathematics at Heidelberg, eliciting the warmest praise from Königsberger and Kirchhoff. In the autumn of 1870 she went to the University of Berlin, where no women were admitted. At a perfunctory test at his house the great Weierstrass was astounded by her lucid

and original solutions of the problems that at the time engaged his most advanced pupils, and henceforth he guided her studies for three years. In 1874 she received the degree of Ph.D. at the University of Göttingen on the basis of her memoir *Zur Theorie der partiellen Differentialgleichungen*. After receiving their degrees Sonya and her husband lived together until he became involved in speculations in housebuilding, newspaper publishing, petroleum wells, etc. The couple parted, and Sonya went abroad to make for herself a name in science. But her husband's death, which followed shortly, was a crushing blow to her, and she resumed scientific work only after a lingering illness. In 1883 Mittag-Leffler, a pupil of Weierstrass and rector of the University of Stockholm, obtained for her a docentship. After a year of lecturing in German she was appointed professor of higher analysis for five years, on condition of teaching in Swedish. She held this professorship until her death. In 1888 she received in person the Prix Bordin (doubled to 5000 francs) of the Paris Academy of Sciences for her *Sur un cas particulier du problème de la rotation d'un corps pesant autour d'un point fixe*. For two other essays the Stockholm Academy awarded her a prize of 1500 kroner in 1889. Besides she contributed a number of important papers to scientific periodicals. She had, moreover, literary abilities in addition to her mathematical talents. In 1877 she wrote *The Privatdozent*—a sketch from the life of a small German university town—which met with a hearty reception. Her *Recollections of Childhood*, published in a Russian magazine (1890), aroused widespread attention. In Sweden she formed an intimate friendship with Anna Leffler, sister of Mittag-Leffler and a striking figure in Scandinavian letters. They had a strong influence upon each other, and of several works written in collaboration, *A Struggle for Happiness* (1887) is the most characteristic. It is a panegyric of love as the main-spring of complete life, and the heroine, Alice, who seeks for it in vain, is Kovalevsky herself. In one of her periods of despair she caught a severe cold, but paid no attention to it, and attended to her lectures almost until her death from pneumonia, Feb. 10, 1891. Consult: Anna Leffler, *Sonya Kovalevsky* (Stockholm, 1892); *Autobiography* (New York, 1895); L. M. Hansson, *See Modern Women: Psychological Sketches*, translated from the German by H. Ramsden (Boston, 1896); G. Retzius, *Das Gehirn des Mathematikers Sonya Kovalevsky* (Stockholm, 1900).

KOVNO. A western government of European Russia, in Lithuania, bordering on Poland and Prussia. Area, 15,518 square miles (Map: Russia, B 3). It has a level surface, interspersed with numerous small lakes and watered by the Niemen and its tributaries. The climate is moderate and healthful. Kovno is chiefly an agricultural region, but the horse and cattle breeding industries are important and growing, while dairying is increasingly pursued. Considerable quantities of grain, mainly wheat and rye, are annually exported. Pop., 1912, 1,819,540, of whom the Lithuanians represented about 73 per cent and the Jews 15 per cent. There are also a number of German colonists. Capital, Kovno.

KOVNO. The capital of the government of the same name in Russia and a first-class fortress, situated at the confluence of the Vilja with the Niemen, 506 miles southwest of St. Petersburg (Map: Russia, B 3). It consists of the

old and the new town and has a number of handsome squares, a park, and an interesting old town hall, opposite which is a curious iron pyramid commemorating the departure of the French in 1812. The educational institutions comprise a Gymnasium and seminaries for priests and teachers. Kovno manufactures wire and nails. The grain trade, once very important, has somewhat declined, but the town is an important centre for the transit trade with Prussia. Pop., 1903, 73,743, 1911, 87,986, of whom nearly half were Jews. Kovno was founded in the eleventh century and from 1384 to 1398 belonged to the Teutonic order. It became Russian after the third partition of Poland in 1795.

KOWLOON, kou'loon', or **KOWLUNG**, kou'-loong'. A peninsula of southern China, situated opposite Hongkong. A small portion of it, 4 square miles, was ceded by the Chinese government to Great Britain in 1860, and a lease of about 376 square miles was obtained in 1898 for a period of 99 years. The population is Chinese and is estimated at about 85,000. The harbor of Kowloon was declared a free port in 1887. Administratively the territory on the mainland forms a part of Hongkong, but the lease stipulated that the city of Kowloon should remain under Chinese jurisdiction. At Kowloon is a station of the Chinese maritime customs. In 1912 imports amounted to hk. tls. 26,685,659, and exports to 12,517,000. The total trade of the port hk. tls. 39,202,659. For the same year the Kowloon Railway reported a traffic of hk. tls. 485,657 in imports and 359,829 in exports, a total of hk. tls. 845,486. See HONGKONG.

KOW'RIE PINE. A New Zealand tree. See **KAURI PINE**.

KOWTOW, or **KOUTOW**. A Chinese form of salutation. See **KOTOW**.

KOXINGA, kô-shing'a or kôk-sin'gâ (Chin, *Ching Ch'ing-kung*) (1623-63). A noted Chinese patriot and pirate, who drove the Dutch out of Formosa and became King of that island. He was born in 1623 in Hualdo, Japan. His father, Ching Chih-lung, originally a poor tailor of Fukien, had married a Japanese wife, and partly by trade and partly by freebooting had amassed great wealth, and as the possessor of a fleet of 3000 junks became master of the seas. About 1628 he apparently abandoned piracy, entered the service of the Ming Emperor of China, then struggling against formidable rebellions within and the attacks of the Manchus without, and became admiral of the Imperial fleet. Some years later his wife joined him at Nanking with the young Ching-kung, who was sent to school, and who at 22 was presented to the Emperor, who gave him a prominent command and conferred upon him his own surname, Chu, remarking that he was worthy to bear the Imperial surname. From this circumstance he became known as Kwôh-hsing-yeh (in Japanese Koku-sen-ya, his worship of the national surname), which was corrupted by the Portuguese into Koxinga. Ere long the Ming Emperor, finding himself unable to hold Nanking, fled to Poochow, which still held out against the Manchus, and Koxinga's father, yielding to the overtures of the Manchus, who promised to make him a prince, was made a prisoner and carried to Peking, where he died. Koxinga, collecting his father's fleet and raising a large army, proceeded to harry the Chinese coast, capturing cities, burning and pillaging, and defying every

fleet sent against him, suffering but one severe defeat, during his siege of Nanking in 1656, when he lost 500 of his ships, besides the camp equipment of his land forces.

In 1661 he attacked the Dutch in Formosa, who surrendered after a four months' siege and retired to Batavia, and Koxinga proclaimed himself King. With this island as a base of operations, he renewed his attacks on China with such ferocity that, in 1682, the Manchu government commanded the inhabitants of the two provinces of Fukien and Kwangtung to remove, on pain of death, 10 miles inland. Every town and village within that belt was burned or leveled to the ground, the roads were broken up, and for six years all means of communication with the sea were cut off and all commerce ceased. This tremendous feat of defensive warfare stands unique in the history of the world. In the following year Koxinga was killed in an engagement with the Dutch and was succeeded by his son, who, as King of Formosa, continued the anti-Manchu warfare.

In 1875, on the memorial of the Imperial Commissioner then in Formosa, and the literati of Taiwanfu, Koxinga was canonized, and a temple erected in his honor. His descendants were given the rank of Marquis, one of the few titles of nobility in China, and the Chinese named one species of rodent after him.

KOYUKUK (kô-yô'kuk) **RIVER**. An Alaskan river that flows into the Yukon about 450 miles from its mouth (Map: Alaska, G 3). The Koyukuk has a drainage basin of 25,000 square miles and is about 650 miles in length, of which 500 miles is navigable for steamboats, to Bettles. Placer mining is successful in the camps around Coldfoot, 100 miles above Bettles. At Allakaket, north of the Arctic circle, is the Episcopal mission of St. John in the Wilderness.

KOYUN'JIK, or **KUYUNJIK**. One of the mounds of ancient Nineveh, and the only one belonging to the city proper which has been excavated with any degree of completeness. It is situated east of the Tigris, opposite the present town of Mosul, and in the part of the ancient city north of the Khosar. The chief discoveries at Koyunjik were made by Layard and Rassam and include palaces of Asurbanipal and Sennacherib and the famous library of the former King. For further particulars, see **NINEVEH**.

KOZLOV, kôz-lôf', **IVAN IVANOVITCH** (1779-1840). A Russian poet, born in Moscow. In 1807 he was Councilor of State in Moscow. Afterward he was transferred to St. Petersburg, but his career was cut short in 1812 by a stroke of paralysis, which deprived him of the power to walk. He also became blind, but studied German and English, became known as a translator of Byron's *Bride of Abydos* and Mickiewicz's sonnets, and wrote an original poem, *Chernets* (The Monk, 1824), which met with fleeting popularity. It was republished along with his other poems in the complete edition of his works brought out in St. Petersburg (1855).

KRA, krâ. The isthmus connecting the Malay Peninsula with the mainland of Asia (Map: Asia, L 7). It has an average width of 44 miles; it is greatly narrowed by the Pakcham and Chumpon rivers.

KRAA. A macaque (q.v.).

KRAAL, krâl (Boer Dutch, perhaps from Sp. *corral*, cattle pen, from *corro*, bull ring, from

correr, Lat. *currere*, to run). A term in general use among the Boers (see **BOER**) in South Africa to denote a village, or a collection of huts in an inclosure, or sometimes a single hut in a stockade.

KRAEVSKY, A. A. See **KRATEVSKY, A. A.**
KRAFFT (KRAFT), kräft, ADAM (1450 or 1455-1507). The principal German sculptor of the late-Gothic period, born probably at Nuremberg. Very little is known of his life or training beyond the fact that the year 1490 found him actively engaged in Nuremberg, a contemporary and friend of the famous founder Peter Vischer. He probably began as a simple stonemason and was trained in the local schools. He appears as a finished master in his earliest-known work at Nuremberg, the celebrated "Seven Stations," completed about 1490, on the road to the cemetery of St. John, but now in the Germanic Museum. They are carved in somewhat coarse sandstone, in high relief, and show in the composition a mixture of pictorial and plastic elements and the realistic hardness in individual figures and drapery which was prevalent in the fifteenth century. Of the same date is the "Calvary," a group of heroic size, in the cemetery of St. John. From 1492 dates the magnificent tomb of the Schreyer family, outside the church of St. Sebaldus, representing the three principal scenes from the Passion of Christ. Of three other sepulchral monuments, dating probably from 1498 to 1501, the epitaph of the Pergerstorff family, in the Frauenkirche, a large high relief representing the Virgin with the infant Christ crowned by angels, with groups of figures kneeling at her feet, is the finest. Similar in subject, but different in treatment, is the Landauer tomb, in the Tetzl Chapel of St. Ägidius' Church, and more simply yet happily conceived is the tomb of the Rebeck family, in the Frauenkirche. Krafft's masterpiece, however, is the elaborate tabernacle in the church of St. Lawrence, erected at a cost of 770 gulden, by Hans Imhof, in 1493-1500. It is a towering pyramid of elegant proportions, reaching a height of 64 feet, and is of amazing richness and delicacy in its decoration, as regards both the many sculptured figures and reliefs and the architectural features. He executed, moreover, large numbers of lesser commissions of a decorative character, such as the relief above the door of the ancient city scales. His last work was the large "Burial of Christ," a group of 16 life-size sandstone statues in the Holzschuler Chapel in the cemetery of St. John (1507). Notwithstanding the number and importance of his commissions, in late life he suffered financial difficulties and borrowed heavily from the Imhof family. According to common tradition, he died in the hospital at Schwalbach. The master's own portrait probably survives in a relief figure of the Schreyer tomb and in a kneeling statue of the tabernacle of St. Lawrence.

Bibliography. "Adam Kraft," in the *Art Journal*, vol. xxi (London, 1869); Wanderer, *Adam Kraft und seine Schule* (Nuremberg, 1869); Bergau, "Adam Kraft," in Dohme, *Kunst und Künstler* (Leipzig, 1877); Bode, *Geschichte der deutschen Plastik* (Berlin, 1887); Daun, *Adam Kraft und die Künstler seiner Zeit* (ib., 1897); id., *Peter Vischer und Adam Kraft* (Bielefeld, 1905).

KRAFFT-EBING, a'bing, RICHARD, BARON VON (1840-1902). An eminent German neurolo-

gist, born at Mannheim. He was educated at Heidelberg, Zurich, Vienna, and Prague. After three years' practice at Baden-Baden, as specialist for nervous and mental diseases, he became professor of psychiatry at the University of Strassburg in 1872. A year later he went to Graz and remained there as professor of psychiatry and nervous diseases until 1889, when he accepted the same professorship at the University of Vienna. He resigned in 1902 and returned to Graz, where he remained until his death. He was the author of numerous books and monographs dealing with pathological psychology in its relation to the law and on nervous and mental diseases. Many of these have been widely translated. Some of the more important are: *Die Melancholie Eine klinische Studie* (1874); *Grundzüge der Kriminalpsychologie für Juristen* (2d ed., 1882); *Die progressive allgemeine Paralyse* (1894); *Nervosität und neurasthenische Zustände* (1895). Four of his books appear in English translations by Craddock: *An Experimental Study in the Domain of Hypnotism* (New York and London, 1889), *Psychosis Menstrualis* (1902), *Psychopathia Sexualis* (12th ed., 1903), a remarkable book, which has become standard in its field, and *Text Book of Insanity* (1905).

KRAFT, ADAM. See **KRAFFT, ADAM.**

KRAG, kråg, THOMAS PETER (1868-1913). A Norwegian poet and novelist, born at Kragerø, a brother of V. A. W. Krag. He was brought up at Christiansand, entered the University of Christiania in 1890, and the next year published *Jon Græff*, narrative verse, in which he combined epic and lyric power. This was followed by *Fra den gamle By* (1892), *Ensomme Mennesker* (1893), and *Mulm* (1893), in which he gives full poetical expression to his love of nature in her more majestic aspects. Nature is more than mere background even in his novels, such as *Kobberslangen* (1895), where he reaches his highest point. *Ada Wilde* (1896), *Ulf Ran* (1897); *Enken* (1899); *Gulvor Kjeld* (2d ed., 1905), *Mester Magnus* (2d ed., 1909). This last undoubtedly expresses his deepest feelings and highest aspirations. Weaker in thought and form are *Fru Beates Hus* (1898), *Hjem* (1900), *Det glade Hjørne* (1901), *Ilduljen* (2d ed., 1905), and *Det Allerhelligste* (3d ed., 1907). *Tusmørke* (1898), *Sorte Skove* (1903), and *Tubalden Fredløse* (1909) are notable for their descriptions. With the drama *Kong Agon* (1894; 2d ed., 1908) he was less successful. Other works are *Ægtemænd og Lygtemænd* (1904), *Maagereden* (1906), and *Offerlam* (1907). Krag stands in the first rank among contemporaneous Norwegian authors. His interpretation of life and nature is that of a mystic; his style is richly imaginative. Consult Erik Lie, in *Dagbladet*, No. 13 (Christiania, 1894), and C. Nærup, in *Illustreret Norsk Literaturhistorie* (ib., 1905).

KRAG, VILHELM ANDREAS WEXELS (1871-). A Norwegian poet, dramatist, and novelist, born at Christiansand, a brother of T. P. Krag. In 1891, a year after he had entered the University of Christiania, he published a collection of poems which won success at once. Both in form and thought they show Danish influence, calling to mind Drachmann and J. P. Jacobsen. In prose followed *Nat* (1892), and the fairy drama *Vester i Blaafield* (1893), with less originality. Among his later poems *Sange fra Syden* (1894), *Nye Digte* (1897), *Norge* (1903),

the lively *Vestlandsviser* (Songs from the West, 1898), take first place. *De Gamles Juleaften* (1894), a drama full of warmth and feeling, met with great success; so also did *De gode Gamle* (1895). Among his other dramas should be mentioned *Den sidste Dag* (1897), *Livet en Leg* (1901), *Sangen om Florens* (1907), *Situationens Herre* (1903), and the idyllic humorous sketch *Baldevisns Bryllup* (1900). The most important of his numerous stories are *Hjemve* (1895); *Den glade Løjtnant* (1896); *Fra de love Stuer* (1897); *Marianne* (1899); *Isaac Kapergast* (1901); *Lille Bodil* (2d ed., 1902); *Den gamle Garde* (1903); *Thea Marie* (1904); *Holmerne de graa* (1905); *Vandringsmand* (1907). Krag was editor of *Juleaften* and *Kringsjaa*, and in 1908-10 director of the National Theatre at Christiania. He married the daughter of Alexander L. Kielland and lived much abroad, part of the time with a government stipend. Consult C. Nærup, *Illustreret Norsk Literaturhistorie* (Christiania, 1905).

KRAGUYEVATS, krà-gu'yà-vàts. The capital of the Serbian province of the same name, situated on the Lepentisa, west of the Morava, 59 miles south of Belgrade, with which it is connected by rail (Map: Balkan Peninsula, C 2). It is the third city in size in Serbia. It was until 1842 the residence of the Serbian princes, and between 1868 and 1880 the Serbian Parliament usually met there. It has a foundry, an arms factory, a Gymnasium, a palace, and an arsenal. Pop., 1900, 15,503; 1910, 18,452.

KRAILSHEIM, krils'him. A town of Germany. See CRAILSHEIM.

KRAIN. See CARNIOLA.

KRAIT, krit (East Indian name), or **CRAIT**. The most dreaded of East Indian venomous snakes (*Bungarus caeruleus*). It is a near relative of the cobras and is dark brown or purplish, with narrow crossbars or white specks or alternately barred brown and yellow. It sometimes reaches a length of 4 feet and is active and fearless, pursuing and feeding upon rats, lizards, and snakes. It is numerous throughout all the warm parts of India, especially in Bengal, and is likely to creep into houses and tents. The authorities believe that it causes more deaths in India, Assam, and Burma than any other snake. Several other species of the genus, called rock snakes by English people in India, are known, one of them being the still larger king snake or rajsamp (*Bungarus fasciatus*), which is bright yellow, encircled with many black rings. A third species is peculiar to Ceylon, and others extend the range of the genus as far east as southern China. Consult: Fayer, *Thanatophidia of India* (London, 1874), and Ewart, *Poisonous Snakes of India* (London, 1878), both with colored plates; *Proceedings of the Zoological Society of London* (ib., 1899); and especially Wall, "The Poisonous Snakes of India," in *Journal of the Bombay Natural History Society*, vol. xvii (Bombay, 1906).

KRAJOVA, krà-yò'vâ. A town in Rumania. See CRAIOVA.

KRAJOWA. See KRAY VON KRAJOWA.

KRAKATOA, krà'kà-tò'à, more correctly **KRAKATAU**. A volcano on the small island of Pulu Rakata in the Sunda Strait between Java and Sumatra (Map: East Indies, C 7). The island has an area of 6 square miles, about one-half of its former size. The volcano had been in a dormant state since 1680, when, in

May, 1883, it became active, culminating on the night of August 26-27 in one of the most disastrous eruptions known in history, presenting the rare type of explosion. A mass of rock material, estimated at more than a cubic mile, was thrown into the air in the form of lapilli and dust by a succession of explosions that were heard over 150 miles away. The dust was carried to an estimated vertical distance of 17 miles, and in the upper air currents it was borne eastward in a complete circuit of the globe. The suspension of this finely divided material in the atmosphere has been established as the cause of the brilliant sunsets which during the following winter and spring were observed over a large portion of the earth's surface. The explosions were followed by violent atmospheric disturbances that passed around the earth at the rate of 700 miles an hour. A series of gigantic sea waves was also generated, and these caused great loss of life. The water advancing upon the shores of the neighboring islands swept away whole villages, while the oscillations were noticeable as far as the shores of South America. After the terrible convulsions it was found that the northern part of the island, including the highest peak, had disappeared. The total loss of life probably exceeded 30,000, one authority estimating it at 36,380. The island is without permanent population. Consult Verbeek, *Krakatau* (Batavia, 1884), and Royal Society of London, *The Eruption of Krakatoa and Subsequent Phenomena*, edited by J. G. Symons (London, 1888). See VOLCANO.

KRAKEN, krà'ken (Dan., from Norweg *krake*, sort of sea monster). A mythical colossal creature said to have haunted the seas and coast of Norway. Its shape and habits were described by the Norwegian Bishop Pontoppidan in 1750. According to his account, its back was about a mile and a half in circumference; its body rose from the sea like an island, stretching out mastlike arms capable of dragging down the largest ship, and when it sank towards the bottom, it caused a whirlpool in which large vessels were involved to their destruction. It was also said to make the waters around it thick and turbid and thus was able to devour the shoals of fishes that swam to the place attracted by the musky smell.

The origin of the various stories of the kraken is probably attributable to the occasional occurrence in the northern Atlantic of colossal squid. It is these gigantic animals which on rare occasions have been seen by fishermen and others and which have given rise in past ages to the stories or fables of this kind. See SQUID.

Consult: A. S. Packard, "Colossal Cuttlefishes," in *American Naturalist*, vol. vii (Salem, 1873); A. E. Verrill, "The Colossal Cephalopods of the North Atlantic," in *American Naturalist*, vol. ix (ib., 1875); id., "Gigantic Squids," in *Transactions of the Connecticut Academy*, vol. v (New Haven, 1879); J. Gibson, *Monsters of the Sea* (London, 1887).

KRAMBAMBULI, kràm-bàm'bù-lè. A Slavic term originally signifying cherry brandy; then, especially in student slang, any spirituous drink. Krambambuli is the title of one of the most popular German student songs, the words of which were written by Wittekind in Danzig in 1745 under the pseudonym of Crescentius Koromandel. The music is a popular eighteenth-

century air. The song in an English translation is also popular in American colleges.

KRAMERIA. See RHATANY.

KRANS, HORATIO SHEAFE (1872-). An American author and editor, born in Boston and educated at Columbia University (A.B., 1894; Ph.D., 1903). After 1900 he was engaged in literary and editorial work for magazines and reviews and was literary adviser to G. P. Putnam's Sons in 1905-09 and to the Sturgis and Walton Company in 1909-13. He wrote *Irish Life in Irish Fiction* (1903), *William Butler Yeats and the Irish Literary Revival* (1904), and *Oliver Goldsmith, a Critical Biography* (1907); he edited the *Lincoln Tribute Book* (1909), *English Love Poems* (1909), *The Lost Art of Conversation* (1910), and, as associate, *The World's Wit and Humor* (10 vols., 1906). In 1914 he served as associate editor of the NEW INTERNATIONAL YEAR BOOK, and he contributed articles on topics in American and English literature to the second edition of the NEW INTERNATIONAL ENCYCLOPÆDIA.

KRANTZ, KRÄNTZ, ALBERT (*1450-1517). A German scholar and statesman. He was born in Hamburg, traveled widely in Europe, studied theology and philosophy at Hamburg and Rostock, and became rector of the latter university. As syndic of Hamburg he was present in 1489 at the Hansa-Assembly at Wismar and was sent as Ambassador to France in 1497 and to England in 1499. In 1500 he was chosen arbitrator by John, King of Denmark, and Frederick, Duke of Holstein, in their dispute concerning the Province of Ditmarschen. He considered Wiclif and Huss as heretics and was not in sympathy with the movement . . . by Luther, although he agreed with his attitude on the subject of indulgences and introduced many ecclesiastical reforms while dean of the chapter of Hamburg, to which he was appointed in 1508. His principal works are *Chronica Regnorum Aquilonarum*, published in Strassburg in 1562, and an ecclesiastical history of Saxony. Consult Hauck-Herzog, *Real-Encyclopædie für protestantische Theologie und Kirche* (3d ed., Leipzig, 1896-1913).

KRANTZ, JEAN BAPTISTE SÉBASTIEN (1817-99). A French engineer and politician, born at Arches, Vosges, and educated at the Polytechnique (1836) and the Ecole des Ponts et Chaussées (1838). He was best known as constructor of the Industrial Palace at the Exposition of 1867, as inventor of a movable dam for the Seine (1868), and for his service in the siege of Paris in 1871. In the last year he was elected a deputy and in 1876 was elected to the Senate, where he opposed Boulanger and was leader of the Opportunists. He wrote *Projet de création d'une armée des travaux publics* (1847) and *Observations au sujet des chemins de fer* (1875).

KRANTZ, JULES FRANÇOIS EMILE (1821-1914). A French naval officer, born at Givet, a cousin of J. B. S. Krantz. He entered the navy in 1837, was captain of a frigate by 1861, and in 1869 was promoted to command the training ship *Louis XIV*. In the Franco-German War he directed the defenses of Fort Ivry and in 1871 was chief of department in the Ministry of Marine; two years afterward he commanded the naval division in Chinese waters as rear admiral. On his return to France he was made director of the marine works and vice admiral in 1877. He was placed on the reserve in 1886 and was Minister of

Marine in successive cabinets in 1888-89. Noted as an authority on manœuvres and as a mathematician, Krantz published *Éléments de la théorie du navire* (1852) and *Considérations sur les rouls des bâtiments* (1867).

KRAPF, KRÄPF, JOHANN LUDWIG (1810-81). A German missionary, explorer in British East Africa, and specialist in African linguistics. He was born at Derendingen, near Tübingen, where he studied theology. In 1837 he went to Abyssinia as missionary of the English Church Missionary Society and with his fellows, Erhardt and Rebmann, made many valuable tours into Usambara (1848, 1852) and Ukamba (1849, 1851). Krapf brought to Europe the first definite information about the Victoria Nyanza, Mount Kilimanjaro, and Mount Kenia, which he visited in 1849. After a short stay in England he returned to Africa in 1854, but was forbidden by King Theodore to enter Abyssinia. He returned to Germany and lived near Stuttgart till 1867, when he joined the English expedition to Abyssinia. He wrote *Reisen in Ostafrika in den Jahren 1837-55* (2d ed., 1867); *Vocabulary of Sw East African Languages* (1850), *Elements of the Kisuahili Language* (1850); several biblical translations into African dialects; and the *Dictionary of the Swahili Language* (1882). Consult Claus, *Ludwig Krapf* (Basel, 1882).

KRAPINA, KRÄPĚNÁ. See PALEOLITHIC PERIOD.

KRAPOTKIN. See KROPOTKIN.

KRASICKI, KRA-SHĚT'SKĚ, IGNACY (1735-1801). A Polish writer and social worker. He was born in Dubiecko and studied in Lemberg and Rome. In 1767 he was appointed Bishop of Ermeland, but he lived mostly in Warsaw. After the first partition of Poland, in 1772, he enjoyed the favor of Frederick the Great. In 1778 he published his mock-heroic *Mousiad (Myszeas)*, full of allusions to the state disorders and the wrangles of Polish nobility, and also his *Monachomachia*, in which he ridicules the cloistered life of the monks. This latter work aroused a storm of criticism, and his witty reply, *Antimonachomachia* (1780), intensified public interest in the matter. Besides these books he wrote much verse and prose and translated Ossian into Polish. In 1795 he was made Archbishop of Gnesen. He died six years later, in Berlin. His works were published by Dmochowski, in 10 volumes (Warsaw, 1803-04; latest ed., 1878). The *Monachomachia* was translated into German (*Der Monchekrieg*) by Winkiewski (Berlin, 1870). Consult J. J. Kraszewski, *Ignacy Krasicki* (Warsaw, 1880), and Józef Treliak, I, "Krasicki, Charakterystyka wramach szkicu biograficznego," in *Biblioteka Warszawska*, (ib., 1901).

KRASINSKI, KRÄ-SHĚ'NY'-SKĚ, ZYGMUNT, COUNT (1812-59). One of Poland's greatest poets. He was born and died in Paris. He left Russia, where his father, who held a high military position, was despised by his Polish countrymen, who accused him of Russophile sentiments, and devoted himself to literature, becoming a personal friend of Mickiewicz (q.v.) and an adherent of romanticism. In 1834 he published his *Undivine Comedy (Nieboska Komedia)*. It deals with the struggle between degenerated aristocracy (Count Henry) and the suffering people (Pancratius). Both Henry and Pancratius die on the battlefield, and a cross appears in the heavens, symbolizing the ulti-

mate triumph of religion over the passions of men. The dramatic poem *Irydion* (Paris, 1836) was an allegory of Poland's sufferings. Like the earliest Slavophiles, he believed in the regeneration of the world through his country, of whose ultimate restoration he felt sure. His last great work, *Dawn* (*Prozedsвіт*, 1843), is a philosophical poem, wherein he embodied his view of the world. In 1845 he published his *Psalms of the Future: Of Faith, Hope, and Love* (*Psalmi przyzłości*). These were directed against the impending rebellion. For political reasons his name did not appear on his works during his lifetime. The best edition is in four volumes (Lemberg, 1880-88). German translations of his works are: *Ungöttliche Komödie*, by Batornicki (Leipzig, 1841); *Irydion* (ib., 1881); and the novels *Versuchung* (trans. of *Pokusa*, Cracow, 1881) and *Sommernacht* (*Noć letnia*, Vienna, 1881). Consult: Tarnowski, *Zygmunt Krasński* (Cracow, 1892), which is the best, the *Correspondence* published in Lemberg (1880-88), also Julian Klaczko, "Polish Poetry in the Nineteenth Century," in Z. Krasński, *The Undivine Comedy* (Philadelphia, 1875), Juliusz Kleiner, *Zygmunt Krasński: Dzieje Myśli* (2 vols, Lemberg, 1912); Anna Ender, "Sigismondo Krasński," in *Nuova Antologia*, vol. clxiv (5th series, Rome, 1913).

KRASNIK; kräs'nik. A town in Russian Poland in the Province of Lublin, 28 miles southwest of the city of Lublin. Pop., 1910, 9178. It was the scene of a three weeks' battle between the Austrians and Russians in the European War of 1914. During the first week the Austrians drove the Russians towards Lublin, but upon the arrival of heavy reinforcements the latter compelled the former to retreat hastily across the boundary into Galicia. See WAR IN EUROPE.

KRASNOVODSK, kräs'no-vódsk'. A fortress and capital of the Transcasian Province of Asiatic Russia, situated on Krasnovodsk Bay, on the east coast of the Caspian Sea (Map: Asia, G 5). It is 69 feet below sea level and is the starting point of the Transcasian Railway to Merv and Bokhara. Its industries are the manufacture of salt and sulphur and the catching of fish and seals. Pop., 1910, 7775.

KRASNOYARSK, kräs'no-yärsk'. The capital of the Government of Yeniseisk, Siberia, situated on the Yenisei and on the Trans-Siberian Railway, about 2720 miles by rail from Moscow (Map Asia, K 3). It has 15 churches, Russian, Lutheran, and Catholic, a synagogue, a theological and a teachers' seminary, a library, a technical and a railway school, a museum, and a theatre. The chief manufactures are brick, leather, and soap. There is also a considerable transit trade in tea. The town was founded in 1628 as a fortified prison settlement. Pop., 1904, 40,910; 1912, 80,102.

KRASNOYE SELO, kräs'nó-ye sä-ló'. A well-known summer resort in the Government of St. Petersburg, Russia, on the Ligovka River and the St. Petersburg-Reval Railway. It has an Imperial palace with a park and a number of villas, the summer residences of the Russian nobility. The Imperial Guards camp here during the summer, and in August the Czar holds a parade in which about 75,000 troops take part. Pop., 1897, 3286; 1912, 3741.

KRASZEWSKI, krá-shéf'ské, JÓZEF IGNAOY (1812-87). A Polish novelist, historian, aesthetician, publicist, and poet, born in Warsaw. He

studied history and philology at the University of Vilna, took part in the uprising of 1830-31, and was imprisoned until 1833. He settled on his country estate in Volhynia in 1837 and devoted himself to literature. The works which he produced at this period show clearly the influences of Gogol, Dickens, and Balzac. Between 1853 and 1858 he was curator of schools in Volhynia. In 1859 he took up at Warsaw the publication of the *Gazeta Polska*. Exiled in 1863, he settled in Dresden and in 1876 became a Saxon subject. In 1884 he was sentenced to three and a half years' imprisonment on the charge of high treason in having procured plans of a German fortress for the French government, but after a time received a six months' leave of absence, on account of his impaired health, on depositing 20,000 marks as security. He went to Italy and never returned to prison, dying in Geneva. Kraszewski was the most productive of all Polish writers and one of the most productive of all literatures; of his works, numbering more than 350 titles and about 600 volumes, a selection in 102 volumes appeared in Lemberg in 1871-75. Most of them are works of fiction. He chose as themes social political questions, his point of view being democratic and nationalist; the greater number of his novels deal with Polish history, especially the history of Poland in the eighteenth century, which the author knew thoroughly. Besides fiction Kraszewski wrote short stories and poetry. His most important poetical work is *Anafielas* (1839-44), a great epic trilogy of Lithuania. A German translation of it appeared in 1883 at Posen. George Eliot is said to have derived the idea of *Silas Marner* from his *Jermola, the Potter* (1857). Some of his sketches Kraszewski wrote under the pseudonym Boleslawita. Selections from his works were published in 12 volumes in German (Vienna, 1880-81). A number of his novels and tales have been translated into the principal European languages. *Morituri* (1875) and *Resurrecturi* (1876), are perhaps the best known outside of Poland. Consult Bohdanowitsch, *Kraszewski in seinem Werken und seinen Werken*, which is overenthusiastic (Leipzig, 1879), and, in Polish, Chmielowski, *Józef Ignacy Kraszewski* (Cracow, 1888). He has been called the Dumas of Polish literature.

KRAUS, krous, FRANZ XAVER (1840-1901). A German Roman Catholic theologian and archaeologist, born at Treves. He studied at the universities of Treves, Freiburg, Bonn, and Paris. In 1872 he became professor extraordinary of history and Christian archaeology at the University of Strassburg and in 1878 he was appointed professor ordinarius of Church history at the University of Freiburg. His publications include: *Ueber das Studium der Theologie sonst und jetzt* (1890); *Lehrbuch der Kirchengeschichte* (1872-87); *Realencyclopädie der christlichen Altertümer* (1880-86); *Dante, sein Leben und sein Werk* (1897). Consult Hauviller, *Franz Xaver Kraus, ein Lebensbild* (Freiburg, 1904).

KRAUS-BOELTÉ, krous'-bul'tá, MARIA (1836-). An American kindergarten expert, born in Mecklenburg-Schwerin, Germany, the daughter of Judge J. L. E. Boelté. After receiving a full course of kindergarten training in Germany, in 1860 she entered active work in London, where, two years later, she had charge of a kindergarten exhibit at the London Inter-

national Exhibition. In 1867 she went to Hamburg to teach in the Fröbel Union, and later, at Lübeck, she had charge of a kindergarten, with classes connected for the training of teachers. She returned to England in 1870, came to the United States in 1872, and established, with the aid of Henrietta B. Haines, a kindergarten and mother's class in New York. In 1873 she married Prof. John Kraus and with him opened a Seminary for Kindergarten teachers, which she continued alone after her husband's death, in 1896. She lectured on kindergarten methods at the New York University Summer School in 1903, 1904, and 1907, and at educational meetings. In 1899-1900 she was president of the kindergarten department of the National Education Association. Besides several "научно-педагогические" and articles, she is author, with John Kraus, of *The Kindergarten Guide* (2 vols., 1877; new ed., 1905).

KRAUSE, krou'ze, ERNST LUDWIG (1839-1903) A German author, known under the pseudonym Carus Sterne, born at Zielentz. He soon abandoned his original profession of pharmacist for the study of natural history and the history of civilization, settled in Berlin in 1866, and contributed much to the dissemination of natural science, especially of Darwin's theories. In this connection he was led by his researches to recognize in Charles Darwin's grandfather, Erasmus Darwin (q.v.), the true originator of the theory of the descent of man. Darwin caused the treatise devoted to this subject to be translated into English and to be supplemented by a biography of his grandfather (1879). In conjunction with Darwin and Haeckel, Sterne edited the monthly *Kosmos* (1877-82). His other publications include: *Werden und Vergehen: Eine Entwicklungsgeschichte des Naturganzen* (6th ed., 1905); *Die Krone der Schöpfung* (1884); *Charles Darwin und sein Verhältnis zu Deutschland* (1885); *Plaudereien aus dem Paradiese: Der Naturzustand des Menschen* (1886); *Die allgemeine Weltanschauung in ihrer historischen Entwicklung* (1889); *Natur und Kunst* (1891); *Tuskoland* (1891); *Die Trojaburgen Nordeuropas* (1893); *Die nordische Herkunft der Trojasage* (1893); *Geschichte der biologischen Wissenschaften im neunzehnten Jahrhundert* (1901).

KRAUSE, KARL CHRISTIAN FRIEDRICH (1781-1832). A German philosopher and writer on Freemasonry. He studied philosophy at Jena, became privatdocent there in 1802, then taught in Dresden, and lectured subsequently in Berlin and Göttingen. Though his courses in philosophy were very popular, he was unable to secure a professorship. For this purpose he went to Munich (1831), but was disliked as a Socialist, since he maintained that all mankind should be associated in a common endeavor for universal development. Feeling that he found in Freemasonry the first principles of such an organization, he had joined the order in 1805 and written much in its interest. He roused resentment, however, by his independent theories and was expelled in 1810. Among his works on this subject were *Die drei ältesten Kunsturkunden der Freimaurerbrüderschaft* (3d ed., 1849) and *Höhere Vereingung der echt überlieferten Grundsymbole der Freimaurerei* (3d ed., 1820). In philosophy Krause's work has been differently estimated by different historians. Heinze, in his revision of Ueberweg's *History of Philosophy*, speaks of Krause as "the

many-sided, peculiar, and deep thinker," while Windelband says that "Krause has scarcely any other originality than the very objectionable one of presenting the thought common to the whole idealistic development in an unintelligible terminology." The universe, for Krause, exists in God. God is essence prior and superior to all distinction and difference and yet comprehending within itself all distinctions and differences. These comprehended differences constitute finite realities, which are thus members of the articulate system of divine essence. Organic union is thus a fundamental fact of reality and hence must be striven for by man in his moral, social, and political life. Every individual should be a member of a union (*Bund*), and every union should belong to a larger union, until at last all humanity is included in a definitely organized social system. His most important works on philosophy, published in his lifetime, are: *Entwurf des Systems der Philosophie* (1804); *System der Sittenlehre* (1810); *Das Urbild der Menschheit* (1811); *Vorlesungen über das System der Philosophie* (1828). After his death it was found that he had left behind him an immense amount of matter in manuscript, part of which has been published. Consult: S. Lindemann, *Uebersichtliche Darstellung des Lebens und der Wissenschaftslehre Krauses und dessen Standpunktes zur Freimaurerbrüderschaft* (Munich, 1839); Hohfeld, *Die Krausesche Philosophie* (Jena, 1879); Martin, *Krauses Leben, Lehre und Bedeutung* (Leipzig, 1881); Eucken, *Zur Erinnerung an Krause* (ib., 1881); Ludwig Kunze, *Die pädagogischen Gedanken K. Chr. Fr. Krauses in ihren Zusammenhänge mit seiner Philosophie dargestellt* (Langensalza, 1911).

KRAUSS, krouss, GABRIELE (1842-1906) An Austrian dramatic soprano, born in Vienna. She studied at the conservatory in that city and with Marchesi. She was a member of the Vienna Court Opera (1860-67), at the Théâtre Italien (1867-71), and, after singing at Baden and Milan, was engaged at the Grand Opéra, Paris (1875-86). In 1880 she was made an officer of the Académie. Her most famous rôles were Mathilde (in *Les Huguenots*), Aida, Marguerite (in *Faust*), and Desdemona.

KRAUTH, krouth, CHARLES PORTERFIELD (1823-83). An American Lutheran theologian, son of Charles Philip Krauth. He was born at Martinsburg, Va., graduated at Pennsylvania College, Gettysburg, in 1839, and at the theological seminary there in 1841. Ordained to the ministry, he served as pastor of churches in Virginia, Maryland, and Pennsylvania until 1864, when he was appointed professor of systematic theology in the Lutheran Theological Seminary at Philadelphia. Here he remained until his death. He was also professor of intellectual and moral philosophy at the University of Pennsylvania after 1868 and vice provost of the same university after 1873. Krauth was chairman of the Old Testament company of the American Bible Revision Committee and an authority on the history, doctrines, and liturgy of the Lutheran church. His most important works were *The Conservative Reformation and its Theology* (1871) and *Vocabulary of Philosophical Sciences* (1879).

KRAVITCHINSKI, kráf-chín'ski. See STEP-NIAK.

KRAYEVSKY, krä-yéf'ski, or **KRAEVSKI**, ANDREI ALEXANDROVITCH (1810-89). A Rus-

sian journalist, born in Moscow. He was educated at the university there and taught for a time, but began editorial work in 1839 with the *Otechestvennyia Zapiski*, which he continued for 10 years, being also connected with the *Russkii Invalid* from 1857. In 1863 he established the *Golos*, an influential paper, on the Liberal side of Russian politics, which had a very large circulation.

KRAY VON KRAJOWA, kri fôn krà-yô'vâ, PAUL, BARON (1735-1804) An Austrian general, born at Késmárk, Hungary. He entered the Imperial army in 1754, fought in the Seven Years' War and in the war with the Turks (1788-89), became major general and Baron after the Peace of 1790, and commanded in the Netherlands. In 1794 he defeated Pichegru at Catrou, in 1796 beat Kléber near Wetzlar, took part in the battles of Amberg and Würzburg, and was made field marshal lieutenant. His reverses in 1797 were followed by the victories of Verona, Legnago, Magnano, and Mantua in the Italian campaign of 1799. In the following year he succeeded Archduke Charles in command of the army in Germany, but was unsuccessful. The truce of Parsdorf brought to an end his operations in Germany, and he was compelled to turn over the command to Archduke John. He retired to Pest and died there.

KREATINE (from Gk κρέας, *kreas*, flesh), or **CREATINE**, $C_4H_7N_3O_2$. An organic substance found in considerable quantities in the muscles and the nervous tissues of vertebrata. When boiled with baryta water, it is readily converted into urea, and hence it is considered as one of the probable mother substances of urea in the body. It also occurs in urine, but the fact that it is found there has been attributed to the transformation of an allied substance, kreatinine, during the process of extraction. Kreatine may be prepared from Liebig's beef extract by dissolving in water and precipitating the solution with an excess of basic acetate of lead, the kreatine remaining in solution; the excess of lead is eliminated by passing a current of sulphureted hydrogen through the solution, which is again filtered and evaporated on the water bath to the consistency of a thin sirup. On standing in a cool place the kreatine separates out from the latter in somewhat impure form; it is then purified by recrystallization from water. With one molecule of water kreatine crystallizes in the form of colorless rhombic prisms, sparingly soluble in cold water and alcohol and insoluble in ether, but very readily soluble in hot water. Chemically kreatine acts as a weak base, forming crystalline compounds with acids. Its presence may be detected by converting it into kreatinine (by boiling with dilute mineral acids) and identifying the latter (See KREATININE.) The chemical constitution of kreatine is represented by the following formula:

KREATININE, or **CREATININE** (from *kreatine*), $C_4H_7N_3O$. A chemical substance closely allied to kreatine, from which it may be prepared by heating with dilute mineral acids. It is a natural constituent of urine and of the muscles of certain fishes and has been found in small quantities in sweat. It is a colorless crystalline substance, soluble in water and in

alcohol and acting as a strong base, forming crystalline compounds with acids. One of its characteristic reactions is the direct combination with zinc chloride, resulting in the formation of a crystalline salt having the formula $(C_4H_7N_3O).ZnCl_2$. By this reaction kreatinine may be readily prepared from urine, which is for this purpose evaporated to a small volume and precipitated with zinc chloride; the zinc chloride compound of kreatinine is decomposed by boiling with oxide of lead, and the kreatinine thus set free is purified by crystallization. The zinc chloride reaction may also be employed for detecting the presence of kreatinine. The following (*Jaffé's reaction*) is another delicate test for kreatinine: A small quantity of a solution of picric acid in water is added to the liquid in which the presence of kreatinine is suspected; if then a few drops of a weak sodium hydroxide solution are added, an intense red coloration is produced if kreatinine is present. Kreatinine is readily converted into kreatine by combining with the elements of water. (See KREATINE.) The chemical constitution of kreatinine is represented by the following formula:

KREBS, krëbz. A city in Pittsburg Co., Okla., 3 miles (direct) east-southeast of McAlester, on the Chicago, Rock Island, and Pacific, and the Missouri, Kansas, and Texas railroads (Map: Oklahoma, F 4). It is in a productive coal and cotton region, coal mining being the chief industry. The water works are owned by the city. Pop., 1900, 1508; 1910, 2884.

KREFELD, krä'felt, or **CREFELD**. A prominent manufacturing town of Prussia, situated in the Rhine Province, near the left bank of the Rhine, 34 miles northwest of Cologne (Map: Prussia, B 3). Among its few noteworthy buildings may be mentioned the town hall, with good frescoes, and the Kaiser Wilhelm Museum, with work by the Della Robbias, Eberlein, Meunier, and Rodin. It has many memorials, including one to Karl Wilhelm. The educational institutions include a Gymnasium, two Realschulen, a textile academy, with a textile museum, a teacher's seminary, a commercial academy, an agricultural school, and a conservatory of music. As a centre of the silk and the velvet industries, Krefeld has few rivals in Europe. These industries, established by the Protestants and Mennonites during the seventeenth and eighteenth centuries, employ over 20,000 looms and now give occupation to the larger part of the industrial population and yield an annual output of over \$20,000,000. It has a harbor on the Rhine and does a good river trade. Krefeld manufactures cotton goods, machinery, spirits, carpets, cravats, soap, celluloid, and chemical goods, boilers, leather, and beer. A railway repair shop is located here. The commerce is chiefly in local manufactures and coal. Pop., 1900, 106,893; 1910, 129,406, over four-fifths Roman Catholic. Krefeld is first mentioned in 1166. It obtained municipal privileges in 1373, and, after having been in the possession of the Count of Mors and the princes of Nassau-Orange, it passed with the death of William III of England to Prussia.

KREHBIEL, krä'bél, HENRY EDWARD (1854-). An American musical author and critic, born at Ann Arbor, Mich. He studied law in

Cincinnati, where he acted as musical critic of the *Cincinnati Gazette* from 1874 to 1878. Later he studied the history and theory of music and eventually came to be known as a leading critical authority. For a time he was editor of the *New York Musical Review* and in 1880 he became musical critic of the *New York Tribune*. His writings include: *Studies in the Wagnerian Drama* (1891); *The Philharmonic Society of New York: A Memorial* (1892); *How to Listen to Music* (1896); *Music and Manners in the Classical Period* (1898); *Chapters of Opera* (1908); *The Pianoforte and its Music* (1910); *Afro-American Folk-Songs* (1913). In collaboration with Russell Sturgis he published the *Annotated Bibliography of Fine Art* (1897). Other works are *A Translation of Courvoisier's Technique of Violin Playing* (2d ed., 1896) and articles in *Music of the Modern World* (1895-97). He was American editor of the new edition of *Groves's Dictionary of Music and Musicians* (1904-10).

KREHL, kräl, CHRISTOPH LUDOLF EHRENFRIED (1825-1909). A German Orientalist, born at Meissen, and educated at Leipzig, Tübingen, Paris, and St. Petersburg. After a year's residence in the latter place, he became secretary of the Royal Library of Dresden in 1852 and in 1861 went to Leipzig as librarian of the university and professor of Oriental languages. He wrote: *Ueber die Religion der vorislamischen Araber* (1863), *Ueber die koranische Lehre von der Prädestination* (1870), *Beiträge zur Charakteristik der Lehre vom Glauben im Islam* (1877), *Das Leben und die Lehre des Muhammed*, vol. 1 (1884); and edited certain Arabic texts.

KREIL, kril, KARL (1798-1862). An Austrian meteorologist and astronomer, born in Ried. He was educated at the University of Vienna, where he studied law before devoting himself to astronomy. In 1827 he became an assistant at the Vienna Observatory, from which he went to Milan in 1831 and thence in 1838 to Prague, where he was from 1845 to 1851 director of the observatory. In 1851 he returned to Vienna to take charge of the Central Meteorological and Magnetic Bureau. He made particularly important studies of terrestrial magnetism, discovering (1841) that it is practically unaffected by the moon, and writing *Anleitung zu den magnetischen Beobachtungen* (2d ed., 1858). Many automatically registering meteorological machines were devised by him. He edited from 1849 until his death the *Jahrbuch* of the Central Bureau at Vienna. Among his many published works are: *Cenni storici e teorici sulle comete* (1832); *Ueber die Natur und Bewegung der Kometen* (1843), studies of lunar influence on magnetic declination and on atmospheric conditions; and *Klimatologie von Böhmen* (1865).

KREISLER, kri'zlér, FRIEDRICH (1875-). An Austrian violinist, born in Vienna. When only seven years of age, he was admitted to the Vienna Conservatory and the class of Hellmesberger. Having won the gold medal for violin playing in 1885, he left and went for further study to Paris, where he became a pupil of Massart (violin) and Delibes (composition) at the Conservatoire. At the end of two years he left that institution also as the winner of the gold medal. Equipped with a stupendous technique, he began his concert tours in 1888 and visited the United States in the following

year, appearing jointly with Moritz Rosenthal. After his return he temporarily abandoned the violin, studying art and medicine and serving a year in the army. In the spring of 1899 he reappeared in Berlin and in the fall made a second tour of the United States. It now became evident that he had completely changed his ideals. From a fabulous technician, whose chief ambition seemed to be a desire to rival Paganini, he had developed into an interpretative artist of the first rank. To-day the verdict of those most competent to judge is that Kreisler is, without any qualification, the greatest living master of the violin. His repertory is enormous, comprising practically everything of note that has been written since the seventeenth century. Certainly no other violinist offers programmes of such variety or diversity of styles. He plays throughout the civilized world, and a season seldom passes that he does not appear in the United States. In 1914 he fought for Austria in the European War until he was wounded at Lemberg. Later in the year he was able to come to America to fill engagements.

KREITTMAYR, krit'mir, ALOYS WIGULAUS, BARON VON (1705-90). A Bavarian jurist and statesman, born in Munich. He studied law at the universities of Salzburg, Ingolstadt, Utrecht, and Leyden, and in 1745 was made a member of the Privy Council at Munich and created Baron. In 1749 he was made Vice Chancellor and Cabinet Minister, and held the former office until his death. He codified the most important branches of law of his country, under such titles as *Codex Juris Bavarici Criminalis* (3d ed., 1785), *Codex Juris Bavarici Judiciarii* (latest ed., 1841), and *Codex Maximilianus Bavaricus Civilis*, supplying every section with annotations (latest ed., 1841). He also published *Grundriss der gemeinen und bayerischen Privatrechtsgelehrsamkeit* (1768) and *Grundriss des allgemeinen deutschen und bayerischen Staatsrechts* (2d ed., 1789). In recognition of his services to the state a monument was erected to his memory at Munich in 1845. Consult the biography by Kalb (Munich, 1825).

KREILING, krä'ling, AUGUST VON (1819-79). A German painter and sculptor. He was born at Osnabrück, May 23, 1819, and studied sculpture under Schwanthaler at Munich, but soon began painting. His first important work was the decoration of the ceiling of the Royal Theatre in Hanover. In 1853 he was appointed director of the Art School at Nuremberg, which he developed into a prominent school of industrial art. At the same time he painted a large fresco, the "Coronation of Louis the Bavarian," for the Maximilianeum at Munich; restored and decorated the old castle at Nuremberg; modeled colossal bronze statues of Prince Henry of Reuss, at Gera, and of Kepler, at Weil, and the large bronze fountain presented by Mr. Probasco to Cincinnati. His best-known painting is "The Education of Erwin von Steinbach," in the Museum of Hanover.

KRELL, or **CRELL**, NIKOLAUS (c.1551-1601). A Saxon Chancellor and religious reformer. He was born at Leipzig, educated there, was made Chancellor in 1589, and, becoming a convert to Calvinism, used his office to the full to favor that form of Protestantism, although fully aware of the strong attachment of his fellow countrymen to Lutheranism. He introduced a Calvinistic catechism, and an edition of the German Bible with Calvinistic notes

MOSCOW
THE KREMLIN

—hence called Krell's Bible. He substituted Calvinists for Lutherans in prominent pulpits and did not require subscription to the Formula of Concord. In 1591, on the death of Christian, Elector of Saxony, who had upheld him, he was deposed, imprisoned, and tried, partly on political but also on religious grounds. After long imprisonment he was beheaded in Dresden, Oct. 9, 1601. Consult: Georg Brandes, *Der Kanzler Krell* (Leipzig, 1873); Bohnenstaad, *Das Processverfahren gegen den kursächsischen Kanzler Dr Nicolaus Krell, 1591 bis 1601* (Halle, 1901). See CRYPTO-CALVINISTS.

KREMENETZ, krēm'ye-nyét's. The chief town of a district of the same name in the Government of Volhynia, Russia, 182 miles west of Zhitomir (Map: Russia, C 4). In the vicinity are the ruins of an ancient Polish castle. Flour, mead, and beer are the chief products, and there is some trade in grain. Kremenetz is a town of considerable antiquity, dating from the eighth century. It was besieged by the Mongols in 1241 and 1245 and was the residence of Queen Bona Sforza from 1522 to 1527. Pop., 1912, 18,752, of whom one-third are Jews.

KREMENTCHUG, krēm'en-chöög'. The capital of a district of the same name, in the Government of Poltava, Russia, situated on the left bank of the Dnieper, 60 miles south-southwest of Poltava (Map: Russia, D 5). It has extensive manufactures of tobacco, agricultural machines, flour, carriages, trimmed lumber, etc. The town is a great mart for salt, tallow, brandy, and linseed, and is the centre of a rich agricultural district the produce of which is brought both by rail and river. In addition to its manufactures there is a flourishing trade in wheat, rye, barley, buckwheat, timber, and oats. The chief buildings are the cathedral, the arsenal, and the town hall. Pop., 1912 (including the town of Krukov, on the opposite bank of the Dnieper), 98,652, about 45 per cent of whom are Jews.

KREMER, krām'ēr, ALFRED, BARON VON (1828-89). An Austrian Orientalist and politician. He was born in Vienna, was educated there, and on the recommendation of Hammer-Purgstall the Vienna Academy of Sciences sent him to Syria and Egypt (1850). When he returned, he was appointed professor of modern Arabic in the Polytechnic Institute of Vienna. Soon afterward (1852) he became interpreter to the Austrian consulate in Egypt, and he was advanced to be Consul at Cairo (1859), at Galatz, Rumania (1862), and at Beirut (1870). In 1872 Kremer was made ministerial counselor, in 1876 was sent to Egypt as member of the Egyptian Debt Commission, and in 1880 was made Minister of Commerce, but held the position less than a year. His most important writings are: *Mittelsyrien und Damaskus* (1853); *Dwan des Abu-Nuwas* (1885); *Ägypten: Forschungen über Land und Volk* (1863); *Ueber die sudarabische Sage* (1866); *Geschichte der herrschenden Ideen des Islams* (1866); *Kulturgeschichtliche Streifzüge auf dem Gebiete des Islams* (1873); *Kulturgeschichte des Orients unter den Chalifen* (1875); *Beiträge zur arabischen Lexikographie* (1883-84). In Austrian politics Kremer was opposed to Slavic pretensions and to the clergy. Consult his *Die Nationalitätsidee und der Staat* (Vienna, 1885).

KREMER'S, krēm'ēr's, EDWARD (1865-). An American pharmacist. Born in Milwaukee, Wis., he was educated at the University of

Wisconsin (Ph.G., 1886; B.S., 1888), and at Göttingen (Ph.D., 1890). He returned to the University of Wisconsin, where he was instructor in pharmacy in 1890-92, professor of pharmaceutical chemistry after 1892, director of the course in pharmacy after 1899, and director of the Pharmaceutical Experiment Station after 1913. He was editor of the *Pharmaceutical Review* from 1896 to 1900, scientific editor of the *Midland Druggist and Pharmaceutical Review* in 1909-10, and coeditor of the *Standard National Dispensary* With Gildemeister and Hoffmann, he is author of *The Volatile Oils* (1900, 2d ed., 1913), a subject on which he became an authority.

KREM'LIN. A name of uncertain origin, used to designate the citadel in a Russian city. The best-known kremlin is that of Moscow (q.v.). The kremlins of Novgorod (q.v.) and Rostov (q.v.) are also of considerable historical interest.

KREM'NITZ (Hung. *Kormóczbánya*). A royal free town of the County of Bars, Hungary, 158 miles by rail north from Budapest (Map: Hungary, F 2). It is surrounded by walls and contains an old town hall, with valuable archives, a mint, an old castle, thirteenth and fourteenth century churches, and the house of Queen Mary. The town is famous for the gold and silver mines situated in the vicinity and still included among the richest in Hungary. All coinage in Hungary is done in the Kremnitz mint. It also has manufactures of paper, ochre, and stoneware. Pop., 1900, 4306 (with surrounding villages, 8906); 1910, 4515, mostly Roman Catholics.

KREM'NITZ, MITE (MABIE) (1854-). A German author, born at Greifswald and married to a physician who settled at Bucharest in 1875. Brought into friendly relations with Queen Elizabeth of Rumania (Carmen Sylva), she published, in collaboration with the latter, *Rumanische Dichtungen*, translations (3d ed., 1889), and, under the pseudonym Dito und Idem, the drama *Anna Boleyn* (1886), the novels *Aus zwei Welten* (7th ed., 1901) and *Astra* (3d ed., 1887), and the collections of stories *In der Irre* (4th ed., 1901) and *Rache und andre Novellen* (1889). Her other writings include: *Rumanische Skizzen* (1877); *Rumanische Märchen* (1882); *Carmen Sylva: Ein Lebensbild* (1882), the novels and tales *Ausgewanderte* (1890), *Elina* (1895, 2d ed., 1910); *Herr Baby* (1901); *Mann und Weib* (1902); *Am Hofe von Ragusa* (1902), *Fatum* (1903), *Eine Hilfloze* (1906), *Siegerin Zeit* (1907); *Die Geträuschten* (1909); *Laut Testament* (1910; 3d ed., 1911). Under the pseudonym George Allan she wrote *Fluch der Liebe* (1881) and other stories. In 1897 she removed to Berlin.

KREM'NITZ WHITE. See WHITE LEAD.

KREMS, krēms. A town of Lower Austria, situated at the confluence of the Krems with the Danube, 40 miles by rail northwest of Vienna (Map: Austria, D 2). It is adjacent to the town of Stein, located on the edge of the river. Krems has four churches, an old town hall with archives, a teachers' seminary, a Piarist college, a school of commerce, a vintners' school, a library, and a noteworthy city museum. It manufactures steel products, white lead, chocolate, mustard, machinery, small firearms, and deals also in wine and saffron. Pop., 1900, 12,657; 1910, 14,384.

KREMSIER, krēm'sér. A town of the

Crownland of Moravia, Austria, situated in a fertile region on the March, 20 miles south-southeast of Olmütz. It consists of the old walled town and a number of suburbs and contains a collegiate church, an archiepiscopal palace with a fine library of 24,000 volumes, several Gymnasias, a seminary for teachers, a denominational school, an agricultural school, and two conservatories of music. The chief manufactures are machinery, sugar, flour, and malt. There is trade in barley, fruit, and cattle. During the revolutionary troubles of 1848-49 the Austrian Reichstag met here for several months. Pop., 1900, 13,991, 1910, 16,528, mostly Roman Catholic Czechs.

KRES. See KRIS.

KRESTOVSKI, krës-töf'ski, V. The pseudonym of the Russian author Nadezhda Dmitrievna Khvoshtchinskaya (q.v.).

KRESTOVSKI, VSEVOLOD VLADIMIROVITCH (1840-95). A Russian historian and romancer, born in the Government of Kiev. He studied at the University of St. Petersburg, but left without graduating, to enter a cavalry regiment, whose history he wrote (1874). His literary work he gained the appointment of military historian and published an official account of the Russo-Turkish War (1879). Besides this and meritorious translations of Horace, Vergil, and Heine (appearing in periodicals after 1857), he produced a number of novels, in the manner of Eugène Sue, such as *Ne porvyni i ne poslednu* (Neither the First Time nor the Last) (1859), *The Sphinx* (1860), and *The Saint Petersburg Slums* (1867), written in imitation of Sue's *Mystères de Paris*. A complete edition of his works was published in 1873; a second edition in 1903.

KRETSCHMANN, krëch'mân, KARL FRIEDRICH (1738-1809). A German poet, born at Zittau. He studied law at Wittenberg and held legal offices in Zittau until 1797. His defense of the exploded theory of Germanic bards did much to make him ridiculous, but his epigrams, lyrics, and tales brought him a reputation for unusual felicity of diction. He was an imitator of Klopstock (q.v.) and Gerstenberg (q.v.). His works include *Der Gesang Rhingulphs des Barden* (1769); *Kleine Romane und Erzählungen* (1799-1800), and the comedies, *Die Familie Eichenkron*, *Die Belagerung*, and *Der alte böse General*. His complete works were published at Leipzig (1784-1805). Consult Knothe, K. F. *Kretschmann* (1858), and Ehrmann, *Die bardische Lyrik im achtzehnten Jahrhundert* (Halle, 1892).

KRETSCHMER, krëch'mër, EDMUND (1830-1908). A German musician, born at Ostritz in Saxony. He studied music with J. Otto and J. Schneider in Dresden, where in 1854 he became organist of the Catholic church and court organist in 1863. Two years later his *Gesterschlacht* won first prize at the first German Sängerefest (Dresden), and in 1868 a *Mass* won a prize at the international competition in Brussels. He founded and conducted several choral societies. His operas, *Die Folkunger* (1874), *Heinrich der Lowe* (both words and music, 1877), and *Schon Rotraut* (1887) were popular; and he also wrote masses, suites, etc.

KRETSCHMER, PAUL (1866-). A German philologist. He was born in Berlin; was educated in the University of Berlin, where he became docent in 1891; and became professor at Marburg in 1897 and at Vienna in

1899. In 1907 he undertook the editorship of *Glotta*, a periodical devoted to Greek and Latin linguistics. His great work was the valuable and critical *Einleitung in die Geschichte der griechischen Sprache* (1896). He also published: *Griechische Vasenschriften* (1894); *Entstehung der Koine* (1900); *Die heutige lesbische Dialekt* (1905).

KRETZER, krët'sër, MAX (1854-). A German novelist and dramatist. He was born at Posen, went to Berlin while he was young, worked in a factory, became a painter's assistant, and educated himself. While recovering from injuries suffered in an accident, he took up literature, continued his education as an autodidact, and made a reputation as a novelist of the Naturalistic school, especially with his Socialistic novel *Meister Timpe* (1888, 4th ed., 1908). His writings include: *Die beiden Genossen* (4th ed., 1900); *Sonderbare Schwärmer* (3d ed., 1903). *Drei Weser* (1885), *Im Sündenbabel* (1886, 2d ed., 1905); *Die Bergpredigt* (4th ed., 1901), *Der Millionenbauer* (15th ed., 1911; dramatized, 1891), *Gefährtes Haar* (1891); *Die Buchhalterin* (1893), *Der Bassgeiger* (last ed., 1895); *Die gute Tochter* (1895, 2d ed., 1900), *Der blinde Maler Ulrich* (1896); *Das Gesicht Christi* (1899; 6th ed., 1911); *Verbundene Augen* (1899), *Treibende Kräfte* (1903), *Familienklaven* (1904), *Das Armband* (1905) the plays *Bürgerlicher Tod* (1888); *Der Sohn der Frau* (1898), *Die Verderberin* (1900); *Der wandernde Taler* (1902); *Der Holzhandler* (1900; 20th ed., 1911); *Der Mann ohne Gewissen* (1905; 2d ed., 1907), *Das Kabarettferkel* (1907); *Der Mut zur Sünde* (1909; 2d ed., 1910); *Reue* (1910); *Waldemar Tempel* (1911); *Die flanken Knöpfe* (1912); *Stehe auf und Wandle* (1913) the epic, *Im Sturmwind des Sozialismus* (1883; 10th ed., 1907), in which there is a marked tendency towards Socialism: and verse, *Gedichte* (1914). In his earlier works, which give wonderful pictures of the life of the German laborer, he was successful; but when he undertook to rise to the heights of the artistic novel, he failed. He has been called the German Zola. Consult Kloss, *Max Kretzer* (1896).

KRETZSCHMAR, krëch'mär, AUGUST FERDINAND HERMANN (1848-). A German musician, born at Olbernhau. In 1871 he became teacher of harmony and the organ at the Leipzig Conservatory, of which he was a graduate. In 1887 he became musical director at the University of Leipzig. A good organist and composer, he was more famous as a critic. In 1904 he became professor of the history of music at the University of Berlin. Among his writings are *Führer durch den Konzertsaal* (3 vols., 1887) and the essays, *Brahms*, *Venetian Opera*, *Peter Cornelius*, and *Die deutsche Klaviermusik seit Schumann*.

KREUTZER, kroi'tsër, KONRADIN (1780-1849). A German composer, born in Baden. He was for two years a medical student at Freiburg, but abandoned his medical studies and devoted himself to music. As a boy, he had studied music with Rieger and Ernst Weihrach, and at 20 years of age he produced his first operetta, *Die lachertliche Werbung*. Ten years of study (part of the time under Albrechtsberger for counterpoint) followed, during which time he produced *Æoip in Phrygien* (1808) and *Jery und Bately* (1810). He now made several successful tours as a concert pianist and pro-

duced a number of dramatic works. In 1817 he was appointed kapellmeister to Prince Fürstenberg. In 1822 he became kapellmeister at the Kärntnerthor Theater at Vienna, which position he held for varying periods up to 1849, part of the time acting in a similar capacity at the Josephstädter Theater. In 1840 he went to Cologne, in 1846 he returned to the Kärntnerthor Theater, but left it soon to become kapellmeister at Riga, where he died. He was the composer of about 30 operas and one oratorio, besides church music, chamber music, pianoforte pieces, and songs, choruses, etc. Of his smaller compositions a few of his songs and some of his male choruses alone remain popular. Of his operas only two have retained the interest of his countrymen, *Das Nachtlager von Granada* (1834) and *Der Verschwendende* (1836).

KREUTZER, RODOLPHE (1766-1831). A famous French violinist and composer. He was born at Versailles and received his earliest education from his father, who was a musician in the Royal Chapel, and later he was placed under Stamitz. By the time he was 13 years of age he had successfully appeared in public, and before he was 21 had numerous compositions to his credit. In 1797 he made a tour through Italy, Germany, and Holland, after which he returned to Paris with an established reputation as a violinist. He obtained the patronage of Marie Antoinette and at the same time became violinist at the Opéra Comique. His next appointment was as solo violin at the Opéra in succession to Rode, soon followed by the position of *chef d'orchestre*, which he held for 14 years, when he was decorated with the Legion of Honor and became general director of music at the Opéra, a post which he retained till his retirement in 1826. He was a prolific composer, but his music, as a rule, was constructively weak, except in that written for his own instrument. The celebrated *Kreutzer Sonata* of Beethoven was dedicated to him. His works include about 40 dramatic works, two symphonies concertantes for two violins and for two violins and cellos, concertos, quartettes, trios, duets, five sets of sonatas for violin and bass, eight sets of studies for violin, and airs with variations. He collaborated with Rode and Baillot in the preparation of the celebrated violin method used in the Paris Conservatory. He died in Geneva. Consult H. Kling, *Rodolphe Kreutzer* (Brussels, 1898).

KREUTZER SONATA. A novel by Lyoff (Leo) Tolstoy (q.v.), published in 1890. It is an attack on the conventional marriage of contemporaneous society. At the time of its publication it was considered an attack on all marriage and consequently aroused bitter antagonism.

KREUZER, krois'tsēr (Ger., from *Kreuz*, cross, formerly stamped on it). A small coin, originally silver, but later copper, current until 1876 in south Germany, the sixtieth part of the gulden or florin (q.v.). The term also applies to a small coin of Austria, equal to two heller, or one-fiftieth of a krone, equivalent to four-tenths of a cent.

KREUZNACH, kroits'näg. A town and health resort in the Rhine Province, Prussia, on both sides of the Nahe, 9 miles south-southwest of Bingen (Map: Prussia, B 4). It has crooked, narrow streets and old-fashioned houses and is noted chiefly for its salt springs, discovered in 1478, which are very efficacious for skin diseases. The waters and salt of Kreuznach

are exported in considerable quantities, and the place is visited annually by about 8000 people. In the vicinity of the town are the ruins of a Roman castrum. Kreuznach has considerable manufactures of tobacco, leather, combs, and glass bottles. It has also a large trade in sparkling wine and grain. A factory has been built to extract radium from the waters. Its schools include a Gymnasium and a vintners' school. Pop., 1900, 21,334, 1910, 23,167. The town is mentioned as early as 819 as the Carolingian palatinate of Cruciaticum, and was once the capital of the County of Sponheim.

KRIEGE, krē'ge, JOHANNES (1859-). A German jurist, born in Luddinghausen. He entered the government service in 1880 and in 1886 was employed by the Foreign Office, becoming vice consul in Amsterdam. From 1889 to 1896 he held consular posts at Asunción and Serajevo, and then returned to the Berlin Foreign Office, where in 1911 he became director of the legal department. In 1900 and 1904 he was German delegate to The Hague conferences in private international law, in 1907 to The Hague Peace Conference, in 1908-09 to the London Conference on the laws of naval warfare, and in 1910 and 1912 to The Hague Conference on commercial law. In 1906 he became a member of the arbitration court at The Hague.

KRIEGSSPIEL, krēks'shpēl'. See WAR GAME.

KRIEHN, krēn, GEORGE (1868-). An American writer and lecturer on art. He was born at Lexington, Mo., graduated (1887) from William Jewell College, and, after five years of travel and study in Europe, received the degree of Ph.D. from Strassburg. He was instructor in history at Johns Hopkins University (1892-94) and assistant professor at Leland Stanford (1894-98), during several years lectured in Chicago on art topics and promoted the municipal art movement, and after 1901 resided in New York. In 1907 he became staff lecturer at the Woman's Art School of Cooper Union, and in 1912 he was appointed by Columbia University extension lecturer, at the Metropolitan Museum, on the history and appreciation of art. He wrote *The English Ruins in 1450* (1892), edited and translated Muther's *History of Painting* (2 vols., 1900), revised Ferguson's *History of Architecture* (2 vols., 1910), and had charge of the department of painting and sculpture in the first and second editions of the NEW INTERNATIONAL ENCYCLOPÆDIA.

KRIEKER, krēk'ēr. A gunners' name for one of the jacksnipe (*Pisobia maculata*).

KRIEMHILD, krēm'hilt. See NIBELUNGENLIED.

KRIMMITSCHAU, krim'it-shou. A town in Saxony. See CRIMMITSCHAU.

KRIS, krēs, KRES, CREESE, or CREASE (Malay, dagger). A Malay dagger, the universal weapon of the inhabitants of the Malayan Archipelago. It is made in many different forms—short or long, straight or crooked. The hilt and scabbard are often much ornamented; the hilt is sometimes of wood, sometimes of ivory. The blade is sometimes wavy (always with an uneven number of waves), sometimes the blade is long, straight, and very narrow. Men of all ranks wear this weapon; and those of high rank, when in full dress, sometimes carry three or four. In Java women sometimes wear it. See MALAYAN PEOPLES.

KRISHABER, kré'shà'bàr', MAURICE (1836-83). A French laryngologist, one of the founders of the modern treatment of diseases of the larynx. He was born in Fuketchegy, Hungary, and studied medicine at Vienna and Prague and at Paris, where he began to practice in 1864. He became a French citizen in 1872. He founded, with Isambert and Ladreit, the *Annales des Maladies de l'Oreille et du Larynx* (1875), devoted himself to nervous diseases, and wrote: *Des laryngopathies pendant les premières phases de la syphilis*, with Mauriac (1876); "Sur le cancer du larynx," in the *Annales* (1879); and, on "Krishaber's disease," *De la neuropathie cérébro-cardiaque* (1873).

KRISH'NA (Skt. *kṛṣṇa*, black). The eighth avatar or incarnation of the Hindu god Vishnu. See VISHNU.

KRISHNA. A river of India. See KISTNA.

KRISTIANIA, kris'tò-à-né-à. A city of Norway. See CHRISTIANIA.

KRISTIANSTAD. See CHRISTIANSTAD.

KRIZHANITCH, or **KRIZANIĆ**, kré'zhà-ních, YURI (JURI) or GEORGE (1617-c.1686). A Russian author, a promoter of Pan Slavism, and one of the earliest students of Slavic philology. He was a Serb (Croatian) by birth; was educated at Agram (his birthplace), Vienna, Bologna, and (1640) Rome, where he was trained for the work of converting the orthodox Slavs to Catholicism. This was apparently the germ in his mind of the idea of an ecclesiastical, political, and literary union of the Slavs. Russia seemed to him a promising field for this scheme, but his ideas seemed dangerous, and he was sent to Siberia. While there he wrote his Pan Slavonic grammar, *Grammatichno Iskazaniye*. In this work the Pan Slavic language is a jargon manufactured by the author, on the basis of Old Church Slavic, with admixtures of Russian and the south-Slavic languages, but the author shows no small scientific insight in his ability to see cognates. Even more important among his works and in the history of Pan Slavism was Krizhanitch's *Politius*, published by Bezsonov (*Russia in the Seventeenth Century*, 1859-60). Here he criticizes contemporary conditions in Russia and proposes remedies. His appeal to the Czar to head the Slavs in the fight against the Germans shows remarkable political foresight. He returned from Siberia in 1676, and after that date nothing is known of him. Consult Jagić, *Istoria slavianskoi filologii* (St. Petersburg, 1910).

KROEBER, krò'bér, ALFRED L(OUIS) (1876-). An American anthropologist, born at Hoboken, N. J. In 1896 he graduated from Columbia University (Ph.D., 1901). At the University of California he was instructor in 1901-06, assistant professor in 1906-11, associate professor in 1906-11, associate professor of anthropology after 1911, and curator of the Museum of Anthropology after 1908. He served also as curator of anthropology of the California Academy of Sciences in 1900 and 1903-11. He was one of the founders of the American Anthropological Association and in 1906 was president of the American Folk-Lore Society. He published many papers on the languages, myths, religion, and culture of various Indian tribes.

KROHG, kròk, CHRISTIAN (1852-). A Norwegian painter and author, born in Christiania. After his juridical examination at the University (1873), he went to Karlsruhe to study painting under Gussow, whom he followed

to Berlin (1875). After 1880 he studied in Paris, where for some time he was also teacher at the Academy of Fine Arts. In 1909 he became professor and director of the new Academy of Art in Christiania. A pronounced advocate of realism, Krohg was especially fond of portraying life at sea, as in his "Port the Helm" (1879, Christiania Gallery), "Hard-a-Lee" (1882, the Royal Castle, Christiania), "Norwegian Pilot" (1883, Dresden Gallery), "Eyewitnesses" (1885, Christiania Gallery), "Northwind" (1887), "Letter from Lofoten" (1887), "Leif Eriksson Discovers America" (1893, Christiania Gallery), "Looking for the Pilot" (1899), and "Man Overboard" (1910). Other subjects are "Dawn" (1880), "Albertine" (1886), "The Struggle for Existence" (1889, Christiania Gallery), and "17th-of-May Procession" (1899). He painted striking portraits of Johan Sverdrup, Carl Berner, Gerhard Munthe, Gerhard Gran, O. Thommessen, and August Strindberg (1893); but the portrait of his aunt (1893, Christiania Gallery) is considered his best. His numerous drawings are the collection "Kunstnere" (2 series, 1891-92), and the impressive illustrations to Ibsen's poem "Terje Viken." In Christiania Gallery he is represented with many drawings. He wrote *Foedrag om den bildende kunst som led i kulturudviklingen* (1886), *Ismaas dagreiser til og fra Paris* (1897), *Paa bycykel og jernbane* (1899), and the novels *Albertine* (1886, which was suppressed), *En duel* (1888), and *Dissonanser* (1906). His clever press interviews with well-known men he published as *12 af vore samtidige* (1895), *Egte bergensere* (1905), and *Omkring Mjosa* (1910).—ODA (or OTTILIA) KROHG, née LASSON (1860-), his wife, studied in Paris and at Malines under Gheertz. She painted "Sommernat ved Christiansfjorden" (1887, Christiania Gallery), "Lygten" (1891), and portraits of Gunnar Heiberg (1900, Stockholm Gallery) and Aasta Hansteen (Christiania Gallery) among many.

KROLL, kròl, WILHELM (1869-). A German classical scholar, born in Frankenstein, Silesia. He was educated at Breslau, Berlin, and Bonn, traveled in Italy and Sicily, became professor at Greifswald in 1899, at Münster in 1906, and at Breslau in 1913. He contributed to the *Rheinisches Museum*, to Bursian's *Jahresberichte*, to *Glotta*, and to Pauly-Wissowa's *Realencyklopadie*; edited (1910-13) the sixth edition of Teuffel's *Geschichte der römischen Literatur*; and wrote *Antiker Aberglaube* (1897), *Die Altertumswissenschaft in letzten Vierteljahrhundert* (1905), *Geschichte der klassischen Philologie* (1908).

KROMAYER, krò'mi'ér, JOHANNES (1859-). A German historian of ancient warfare. He was born in Stralsund and was educated in the universities of Jena and Strassburg. After teaching in secondary schools in Strassburg, Thann, and Metz, he traveled in Italy and Greece and led two scientific expeditions to study ancient battlefields—in Greece and Turkey in 1900 and in Italy and north Africa in 1907. He was appointed professor of ancient history at Czernowitz in 1901 and at Leipzig in 1913. His published works include *Antike Schlachtfelder* (3 vols., 1902, 1907, 1911) and *Roms Kampf um die Weltherrschaft* (1912).

KRONBERG, kròn'bàr-y', (JOHAN) JULIUS (FERDINAND) (1850-). A Swedish painter, born at Karlskrona. He entered the academy at

Stockholm at the age of 13, and in 1873 a government scholarship enabled him to continue his studies in Düsseldorf, Paris, Munich, and Rome. In 1875 he sprang suddenly into prominence with "Nymphs and Fauns" (National Museum, Stockholm), a composition of great coloristic charm in the manner of Makart. His other works include "Amorettes" (1878) and "David and Saul" (1885), both in the National Museum, Stockholm; "Death of Cleopatra" (1883); "Queen of Sheba" (1888). He was elected a member of the Stockholm Academy in 1880, and he was professor from 1885 to 1898.

KRONBERG, Louis (1872-). An American figure painter. He was born in Boston, studied at the Boston Museum School, at the Art Students' League, New York, and at the Académie Julian under Laurens and Constant. Establishing himself in Boston, he was appointed instructor in the portrait class of the Copley Society, Boston. Among his best-known works are "Behind the Footlights" (Pennsylvania Academy, Philadelphia) and "The Pink Sash" (Metropolitan Museum, New York). Kronberg is represented also in the Gardner collection, Boston, and in the museums of Boston and Indianapolis. His work shows the influence of his French training—his composition is good and his color soft and harmonious, yet with decided contrasts.

KRONECKER, krō'nēk-ēr, LFOPOLD (1823-91). A German mathematician, born at Liegnitz. He studied at the universities of Berlin, Bonn, and Breslau, and received his doctor's degree at Berlin in 1845. In 1861 he became a member of the Academy of Sciences at Berlin, and the next year he began giving lectures on mathematics in the university. In 1883 he was made professor of mathematics. Kronecker was one of the greatest of German algebraists. He gave a simpler treatment of cyclotomic equations than Gauss, improved the proof of Abel for the insolubility of the general algebraic equation of degree higher than the fourth, and made a thorough investigation of Abelian equations. He also worked out the arithmetical and algebraic problems involved in the theory of elliptic functions and materially improved the general theory. He attempted to do away with all special ideas of number, such as fractions and irrational numbers, and to construct a scientific arithmetic on the basis of the one concept "number," *die Anzahl*. This problem was later elaborated by Klein. Kronecker's most important works are *Grundzüge einer arithmetischen Theorie der algebraischen Grossen* (1882), *Ueber den Zahlbegriff* (1887); *Vorlesungen*, edited by Hensel and Netto, vol. 1 (1894). His *Werke*, edited by Hensel, were published at Leipzig in 1895-99. He assisted also in editing Crelle's *Journal für Mathematik*. Many of his published articles are found in the *Monatsberichte* of the Academy of Berlin, in the *Comptes Rendus* of the Academy of Sciences of Paris, and in the *Annales de l'École Normale Supérieure* of Paris. His correspondence with Dirichlet appeared in the *Göttingische gelehrte Anzeigen* (1885). Consult: Royal Society of London, *Catalogue of Scientific Papers*, vols. iii, x (London, 1869, 1894), and Frobenius, "Gedächtnisrede auf Leopold Kronecker," in *Königliche Preussische Akademie der Wissenschaften, Abhandlungen* (Berlin, 1893).

KRONENBERG, krō'n-en-bēr-k. A town in the Rhine Province, Prussia, near the river

Wupper, about 6 miles south-southwest of Elberfeld. It has a fine town hall, and iron and steel works. Pop., 1900, 10,220; 1910, 12,869.

KRONES, krō'nēs, FRANZ, VON MARCHLAND (1835-1902). An Austrian historian, born at Ungarisch-Ostrau in Moravia and educated at Vienna. In 1865 he was appointed professor of Austrian history in the University of Graz. His books include: *Die österreichischen, böhmischen und ungarischen Länder 1437-1526* (1864); *Zur Geschichte Ungarns im Zeitalter Franz Rákóczy's II* (1870); *Ungarn unter Maria Theresia und Joseph II.* (1870); *Zur Geschichte Oesterreichs im Zeitalter der französischen Kriege und der Restauration* (1886); *Aus Oesterreichs stillen und bewegten Tagen 1810-12 und 1813-15* (1892); *Verfassung und Verwaltung der Mark und des Herzogtums Steier von ihren Anfängen bis zur Herrschaft der Habsburger* (1897); *Oesterreichische Geschichte bis 1526* (1899); *1526 bis zur Gegenwart* (1900).

KRONES, THERESE (1801-30). An Austrian actress of much ability and grace in comic parts. She was born at Freudenthal of parents who were engaged in the theatrical business. After several provincial tours she appeared at the Leopoldstädter Theater in Vienna, where she played with Raimund, who greatly influenced her technique. In 1827 she retired from the stage for a time, being unjustly accused of complicity in the murder of Professor Blank by Jaroszyński. She wrote several plays—*Sylphide* and *Nebelgeist* among them—and is the central figure in a novel by Bäuerle (1854-55) and in a melodrama by Haffner (1861).

KRONSTADT, krō'n'stāt, or **CRONSTADT** (Hung. *Brassó*). A royal free town of the county of the same name, Transylvania, Hungary, picturesquely surrounded on three sides by the Transylvanian Alps at an altitude of 1940 feet. It is a short distance from the Rumanian frontier, 60 miles east-southeast of Hermanstadt, and is the largest and most important industrial and commercial town in Transylvania (Map: Hungary, J 4). The inner town is surrounded by a part of the old fortifications and promenades and is commanded by the citadel of Schossberg, erected in 1553 to ward off the attacks of the Wallachs. There are also the fourteenth-century Gothic Protestant church (known as the "black church" on account of its smoke-stained walls, the result of the great fire of 1689), with a modern carved altar, a fine altarpiece, and one of the largest organs in the Kingdom; the old church of St. Bartholomew; and the town hall, dating from 1420. Not far from the latter stands the large Kaufhaus, erected in 1545. The Blumenau district is given to manufactures, while the upper suburb is inhabited by Rumanians. Kronstadt has the Honterus (Protestant) Gymnasium, with a museum of natural history and archaeology and a library founded in 1544; a seminary for teachers, a Rumanian Gymnasium, commercial academy, and a theatre. Chiefly important are its products of wood and metal; but it manufactures cloth, leather, sugar, stoneware, paper, blankets, Portland cement, and candles. There are also many small industries. Pop., 1900, 36,646; 1910, 41,111. Magyars, Wallachs (Rumanians), and Germans, mostly Protestants. Kronstadt is said to have been colonized in the thirteenth century by the Teutonic Knights. It was destroyed by the Tatars and the Turks in the

fifteenth century and became in the sixteenth century the centre of Protestantism in Transylvania, Johannes Honterus, "the Apostle of Transylvania," having preached here.

KRONSTADT, krón'shtát. A strong sea fortress and port of Russia, situated on the island of Kotlin, in the eastern part of the Gulf of Finland, 31 miles west of St. Petersburg (Map: Russia, C 2). It is regularly built and very strongly fortified by walls, earthworks, forts, and batteries. It has three harbors, including a commercial harbor, accommodating 1000 vessels. Prior to the construction of the sea canal from Kronstadt to St. Petersburg sea-going vessels usually unloaded at Kronstadt, and the freight was carried to St. Petersburg in small steamers. The completion of the canal made the port of St. Petersburg accessible to large vessels, with the result that Kronstadt greatly declined in commercial importance. The town has numerous public buildings, being the seat of the Admiralty and an important naval station. The house which Peter the Great occupied in 1710 is one of the sights of the town, and some interesting specimens of the workmanship of the Czar carpenter are found in the churches. The educational institutions comprise two Gymnasias, a naval and a marine engineer's school, and a school for sailors. The city also contains a naval and a civil hospital and the British seaman's hospital, supported by a tax on British shipping. The industries of the town are chiefly in connection with the government navy yards, but there are also machine works, saw mills, etc. The sea commerce of Kronstadt is still very important, and the port is connected by steam with Riga, Stockholm, Stettin, Lübeck, and Hull. During a part of the winter, during which the port is icebound on the average of 150 days each year, the transportation of freight from Kronstadt to St. Petersburg is effected by means of a railway line built on the ice. Kronstadt was founded by Peter the Great in 1710. It forms a separate administrative division under a military governor, who is also the commander of the port. Pop., 1911, 68,273

KROPOTKIN, PETER ALEXEYEVITCH, PRINCE (1842-). A Russian geographer and anarchist, born at Moscow. He became a member of the corps of *pages de chambre*—a privilege much sought after by the nobility because of the intimate relation of the pages with the Imperial family—and received an excellent education in physical and military science. It was the ambition of his father that Kropotkin should devote his life to service at the court; but the life at St. Petersburg repelled him, and in 1862 he elected service in a Cossack regiment which was to be stationed in the Amur region in Siberia. There he engaged in several important administrative duties and made explorations in parts of Manchuria, then wholly unknown to geographical science. A study of the economic conditions of the Amur settlements led him to entertain schemes for important reforms; but the bureaucratic administration rendered any reform impossible, even thwarting improvements initiated by the settlers. This experience first prepared him for anarchism. In 1867 he returned to St. Petersburg and entered the university. His explorations in Asia had convinced him that the maps of that continent were based on an erroneous principle. After two years of work he published a new hypothesis,

which has since been adopted by most cartographers. In a geological expedition to Finland Kropotkin discovered that all of northern Europe was once covered by an icecap, an opinion still combated at this date by high authorities, though urged by Venetz (1829), Agassiz (1840), Ramsay (1864), and Torell still earlier. Observation of the economic conditions of the Finnish peasants inspired in him a feeling that natural science avails little so long as the social problem remains unsolved. In 1872 he visited western Europe and spent some months in Switzerland, at that time the centre of the propaganda of the International Workingmen's Association. Kropotkin joined the more conservative collectivistic wing of the party, but soon went over to the Bakunists, or Anarchists. Returning to Russia, he found the nihilistic movement well under way and joined the Circle Tchaikovsky, a revolutionary society with branches throughout Russia. For two years he was busily engaged in carrying on an anarchistic propaganda, devoting a part of his time, however, to geographical science. In 1874 he was arrested and consigned to the fortress of Peter and Paul at St. Petersburg, where by special favor he was permitted to elaborate the results of his explorations in Finland. After two years of imprisonment he escaped to England and in 1877 went to Switzerland, where he again became actively engaged in the anarchistic movement. In 1879 he began to publish at Geneva *Le Révolte*, the organ of his party. After the assassination of Alexander II he was expelled from Switzerland and after a brief stay in England settled in Thonon, France, where he continued to publish *Le Révolte*. He was arrested in 1883 for alleged complicity in anarchistic plots at Lyons and was sentenced to five years' imprisonment. In 1886 he was set free and went to England, where he took an active part in the socialistic movement of that year. Since that time he has lived in England, devoting himself to writing and lecturing in defense of anarchism. He visited the United States in 1900.

While a believer in revolution as a necessary means to social reform, Kropotkin has always displayed a disinclination for violent measures. His ideal is a society of small communities of equals, federated for the purpose of securing the greatest possible sum of well-being, with full and free scope for every individual initiative. Government and leadership have no place in his scheme of social organization. He recognizes that it is impossible for any man to conceive the method of operation of such a society, but trusts to the collective wisdom of the masses to solve the problems involved.

Kropotkin's writings include: *Paroles d'un révolté* (1884); *In Russian and French Prisons* (1886); *La conquête du pain* (1888; Eng. trans., *The Conquest of Bread*, 1906, new ed., 1913); *L'Anarchie, sa philosophie, son idéal* (1896; Eng. trans., 1897); *The State: Its Part in History* (1898); *Fields, Factories, and Workshops* (1899; 8th ed., 1912); *Mutual Aid, a Factor in Evolution* (1902; 2d ed., 1903); *Modern Science and Anarchism* (1903; rev. ed., 1912); *The Orography of Asia*, with maps (1904); *The Desiccation of Asia* (1904); *Ideals and Realities in Russian Literature* (1905); *The Great French Revolution, 1789-1793* (1908); *Terror in Russia* (1909); *La science moderne et l'anarchie* (1912). Consult Kropotkin's own *Memoirs of a Revolutionist*

(Boston, 1899; 3d ed., 1908; French, German, Dutch, Swedish, Danish, Spanish, Italian, Russian trans.); Emil Daniels, "Der Anarchist Fürst Kropotkin," in *Preussische Jahrbuch*, vol. cii (Berlin, 1900); Fritz Havelka, "Fürst Peter Kropotkin und der Anarchismus," in *Zeitschrift für Volkswirtschaft, Sozialpolitik, und Verwaltung*, vol. x (Vienna, 1901); Federico de Roberto, "Pietro Kropotkin," in *Nuova Antologia*, vol. ccii (5th series, Rome, 1905); Victor Robinson, *Comrade Kropotkin* (New York, 1908).

KROTOSCHIN, krò'tò-shên. A town in the Prussian Province of Posen, 43 miles northeast of Breslau (Map Prussia, G 3). Its manufactures include machinery, iron, bricks, trimmed lumber, dairy products, and beer. Pop., 1910, 13,064.

KRÖYER, krëy'ër, PETER SEVERIN (1851-1909). A Danish genre and portrait painter, born at Stavanger, Norway. He was a pupil of the Copenhagen Academy and afterward studied in Paris under Bonnat. He traveled extensively in Europe, especially in Italy, and his "The Italian Village Hatmakers" is in the Copenhagen Gallery. It is a model of vigorous realistic work. After his return to Denmark he devoted himself largely to painting life at Skagen, subjects such as "Fishermen Setting out by Night," "Artist's Breakfast at Skagen," "A Summer Day upon the Beach at Skagen," and "The Musical Soirée." His most notable portrait studies are "The Committee for the French Section of the Copenhagen Exhibition of 1888," and "A Meeting of the Society of the Sciences," in which, as in all his interiors, he shows great skill in the handling many figures and in the management of light.

KROZET (krò-zä') ISLANDS. A volcanic archipelago in the Indian Ocean. See CROZET ISLANDS.

KRU, kröö, or **KRUMEN**, kröö'men. A tribe of negroes living on the coasts of Liberia and French Guinea in West Africa. The Kru are among the few African tribes that are skilled in seafaring. They are noted as boat builders and as hardy sailors and are valued as crews for men-of-war and merchant ships. They are also the best factory workers of all the negroes, and one may depend on their obedience, faithfulness, and courage. Their fairness in bargain and readiness to enter into engagements have given them a great part of the trade of their country. Consult Büttikofer, *Reisebilder aus Liberia*, vol. i (Leyden, 1890).

KRÜDENER, krü'den-ër; BARBARA JULIANE, BARONESS VON (1764-1824). A novelist of the Romantic school and one of the most prominent apostles of Pietism during the early years of the nineteenth century. She was born at Riga, Nov. 21, 1764, the daughter of Privy Councillor von Vietinghoff, one of the richest landowners of Livonia. In 1783 she married Baron Burkhard von Krüdener, a widower of 50 and a rising diplomat, at this time attached to the Russian Embassy at Paris. In 1784 the Baron became Ambassador to Venice and two years later was transferred to Copenhagen. The young wife devoted herself to her husband with an excess of tenderness which proceeded from her absence of love. Bad health and ennui sent her in 1789 to France, where she lived in Paris, Baréges, and Montpellier, surrounded by a little court of sentimental worshipers, chief among

whom was Bernardin de Saint-Pierre, author of *Paul and Virginia*. In France, too, she fell in love with a young officer in the Hussars, Charles Louis de Frégeville, and with two brief intervals lived apart from her husband, and in 1791 she returned to her husband, confessed her guilt, and demanded her freedom. The honor of the name made this impossible, but, except for a temporary reconciliation in 1793 and a subsequent spasmodic return to her marital duties, the two lived apart till the Baron's death, in 1802. For the Baroness this was a period of gay frivolity passed in Germany and Switzerland. In 1801 she met Madame de Staël at Coppet and in December accompanied her to Paris, where her wonderful powers were allowed full play. In 1803 she published *Valérie*, a novel of feeling, based on the love episode with her husband's secretary. It was marked by charm of style and a delicacy of sentiment bordering on mysticism. The author of *Valérie* took her place among the literary gods of Paris.

In 1804 she returned to Riga, and there in the following year occurred her remarkable "conversion" to the teachings of the Moravians. She speedily began to preach the worth of unworldliness, self-surrender to the will of God, and a return to the simplicity of Christ's teaching. At Königsberg, in 1807, Queen Louise of Prussia fell under her influence. From Königsberg she traversed Germany to Karlsruhe, where she associated much with Jung-Stilling (q.v.) and became thoroughly steeped in Pietism and a convert to dreams of the millennium. For nearly eight years she continued her missionary work in Germany, Switzerland, and Alsace, till in May, 1815, at Heilbronn in Württemberg, she met the Emperor Alexander of Russia, then in the full flush of his glory as leader of the victorious allies against Napoleon. The Emperor fell immediately under her spell. He prayed and read the Scriptures with her and took her with him to Paris, where her house became the centre of a Pietistic movement as intense as it was short-lived. Her influence over Alexander continued unabated, and as the Emperor's "conscience" she was instrumental in furthering the formation of the Holy Alliance (q.v.), though she was not its originator, as is frequently stated. With the Czar's departure for Russia her downfall began. She removed to Basel, where her preaching aroused the hostility of the authorities and led to her expulsion. Followed by a mob of fanatics and beggars, she wandered through northern Switzerland without finding a place of refuge, yet steadfastly pursuing her mission. In 1817 she set out for her home at Kosse. There she remained till 1820, when she went to St. Petersburg. With Princess Anna Golitzyn she became the leader of a religious revival which spread rapidly among the polite classes and assumed such dimensions as to arouse the displeasure of the Czar, who in addition was angered by Madame Krüdener's intercessions in behalf of the Greeks, who were then engaged in their struggle for independence against the Turks. She was compelled to leave the capital and returned to Kosse; but a dangerous disease brought on by her ascetic practices necessitated her departure for the Crimea, where she died, at Karasu-Bazar, on Christmas morning, 1824. Consult: Ford, *Life and Letters of Madame Krüdener* (London, 1893), containing a bibliography; F. Muhlenbeck, *Etude sur*

les Origines de la Sainte-Alliance (Paris, 1888); Turquan, *La baronne de Krüdener* (ib., 1900).

KRUG, קרוג, WILHELM TRAUOGT (1770-1842). A German philosophical writer, born at Radis (Prussia). He studied at Wittenberg as a pupil of Reinhard and Jehnichen and at Jena under Reinhold, and from 1801 to 1804 was professor of philosophy in the University of Frankfurt-on-the-Oder. In 1804 he succeeded Kant as professor of logic and metaphysics at Königsberg and from 1809 until his retirement in 1834 held the chair of philosophy at Leipzig. He fought in the War of Liberation (1813-14) as captain of mounted chasseurs. His *Handbuch der Philosophie und philosophischen Litteratur* (3d ed., 1828) gives in concise form his philosophical system, a lengthy exposition of which was developed in the *Fundamentalphilosophie* (3d ed., 1827), the *System der theoretischen Philosophie* (2 vols., 3d ed., 1830), and the *System der praktischen Philosophie* (2d ed., 1829-38). This system has for its basic idea a transcendental synthesis of being and knowledge, i.e., synthesis original and therefore unexplainable, in accordance with which the understanding recognizes the existence of the subject and recognizes also the existence of the external world and of a connection between the two. Thus his system is seen to be an attempted harmony of idealism and realism. Consult the autobiography *Meine Lebensreise* (2d ed., Leipzig, 1842).

KRÜGER, קרן'גער, ALBERT (1858-). A German etcher and engraver. He was born at Stettin, studied at the Berlin Academy, and began as an illustrator. He then took up etching and copperplate engraving under Jacoby and later devoted himself chiefly to chromoxylography and mezzotint. He did much excellent work for the Berlin Gallery and for the *Zeitschrift für bildende Kunst* and other art periodicals. His original etchings show individuality, and among his reproductions of old masters are plates after Rembrandt, Durer, Van Eyck, and Botticelli.

KRÜGER, GUSTAV (1862-). A German Church historian, born in Bremen. He was educated in the universities of Heidelberg, Jena, Giessen, and Göttingen, and became professor (and in 1902-03 was rector) at Giessen. His special field was early Church history and dogma, and among his important works are: *Lucifer von Calaris und das Schisma der Luciferianer* (1886); *Justins Apologien* (1891; 3d ed., 1904); *Augustin de catechizandis rudibus* (1893; 2d ed., 1909); *Geschichte der Altchristlichen Literatur in den ersten drei Jahrhunderten* (1895; 2d ed., 1897); *Kritik und Ueberlieferung auf dem Gebiet der Erforschung des Urchristentums* (1903); *Dreieinigkeit und Gottmenschheit* (1905); *Handbuch der Kirchengeschichte* (1909-13).

KRÜGER, KARL WILHELM (1796-1874). A German Hellenist, born at Gross-Nossin in Pomerania and educated at Halle (1816-20). From 1820 to 1838 he taught in schools at Zerbst, Bernburg, and Berlin. His writings include: *Griechische Sprachlehre für Schulen* (1842-56; 6th ed., 1892); *Historisch-philologische Studien* (1836-51); *Kritische Analekten* (1863-74); and editions of Arrian, Xenophon, Thucydides, and Herodotus. In his editions he showed marked power in grammatical exegesis. Consult Pökel, *Krügers Lebensabriss* (Leipzig,

1885), and Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

KRÜGER, PAUL (1840-). A German jurist. He was born in Berlin, where he studied jurisprudence. In 1863 he began to lecture on Roman law at the university of his native town. After 1888 he was professor of the same subject at Bonn. His contributions to law literature include: *Prozessuale Konsumtion und Rechtskraft des Erkenntnisses* (1864); *Kritik des Justinianischen Codex* (1867); *Kritische Versuche im Gebiete des römischen Rechts* (1870); *Geschichte der Quellen und Litteratur des römischen Rechts* (1888; 2d ed., 1912). The last named was translated into French by J. Brissaud (1893). Especially important are his critical edition of the *Codex Justinianus* (1877), his *Justinianische Institutionen* (1867, 3d ed., 1908), and his *Corpus Juris Civilis* (vol. i, with Mommsen, 1868-72, 12th ed., 1911; vol. ii, 1874, 7th ed., 1900; vol. iii, 1880-91).

KRUGER, קרוג'גער, STEPHANUS JOHANNES PAULUS (1825-1904). President of the South African Republic (1883-1900). He was born in Colesberg, Cape Colony, Oct. 10, 1825. His ancestor, Jacob Kruger, went from Berlin in the Dutch East India Company's service in 1713, at the time when the foundations of many of the leading Boer families were being laid by immigration. In 1836 young Paul shared with his family the hardships of the great trek, when the blunders of the British colonial administration made enemies of the leading Boers of Cape Colony and drove them to a self-imposed exile which resulted in the founding of the new South African Republic beyond the Vaal. (See BOER.) Paul's mother, who was a Steyn, died in his early youth and his father in 1852. The young man grew to manhood amid the hardships which attended the winning of the country from the savage natives. He was distinguished for strength and personal prowess; but his education was limited, being confined to writing and reading, and the latter mainly to the Old Testament. The fact that Kruger was brought up in the beliefs of the narrowest and most bigoted branch of the Dutch Reformed church in the Transvaal explains much of his later political attitudes and relieves him of the charge of hypocrisy sometimes preferred by his adversaries. His early and deep conviction that he enjoyed the special favor of God secured him later the ardent support of his sect. After the Sand River Convention (1852), when the conflict arose between two parties among the Boers themselves, Kruger cast his lot with the Nationalist and orthodox party of Pretorius, and in the collision of the Pretorius party with the Orange Free State in 1857 he was one of the negotiators on the part of the former of the treaty which averted hostilities and secured to the Transvaal the recognition of independence from Great Britain. He then held the rank of commandant in the Rustenburg District. In the rivalry between the Dutch Reformed and Separatist Reformed churches he was a strong supporter of the latter as the more orthodox. He headed the movement to overthrow Schoeman, who misused his powers as acting President in 1860. Elected commandant general of the reorganized Republic in 1863, Kruger put down the civil strife which had been the curse of the Boers from the time they obtained their independence, arranged peace with the Zulus, and

defeated the Basutos. He was Vice President of the Republic under President Burgers. In 1877, when the failure of the Burgers policy and the skillful diplomacy of Sir Theophilus Shepstone had brought the Republic to the point of a grudging reception of annexation, Kruger became the head of the protesting Nationalist party, although he held office for eight months under the annexation government. He was the principal member of the deputations which protested against annexation both to the Cape and to the English government. Events rapidly moved towards armed resistance to the British authority, as the promises made in 1877 were not kept, and in 1880 the National Committee reorganized the government, with Kruger in his old position of Vice President. He was an active participant in the war which followed, and negotiated together with General Joubert (q.v.) and Pretorius after the defeat of the English at Majuba Hill, the preliminaries for the Pretoria Convention of 1881 and succeeded in securing still more advantageous conditions for his country through a visit to England in 1883. The Boers having won back their independence, though under a reserved British suzerainty, elected Kruger President in 1883 over Joubert by 3431 votes to 1171. He was reelected in 1888, 1893, and 1898. In the South African Republic, after he became President, Kruger was more and more a power, his influence over his own people being almost boundless. Friction with the British government increased through the development of the Rand gold mines (which were discovered in 1886), the unmeasured ambitions of the British South Africa Company, and the discontent of the Uitlanders, who had become an important factor in the Transvaal population, and whose influence Kruger tried to counteract through favoring the Hollander party. His policy during this period has been criticized, especially his modification of the franchise laws in favor of the Dutch element; but English jealousy had created difficulties for his administration and had frustrated his attempt to secure a seaport for his country. When the Jameson raid, at the close of 1895, produced a crisis, President Kruger showed his moderation and diplomacy in the management of the difficult details of that case. Through his influence Dr. Jameson and his associates were turned over to the English government for trial in the English courts against the wishes of the more hot-headed Boers. The evident intention of the British Colonial Office to force the Republic to submission, and the refusal, determined or obstinate, as one may look at it, of President Kruger to yield anything to British suzerainty, brought on in 1899 the war of which Kruger had said that the submission of his people would be purchased at "a price that would stagger humanity." In preparation for the struggle which he had long regarded as inevitable, Kruger had put the Transvaal into an excellent defensive state by the purchase of large quantities of arms and ammunition, being ably assisted in his preparation by the commandant general of the forces "Slim Piet" Joubert (q.v.). During the first period of the war President Kruger remained in Pretoria, where he maintained order by the sheer force of his personality. After the fall of Pretoria (June 5, 1900), President Kruger fled into Portuguese territory, and on October 19 sailed on the Dutch battleship *Gelderland* from Lourenço Marques

for Europe in the hope of securing foreign aid or intervention. He was received with enthusiasm in France, and had an interview with President Loubet, but failed to obtain an audience with the German Emperor and the Russian Czar and took up his residence in the Netherlands, making his home in Utrecht and The Hague. His efforts to secure foreign intervention failed, but he continued to exhort the Boers to stand fast to the last. Kruger first married a Miss Du Plessis, whose family is a branch of that to which Cardinal Richelieu belonged. His second wife was a niece of the first Mrs. Kruger. They had several children.

Bibliography. The most ambitious biography is Van Dordt, *Paul Kruger und die Entstehung der südafrikanischen Republik*, translated into German by Kohlschmidt (2 vols., Basel, 1900), written from a very friendly standpoint; in English the biography by Statham, *Paul Kruger and his Times* (London, 1898), is too one-sided to be reliable, though it throws much light on South African history from the Boer side; Paul Kruger, *Memoirs*, translated by A. Teixeira de Mattos (New York, 1902). On the other side the following works are mere political contributions to the material for the history of the period: Glückstein, *Queen or President? An Indictment of Paul Kruger* (London, 1900); Scohle and Abercrombie, *The Rise and Fall of Krugerism* (New York, 1900). See TRANSVAAL; SOUTH AFRICAN WAR.

KRUMBACHER, krūm'bāg-ēr, KARL (1856-1909). A distinguished German Byzantine scholar, born at Kurnach in Bavaria. He studied at the universities of Leipzig and Munich, was professor at Leipzig for about 15 years after 1892, and at the time of his death was professor at Munich. He is best known for his *Geschichte der byzantinischen Literatur* (2d ed., 1897), which covers the period from Justinian to the fall of Constantinople, a monument of wide and sound learning, with important bibliographical material. He was also prominent as founder and editor of the *Byzantinische Zeitschrift* and as editor of the *Byzantinisches Archiv*. Among his other works are: *Ein neuer Codex der Grammatik des Dositheus* (1884); *Griechische Reise* (1886), the outcome of extensive travels, *Beiträge zu einer Geschichte der griechischen Sprache* (1885-89); *Mittelgriechische Sprichwörter* (1893); *Studien zu Romanos* (1898); *Die Moskauer Sammlung mittelgriechischer Sprichwörter* (1900); *Das Problem der neugriechischen Sprache* (1902); "Die Griechische Literatur des Mittelalters," in *Die griechische und lateinische Literatur und Sprache*, by various hands (3d ed., 1912); *Populäre Aufsätze* (1909).

KRUMMEN. See KRU.

KRUMMACHER, krūm'māg-ēr, FRIEDRICH ADOLF (1767-1845). A German theologian and a writer of devotional poetry and prose, born at Tecklenburg. He studied theology at Lingen and Halle, taught in the high school at Hamm, was head of the high school at Mörs, and became, in 1800, professor of theology at Duisburg. In 1807 he returned to the ministry, became pastor at Kettwig, and in 1812 was called to Bernburg as general superintendent and chief court preacher. He accepted a call to Bremen in 1824 and retired in 1843. His *Parabeln* (9th ed., 1876) soon became a religious classic. They were first translated into English in 1825. Consult Maria Krummacher, *Unser Grossvater*

(3d ed., Bielefeld, 1891).—His son **FRIEDRICH WILHELM** (1796-1868) became court chaplain (1853) at Potsdam. He was a preacher of great eloquence, but a reactionary theologian. Many of his works have found favor in translations in England. Among them are: *Elias der Thisbiter* (6th ed., with author's life, 1903); *Elisa* (1839-42); *Passionsbuch* (1856). *Salomo und Sulamith* (1827; 9th ed., 1875) was also published. Consult his *Selbstbiographie* (Berlin, 1891).

KRÜMMEL, krūm'mel, Otto (1854-1912). A German geographer, best known for his work in oceanography. He was born at Exin and was educated at Berlin and at Göttingen, where he was appointed docent of geography. He accepted a chair as professor at Kiel in 1883. In 1889 he accompanied the Plankton expedition. In 1911 he became professor of geography at Marburg. His publications include: *Die aquatorialen Meeresströmungen des atlantischen Oceans* (1877); *Der Ocean* (1886; 2d ed, 1902); *Handbuch der Oceanographie* (1887; 2d ed., vol. i, 1907, vol. ii, 1911); *Die Reisebeschreibung der Planktonexpedition* (1892).

KRUMMHOLZ, krūm'hōlts (gnarled wood). A term which has long been used by German botanists for the gnarled and spreading form of the mountain pine (*Pinus montana*), and which has now become, even in English, a general term for the low scrubby growth of woody plants above the timber on mountains. Good examples of this habit are seen in several spruces and pines, notably in *Pinus flexilis* in the Rocky Mountains and in the mountain hemlock (*Tsuga mertensiana*) on many of the mountains from Oregon to Alaska. These species form large trees at lower altitudes, but above the limit of tree growth the trunks become low and prostrate, the number of branches multiplies, they bend close to the ground and twist and turn in all directions. This peculiar habit of growth is probably due to the high transpiration caused by exposure to the high winds and intense sunlight of alpine regions, together with the low temperature of the soil that makes absorption difficult. See also **ALPINE PLANT**; **MOUNTAIN PLANTS**.

KRUPP, krup, ALFRED (1812-87). Inventor, metallurgist, and manufacturer. He was the son and successor of Friedrich Krupp, the founder of the steelworks at Essen, and was born at Essen, Prussia. His brother Hermann was associated with him until 1848, when Alfred assumed entire control, and by persistent study and great diligence continued his father's efforts to improve the manufacture of steel. His exhibit at London in 1851 first drew the attention of the world to him, and in 1852 the successful invention of a method of manufacturing weldless railway tires enabled him to enlarge his establishment. His breech-loading rifle and other cannon were adopted by the Prussian army in 1861, and the War of 1870-71 established its superiority. His factory soon became known for the heavy ordnance and armor plate which were constructed there not only for Germany, but for other European nations except France, for whom the Krupps have never manufactured munitions of war. He died July 14, 1887. Consult: Bildeker, *Alfred Krupp* (Essen, 1888); in English, Niemeyer, *Alfred Krupp*, translated by Michaelis (New York, 1888); Frobenius, *Alfred Krupp* (Dresden, 1898). See **ARMOR PLATE**; **ORDNANCE**.

KRUPP, FRIEDRICH (1787-1826). Iron-master and founder of the famous Krupp Works. He was born at Essen, Rhenish Prussia, and after the death of his father he was brought up by his grandmother, who had, in 1800, purchased the Sterkrade Works. Here Friedrich endeavored to make cast steel, the secret of which was carefully guarded in England. With Gottlob Jacobs, an engineer, Krupp made his first experiments at the Sterkrade Works and after the sale of the plant in 1808 continued his attempts independently at Essen. In 1810 he founded a small forging plant near Essen and in 1815 formed a partnership with Friedrich Nicolai for the production of cast steel, a product which was found excellent for certain purposes, such as mint dies, stamps for buttons, etc. Yet the demand was not sufficient to keep the works in operation, and soon after 1820 Krupp was obliged to give up his house to occupy a small one-story laborer's cottage near his plant. The hut is still preserved in the midst of the present gigantic establishment. Shortly before his death he confided to his son Alfred (qv) the secret of making cast steel, which the latter developed successfully. For a history of the great enterprise, consult *Krupp, 1812-1912* (Jena, 1912), published on the one hundredth anniversary of the birth of Alfred Krupp.

KRUPP, FRIEDRICH ALFRED (1854-1902). A German gunmaker, son of Alfred Krupp. He increased and diversified the output of the Krupp Works, which he extended by the incorporation with them of other enterprises, especially the manufacture of machinery and shipping interests. A member of the Prussian Upper House and Council of State, he also sat in the Reichstag from 1893 to 1898. Just before his death his private character was violently assailed by the Socialist newspaper the *Vorwärts*, and it was said that this arraignment hastened his end. The Emperor vigorously defended Krupp, especially in a public speech at his funeral, and the heirs began a suit against the *Vorwärts*, but soon abandoned the action.

KRUPP FOUNDRIES, SOCIAL WORK AT. About 1861 the firm of Krupp at Essen, Germany, where there were not in the town sufficient houses for their employees, began building dwellings. By 1862, 10 houses were ready for foremen, and in 1863 the first houses for workmen were built in Alt Westend. Neu Westend was built in 1871 and 1872, and a number of other colonies were established later, the last being Friedrichshof. Each colony has a market place, a coöperative retail establishment, a park, a music hall, bathhouses, etc. Now some 5000 dwellings are provided, many being given rent free to widows of former workers. A coöperative society founded in 1868 has become the Consum-Anstalt, and profits are divided according to amounts purchased. A boarding house for single men, the Ménage, was started in 1865 with 200 boarders. Insurance societies—accident, life, and sickness—exist among the men, and the firm contributes for their support \$60,000 per year. A widow's pension system is maintained, payments under which run up to nearly \$952,000 annually. There is a trust fund of \$250,000 for the benefit of the needy who are not qualified to get pensions. Essen also has a fund of \$125,000 used in building workmen's houses, and there is also a building association. Technical and manual training schools are provided. The

relations between employers and men have been excellent. It is noteworthy, however, that the spread of Socialistic ideas among the workmen at Essen has been very rapid. Consult Friedrich Krupp, *Fried. Krupp Aktiengesellschaft* (Essen, 1901).

KRUPP STEEL, **KRUPP ARMOR PLATE**; ETC. See **ARMOR PLATE**.

KRUPP VON BOHLEN UND HALBACH, fón bó'len unt hál'bak, GUSTAV G. F. M. (1870-). A German steel manufacturer. Born at The Hague, Holland, he received his education at the Gymnasium of Karlsruhe and at the universities of Lausanne, Strassburg, and Heidelberg. Entering the German foreign office in 1897, he was successively Secretary of Legation at Washington (1899-1900), attaché of the Legation at Peking (1900-03), and attaché of the Legation at the papal court, Rome (1904-06). In 1906 he married Berta, elder daughter of Friedrich Alfred Krupp (qv), and at this time was allowed to assume Krupp as a prefix to his own name. In the same year he became chief director of the Krupp Works, which, in 1903, in accordance with the will of Friedrich Alfred Krupp, had been made into a stock company, all the stock being held by the Krupps, however. In September, 1914, the Krupps, who were awarded large contracts when the European War broke out, subscribed \$7,500,000 towards the German war loan of \$1,250,000,000. In January, 1915, several houses at the Krupp Works were destroyed by bombs dropped from aeroplanes of the allies. Gustav Krupp von Bohlen und Halbach was decorated by Emperor William with the Iron Cross, first class.

KRUSE, krú'se, HEINRICH (1815-1902). A German dramatist and publicist, born at Stralsund. He studied philology at the universities of Bonn and Berlin. In 1847 he took up journalism, and in 1855 he became chief editor of the *Kölnische Zeitung*. He devoted himself, however, largely to play writing. Of his dramas the following are considered of great merit. *Die Grafen*, a tragedy (1868), which, along with Geibel's *Sophonisbe*, was awarded the Schiller prize, *Brutus* (1874), *Das Mädchen von Byzanz* (1877); *Der Verbannte* (1879). In most of his dramas Kruse outlines his characters with strength, and the play of human passion and action is expressed with true dramatic effect, but his sea stories and short epics are better. Consult F. H. Brandes, *H Kruse als Dramatiker* (Hanover, 1898).

KRUSENSTERN, krú'sen-stérn, ADAM JOHANN VON (1770-1846). A distinguished Russian navigator and hydrographer born at Haggud (Esthonia). After serving for some time in the British navy, he was intrusted in 1803 by Emperor Alexander with the command of a scientific and commercial expedition to the North Pacific coasts of America and Asia. The chief object of this undertaking was the development of the fur trade with Russian America. In connection therewith the government dispatched an embassy for the restoration of trade relations with Japan, in which purpose it was unsuccessful. The interesting geographical discoveries of Krusenstern made his voyage very important for the progress of geographical science. This voyage, in which he was the first Russian to circumnavigate the world, Krusenstern later described in his *Journey around the World* (1810-12, with an atlas of 104 plates; Eng. trans., 1813), which was soon translated

into all the principal languages of Europe. Krusenstern became an admiral in 1841. His further works include an *Atlas de l'Océan Pacifique* (2 vols., 1824-27).

KRUYS. See **CRUYS**.

KRYLOV, kré'lóf, IVAN ANDREEVITCH (1768-1844). A Russian fabulist, the son of a Moscow officer. He received the elements of his education from his mother at Tver, where he learned French from the tutor in the Governor's house. In 1785 he published an opera, *The Coffee Fortune-Teller*, and its success prompted him to write a series of operas and comedies now entirely forgotten. In 1783 he was a petty clerk in St. Petersburg in the Treasury Department. In 1797-1801 he lived with the family of Prince Golitzin as teacher and private secretary and in 1802 was secretary to him while he was Governor of Riga. This position he soon gave up and led the life of a gambler until 1806, when, having shown Dmitriev a few translations from La Fontaine, he was urged to take up this line of literary work. Three fables appeared in 1806, several original ones in 1808-09, and a collection of 23 met with great success in 1809. In 1811 another collection appeared, and Krylov was elected to the Russian Imperial Academy. In 1812 he became an assistant in the Imperial Library at St. Petersburg and was chief librarian from 1816 to 1841. In 1838 the fiftieth anniversary of his literary activity was celebrated. A monument to him was placed in the Summer Garden. Thanks to their genuine national spirit, the joyousness, simplicity, wit, and good humor that pervade them, his fables are the most popular of Russian books, being placed in the hands of children as soon as they are able to read. As a fabulist, Krylov must not be ranked much below La Fontaine. Indeed, in giving every animal a real lifelike character, Krylov has gone a great step beyond La Fontaine himself, whose animals are seldom anything but French gentlemen. This realism, together with his terse, expressive, and vernacular Russian, makes his fables the most popular bits of literature in the language. They have been translated into every important language. Consult: Ralston, *Krilloff and his Fables* (London, 1869; 4th ed., 1883), and Harrison, *Krilloff's Original Fables* (ib., 1884). An admirable study of Krylov in Russian will be found in vol. iii (pp. 213-83) of Grot's *Works* (St. Petersburg, 1901). The latest complete edition of his works is that of V. V. Kalasha in four volumes (St. Petersburg, 1914).

KRYPTON (Gk. κρυπτόν, neut. sing. of κρυπτός, *kryptos*, hidden, secret, from κρύπτειν, *kryptein*, to hide). A gaseous element discovered in the air, by Sir William Ramsay and Morris W. Travers, in 1898. The element appears to be very similar to argon and helium (qv.), but as yet very little is known of its properties, only minute quantities of it having thus far been obtained. According to Ramsay, 20,000,000 volumes of air contain only one volume of krypton. Its molecules, like those of argon and helium, are made up of single atoms, whence its atomic weight, being identical with the molecular weight, is twice the density (referred to hydrogen). From determinations of its density its atomic weight appears to be 82.9. Samples of krypton have been liquefied and even solidified: the solid melted at -169° C.; the liquid boiled at -152° C. Its critical temperature (i.e., the highest temperature at which it can be liquefied)

is -62.5° C., and the critical pressure is 54.3 atmospheres.

KSHATRIYA, kshāt'rē-yā (Skt., ruling warrior, king). The second or military caste in the Brahmanical social system. See CASTE.

KTAADIN, k'tā'din. See KATAHDIN.

KUANG HSÜ. See KWANG-SÜ

KUANZA, kwän'zä, or **COANZA**. A river of Portuguese West Africa (Map: Congo, Belgian, B 4). It rises in Lake Mussombo in the south-central part of the colony and flows at first north, then northwest, emptying into the Atlantic Ocean about 35 miles south of St Paul de Loanda and 220 miles south of the mouth of the Congo. Its length is over 700 miles. In its upper course the Kuanza flows through an elevated plateau, from which it drops to the low coast region in the cataract of Kambamke, known also as Livingstone Falls. The river is navigable for over 100 miles below Ndondo, but the entrance of ocean vessels is obstructed by a bar at its mouth.

KUBAN, koo-bā'ny'. A province in the western part of northern Caucasus, Russia, with an area of about 36,645 square miles (Map: Russia, E 6). It borders on the Black Sea and the Sea of Azov and is divided by the river Kuban into two parts, of which the northern has the character of a steppe, while the southern belongs to the region of the Caucasus Mountains and is covered to a large extent with forests. The territory is watered chiefly by the Kuban and has a mild but variable climate. Agriculture and stock raising are the chief occupations, 75 per cent of the area under crops being devoted to wheat. Tobacco is cultivated extensively. There are a number of salt lakes in the territory, and the rivers are well stocked with fish. The region contains extensive mineral deposits, including petroleum, zinc, lead, coal, and silver. The oil wells are exploited on an extensive scale. The chief manufacturing establishments are flour mills, tobacco factories, distilleries, breweries, and tanneries. The Cossacks, who constitute over 40 per cent of the inhabitants, are exempted from certain taxes and are organized on a military basis. Pop., 1912, 2,830,200, of whom over 90 per cent were Christians and the rest chiefly Mohammedans. The colonization of the territory by Russia was begun at the end of the eighteenth century, and the original inhabitants now constitute only a small part of the population. Capital, Ekaterinodar (q.v.).

KUBAN (ancient *Hypans*, or *Vardanes*). One of the chief rivers of the Caucasus, Russia (Map: Russia, E 5). It rises near Mount Elbruz, at an altitude of nearly 14,000 feet, and flows at first north and then west, finally through marshy regions which are frequently overflowed, falling by a number of arms partly into the Sea of Azov and partly into the Black Sea. Its total length is 525 miles. It is navigable for steamers for over 70 miles, but it has a very variable volume. Its chief tributaries are the Laba and the Bielaya.

KUBAN'GO, or **O'KAVAN'GO**. A river of south Central Africa. It rises in the mountains of Angola, near the source of the Kunene, and flows in a generally southeasterly direction until it loses itself in the wide, marshy tracts of western Rhodesia, north of Lake Ngami (q.v.) (Map: Cape of Good Hope, D 1). It reaches that lake through the Tonke during the rainy season, but it is also supposed that a part of its volume at high water flows into the Zambezi through the

Kuando, in which case the Kubango must be regarded as one of the principal tributaries of the Zambezi.

KUBELIK, koo'be-lék, JAN (1880-). A Bohemian violinist, born at Miehle, near Prague. He received some musical instruction from his father, who was a market gardener and when only 12 years old he entered the Prague Conservatory. In 1898 he began to give recitals, in 1900 he appeared with the Berlin Philharmonic Society and in June of the latter year made his début in London with a concerto by Paganini. His playing of that master's compositions was remarkable, and upon his American tours he met with extraordinary popular success. His technique was remarkable, but his interpretation suffered in comparison. Kubelik received numerous decorations and appointments.

KUBĒRA, or **KUVĒRA**. The Hindu god of wealth. An old Indian etymology in Sanskrit explains his name as meaning 'having a wretched (*ku*) body (*vēra*),' and it may be that this folk-etymology is not so far astray as designating the bizarre shape with which he is invested by Hindu mythology. According to Sanskrit literature, his residence, Alakā, is situated in the mines of Mount Kailasa, and he is attended by the Yakshas, Mayus, Kinnaras, and other imps, anxiously guarding the entrance to his garden, Chaitraratha, the abode of all riches. Nine treasures—apparently precious gems—are especially intrusted to his care. His wife is an ogress, Yakṣī or Yaksīnī, and their children are two sons and a daughter. As one of the divinities (Lokapālas, world guardians) that preside over the regions, he is considered also to be the protector of the North. Consult Dowson, *Hindu Mythology* (London, 1879), and Wilkins, *Hindu Mythology* (ib., 1900).

KUBLAI KHAN, koo'blī kân', or **KHUBLAI KHAN** (1216-94). Grand Khan of the Mongols and Emperor of China. He was the grandson of Genghis Khan (q.v.), through the latter's fourth son, Tuli Khan. When a boy of 10, he participated in the last campaign of his grandfather. He succeeded his brother Mangu as Grand Khan upon the death of the latter, in 1259, while engaged in a campaign to complete the subjugation of China. This task Kublai carried to a conclusion. Invited by Si Tsong of the Sung dynasty to aid in the expulsion of the Kin Tatar dynasty, he invaded China in 1260 with an immense army, drove out the Tatars, and took possession of north China. He founded the city of Khan Balig (Kambalu) and made it his capital. This was the nucleus of Peking. Kublai maintained only nominally the extended sway of the previous members of his dynasty, the great empire that had been reared by conquest having practically broken up into four divisions (see MONGOL DYNASTIES), but his rule was absolute and efficient in eastern Asia. He was one of the ablest of his race, an organizer and administrator of a high degree of ability and intelligence. He conformed in great measure to the Chinese civilization, which was far in advance of that of his own people. In 1279 he completed his conquest of China by subduing the south, and as the first foreign Emperor founded the Yuen dynasty. His repeated attacks, however, failed to reduce Japan to submission. The Venetian Polo brothers, with the better-known son and nephew, Marco Polo (q.v.), spent some years at Kublai's court and enjoyed his respect and confidence. Desiring to establish

some higher form of religion in his Empire, he made them his messengers to the Pope to invite the sending of Christian missionaries to his people. Christendom was too much occupied with its own quarrels over ecclesiastical politics to heed the invitation, and the Khan turned to the Grand Lama, the head of the Buddhists, who was not slow to seize so glorious an opportunity for the conversion of an empire. Kublai Khan died in Peking, in 1294. The Empire he had organized did not long survive under his incapable successors, and in 1368 the dynasty of Yuen was expelled from China. Consult. Yule, *Cathay and the Way Thither* (2 vols., London, 1866); id (ed.), *The Book of Ser Marco Polo* (ib., 1875); Howorth, *History of the Mongols* (4 vols., ib., 1876-88); L. J. Markae, "Kublai Khan, or the Popes and the Tartars," in *American Catholic Quarterly Review*, vol. xxv (Philadelphia, 1900).

KUBOTA. See AKITA.

KUBUS, koo'booz, or ORANG-KUBU. A people of Malay stock, inhabiting the marshy, forested region northwest of Palembang in south-central Sumatra, and one of the most primitive tribes in existence. They are particularly interesting because in the matter of character, general behavior, etc., they apparently rank higher than some of the more civilized of the kindred peoples about them. For instance, they do not appear to be such cannibals as the Battas once were. Marriages between Kubu women and Malay men are said to be rare. Besides the information in general works on Sumatra and the East Indies, such as Forbes, 1 *Naturalist's Wandering in the Eastern Archipelago* (London, 1885), reference may be made to Zelle, "Les Orangs-Koubous," in the *Bulletins de la Société d'Anthropologie de Paris* for 1891, where some useful details are given. Both physical anthropology and ethnography are dealt with in Hagen, *Die Orang Kubu auf Sumatra* (Frankfort-on-the-Main, 1908).

KUCH, or COOCH, BEHAR, kooch be-har'. A sub-Himalayan native state in the northern part of Bengal, India (Map India, F 3). Area, 1307 square miles. Though the soil is generally fertile and productive, the entire state is so low that it is difficult to drain and is subject to inundation by the Tista, Sankosh, Dhoila, and Torsa rivers. A railway extends from the frontier town of Dhubri to the capital, Kuch Behar. Crops of rice, tobacco, maize, pulses, and sugar cane are raised. In the state are the ruins of the two ancient capitals of the Kamrup Hindu dynasty, which was overthrown by the Afghans at the end of the fifteenth century. Pop of state, 1901, 566,974; 1911, 592,952.

KÜCHENMEISTER, kuk'en-mi'stēr, GOTTLIEB FRIEDRICH HEINRICH (1821-90). A German physician, specialist on intestinal parasites. He was born at Buchheim, studied at Leipzig and Prague, and practiced at Zittau and later at Dresden (1859). He distinguished the *Tænia saginata* (or *mediocanellata*) from the *armata*, showed the special danger of the pork tapeworm, and made studies in the development of trichina and other entozoa. His principal works are *Versuche über die Metamorphose der Finnen in Bandwürmer* (1852); *Entdeckung über die Umwandlung der sechshakigen Brut gewisser Bandwürmer in Blasenbandwürmer* (1853); *Die in und an dem Körper des lebenden Menschen vorkommenden Parasiten* (with illustrations, last ed., with Zurn, 1878-81). He was an eager advocate of cremation. Consult the posthumous *Die Totenbestattungen der Bibel und*

die Feuerbestattung (Stuttgart, 1893), with a biographical sketch.

KUCHÍN, ku-chín'. A numerous group of Athapaskan tribes, extending across central Alaska and the adjacent portion of British America from the Eskimo border at the mouth of the Yukon northeastward almost to the mouth of the Mackenzie. The various bands are known as Tukuth-kuchín (rat people), Han-kuchín (river people), etc., the dialects differing but little one from another. The eastern bands are also known collectively as Loucheux by the French voyageurs. The Kuchín are described as superior to their neighbors in intelligence and manly qualities. They are great traders, making long voyages up and down the Yukon between the interior tribes and those of the coast, skins being the ordinary merchandise and shell beads the medium of barter. They subsist primarily by hunting and fishing, taking large quantities of salmon in nets, fish drives, or from boats. Their ordinary dwellings are low, elliptical wickiups of poles covered with skins, sometimes occupied jointly by several families. Their dress is of deer or rabbit skin, including caps and mittens, both sexes dressing nearly alike excepting that the shirt of the man is pointed in front and behind. The men wear nose rings, and the women formerly tattooed. They are very fond of dancing, feasting, and athletic games, such as wrestling and foot-racing. The dead are usually exposed on scaffolds or sometimes cremated. The widow watches near the grave for a year, when the bones are burned and the ashes placed in a box hung from the top of a pole. A funeral feast is then made, ending with games and a distribution of presents, after which the widow is free to marry again. They are said to have decreased one-half within living memory, partly from new diseases, but largely from the widespread practice of female infanticide, which the women justify on the ground that they wish to save their daughters from the hardships to which they themselves are subjected. Consult A. G. Morice, in *Archæological Report*, 1905 (Toronto, 1906).

KÜCKEN, kü'ken, FRIEDRICH WILHELM (1810-82). A German musician, born at Bleckede, near Hanover. He studied music under Lührs, music director at Schwerin, and later with Burnbach in Berlin, Sechter in Vienna, and Halévy in Paris. At first he was a member of the court orchestra at Schwerin, but upon the success of some of his songs he was appointed music teacher to the hereditary Grand Duke. In 1839 his opera *Die Flucht nach der Schweiz* was well received, and in 1849 *Der Prätendent* followed. Two years later he became one of the two court kapellmeisters at Stuttgart and subsequently served alone until 1861. He composed sonatas for violin, piano, and cello, and quartets for male chorus, but his songs made him famous. They were exceedingly popular because of their melodiousness, and a number of them have become real folk songs. They are in the same class as those of the popular Abt (q.v.). His work, however, was never well received by musicians. He died at Schwerin.

KUDALUR. See CUDDALORE.

KUDU, koo'doo. Another name for the African antelope, the koodoo (q.v.).

KUEHL, kül, GOTTHARD (1850-). A German painter and etcher. He was born at Lübeck and studied at the Munich Academy under Von Dietz and afterward in Paris. His

earlier pictures, in their minute, piquant treatment, love of ornament, and dazzling light effects, show the influence of Fortuny; later he adopted the Naturalistic methods inaugurated by Liebermann and the French Impressionists. Kuehl is fond of painting gorgeous church interiors, views of old-fashioned cities, and interiors with scenes of peasant life. In 1895 he was appointed professor at the Dresden Academy. Among his best-known paintings are: "A Conversation" (Luxembourg, Paris); "The Elbe Bridge" and "Sad News" (Dresden Gallery); "In the Orphanage at Danzig" (Leipzig Museum); "The Old Man's Home" (National Museum, Berlin); "Sunday Morning" (Munich Pinakothek); "The Court-Yard of King Arthur in Danzig" (Vienna Museum); "Corner of a Drawing Room" and "Girl on a Green Box" (exhibited at the Metropolitan Museum, New York, 1909). He was awarded the French state medal and received gold medals at Munich and Dresden and the Prussian gold medal for art.

KUEICHOU. See KWEICHOW.

KUENEN, ku'nen, ABRAHAM (1828-91). A distinguished biblical scholar and one of the founders of the modern critical school. He was born at Haarlem, Sept. 16, 1828, studied at Leyden, and was made professor of theology there in 1853. He died at Leyden, Dec. 10, 1891. Kuenen early distinguished himself by his fearless application of critical methods in the study of the Old Testament regardless of tradition or the consequences alleged to result from such methods. His publications are marked by great accuracy and keen critical and historical acumen, and he lived to see his methods approved and many of his theories adopted by the majority of scholars in Europe and America. His works include: *Liber Geneseos* (1851); *Libri Exodus et Levitici Secundum Arabicam Pentateuchi Samaritani Versionem ab Abu Saido Conscriptam* (1854); *Historisch-kritisch Onderzoek naar het ontstaan en de versameling van de boeken des Ouden Verbonds* (1861-65; 2d ed., 1885-93; Eng. trans. of vol. i, *The Hexateuch*, London, 1886); *De godsdienst van Israël tot den ondergang van den Joodschen Staat* (1869-70; trans., *The Religion of Israel*, 5 vols., London, 1874-75); *De profeten en de profetie onder Israël* (1875; trans., *Prophets and Prophecy in Israel*, London, 1877); *National Religions and Universal Religion* (Hibbert Lectures, 1882). From 1867 till his death he was one of the editors of the *Theologisch Tijdschrift*, and in this journal many of his most important investigations of special points connected with the composition of the Pentateuch and historical books of the Old Testament appeared. A number of his articles in this periodical were collected and published after his death in a German translation by Karl Budde, under the title *Gesammelte Abhandlungen zur biblischen Wissenschaft* (Freiburg, 1894).

KUEN-LUN, kwën'loón', or **KUN-LUN.** A great mountain system of Central Asia, lying on the north edge of the plateau of Tibet (Map: Asia, K and L 5). The physical relations of the mountain ranges in this part of Asia have not been as yet clearly explained; but most authorities, following Richthofen, include under this system the various groups of highlands that stretch in an easterly direction from the Pamirs to the interior of China. As thus defined, the Kuen-lun is one of the most important mountain systems of Asia, mostly because

of its effects as a barrier to migration. In the western section, formed by the mountains of Kashgar and the Russian chain, between East Turkestan and India and Tibet, the mountains exceed 20,000 feet in elevation and carry enormous snow fields and glaciers. The few passes, which rise to altitudes of 15,000 feet or more, can be crossed only with extreme difficulty by using the yak as the beast of burden. The narrow gorgelike valleys of the Yarkand and Karakash are the only notable interruptions in this part. East of about long. 89° E. the Kuen-lun system is developed as a series of parallel or slightly diverging chains. The most northerly chains—the Altyn Tagh and Nanshan—follow the north boundary of Tibet towards northwest China proper; they attain an extreme elevation of 15,000 to 20,000 feet. The central and southern ranges, including the Marco Polo, Columbus, Przhevalski, and others, have a southeasterly trend and are of more broken character. East of the Chinese frontier the system is developed in two lines of highlands which extend across north China almost to the coast.

KUFIC WRITING. A peculiar type of the North Arabic script, characterized by its angular form. It appears for the first time in a trilingual (Greek-Syriac-Arabic) inscription from the year 512 A.D., found at Zebed, and in a bilingual (Greek-Arabic) inscription, dated in 508 A.D., discovered in the Leja. As it shows the greatest similarity to the script used in the Nabataean inscriptions found on the Sinaitic Peninsula, while the earlier form of the Nabataean alphabet, found at Petra and in Hejaz, may still be seen in the Arabic inscription from Nemara written in 328 A.D., it has been inferred that the so-called Kufic developed from the Sinaitic in the course of the fourth and fifth centuries A.D. This angular form of the alphabet lent itself especially to monumental use, such as inscriptions on buildings and legends on coins. For writing on parchment and papyrus, a more cursive, round script was used, called Naskhi. We now possess papyri in which this form of writing is used that go back to the first half of the seventh century A.D., and a very large number belong to the second half of that century. From its character it is evident that it must have been in use for a long time, together with the more angular Kufic. Whether the suras dictated by Mohammed in Mecca and Medina were written down by his scribes in Naskhi or Kufic is a question which cannot, in the present state of our knowledge, be answered definitively. Either is possible, though the probability is somewhat in favor of the Naskhi where the writing was on papyrus and a modified form of the angular script where other material was used. The same uncertainty applies to the edition made by Uthman and the earliest copies of the Koran. The oldest dated manuscript of the Koran was written about 784 A.D. In this as in all copies of the Koran coming from the third and fourth centuries of the Hejira, with one notable exception, the script is Kufic. There can be no doubt that it is named after the city of Kufa, which until the foundation of Bagdad was the most important centre of Moslem life in the East, and it is natural to suppose that the monumental script was there employed for the first time in writing on papyrus. The Kufic character, which is of a somewhat clumsy and ungainly shape, was almost never used for any other literary pro-

ductions in Islam than the Koran, a fragment of a grammatical work being the only known exception. The distinction from the cursive Naskhi used for popular purposes the Kufic was a hieratic script. It was employed in inscriptions on mosques, palaces, and forts, and on the coins of Moslem rulers, until it was crowded out by the Naskhi, which meanwhile had grown more perfect. Epigraphically it is found in several forms. The simple Kufic was employed from the first century of the Hejira up to the middle of the fourth. It has all the angular character of this script. The *ornamental* Kufic is represented by the inscriptions of the Fatimid dynasty in Egypt (969-1171); this has wrongly been called the Karmatian. The *decorative* Kufic is used for Koran verses which simply serve the purpose of adornment. Since the introduction of the round Naskhi characters the decorative Kufic has developed several varieties. Sometimes the letters take the form of leaves and branches, sometimes they are elongated and thin; or, again, they are square and geometric. The victory of the Naskhi over the Kufic is supposed to have been due to the Sunnite reaction under the Seljuks, Atabeks, Nur el-din, and Saladin. But it is at least doubtful whether the progress was from the east to the west rather than the opposite. Naskhi seems to have appeared earlier in the Far West on the coins of the Almoravides (q.v.) from 1106 on, than in Mesopotamia, Syria, and Egypt, where it entered with Saladin. The earliest Naskhi inscription in Syria is of 1155. The last Fatimid inscription in ornamental Kufic in Cairo is dated 1160. Saladin's first inscription in Cairo (in Naskhi) is dated 1183. Different kinds of these Naskhi (in which the alphabet is arranged according to the outward similarity of the letters) are the *Du'ān* (only employed for decrees, passports, etc.), the *Ta'lik* (the court script, chiefly used in Persia since 1010), the *Thuluth* (threefold, highly flourished and involved, used at the head of books and documents), the *Yakuti*, *Rigān*, etc. The Maghrebin cursive script used in northwestern Africa is a direct development of the Kufic.

KUFOW. A city in China. See KIUHFW.

KUFT. kuft. See KOPTOS.

KUGLER, koo'glër, FRANZ (1808-58). A German art historian and poet. He was born at Stettin and studied at the universities of Berlin and Heidelberg and at the Academy of Architecture, Berlin. After the completion of a very diversified course of study he devoted himself to the history of fine art. In 1833 he became a professor of art history in the Academy of Fine Arts and docent in the University of Berlin. His best-known work is the *Handbuch der Geschichte der Malerei*, etc. (Manual of the History of Painting from the Time of Constantine the Great to the Present Day) (1837), which has been translated into English—the part relating to Italian art by Sir Charles and Lady Eastlake and revised by Austen Henry

Layard (London, 1891; latest ed., 1907), and that relating to the German, Dutch, and Flemish schools under the editorship of Sir Edmund Head, revised by Sir Joseph A. Crowe (London, 1898). These works were for years standard manuals. His other works include a *Handbuch der Kunstgeschichte* (Manual of the History of Art) (1842; revised by Lübke, Stuttgart, 1871-72), the first attempt to treat the subject in its relation to the great historical epochs; *Geschichte der Baukunst* (Berlin, 1855-60), the most complete work on the subject in its day. Kugler is also known as a poet and as the author of several dramas, published in his *Belletristische Schriften* (Berlin, 1852). His works, characterized by sound scholarship, rank him rather as an historian than as a critic.

KUH, koo, EMIL (1828-76). An Austrian critic and poet, born in Vienna, of Jewish parents. He studied philosophy and history, embraced Catholicism in Berlin in 1857, and returned to Vienna, where he became prominent as a literary critic through his contributions to the leading newspapers, and in 1864 was appointed professor of German language and literature at the Handelsakademie. His most valuable work is a comprehensive biography of Friedrich Hebbel (1877), although its partiality provoked great opposition. Besides, he published: *Ueber neuere Lyrik* (1865), an excellent essay; *Zwei Dichter Oesterreichs: Franz Grillparzer und Adalbert Stifter* (1872), *Dichterbuch aus Oesterreich* (1863), an unusually well-selected anthology. His own lyrics are original in sentiment and graceful in diction, but of little significance. With Julius Glaser he edited the collected works of Hebbel (Hamburg, 1864-66), and with Pachler the *Nachlass* of Friedrich Halm (Vienna, 1872). Consult article in the *Allgemeine deutsche Biographie*, vol. xvii (Leipzig, 1883).

KUHLAU, koo'lou, FRIEDRICH (1786-1832). A German composer, born at Velzen, Hanover. When very young, he lost one eye, but despite this handicap and his poverty, which compelled him to gain a living by singing in the streets, he managed to study harmony under Schwencke in Brunswick. To avoid the conscription in Germany he went to Copenhagen in 1810, where he became first flute in the King's band (1813) and five years later became court composer. Meanwhile he had composed a number of operas, popular in their day, but long since forgotten. His songs, quartets, and concertos were once widely known, but at present only his sonatas and sonatinas (two and four hands) for the piano are in use. These, however, seem likely to remain for some time among the really valuable material for young players.

KUHN, koon, ERNST (1846-). A German Orientalist, son of Franz Felix Adalbert Kuhn, born in Berlin. He was educated there and at Tübingen, and, after lecturing four years at Halle and Leipzig, in 1875 became professor of Sanskrit and comparative philology at Heidelberg. Two years later he went to Munich as professor of Sanskrit. After his father's death he became editor of Kuhn's *Zeitschrift für vergleichende Sprachforschung* (merged with Bezzenberger's *Beiträge zur Kunde der indogermanischen Sprachen* in 1906), and from 1892 to 1894 edited the *Orientalische Bibliographie*. One of his most important works is the *Grundriss der iranischen Philologie*, published with Geiger (Strassburg, 1895-1904). He also published

important studies on Pali, Singhalese, and other Oriental languages. Among his later writings are *J. K. Zeuss zum 100 jährigen Gedächtnis* (1906) and *Uebersicht der Schriften Theodor Nöldeke's* (1907).

KÜHN, kün, or **KINO**, kē'nó, EUSEBIUS FRANZ (c.1644–1711). A Jesuit missionary, born in Trent, Austria. After teaching mathematics for a time at the University of Ingolstadt, he sailed on a mission to Mexico, where he and Father Salva Tierra undertook (1686) to convert the native tribes in what are now California and Arizona. Father Kuhn's labors met with great success. The result of his long and hazardous foot journeys was the establishment of the missions of Santa-Maria Somanca, Gueravi, Cocospera, San Cayetano, and 10 others, the largest being San Xavier del Bac in Arizona. Few of these survived him, but his manuscripts remain, and two of them were printed under the titles *Explicación astronómica del cometa que se vió en todo el orbe en 1680 y 1681* (Mexico, 1681) and *Mapa del paso por tierra á la California* (1706).

KUHN, FRANZ, BARON VON KUHNENFELD (1817–96). An Austrian general born at Prossnitz, Moravia. He entered the army in 1837, took part in the campaigns of 1848 and 1849 in Italy and Hungary, and distinguished himself particularly in the battles of Santa Lucia and Custoza and at Milan. He was made a noble in 1852. During the Italian campaign of 1859 he was chief of staff, and in 1866 commander of the forces in Tirol, where he successfully repulsed the invasion of Garibaldi. Promoted after the war to lieutenant field marshal, he was appointed Minister of War in 1868, in which capacity he rendered important services by reorganizing the army and perfecting the Landwehr. In 1873 his rank was raised to that of feldzeugmeister, and in 1874 he assumed the command of the forces in the provinces of Styria, Carinthia, and Carniola, and of the Third Army Corps at Graz. He was suddenly relieved of his post in 1888, owing to his overfrank criticism of the inspector general of the army, Archduke Albrecht. Besides various writings on astronomical, geographical and military subjects, he published *Der Generalstab* (2d ed., 1878).

KUHN, FRANZ FELIX ADALBERT (1812–81). A celebrated German philologist and mythologist, born at Königsberg, Prussia. He was educated at the University of Berlin, in 1841 became an instructor in the Köllnisches Gymnasium of Berlin, in 1856 a professor in that institution, and in 1870 its director. He was a founder (1851) of the *Zeitschrift für vergleichende Sprachforschung*, in which Karl Verner published (1875) the article "Eine Ausnahme der ersten Lautverschiebung," the first announcement of Verner's law (q.v.); and (1856) of the *Beiträge zur vergleichenden Sprachforschung*, combined with the former in 1875 in the *Zeitschrift für vergleichende Sprachforschung auf dem Gebiete der indogermanischen Sprachen*. His *Zur ältesten Geschichte der indogermanischen Völker* (1845) was a pioneer attempt towards a restoration of the civilization of the primitive Indo-European race by means of a comparative study of the Indo-European languages. Kuhn was a founder of the new science of comparative mythology, to which he contributed numerous papers in the journals edited by him, and his admirable *Herabkunft des Feuers*

und des Gottertranks (1859; new ed., 1886), standard in its field and an admitted criterion for researches of the sort. Kuhn upheld the theory, now abandoned, of the essentially linguistic origin of myths in *Ueber die Entwicklungsstufen der Mythenbildung* (1873). He also wrote on specifically Teutonic mythology and folklore: *Markische Sagen und Marchen* (1842); *Norddeutsche Sagen, Marchen und Gebräuche* (1848); *Sagen, Gebräuche und Marchen aus Westfalen* (1859).

KUHNAU, kōū'nou, JOHANN (1660–1722). A German musician and author, born in Geising, Saxony. As a pupil of the Kreuzschule at Dresden and as a chorister in that city, he gained a thorough musical education. In 1680 the plague compelled him to leave Dresden, and after serving as cantor at Zittau he became (1684) organist of St. Thomas's at Leipzig. In 1700 he was made musical director of the university there and cantor at St. Thomas's, where J. S. Bach became his successor. Of his compositions, those for the piano (clavier) are most important, and he is ranked as the greatest composer for that instrument before Bach. He is particularly famous for having developed the separate movements of the piano sonata. He wrote a number of books on music and besides was the author of many translations and some excellent satirical poetry. He died in Leipzig. Consult G. E. Wagner, *Johann Kuhnau* (Frauenstein, 1912).

KÜHNE, kü'ne, AUGUST (1829–83). A German novelist, whose pseudonym was Johannes van Dewall. He was born at Herford in Westphalia, the son of an officer. In 1848 he became an officer in the artillery at Berlin, and he took part in the campaigns of 1866 and 1870. His first essay in literature was *Geschichte des dänischen Feldzugs* (1864). *Skizzen aus dem Feldzug von 1866* (1868) was published anonymously. Like the history of the Danish campaign, it showed its author to be possessed of a keen insight and lively style. But he is better known for his later works, the humorous tales, *Kadettengeschichten* (1878), and such novels as *Eine grosse Dame* (2 vols., 1875), *Der rote Baschkik* (1873), *Der Ulan* (1875), *Der Spielprofessor* (1874, 3d ed., 1892), *Unkraut im Weizen* (1877); *Die beiden Russinnen* (1880), *Nadina* (1884). His best novel is *Strandgut* (3 vols., 1877). They all depict the life of officers and society women and the upper classes of the demimonde.

KÜHNE, FERDINAND GUSTAV (1806–88). A German novelist and critic, born at Magdeburg and educated at Berlin, where he was a pupil of Hegel. From 1835 to 1842 he edited *Die Zeitung für die Elegante Welt*, from 1846 to 1850 the *Europa*. His relation to the "Young Germany" movement is manifest in his early novel, *Eine Quarantäne im Irrenhause* (1835), and his *Christus auf der Wanderschaft*, a satire on the papacy (1870), and in the *Klosterromane* (2 vols., 1838 and 1877). His poetry in its general tone, if not in its purpose, may be considered typical of the same school, although it did not go to the extremes. Besides his novels, mostly historical, e.g., *Die Rebellen von Irland* (3 vols., 1840) and *Die Freimaurer*, probably his best novel (1854), his dramas, *Isaura von Kastilien*, *Kaiser Friedrich III.*, and *Die Verschwörung von Dublin*, and the continuation of Schiller's *Demetrius*, only moderately successful, especial mention should be made of his

critical essays, such as *Weibliche und männliche Charaktere* (1838); *Portraits und Silhouetten* (1843); and, among his best works, *Deutsche Männer und Frauen* (1851), which clear, elegant style made popular. In 1890 Pierson edited *Empfundenes und Gedachtes: Lose Blätter aus G. Kühnes Schriften*. Consult Pierson, *Gustav Kühne* (Dresden, 1890).

KÜHNE, WILHELM (1837-1900). A German physiologist, born in Hamburg. He received his scientific training at Göttingen, Jena, Berlin, Paris, and Vienna, was chemical assistant in the Pathological Anatomical Institute of the University of Berlin in 1861-63 and professor of physiology in the University of Amsterdam from 1868 to 1871. In 1871 he was appointed to the chair of physiology and the directorship of the Physiological Institute at Heidelberg. He made original researches in physiological chemistry, especially of digestion, in nerves and muscles, and in the chemical influence of light on the retina. His publications include *Myologische Untersuchungen* (1860), *Lehrbuch der physiologischen Chemie* (1866-68); and, after 1883, with Voit, he edited the *Zeitschrift für Biologie*.

KUHNENFELD, kōō'nēn-fēlt, BARON VON. See KUHN, FRANZ.

KÜHNER, ky'nēr, RAPHAEL (1802-78). A German classical scholar. He was born in Gotha, was educated at Göttingen, and from 1824 to 1863 taught in the Hanover Lyceum. He published an edition of the *Tusculana Disputationes* of Cicero (1829, 5th ed., 1874). His large *Greek Grammar* (2 vols., 1834-35), translated by Jelf (1842-45), a vast collection of materials, reached a third edition, in four volumes, by Blass and Gerth (1890-1904). His large *Latin Grammar* (2 vols., 1877-79) has been reedited in enlarged form by Holweilig and Stegman (Hanover, 1912-14). His smaller *Greek Grammar* and *Latin Grammar* passed through many editions.

KÜHREIGEN, kōō'rī'gen, DER (Ranz des Vaches). An opera by Kienzl (qv), first produced in Vienna, Nov. 23, 1911, in the United States, Feb. 21, 1913 (Philadelphia). For description of the musical term, see RANZ DES VACHES.

KUICHLING, kīsh'ling, EMIL (1848-1914). An American hydraulic and sanitary engineer. He was born at Kehl, Germany, but came early to the United States and graduated from the University of Rochester in 1870. In 1870 to 1873 he studied at the Karlsruhe (Germany) Polytechnic School. He served as assistant engineer on the New York State canals in 1869 and 1873 and as assistant engineer in 1873-85 and chief engineer from 1890 to 1900 of the Rochester water works, and from 1881 to 1891 was consulting engineer for the New York State Board of Health. In 1890 he established himself as a consulting engineer in New York City. He constructed the sewerage and water works of many cities in the United States, and was author of several articles in technical journals on hydraulic and sanitary engineering.

KUILENBURG, kōō'len-būr-k, or CULEN-BORG, kōō'len-bōrk. A town of the Netherlands, situated on the left bank of the river Leck, 12 miles southeast of Utrecht (Map: Netherlands, D 3). Its town hall dates from the sixteenth century. The town has a good harbor and is well known for its railroad bridge, which crosses the river in a single span of

492 feet and in 4200 feet in total length. The principal manufactures are glass, lumber, cigars, ribbons, and flour. Pop., 1899, 8280; 1910, 8965.

KUIS. See INDO-CHINESE.

KUKA, kōō'kā. Formerly one of the largest towns of Central Africa and capital of the Kingdom of Bornu (qv), situated near the west coast of Lake Chad (Map: Africa, F 3). It consists of two distinct towns—one to the east with the court and aristocracy and the other the masses. Pop. (est.), 60,000. Kuka was formerly an important slave market and junction point of many caravan routes. It was completely destroyed by Rabeh, the conqueror of Bornu, in 1898, and rebuilt by the British in 1902.

KU-KAI, kōō'kī. See KŌBŌ DAISHI.

KU-KLUX KLAN, or KUKLUX, kū'klūks' (from Gk. κύκλος, *kyklos*, circle, so called as being a secret society, and Eng. *clan*, with altered spelling to give the mysterious abbreviation K. K. K.) A secret organization which existed in some of the Southern States during the period, roughly speaking, from 1865 to 1876. The period of its greatest activity was from 1868 to 1870. It is said to have originated in Pulaski, Tenn., in 1865, during the administration of Governor Brownlow, and to have been at first an association of young men for mutual pleasure and amusement. The demoralization and turbulence of the negroes at the close of the war necessitated, it was felt, some means of restraint, which the government did not then afford. The "association" devised by the young men of Tennessee was adapted to this purpose. In its beginnings it was not greatly different from the old slave patrol and was intended simply to scare the superstitious blacks into good behavior and obedience, and its membership comprised some of the best citizens of the South. Its original purposes as set forth in the prescript or constitution of the Klan, a copy of which is printed in the report of the so-called Ku-Klux Committee of Congress, were the protection of the weak and innocent from the outrages of lawless and brutal persons; the relief of the injured and oppressed; the extension of aid to widows and orphans of Confederate soldiers, and assistance to the government in the execution of all constitutional laws. The prominent Southerners who testified before the committee asserted in justification that it was intended to counteract the evil influence of the Loyal Leagues, or secret political organizations of the negroes, which were formed under the direction of "carpetbag" politicians for the purpose of controlling the votes of the blacks in the elections. In a word, its object was to oppose the influence of the negro in government and society.

But the organization was soon perverted. It became a band for the purpose of whipping, banishing, and murdering negroes and "Northern men." Many of the better class of citizens abandoned it, and henceforth it consisted of the more restless and lawless characters of the South. At first the organization did not bear the same name in every part of the South. It was variously known as the Knights of the White Camelia, the Pale Faces, the Brotherhood, etc., but eventually came to be known everywhere by the more mysterious name of the Ku-Klux Klan. Its sphere of operations was styled the Invisible Empire; the chief function-

ary was the Grand Wizard; each State was a Realm, ruled over by a Grand Dragon, each congressional district was a Dominion, at the head of which was the Grand Titan; each county was a Province under the rule of a Grand Giant; and each county was subdivided into Camps or Dens, each governed by a Grand Cyclops. The members of a Den were called Ghouls. They went disguised in their nocturnal raids, the prevailing costume being a long white robe, a mask for the face, and a high cardboard hat or cap with ears or horns attached. The horses which they rode were quite as effectively disguised. Exaggerated tales circulated among the freedmen as to the numerical strength and supernatural powers of the Ku-Klux, said to be spirits of dead Confederate soldiers. Resolutions to punish were introduced in secret meeting of the Klan, and its decision took the form of a decree. The most frequent victims were negroes active in politics, agents of the Freedmen's Bureau, "carpetbaggers," "scalawags," and Northern school-teachers and ministers. These were sometimes merely warned to desist from a certain course or notified to leave the community, but sometimes suffered punishments of whipping or death. In the case of a mere warning or notification the decree was couched in a strange and half-mysterious phraseology and posted in some conspicuous place about the premises of the victim for whom it was intended. The following is a typical example:

K K K. Dismal Swamp
2D, XI A. 11th hour

Mene, mene, tekell upharin. The bloody dagger is drawn, the trying hour is at hand, beware. Your steps are marked, the eye of the dark chief is upon you. First he warns, then the avenging dagger flashes in the moonlight.

By Order of the Grand Cyclops

LIXTO.

Following the withdrawal of the military governments in the South between 1868 and 1870 and the restoration of civil government, the Ku-Klux "outrages" increased to such a degree as to threaten the general security. Republican legislatures passed stringent acts to break up the Klan and bring its guilty members to justice, but public sentiment was not sufficiently strong against Ku-Klux methods to make the enforcement of the laws effective. Furthermore, since its deeds were usually committed at night by men in disguise, it was difficult to get sufficient evidence upon which a grand jury could frame a bill, or, if that could be done, it was next to impossible to impanel a jury that would find a verdict for the State, few men being courageous enough to give testimony that would incriminate a member of the Klan. Consequently the efforts of the Republican State governments accomplished little towards breaking up the disorder.

On March 23, 1871, President Grant sent a special message to Congress in which he declared that life and property were insecure in some of the Southern States, and that mail carriers and revenue collectors were in danger of personal violence. He urged Congress to enact appropriate legislation to meet the situation. A joint select committee of 21 members was thereupon appointed to inquire into the condition of affairs in the South. A subcommittee took the testimony of various persons at Washington, who were partly familiar with the situation in the South, and other subcommittees were appointed to visit and take testimony in the

affected States. Their report showed the existence of but little disorder in Virginia, Florida, or Louisiana, but pointed out that many crimes, some of them revolting in character, had been committed for political reasons only in various localities of Alabama, Mississippi, South Carolina, Georgia, North Carolina, Tennessee, and Texas, and that life and property were insecure in many localities. Without waiting for the report Congress, on April 20, 1871, passed the Enforcement Act, popularly known as the Ku-Klux Act, or Force Bill. Its most important provision was the extension of the jurisdiction of the United States courts to all Ku-Klux cases, and the authorization of the President to employ the land or naval forces to suppress disorders and to suspend the writ of habeas corpus during the continuance of the Ku-Klux troubles. It also authorized the Federal judges to exclude from the juries those who were believed to be accomplices of persons engaged in committing Ku-Klux outrages. The law seems to have caused a great falling off in the number of Ku-Klux outrages, and the Klan gradually died out. The movement had accomplished its chief object by replacing the whites in control of society and government. Consult Lester, Wilson, and Fleming, *The Ku-Klux Klan* (New York, 1905). For constitutions and rituals of the Ku-Klux Klan and the Knights of the White Camelia, consult Fleming, *Documentary History of Reconstruction* (2 vols., Cleveland, 1907).

KUKOLNIK, koo'kol'-nyik, NESTOR VASILYEVITCH (1809-68) A Russian dramatist and novelist. His style is florid and rhetorical. His novels include *Evelina* (1840), *Patkul*, and *Alfy Aldona* (1842). His plays are extremely patriotic and very bombastic. Among them are *Torquato Tasso* (1833), *Kniaz Kholmakiy* (with music by Glinka), and *Gulio Mosti*.

KUKUI, CANDLENUT, TUNG, or CHINESE WOOD OIL. The oil expressed from the kernels of the fruit of several species of *Aleurites*. In Hawaii the common species is *Aleurites moluccana* or *Aleurites triloba*, in Japan *Aleurites cordata*, in China *Aleurites montana* and *Aleurites fordii*. These species are found from Japan and China to India, the Philippines, Australia, Polynesia, etc., and some have been successfully introduced into other countries. The trees attain a height of 40 to 60 feet, have variously lobed leaves, and produce fruits 2 to 3 inches in diameter, each containing 2 to 5 or more oil-bearing seeds. The seeds yield 50 to 60 per cent of oil, which is said to be one of the best drying oils known. It is largely used in the production of varnish which dries more quickly and is less liable to crack than that made from kauri gum. The oil has a specific gravity of 0.94, dries quickly when used with paint, and preserves wood against moisture. The imports of oil into the United States in 1911 were 5,800,000 gallons, valued at about \$3,000,000. The pomace after the oil has been expressed is valuable as a fertilizer. The Chinese species, *Aleurites fordii*, has been introduced and successfully cultivated since 1906 from South Carolina to Florida and west to Texas and in California. Attempts are being made to revive the industry in Hawaii, where the tree is one of the dominant species of the lower mountains.

KUKULCAN, koo'-kool'-kan. A culture hero or divinity of the Maya, next in importance to

Itzamna at the time of the Spanish conquest. The name means 'feathered serpent' and is equivalent to the Aztec Quetzalcoatl. Many students have identified Kukulcan with the Long-nosed God of the ancient Maya sculptures and manuscripts. This god, who was especially connected with water, has a grotesque face that in reality is a modified serpent face. The cult of this divinity flourished in the first centuries of the Christian era in southern Yucatan, Guatemala, and western Honduras. It seems to have spread northward into Mexico, if we may judge by the sculptures and pottery of the Zapotec and pre-Aztec tribes. Under the name Quetzalcoatl (q.v.), a mere descriptive term, this divinity was especially worshiped at Cholula, one of the earlier Mexican cities. He was regarded as the patron god of fine arts and of the older order of civilization. Traditions connected him with the east, i.e., Yucatan. The pictures of Quetzalcoatl as God of the Morning Star and of Ehecatl as God of the Winds are very similar to each other in Mexican codices and betray their serpent origin.

It is likely that Kukulcan is simply the name under which the ancient Maya god was reintroduced into his native land when Mexican rulers secured a foothold in northern Yucatan in the thirteenth century. His worship was particularly strong at Chichen Itza, which became the capital of the conquerors, and in late traditions he was credited with the founding of this ancient city. The round towers at Chichen Itza and Mayapan are supposed to be connected with the worship of Kukulcan. These buildings are of late date and are unlike any other structures in Yucatan.

KUKULJEVIĆ-SAKČINSKI, koo'kool-yá'-vich-sák-chín'ské, IVAN (1816-89). A Croatian author and statesman, born at Warasdin. He was educated at Agram, served in the army (1833-42), and then entered politics. His first poem, "An Kroatien," and a few of his other works were written in German, but he is best known for his writings in the vernacular. In 1839 he wrote the first Croatian drama, *Juran i Sofija*. His collected works, *Različita dela* (1842-47), contain poems, dramas, and novels. He was prominent in the agitation of 1848 and for many years was a member of the Croatian Diet. He founded the South Slavonic Academy of Agram and was its president. Among his historical works, besides contributions to the *Archives of the South Slavic Historical Society*, are: *Jura Regni Croatiae, Dalmatiae, et Slavoniae* (1861-62); *Monumenta Historica Slavorum Meridionalium* (1863-75), *Codex Diplomaticus Regni Croatiae, Dalmatiae, et Slavoniae* (1876); and a history of the war against the Mongolians, *Borba Hrvatah s Mongolih* (1863). He also wrote the valuable bibliographies *Slovník umjetnikah jugoslavenskih* (Dictionary of South Slavic Studies, 1858-60) and *Bibliografija hrvatska* (Croatian Bibliography, 1860-63).

KUKU NOR, koo'koo nor', or **KOKO NOR**. A region of Tibet (q.v.).

KUKU NOR, or **KOKO NOR**. A salt lake in the Tibetan province of the same name, situated in the northeast corner of the country, 200 miles northeast of the sources of the Hoang-ho, and at an altitude of 10,000 feet above sea level (Map: China, G 4). It is 60 miles long and 40 miles wide, over 200 miles in circumference and 2300 square miles in extent. The Kuku Nor Mountains rise from its south

shore to a height of over 15,000 feet. Its name, in Chinese Tsing-hai, means 'blue sea,' from the beautiful color of its water. It contains several islands, on one of which is a Buddhist monastery, the home of hermit lamas. No communication is held with the mainland, except in winter, when the ice permits the passage of Buddhist pilgrims to the island, with presents and provisions for the hermits.

KULAMAN, koo-lá'mán. A wild tribe on the west coast of Davao Gulf. They appear to be recent arrivals in the Philippines and are only just beginning to accommodate themselves to a settled existence. So far as is known, this is the only true head-hunting tribe on the island of Mindanao. At certain phases of the moon the warriors are compelled to go in quest of victims, in order that the spirits who guard the tribe may be well disposed. A successful warrior is permitted to wear a distinctive type of garment, which varies in color to the number of lives to his credit (see F. C. Cole, *Wild Tribes of Davao District* (Field Museum Publication, Chicago, 1913). See PHILIPPINE ISLANDS.

KULANAPAN, koo-lá-ná'pán. A North American Indian stock. See POMO.

KULBARGA, kul-búr'ga. A town in India. See GULBARGA.

KULDJA. See KULJA.

KULISH, koo'lish, PANTELEYMON ALEXANDROVITCH (1819-97). A Russian author, born at Voronezh and educated at Kiev. He taught for several years and as a friend and follower of Kostomarov (q.v.) was arrested for his radical politics, imprisoned for two months, and for three years exiled to Tula. He wrote a life of Gogol (1856); ethnographical studies on southern Russia, *Zapiski o yuzhnoy Rusi* (1856-57); an historical novel on Russia in 1663 (1857); and collections of tales and poems in Russian and the dialect of Little Russia.

KULJA, kool'já, or **KULDJA**. A town of East Turkestan, in the valley of the Ili, in lat. 43° 58' N, long. 81° 25' E. (Map: China, D 3). It is usually called "Old" or Tatar Kulja, to distinguish it from Manchu or "New" Kulja, founded in 1764, the ruins of which lie lower down the valley, the city (once a thriving town of 75,000 inhabitants) having been destroyed during the Mohammedan Rebellion, 1865, and its Chinese population exterminated. The name is also applied to Ili, the province in which Kulja stands. By agreement with China Russia in 1871 undertook to occupy the city and province until such time as China could establish permanent government there. By treaty made in 1881 Russia withdrew, but retained a portion to provide a place "where the rebels could find a refuge," and received an indemnity for withdrawing of 9,000,000 rubles. During the Russian occupation Old Kulja was the capital. It is a walled town in Chinese style and has a population of about 10,000, chiefly Taranchi or native Turks. Russia has a consul here with a very large staff. The Chinese capital is now at Suiting, some 25 miles distant.

KULLAK, kul'ák, THEODORE (1818-82). A German musician, born at Krotoschin, Posen. He was intended for the legal profession, but studied music under Albert Agthe, Hauch, Czerny, Sechter, and Nicolai. In 1843, after having already had some experience as a teacher, he became the music teacher to Princess Anna and subsequently to the other children

of the royal family. He founded two conservatories in Berlin, one in 1851 and one in 1855, both of which soon became institutions of the first rank. In 1861 he received the title of royal professor. He was an excellent pianist and a distinguished teacher (Moszkowski and Scharwenka were among his pupils), and wrote *Schule des Oktavenspiels*, known in English as *School of Octave Playing*, which is universally used. His music was principally for the piano and was dainty and popular.

KULLBERG, kul'bar-y', KARL ANDERS (1815-97). A Swedish poet and translator, born in the Province of Skaraborg and educated at Upsala. In 1850 he published a collection of *Dikter* which showed a sense of form, but less marked poetical originality. In 1865 he became a member of the academy. He is best known as translator of Tasso's *Gerusalemme liberata* (2 vols., 1860), Ariosto's *Orlando Furioso* (4 vols., 1865-70), and Petrarch's *Canzonier, Ballader, och Sestimer* (1880). For these translations he was awarded the academy's prize in 1860 and two prizes of the Academy of Sciences (1865, 1871).

KULM, kulm. A small village of Bohemia, Austria, situated 8 miles northeast of Teplice. It is noted as the scene of two bloody conflicts, on Aug. 29 and 30, 1813, between the French and allied German, Russian, and Austrian troops, which resulted in the surrender of the French general Vandamme, with about 10,000 men, after having lost about 5000 men on the field. Pop., 1081.

KULM, or **CULM**, kulm. A town of Prussia in the Province of West Prussia, near the Vistula, about 23 miles northeast of Bromberg (Map: Prussia, H 2). Among its notable buildings are the town hall, dating from the sixteenth century, and the church of St. Mary, the former cathedral of the bishopric of Kulm. It manufactures machinery, boilers, lumber, vinegar, and bricks, has a large oil mill, and handles some grain. Pop., 1890, 9762, 1910, 11,718. Kulm was bestowed by Frederick II in 1226 upon the Knights of the Teutonic Order, who fortified it and made it one of their chief strongholds. In 1466 it was ceded to Poland and in 1772 was annexed to Prussia.

KULMBACH, or **CULMBACH**, koolm'bag. A town in the Province of Upper Franconia, Bavaria, on the White Main, 14 miles northwest of Bayreuth. It is famous for its dark beer, produced in more than 25 breweries and mostly exported. It also manufactures malt, linen, cotton, and plush, cement, machinery, iron, dyes, leather, bricks, and electrical apparatus. In the vicinity, to the east, on a high bluff 1390 feet above the sea, is the former fortress of Plassenburg, from 1398 to 1603 the residence of the margraves of Brandenburg-Kulmbach. It is used as a prison and for the archives of the Principality of Bayreuth. Pop., 1890, 7000, 1910, 10,731.

KULMBACH, or **CULMBACH**, kulm'bag, HANS VON. See SUSS, HANS.

KULPE, kul'pe, OSWALD (1862-1916). A German philosopher and psychologist. He was born at Candau and in 1879 graduated from the Gymnasium at Libau, where he taught for the next two years. He then studied in the universities of Leipzig, Berlin, Göttingen, and Dorpat, returning to Leipzig, where he took the degree of Ph.D. in 1887. He was made privat-docent in philosophy at Leipzig (1891), pro-

fessor of philosophy and æsthetics at Würzburg (1894), professor of philosophy at Bonn (1909), and professor of philosophy at Munich (1913). The leading expositor of the act-psychology of the Würzburg school, he made valuable contributions to epistemology and to the psychology of feeling and thought. His chief works are: *Grundriss der Psychologie* (1893; Eng. trans., 1895 and later); *Einleitung in die Philosophie* (1895; 6th ed., 1913; Eng. trans., 1897); *Philosophie der Gegenwart in Deutschland* (1902; 5th ed., 1911); *Immanuel Kant* (1907; 3d ed., 1912); *Psychologie und Medizin* (1912); *Die Realisierung* (1912).

KULTURKAMPF, kul-toor'kamp'f (Ger., culture war). The name given to the conflict between the Catholic church and the German government which started soon after the formation of the German Empire in 1870. One of the causes which retarded the unification of Germany was the religious division of the people. In the south German states, like Bavaria and Baden, and in the Rhine provinces, the prevailing religion is Catholic. It was feared that a united Germany would mean a Prussian Protestant Germany which might result in a persecution of the Catholic minority, and it was mainly for this reason that the southern Germans sympathized with Austria in the Seven Weeks' War.

Catholic prestige suffered heavily by the defeat of France and by the loss of the Pope's temporal power in 1870. The great wave of nationalism which spread over Germany as a result of unification found expression in bitter hostility to Catholicism as a foreign antinational influence. The Catholics, fearing persecution, organized a new political party, called the Centre, which won 63 seats in the first Imperial Parliament. What added fuel to the flame was the promulgation of the dogma of "papal infallibility" by the Vatican Council in 1870. Some of the German Catholics, among them the theologian Döllinger, refused to accept the new dogma; they were excommunicated and deprived of their positions as priests and teachers. These Old Catholics, as they called themselves, appealed to the government for protection and found a doughty champion in Bismarck, who now saw an opportunity to weaken the Catholic church, which he had always regarded as an enemy to German unity. To his support came the various Liberal and Radical parties who hated Catholicism as the strongest enemy of intellectual and religious freedom. It was the distinguished Liberal politician and scientist, Professor Rudolf Virchow, who first called it the Kulturkampf, or battle for civilization. The struggle between church and state then raged violently. In 1872 the Imperial government forbade teaching by religious orders and expelled the Jesuits from Germany. The May laws enacted (1873-75) by the Prussian legislature, the Landtag, gave the state great power over the education of the Catholic clergy by compelling all priests to pass the Gymnasium examination and to study for three years at a state university. To the civil authorities was given the control over the appointment and dismissal of priests. Religious orders were suppressed, and the church forbidden to interfere in political affairs. All Catholic seminaries were to be subject to state inspection. In 1875 the Imperial government made civil marriage compulsory. These laws

were directly the work of Falk, the Prussian Minister of Public Worship. A storm of protest spread all over Germany. The Pope declared the May laws null and void, and the German Catholics refused to obey them. Many of the bishops and lower clergy were fined or imprisoned and their places declared vacant, and at one time the Catholic organization in Prussia was almost annihilated. But the resistance of the faithful became all the stronger, and before long Bismarck had to face a rapidly growing Centre party, led by Ludwig Windthorst, an exceedingly able politician, who managed to embarrass the government at every point. In spite of the fact that Bismarck had declared that "he would not go to Canossa," he opened negotiations with the newly elected Pope Leo XIII. The growth of Socialism convinced Bismarck that the state had a greater enemy in this revolutionary movement than in the Conservative Catholic church. Besides, the Chancellor needed the support of the Centre in the great scheme of social legislation which he was then fathering. During the years 1878-87 most of the anti-clerical legislation was repealed. At present only the laws concerning civil marriage and the Jesuits are still in force, and in all probability the Jesuits will before long be allowed to reënter Germany, as Catholic opinion is insistent on that point.

The Kulturkampf lasted 15 years and resulted in consolidating the Catholics into a powerful political party which has since become the bulwark against German Socialism. For some years the government of the Empire has been controlled by the Catholic Centre and the Lutheran Conservative parties, who have formed a coalition known as the Blue Black Block. Consult: Hahn, *Geschichte des Kulturkampfes in Preussen* (Berlin, 1881), Wiesmann, *Geschichte des Kulturkampfes* (Leipzig, 1886); Robinson and Beard, *Development of Modern Europe*, vol. ii (Boston, 1908), C. D. Hazen, *Europe since 1815* (New York, 1910). See BISMARCK-SCHONHAUSEN, GERMANY, POLITICAL PARTIES, Germany.

KUM, kōm. The chief town of the province of the same name in Irak-Ajemi, Persia, situated 90 miles southwest of Teheran, on the route between that place and Ispahan (Map: Persia, D 5). It is one of the most famous burial places in Persia, and great numbers of pilgrims flock annually to the tomb of Fatima, a sister of Imam Riza, and the tombs of numerous other saints. Pop. (est.), 28,000. Kum is supposed to have been founded by the Arabs of the Abbaside period at the beginning of the ninth century and flourished until the invasion of the Afghans in the eighteenth century.

KUMAMOTO, kōm'mā-mō'tō. A prefectural city and strongly fortified garrison town of Japan, situated near the west coast of the island of Kiushu, on the river Shirakawa, and about 4 miles above its mouth (Map: Japan, B 7). It is well built and full of gardens. It was formerly the seat of the daimyos of Higo and was besieged by Saigo and his army during the Satsuma rebellion of 1877. It is distant only 25 miles from the volcanic peak Aso-yama and suffered from severe earthquakes in 1889. It is the terminus of the first section (170 miles) of the Trunk Railway of Kiushu, leading from Moji on the north to Kagoshima. The Buddhist temple of Hommyoji outside of the town is a popular place of pilgrimage. The

harbor is accessible to small craft. Pop., 1898, 61,463; 1903, 59,717; 1908, 61,233.

KUMĀRASAMBHAVA, kōm-mā'rā-sūm'-b'hū-vā (Skt., birth of Kumāra, or the war god). The name of one of the celebrated poems of the Hindus. Its author is Kalidasa (see KALIDASA), and its subject is the legendary history connected with the birth of Kumāra, or Kartikeya, the Hindu god of war. (See KĀRTIKĒYA.) It consists of 17 cantos, the first seven of which, devoted to the courtship and wedding of the god Siva and of Pārvati, parents of Kumāra, have been rendered into English verse by Griffith (London, 1879); there is an edition of the Sanskrit text with commentary published by the Nirṇaya Sagara Press (Bombay, 1893), and another (ib., 1898). Consult Macdonell, *History of Sanskrit Literature* (London, 1913).

KUMASSI, or **COOMASSIE**, kōm-mās'sē. The capital of the former negro Kingdom of Ashanti, in the British Gold Coast, in West Africa, situated lat. 6° 34' 50" N., 168 miles by rail north of the port of Sekondi on the Gulf of Guinea (Map: Africa, D 4). The town is built on a rock surrounded by marshy land, and its streets are well laid out. The chief structure is the fort, built in 1896. In the centre is a market place, used also as a parade ground and an exchange. Since the opening of the railway it has outstripped the seaboard towns. Pop., 1906, 6280; 1914, est., 8900. Kumassi was taken by the British in 1874. The town was again taken in 1896. It has an active trade with Central Africa. See ASHANTI; GOLD COAST.

KUMAUN, kū-mā'ūn. A division of the United Provinces, British India, consisting of the three districts of Naini Tal, Almora, and Garhwal (Map: India, D 3). Area, 13,725 square miles; pop., 1901, 1,207,030; 1911, 1,328,790. It lies chiefly on the south slope of the Himalayas, extending from Tibet to Tarai, comprising upward of 30 summits in that range, which vary in altitude from about 18,000 feet to nearly 26,000. With the exception of a belt from 2 to 15 miles broad, on its south frontier, the whole country is one mass of mountains and forests. Its principal rivers are the Pindar and Kailganga. The chief minerals are gold, copper, and lead. Throughout the south belt biennial crops of wheat, barley, oats, millet, peas, and beans are produced, with rice, cotton, indigo, sugar, ginger, and turmeric. The valuable forest tracts are under government supervision. Near the end of the eighteenth century Kumaun was seized by the Gurkhas. Their frequent raids into the neighbouring territory, however, resulted in the annexation of Kumaun by the British in 1815. The principal town is Naini Tal (pop., 15,164). Kumaun is celebrated for its numerous pilgrim resorts at the junction points of its rivers; the most important are Deoprayag and Vishnuprayag. It is growing rapidly, and the cool mountains have many resorts for refuge from the heat of India in summer.

KUMBHAKONAM, or **COMBACONUM**, kōm'bā-kō'nūm (Skt., jar edge, from *kumbha*, jar + *kōna*, edge). The capital of a district of the same name in Madras, British India, situated within the delta of the Cauvery River, about 30 miles from the sea, and 194 from Madras (Map: India, D 7). It contains a number of interesting temples, gateways, and a gate pyramid nearly 150 feet high, profusely adorned

with statuary in stucco. The large reservoir, which is supposed to be filled with water from the Ganges every 12 years by a subterranean passage 1200 miles long, attracts great numbers of pilgrims. The city, a centre of Brahmanism, is regarded as sacred by the natives. Brass, bronze, copper, and lead vessels, silk and cotton cloths, sugar, indigo, and pottery are the chief manufactures, but the silk and cotton industries are dying out. The English have established a small college here. Pop, 1891, 54,300; 1901, 59,763; 1911, 64,647.

KUMISS, or **KOUMISS**, kōō'mis (Tatar *kumiz*, fermented mares' milk). A fermented beverage originally made by the Tatars from mares' milk, but largely made in Europe and America from cows' milk. The method of preparation is not uniform. In the East mares' milk is placed in leathern vessels, with the addition of a portion of a previous brewing and a little yeast. The vessel is frequently shaken or beaten during the fermentation, which prevents the cream from rising and churns a part of the butter fat, which is removed. The fermentation requires from 30 to 48 hours. In the West it is prepared by adding sugar of milk to cows' milk, fermenting in open tanks, removing the casein and butter fat, and bottling during active fermentation. Kumiss has an acid and peculiar taste. It is diuretic and causes free perspiration. It is also credited with stimulant and tonic qualities, promoting the nutritive processes of the body. Kumiss is an invaluable article of diet in wasting diseases, in dyspepsia, in the diarrheas of children, and in convalescence from acute fevers. The stomach retains it when no other food can be taken. Each quart is estimated to contain four ounces of solid food and 1 to 3 per cent of alcohol. The following table gives the average composition of milk, kumiss, and kefir:

	Cows' milk	Kumiss	Kefir
Albuminoids (casein, etc.)	4	1	4
Butter fat	4	2	2
Sugar of milk	5	2½	2
Lactic acid		1	1
Alcohol		1½	1
Water and salts	87	92	90

See KEFIR

KÜMMEL, or **DOPPELKÜMMEL**, dōp'el-kūm'el (Ger., cumin). A liqueur made generally from highly rectified alcohol, flavored with cumin and caraway seeds. It is made chiefly at Riga and is much used in Russia, Germany, and the Eastern Archipelago. See LIQUEUR.

KÜMMEL, kīm'el, HENRY BARNARD (1867-). An American geologist. He was born at Milwaukee, Wis., and graduated from Beloit College in 1889, from Harvard University (A.M.) in 1892, and from the University of Chicago (Ph.D.) in 1895. He served as an assistant geologist on the New Jersey State Geological Survey in 1892-98, was assistant professor of physiography at the Lewis Institute, Chicago, in 1896-99; and became assistant State geologist of New Jersey in 1899 and State geologist in 1902. He was also appointed executive officer of the New Jersey Forest Commission (1905). From 1897 to 1901 he was associate editor of the *Journal of Geography*, and from 1908 to 1913 was president of the Asso-

ciation of American State Geologists. His papers deal with the paleozoic rocks, the stratigraphic clays, and the areal and economic geology of New Jersey.

KUMMER, kum'ēr, ERNST EDUARD (1810-93). A German mathematician, born at Sorau in Silesia. He studied theology and mathematics in Halle (1828-31) and received the doctor's degree in 1832. He then for 10 years taught mathematics in the Gymnasium at Liegnitz, where Kronecker (q.v.) was one of his pupils. From 1842 to 1855 Kummer was professor of mathematics at Breslau and from 1855 to 1884 at Berlin. From 1874 he also taught in the military academy of Berlin. He became a member of the Academy of Sciences in Berlin in 1855 and in 1857 was awarded the grand prize in mathematics by the Academy of Sciences in Paris, of which he became a foreign member in 1868. Kummer's chief contributions to mathematics were in the domains of the hypergeometric (Gaussian) series (Crelle's *Journal*, vol. xv), of cubic and biquadratic remainders (in Crelle, vols. xxiii and xxxii), and of complex numbers. The creation of the theory of ideal numbers (see NUMBER) is due to him, and to the theory of numbers in general he was an extensive contributor. He also devoted himself with success to the subject of pure geometry. In the *Allgemeine Theorie der Strahlensysteme* (Crelle's *Journal*, vol. lvii) he laid down the principles applicable to the so-called Kummer surfaces. These are surfaces of the fourth degree with 16 knot points (*Knotenpunkten*, corresponding to double points of a curve), and 16 singular tangent planes. The points and planes are so related that each of the 16 planes contains six of the points, and through each of the 16 points pass six of the planes. The system of these points and planes is called a Kummer configuration. The theory of these surfaces has been studied by Cayley, Reye, Lie, and others, and Borchardt and H. Weber have shown the relation of this theory to that of hyperelliptic (Abelian) functions. Besides the contributions already mentioned, Kummer's writings include an interesting memoir entitled *Ueber die Wirkung des Luftwiderstandes auf Körper von verschiedener Gestalt, insbesondere auf die Geschosse* (Abhandlungen der Berliner Akademie, 1875). For biographical sketch and list of works, consult the *Jahresbericht der deutschen Mathematiker-Vereinigung*, vol. iii (Berlin, 1894).

KUMMER, FRIEDRICH AUGUST (1797-1879). A German violoncellist, born in Meiningen. He studied the cello under Dotzauer in Dresden, but became an oboist of the King's Band in 1814. In 1817 he became cellist in the same organization. He made several European concert tours, but most of his life was spent in Dresden, in which city he died. He composed many concertos and fantasias for the cello and wrote an excellent *Violoncello School*.

KUMQUAT, kūm'kwōt (Cant. pron. of Chin. *kin keu*, golden orange), *Citrus japonica*. Small shrubby forms of the orange, seldom more than 6 feet high, natives of Cochinchina or China, and extensively cultivated in Japan, Florida, and California. They endure more frost than any other oranges and in cultivation grow 8 to 12 feet tall. The fruit is ovate, oblong, or spherical, and orange-colored. The rind of the kumquat is sweet and the juice acid. It is delicious and refreshing. The Chinese make an

excellent sweetmeat by preserving it in sugar, a practice which is being followed in the United States. The dwarf habit and the dense dark-green foliage make it popular for pot culture. In commercial plantations it is usually budded or grafted on *Poncirus trifoliata* or some sweet orange stock. For illustration, see Colored Plate of CITRUS FRUIT. Consult Hume, "The

KUMQUAT.

Kumquat," in *Florida Experiment Station, Bulletin* 65 (Lake City, 1903); Swingle, "A New Genus of Kumquat Oranges," in *Jour. Wash. Acad. Sci.*, 5 (1915), No. 5, pp. 165-176. The kumquats have recently been grouped by one authority into a new genus, *Fortunella*. The round form is classed as *Fortunella japonica*, and the oval form as *Fortunella margarita*.

KUMUNDUROS, *kōō-mōōn'dū-ras*, or **KOMUNDUROS**, ALEXANDROS (1814-83). A Greek statesman. He was born in Messenia and, after studying for a short time at Athens, returned to his home as a lawyer. He took part in the rising in Crete in 1841 and in 1843 was private secretary to General Grivas during the September revolution. He was chosen deputy in 1851 and was chosen President of the Chamber in 1855. In 1856 he became Minister of Finance in the Miaulis cabinet. For his part in the plot against King Otto (1862) the new revolutionary government under George I (q.v.) made him Minister of Justice. Under Kanaris he was twice (1864 and 1865) Minister of the Interior and in 1865 became for the first time President of the Ministry, being repeatedly reappointed to the position afterward (the last time in 1880). His politics changed from liberal (before 1862) to conservative. He was especially anxious to develop gradually the parliamentary power; but his foreign policy, whose aim was to resist Turkey and extend Greek power, was made impossible by the Congress of Constantinople, and he was forced to resign (1882). Consult Bikélas, *Coumoundouros* (Montpellier, 1884).

KUN'CHINJIN'GA. A peak of the Himalayas, one of the highest mountains in the world, perhaps exceeded only by Mount Everest and Mount Godwin-Austen or Dapsang (Map: India, F 3). It is situated at the northeast corner of Nepal, 60 miles east of Mount Everest. Its height is 28,156 feet.

KUND, *kunt*, RICHARD (1852-1904). A German soldier and explorer, born at Zielenzig in the Neumark. In 1884 he went to Africa in the employ of the African Company. With Tappenbeck he proceeded inland to Leopoldville; at the close of the year 1885 he came to the Mfini and marked its upper course. A few weeks afterward he was severely wounded in a battle with

the natives. In 1887 he was again sent to Africa to explore the southern part of the Kamerun country. On this trip he discovered the Nightingale Falls, but hostilities with the natives soon broke out. Both Kund and Tappenbeck were severely wounded. Ill health forced Kund to return to Germany in 1890. The next three years he spent in sea travel, to rebuild his health, and visited East Africa and the eastern part of India.

KUNDT, *kunt*, AUGUST (1838-94). A German physicist, born at Schwerin in Mecklenburg. He became privatdocent at the University of Berlin in 1866. Two years later he became professor of physics at the Zurich Polytechnicum; in 1870 he went to Würzburg, in 1872 to Strassburg, when that university was being organized, and in 1888 to Berlin, succeeding Helmholtz in the chair of experimental physics. Kundt devoted himself especially to researches on sound and discovered the method of dust figures, which bears his name, for determining the velocity of sound in gases. In addition to investigations in acoustics Kundt also studied the phenomena of anomalous dispersion of light in an elaborate series of experiments. He showed that in certain substances the order of the colors in the spectrum is reversed, notably certain liquids, such as eyanine, mauve, aniline, and aniline blue. The peculiar phenomena of dispersion exhibited by the films of metals was also carefully investigated in an elaborate research occupying over two years. Other notable work was the study of the conduction of heat and friction of gases, the electrical properties of crystals, the rotation of the plane of polarization in gases, and the optical characteristics of metals. These and other researches will be found for the most part in *Poggendorffs Annalen*, *Wiedemanns Annalen*, the *Proceedings of the Berlin Academy of Sciences*, and the *Philosophical Magazine*. His *Vorlesungen über Experimentalphysik*, edited by K. Scheel, were published at Brunswick in 1903. Consult a memorial by Werner von Siemens, in *Königliche preussische Akademie der Wissenschaften, Abhandlungen*, vol. ii (Berlin, 1893).

KUNENE, *kōō-nā'ne*, or **CUNENE**. A river rising in the Ovimbundu Mountains, Benguela, Angola (Map: Congo, B 6). After a southerly course during which it receives several affluents, the chief of which is the Chitanda, it flows westward, marking the boundary between German Southwest Africa and Angola, and enters the Atlantic Ocean in lat. 17° 20' S., after a flow of 720 miles. In its upper course it has a large volume of water throughout the year, but in its lower course, which is through a desert region, it is so completely dried up during the dry season that, after it had been first discovered in 1824, it could not be found again until 1854, when it was visited during the wet season. This phenomenon is due partly to the fact that the river throws off several branches, which flow southeastward into Lake Etosa, a shallow lagoon or marsh situated in the desert of Damaraland, and partly to the diminution of supply at the sources. In the wet season some of the upper waters find a passage to the Zambezi through the Kubango, which drains Etosa. The Kunene was probably at an earlier epoch an affluent of the Zambezi system. The regions between Lake Etosa and the Kubango and between the Kubango and the Zambezi have not been thoroughly explored.

KUNERSDORF, kōō'nērs-dōrf. A village in the Province of Brandenburg, Prussia, 4 miles northeast of Frankfurt-on-the-Oder. It is noted as the scene of one of the most remarkable battles of the Seven Years' War, fought on Aug 12, 1759, in which Frederick the Great was completely defeated by a combined attack of Russians under Soltikov and Austrians under Loudon. The Prussians lost 18,500 men, with almost all their artillery and baggage, while their opponents lost 16,900 men.

KUNG TS'IN (or **CH'IN**) **WANG**, kōōng tsān wāng (1832-98). A Chinese prince and statesman, sixth son of the Emperor Tao-kwang (1796-1820), and brother of the Emperor Hien- (or Hsien-) fung, who fled from Peking at the approach of the French and British allies in 1860 and left Prince Kung to make the best terms with them he could. These were embodied in the treaty signed at Peking, Oct. 24, 1860, opening several new ports and providing for diplomatic representatives at Peking. A new department for foreign affairs was also provided for—the Tsung-li Yamen—and, in 1861, Prince Kung was appointed its President. A few months later Hien-fung died at Jehol and was succeeded by his son, a child of five. Prince Kung and the Empress and Empress Dowager became regents, and the Prince also was appointed to the presidency of the Imperial Clan Court. His position was one of great difficulty; practically every reform he attempted was violently opposed by the Conservative party forming his council, all of whom were averse to Western intrusion and ideas, and he was defeated and reprimanded many times, but was always recalled to power after a short lapse of time. In 1884 his desire for conciliation in the troubles with France led to his dismissal from office. He gave up his hereditary first class principedom and remained in retirement until 1894, when he was recalled to be President of the Tsung-li Yamen, now the Waichiaopu, and ordered to assist Li Hung-chang in the Korean difficulty with Japan. He was also placed on the Grand Council at the special request of the Empress Dowager. It was unfortunate for China and the world that Prince Kung died just before the reform movement of 1898 began. He was a statesman of ability and experience, commanded the respect of all, and was the only one able to keep peace between the opposing factions of the Manchus and the court. He was fairly progressive, not opposed to moderate reforms, and could have guided the Emperor Kuang-hsü, who relied upon his help, into safe paths. Had he lived, the reform movement might have been successful, and the Empress Dowager's coup d'état and the Boxer rebellion prevented.

KUNGU (kōōng'gōō) **CAKE**. A cake eaten by the natives of the Lake Nyassa region in Africa, and made from the pressed bodies of a dipterous aquatic insect of the genus *Cortethra*. Cf. **AHUATLE**; **KOO-CHAH-BEE**.

KUNGUR, kōōng-gōōr'. The chief town of a district in the Government of Perm, Russia, on the rivers Sylva and Iren, 58 miles southeast of the city of Perm (Map: Russia, J 3). Tanning and the manufacture of leather goods, shoes, gloves, mittens, and a kind of leather overcoats are its principal industries. A considerable trade in these articles as well as in cereals, flax, and tallow is carried on. Pop., 1910, 19,638. Kungur was founded in 1647.

KUNIGUNDE, kōō'nē-gun'de, SAINT (?-

c.1039). Wife of the Emperor Henry II (q.v.) and daughter of Count Siegfried of Luxemburg. According to legend Henry and Kunigunde made a vow to live as if unmarried and hence won the title of saints, but this has been disproved. According to another legend, Kunigunde's reputation having been unjustly assailed, she vindicated herself by walking barefooted over hot plowshares. After the death of her husband, in 1024, she retired to the convent of Kauffungen, near Cassel, which she had founded. She spent the remainder of her days in pious works and was canonized in 1200. Her day is March 3, but the year of her death is uncertain. Consult Hirsch, *Jahrbucher des deutschen Reichs unter Heinrich II* (3 vols., Berlin, 1862-75), and Tousseint, *Geschichte der heiligen Kunigunde* (Paderborn, 1901).

KUN-LUN, kōōn'loōn'. A mountain system of Central Asia. See **KUEN-LUN**.

KUNNOJ', or **KUNNOUJ'**. See **KANAUJ**.

KUNTZ, kunt, **KARL SIGISMUND** (1788-1850). A German botanist, born in Leipzig. In 1806 he entered upon a commercial career in Berlin, but through the help of Alexander von Humboldt (q.v.) he was enabled to follow the study of botany; and in 1813 he went to Paris to classify and describe the plants collected in America by Humboldt and Bonpland. His *Synopsis* of this herbarium appeared in 1822-25. He returned to Berlin in 1819 after visits to England and Switzerland, was made professor of botany in the University of Berlin and vice president of the Botanical Garden, and became a member of the Berlin Academy of Sciences in 1829. His works include: *Flora Berolinensis* (1813); *Nova Genera et Species Plantarum* (1815-28), descriptive of the results of Humboldt's journeys, *Les Mimosées et autres plantes légumineuses du nouveau continent* (1819-24); *Les graminées de l'Amérique du Sud* (1825-33); *Handbuch der Botanik* (1831), *Lehrbuch der Botanik* (1847), and a work on monocotyledons entitled *Enumeratio Plantarum Omnium hucusque Cognitarum, Secundum Familias Naturales Disposita* (1833-50).

KUNTZE, kōōn'tse, **JOHANNES EMIL** (1824-94). A German jurist, born at Grimma. He studied law at the University of Leipzig. In 1856 he was appointed professor there. His most important publications are: *Die Obligation und Singularsuccession des römischen und heutigen Rechts* (1856), *Der Wendepunkt der Rechtswissenschaft* (1856), *Das Jus Respondendi in unserer Zeit* (1858), *Deutsches Wechselrecht* (1862), *Prolegomena zur Geschichte Roms* (1882), *Die deutschen Städtegrundungen* (1891), *Zur Geschichte des römischen Pfandrechts* (1893), *Der Cervus Fracturarius des römischen Rechts* (1880).

KUNWALD, kōōn'vāld, **ERNST** (1868-). An Austrian musical conductor, born at Vienna. In 1885 he matriculated at the University of Vienna as a student of law and completed the course in 1891, receiving the doctor's degree. But at the same time he studied music assiduously, piano with Leschetizky and Epstein (1882-86), composition with Grädener (1884-88). In 1893-94 he studied piano and composition with Jadassohn at the Leipzig Conservatory and also acted as chorus master of the Leipzig Opera. In 1895 he went to Rostock as conductor of lighter operas and in 1897 to Sondershausen as regular operatic conductor. From 1898 to 1907 he filled similar positions in Essen, Halle,

Madrid, Frankfort, Berlin (Kroll's Opera), and Nuremberg. In 1907 he was appointed conductor of the Berlin Philharmonic Orchestra, where he remained till 1912. He was then called to Cincinnati as conductor of the local Symphony Orchestra. Under his leadership this orchestra rose to a position of prime importance among the great symphony organizations of the United States.

KUNZ, kúnz, GEORGE FREDERICK (1856-). An American mineralogist and gem expert, born in New York City. He became gem expert for Tiffany & Co., of New York, jewelers, and after 1879 was third vice president of the firm. From 1883 to 1909 he was special agent of the United States Geological Survey. In important capacities related to his profession he was connected with the expositions held in Paris (1889), Kimberley (1892), Chicago (1893), Atlanta (1895), Omaha (1898), Paris (1900), St. Louis (1904). In 1892-98 he investigated American pearls for the United States Fish Commission, and he had charge of precious stones for the twelfth census. He was made an Officer of the French Legion of Honor and received many other decorations, became honorary curator of precious stones in the American Museum of Natural History, and was vice president of the American Institute of Mining Engineers in 1899-1901. In addition he was interested in various civic undertakings, becoming president of the American Scenic and Historic Preservation Society. He published *The Gems and Precious Stones of North America* (1890), *The Book of the Pearl*, with C. H. Stevenson (1908), *The Curious Lore of Precious Stones* (1913), and he contributed to periodicals more than 200 articles on folklore, meteorites, minerals, and gems.

KUNZE, kún'ze, JOHN CHRISTOPHER (1744-1807). An American Lutheran clergyman and scholar. He was born at Artern, Saxony, was educated for the Church at Leipzig, and in 1770 went to Philadelphia as associate pastor of St. Michael's and Zion Lutheran congregations. In 1780 he added to his duties those of professor of Oriental languages in the University of Pennsylvania. From 1784 to 1787 and from 1792 to 1799 he held a like chair in Columbia, having removed to a New York charge in 1784. Kunze was an excellent Hebraist and a skilled mathematician, an advocate of English education for German children, and publisher of the first *Hymn and Prayer Book for Lutheran Churches* in English (1795). He also wrote on the history of the Lutheran church and did much to introduce English into the German pulpits in America.

KUNZITE. See **SPODUMENE**.

KUOPIO, ku-óp'i-ô. A government in the eastern part of Finland, Russia (Map: Russia, C 2). Area, about 16,498 square miles, of which over 16 per cent is lakes. The northern part is covered with dense pine forests, and the soil is mostly unfitted for agriculture. The climate is extremely severe, the average annual temperature being about 36°. Agriculture is in a primitive state, but dairying is carried on extensively. The exploitation of the forests is also an important industry, considerable quantities of iron are mined, and there are engineering, iron and chemical works, saw and paper mills, and distilleries in the province. Pop., 1912, 327,573. Capital, Kuopio.

KUOPIO. The capital of the government of the same name, in Finland, Russia, situated on

the west shore of Kalla Lake, 225 miles northwest of St. Petersburg (Map: Russia, C 2). It is regularly built and has a fine park and is an educational centre of some importance. It is the seat of a bishop and contains a modern cathedral. Pop., 1912, 15,845.

KUPRULI, or **KUPRILI**. See **KIUPRILI**.

KUR, kōōr, or **KURA**, kōō'rā (Lat. *Cyrus*). The largest river in Transcaucasia, Russia, rising in the Territory of Kars, at an altitude of about 6600 feet, and flowing in a generally southeasterly direction past the city of Tiflis towards the Caspian Sea, into which it falls after a course of 830 miles (Map: Russia, G 6). It flows chiefly through a mountainous region and drains an area estimated at 60,000 square miles. The Aras, which prior to 1896 discharged into the Kur a short distance from its mouth, has in great part recovered its old estuary in the Kizil Agatch Bay. Despite its turbulent course the Kur is navigable for steamers for about 130 miles from its mouth.

KURA, kōō'rā, LAKE. See **CHAD**.

KURANDA, kōō-rān'dā, IGNAZ (1812-84). An Austrian publicist and politician, born in Prague, the son of a Jewish bookseller. After journalistic work in Vienna, Leipzig, Stuttgart, and Paris, he went to Brussels, where in 1841 he founded *Die Grenzboten*, a Liberal political and literary weekly. In 1842 he transferred its editorial office to Leipzig, where it subsequently passed into the hands of Gustav Freytag and Julian Schmidt, after Kuranda had returned to Austria and been elected to the Frankfort Parliament in 1848. He settled in Vienna and founded the *Ostdeutsche Post*, a political journal, which ceased to exist in 1866. In 1867 he was elected to the Reichsrat and became one of its most prominent Liberal leaders. He wrote *Belgien in seiner Revolution* (1846).

KURBSKI, kōōrp'skē, ANDREI MIKHAILOVITCH, PRINCE (1528-88). A Russian soldier and writer. He was a military commander under Ivan the Terrible and took part in the siege of Kazan. Being unfortunate in war, he was forced to take refuge in Lithuania, where he entered the service of Sigismund August, the Czar's enemy. At the same time he studied Latin with a view to propagating the Orthodox faith among the Poles. Of much historical interest is his controversial correspondence (1563-79)—half a dozen letters at told—with Ivan, whom he tried to defeat by erudition, but the Czar was gifted with superior talent for spontaneous vituperation. Kurbski, however, had his revenge in the *Life* he wrote of Ivan the Terrible, the first history of his kind in Russia.

KURDISH, kōōr'dish. The language spoken by the Kurds inhabiting Kurdistan, Persia, Afghanistan, and Baluchistan. The number of persons speaking Kurdish is probably not far from 2,300,000. In character the language is Iranian, but it contains many loan words from Arabic, Persian, Turkish, and other neighboring tongues. The old inflections of the Iranian have been given up, and, like the Persian, Afghan, and Baluchi, or even like English, the language is now synthetic. It is divided into several dialects, of which the most important are Luri, Kirmanshahi, Gurani, Mukri, and Zaza, which differ from each other so much as to be sometimes mutually unintelligible. The Kurdish literature is chiefly oral and is especially rich in ballads and lyrics as well as in fairy stories and beast fables. Epics are less developed, and,

as is usual in unwritten literatures, prose is almost entirely lacking.

Bibliography. Garzoni, *Grammatica e vocabulario della lingua kurda* (Rome, 1787); Rich, *Narrative of a Residence in Koordistan* (London, 1837); Lerch, *Forschungen über die Kurden und die iranischen Nordchaldaer* (St. Petersburg, 1857-58); Jaba, *Recueil des notices et récits kourdes* (ib., 1866); Prym and Socin, *Kurdische Sammlungen* (ib., 1870-90); Jaba, *Dictionnaire kurde-français* (ib., 1879); Justi, *Kurdische Grammatik* (ib., 1880); Socin, "Die Sprache der Kurden," in Geiger and Kuhn, *Grundriss der iranischen Philologie*, vol. i (Strassburg, 1895 et seq.); Makas, *Kurdische Studien* (Heidelberg, 1901); Mann, "Kurdisch-persische Forschungen: I. Teil, einer von 1901 bis 1903 und 1906 bis 1907, in Persien und asiatischen Türkei ausgeführten Forschungsreise (2 vols., Berlin, 1906-00).

KURDISTAN, kūr'dê-stân' (Pers., land of the Kurds). The name of a region south of Armenia, in west Asia, extending in a northwest and southeast direction through the northeastern part of the Turkish dominions and the northwestern part of Persia, from about lat. 34° to 39° N. and from about long. 38° to 48° E. (Map: Turkey in Asia, D 2 and E 3). It reaches to Malatia in the west, borders on the Tigris in the south, and embraces Lake Urmiah in the east. On the northern borders is Lake Van. Area, about 56,000 square miles. The region is very mountainous. West of Lake Van there are distinguished three principal and a number of secondary ranges, inclosing high, fertile valleys and forming one of the most picturesque parts of west Asia. As we approach the Persian frontier, the country is still more mountainous, the mountain masses intersecting each other in every direction and having an average elevation of not less than 5,000 feet, with single peaks rising to greater heights. In the Persian part of Kurdistan the ranges decrease in size, and the proportion of open country is much larger. Along the Tigris extends a level plain. Kurdistan belongs to the basins of the Tigris and the Euphrates, being traversed by numerous streams coursing south from the Armenian highlands. Among the rivers which descend from the mountains of Kurdistan to join the Tigris are the Greater and Lesser Zab. The climate is hot and dry in the summer and rather severe in the winter. Cereals and southern fruits are produced in abundance. The region is inhabited mainly by Kurds (q.v.). Turkish Kurdistan is included mainly in the vilayets of Diarbekir, Mamuret-ul-Aziz, Bitlis, and Van. The part belonging to Persia has a relatively small area. In the extreme south of this portion is the town of Kirmanshah. The population is probably not far from 2,500,000. Kurdistan is a part of ancient Assyria.

KURDS, kōrdz, or **KOORDS**. A people after whom certain parts of Turkey in Asia and Persia have received the name of Kurdistan, belonging both by language and physical characters to the Iranian branch of the white race. Physically they are medium-statured, dark, long-headed, and, where not influenced by civilization, harsh-featured and of savage aspect. Their hospitality and other good qualities, including a characteristic sense of honor, have been overclouded in the public mind by their reputation as predatory thieves and agents of Turkish oppression. The vast majority of the Kurds, who

number about 2,300,000, profess Islam, which has brought them into antagonism with the Armenians and other Christian peoples of their environment. The history of the Kurds dates back to the earliest times of which we have record. After the fall of the Assyrian Empire they fused with the Medes and ultimately became Aryanized. They were subjugated by the Macedonians and the Parthians. Under the rule of the Caliphate of Bagdad the Kurds continually revolted. In the ninth century their strongest fortress, Sermaj, was captured along with the whole province of Shahrizor. The twelfth century marks the pinnacle of their power, when they held sway over the territory from Khorasan (q.v.) to Egypt. During the occupation of this region by the Mongols and Tatars, the Kurds withdrew to the Kurdistān Mountains and were only nominally ruled by their successors. For later history, see **TURKEY**. Consult: Millingen, *Wild Life among the Koords* (London, 1870); Cragh, *Armenians, Koords, and Turks* (ib., 1880); Houssaye, *Les races humaines de la Perse* (Paris, 1888); Chantre, "Les Kurdes," in the *Bulletins de la Société d'Anthropologie de Lyon* (Lyons, 1889); id., *Recherches anthropologiques dans l'Asie occidentale* (Paris, 1898); H. F. B. Lynch, *Armenia* (London, 1901); E. Percy, *Highlands of Asiatic Turkey* (ib., 1906); E. B. Soane, *To Kurdistan in Disguise* (Boston, 1914).

KÜRENBERG, kü'ri:n-bērk, DER VON, or DER KURENBERGER. A German poet of the twelfth century, of a knightly race settled near Linz in Upper Austria. His 15 love songs, dating from about 1150-70, were edited by Wackernagel (1827) in Haupt, *Des Minnesangs Frühling* (Leipzig, 1888), and in Bartsch, *Deutsche Liederdichter* (Stuttgart, 1893). As they are in part composed in the Nibelungen stanza, some literary historians, as Pfeiffer and Bartsch, have connected them with the authorship of the *Nibelungenlied*, the original version. Consult: Pfeiffer, *Die Nibelungen* (Stuttgart, 1874); Eugen Joseph, *Die Frühzeit des deutschen Minnesangs, Quellen und Forschungen*, part lxxix (Strassburg, 1886); Böhning, *Das Kurenberger Liederbuch* (Arnstadt, 1901-02).

KURG, kōörg. A province of British India. See **COORG**.

KURGANS, kōōr'ganz. The name applied to ancient sepulchres and grave mounds found in various regions of European Russia and Siberia. The dolichocephalic type of the Transbaikial Kurgans is thought by some to be related to the Hakkas, whom they regard as the best modern representatives of the primitive Chinese.

KURIA MURIA (kōō'rē-ā mōō'rē-ā) **ISLANDS**. A group of five islands situated off the south coast of Arabia (Map: Turkey in Asia, H 8). They aggregate 29 square miles in area, are barren, are inhabited by a few families of Arabs, and contain deposits of guano. They were ceded to England by the Sultan of Oman in 1854 as a landing place for the Red Sea telegraph cable.

KURILE (kōō'rīl) **ISLANDS** (from Russ. *kuriti*, to smoke; so called from the active volcanoes in the group; in Japanese, *Chishima*, thousand isles). A chain of about 32 islands of volcanic origin in the North Pacific Ocean, belonging to Japan and lying between Kamchatka and Yezo (Map: Japan, A 4 to E 2). Some of the peaks, as Chikuratski (6400 feet), Blakiston (4400), Matua (5120), Milne (5650),

are rich in forests. They form one of the 11 provinces of what is known as the Hokkaido, the other 10 being in the island of Yezo. Area, 6153 square miles, coast line, 1496 miles; pop. (est.), 3000. The chief exports are fish and furs. The islands were discovered by the Dutch navigator De Vries, and occupied by Cossacks in 1766, though from ancient times claimed by Japan. After a long diplomatic strife Japan obtained in 1875 those held by Russia in exchange for the southern half of Sakhalin. The principal islands are Itorup, Kunashiri, Paramushiri, and Shumshu. In 1899 a Japanese commercial company began the settlement and commercial development of these islands.

KURINO, kūr'no, SHINCHIRO, VISCOUNT (1862-). A Japanese diplomat, of a Fukuoka samurai family. After graduating from the Harvard Law School he entered the Japanese diplomatic service as Commissioner of the Foreign Office in 1881, becoming vice chief of the Investigation Bureau in 1886. In 1894-96 he was Minister to the United States and secured in 1894 the signature of the treaty under which the United States gave up the principle of extraterritoriality as applied to Japan. Kurino was Minister at Rome (1896), at Paris (1897-1901), and at St. Petersburg up to the eve of the Russo-Japanese War, and from 1906 to 1912 he was the first Japanese Ambassador to France.

KURISCHES HAF, kūr'ish-ēs hāf. An extensive lagoon separated from the Baltic Sea by a bar of sand called the Kurische Nehrung, from 1 to 2 miles in width. The lagoon extends nearly 60 miles along the coast of East Prussia, from Labiau to Memel, where it is connected with the Baltic by the Memel Deep, a channel about 1000 feet wide and 12 feet deep (Map: Germany, J 1). Its greatest breadth at the south extremity is about 28 miles, but its average breadth is not over 14 miles. The water of the Kurisches Haff is fresh, as it receives a number of streams, among which is the large river Niemen, or Memel. The water, which is shallow and silting rapidly, does not permit of much use of the lagoon as a highway of commerce.

KURLAND, kūr'lānt. See COURLAND.

KURNAH, kūr'nā, or **GURNAH**. An Egyptian village on the west bank of the Nile, opposite Karnak, in about lat. 25° 50' N. In the vicinity stands the temple built by Seti I in honor of Ammon of Thebes and of Seti's father, Ramses I. Some of the reliefs and inscriptions were added, after the death of Seti, by his son, Ramses II. Originally the temple was approached through two successive courts, but only traces of these are left. A portico, its roof supported by eight lofty columns, forms the façade of the temple. The rear wall of the portico is covered with reliefs and is pierced by three doors. The central door gives access to a hypostyle hall with six sculptured columns, into which three chambers open on either side. The walls of the hall and of the chamber are adorned with reliefs representing Seti I and Ramses II. A door at the upper end of the hall leads to the sanctuary, on the walls of which Seti I is depicted offering incense before the sacred ram of Ammon. The sanctuary contains four square pillars and is flanked by several chambers. The door on the right of the portico leads to the hall of Ramses II, which originally contained 10 columns, but only traces of them

remain. The door on the left of the portico gives entrance to a vestibule, into which open three chambers, the walls of which are richly decorated with reliefs. A door to the left of the vestibule opens upon a narrow corridor leading to several rooms in the rear of the building. One of the rooms contains reliefs executed in the time of Ramses II; the rest are in ruins. Consult Wilkinson, *Topography of Thebes* (London, 1835), and Mariette, *Voyage dans la Haute-Egypte* (2d ed., Paris, 1893). See also THEBES.

KÜRNBERGER, kūr'n'berg-ēr, FERDINAND (1823-79). A German novelist and critic, born and educated in Vienna. His literary reputation is largely due to the novel *Der Amerikamüde* (1856), which describes the experiences in America of Nikolaus Lenau (q.v.) under the name of Moorfeld and is distinctly unflattering to American life. His other novels include *Der Haustyrann* (1876), the *Novellen* (1861-62 and 1878), and the posthumous collection published by Lauser in 1893. He wrote three dramas, *Catiline* (1855), *Firdusi* (1865), and *Quintin Meiss*. His critical and political writings include *Litterarische Herzenssachen* (1877), which shows a wide knowledge of European literature. Consult Mulfinger, *Kürnbergers Roman der Amerikamüde* (Philadelphia, 1903).

KURODA, kūr-rō'dā, KIYOTAKA, COUNT (c.1835-1900). A Japanese statesman, born in Satsuma. He took an active part in the fighting of 1868 and completed the subjugation of the rebels in the naval operations at Hakodate (q.v.). Later he did much to raise the standard of education of the women of Japan. Becoming Minister of the Department for the Colonization and Development of the Hokkaido—the island of Yezo, plus the Kuriles—he visited the United States and secured a staff of scientific men, who under his direction did much towards developing the country. Out of the survey of Yezo grew the geological survey of Japan, first begun by Raphael Pumpelly (q.v.) and carried on by Prof. Benjamin Smith Lyman (q.v.). In 1874 Kuroda was appointed an Imperial Councillor and in 1876 went to Korea and made a treaty of peace and commerce. In 1877 he commanded a division of the Imperial troops in suppressing the Satsuma rebellion. In 1889, when the constitution was promulgated, he was Premier of the Empire. At the time of his death in 1900 he was president of the Privy Council.

KUROKI, kūr-rō'kē, TAMESADA, COUNT (1844-). A Japanese soldier, born at Kago-hima in the Province of Satsuma. He fought in the Restoration, entered the Imperial army as captain in 1871, took part on the Imperialist side in the Satsuma rebellion in 1877, and in the Chino-Japanese War he distinguished himself at Wei-hai-wei in February, 1895. He attained the rank of general in 1903. As commander of the First Army during the Russo-Japanese War of 1904-05, he overran Korea in the early months of the war and on May 1, in the battle of the Yalu, gained the first of the brilliant series of Japanese victories on land. He took part in all the great battles of the war, Liao Yang, Shaho, and Mukden. In July, 1906, he was appointed extraordinary inspector general of the army and later became general of the second reserve. For his military services he was created Baron after the war with China and Count after the war with Russia. See RUSSO-JAPANESE WAR.

KUROPATKIN, kūr'pāt'k'ēn. ALEXEI NIKOLAYEVITCH (1848—). A Russian general. He entered the army at 16, fought with distinction in Turkestan in 1866-68, and, after passing through the academy of the general staff, fought as a volunteer in Algeria (1874) and in the following year was diplomatic agent at Kashgar. During a campaign in Central Asia (1876) he attracted the notice of General Skobeliév, as whose chief of staff he participated in the Russo-Turkish War of 1877-78. From 1879 to 1883 he commanded the Turkestan rifle brigade, distinguishing himself during the campaign against the Tekke-Turkomans in 1880-81 by a forced march of 600 miles to Geok-Tepe and the storming of that important fortress. In 1890 he became lieutenant general and Governor of the Transcaspien territories and in 1898 Minister of War. In February of 1904 he was ordered to Manchuria to assume supreme command in the East, in a war to which as Minister he was strongly opposed on account of Russia's unpreparedness. (See RUSSO-JAPANESE WAR) After the battle of Mukden (March, 1905) he was relieved of the chief command in favor of General Linievitch, whom at his own request he succeeded in command of the first Manchurian army. He wrote accounts of the Russo-Turkish War (1879, 1884), of the conquest of the Turkomans (1899), and of the Russo-Japanese War (1906), the last of which was suppressed by the Russian government. For his all-important connection with the Far-Eastern War, consult Story, *The Campaign with Kuropatkin* (London, 1904), and, especially, Kuropatkin's own account, *The Russian Army and the Japanese War* (New York, 1909).

KURO SHIO, kūr'ō shē'ō (Jap., black tide). A great current of the Pacific Ocean, washing the southeastern shores of Asia. It has its source in the north equatorial current, which, flowing westward, is partially deflected by the Philippine Islands and Formosa and takes a northerly course into the Eastern Sea. Here the Kuro Shio, under the influence of the southwesterly monsoon, bears off to the northeast past the shores of the Japan Archipelago, gradually taking a more easterly direction and merging with the drift that crosses the Pacific between lat. 40° and 50° N. The color of the stream is a deep blue. Its temperature is 5° to 12° above the normal temperature of the sea at a given latitude, and its velocity varies from 1 to 3.5 miles per hour. The rate of flow varies with the seasons, during the late spring and summer months it is accelerated by the southwest monsoons, while the prevailing northeasterlies that blow from September to March retard or wholly obliterate the current. A branch of the Kuro Shio passes into the Yellow Sea and a second branch into the Japan Sea; but it sends off no arm northward through the Bering Sea, as has been commonly supposed, the northerly current of the Bering Sea being due to local conditions. It does not affect the climate of the Pacific coast of North America. Consult Wild, *Thalassa* (London, 1877), and *Report of the United States Coast Survey for 1880* (Washington, 1882).

KURUTCHKIN, kūr-rōch'kin, VASILII STEPANOVITCH (1831-75). A Russian satirical poet and journalist, born in St. Petersburg. He served in the army and later in the Bureau of Transportation and as early as 1855 attracted attention with his translations of Béranger. In

1859 he launched the first Russian comic journal, which he called *Iskra* (The Spark), which exercised great influence in molding popular social opinion. His collected works appeared in St. Petersburg in 1897.

KURACHÉE, kūr-rā'chē. A district and town of British India. See KARACHI.

KÜRSCHNER, kūrsh'nēr, JOSEPH (1853-1902) A German author and editor, born at Gotha. At first engaged in mechanical engineering, he afterward studied at the University of Leipzig. Besides several publications connected with the history of the German theatre, he edited successively in Berlin and Stuttgart a considerable number of literary monthlies, yearbooks, and other periodicals. He was also editor of the *Deutsche Nationalliteratur*, a critical collection in 222 volumes of much that is best in German literature from the very beginning down to the middle of the nineteenth century, but was most widely known as the editor, after 1883, of the *Allgemeiner deutscher Literaturkalender* (Stuttgart, 1879 et seq.), an annual biographical record of all German authors and their works. His works include: *Konrad Ekhof* (1877), *Tagebuchblätter* (1876), *Heil Kaiser dir!* (1897); *Frau Muska* (1898), *China* (1901); *Kaiser Wilhelm II. als Soldat und Seemann* (1902).

KURSK, kūrsk. A government of central Russia, adjoining Little Russia. Area, about 17,937 square miles (Map Russia, E 4). The surface is only slightly elevated and is intersected by numerous river valleys. It is well watered, and its soil is very fertile. The climate is moderate. Agriculture, the chief occupation of the inhabitants, is carried on in a very crude way. Considerable quantities of grain are exported. Rye, wheat, barley, buckwheat, and oats are the chief cereals, potatoes are grown for distilling, and beetroot is also raised to some extent. The manufacturing industries are only slightly developed, the chief industrial establishments are sugar and flour mills, distilleries, and oil presses. The house industries of the district are very varied, ranging from icons and toys to boots and baskets, but they yield little beyond what is necessary for domestic consumption. Pop., 1912, 3,133,500. Capital, Kursk.

KURSK. The capital of the Russian government of the same name, situated on the small river Kur and on the railway line from Moscow to Kharkov, 280 miles south-southwest of the former town (Map: Russia, E 4). It is built largely of wood. It has a cathedral and two monasteries, that of the Annunciation containing a much venerated icon of the Virgin, an object of much pilgrimage, especially on the first Friday after Whitsunday, when it is escorted to a neighboring monastery by thousands. A great fair is also held here each year. Its educational institutions comprise two Gymnasias, a seminary for teachers and for priests, and a school of geodesy. Tanneries, candle, soap, and tobacco factories, flour mills, distilleries, and a considerable trade in grain, hemp, cattle, and hides, furnish occupation to the larger part of the inhabitants of the town. Pop., 1912, 83,330. Kursk was founded in the ninth century and was pillaged by the Tatars in 1240.

KURTZ, kūrts, JOHANN HEINRICH (1809-90). A German theologian, born at Montjoie in the governmental district of Aix-la-Chapelle.

He studied at the universities of Halle and Bonn. From 1850 to 1870 he was professor of Church history at the University of Dorpat. His works include: *Lehrbuch der heiligen Geschichte* (1843); *Die christliche Religionslehre* (1844); *Lehrbuch der Kirchengeschichte* (1849); *Der Brief an die Hebraer erklärt* (1869).

KURZ, kurts, HEINRICH (1805-73). A German critic and historian of literature, born in Paris and educated at Leipzig and Paris. He studied Chinese under Abel Rémusat and published many articles on Chinese literature, such as *Buchdruckerei und Buchhandel in China* (1828), *Ueber die neuere Poesie der Chinesen* (1828), and *Mémoire sur l'état politique et religieux de la Chine, 2300 ans avant notre ère* (1830). He became a member of the Asiatic Society, editor of the *Journal Asiatique*, and a collaborator on the Chinese dictionary which had been begun by Basile. The revolution of July, 1830, called him back to Germany, and in Munich he became docent of Chinese and editor of the periodical *Bayerns Deputiertenkammer*. At Augsburg his management of *Die Zeit* brought about his imprisonment for two years, during which time he translated a Chinese epic under the title *Das Blumenblatt* (published 1836). Upon his release from prison (1834) he went to Switzerland and became professor of German at Saint-Gall, and later at Aarau, where he was librarian also, and devoted himself to the study of German literature. His most important work is the *Geschichte der deutschen Literatur* (7th ed., 1876), which treats the theme in the pragmatic manner and is valuable because of the abundant biographical material and the judicious selections from the various authors. Among his other works mention should be made of *Handbuch der poetischen Nationalliteratur* (1840-43), *Handbuch der deutschen Prosa* (1845-46), *Die deutsche Literatur im Elsass* (1874), of his *Deutsche Bibliothek* (1862-68), in which he edited the *Esopus* of Burkhard Waldis, the *Simplicianische Schriften* by Grimmelshausen, *Fischart's Dichtungen*, and Wickram's *Rollwagenbuchlein*, and of the critical editions of Schiller (1867-68) and Goethe (1868-70).

KURZ, HERMANN (1813-73). A German poet, novelist, and translator. He was born at Reutlingen, Württemberg, was educated in the theological seminary at Maulbronn, and afterward studied theology and philosophy at the University of Tübingen. From 1843 to 1848 he edited an illustrated weekly at Karlsruhe, then, for a number of years, the Liberal Democratic organ *Der Beobachter* in Stuttgart, and in 1863 was made librarian of the University of Tübingen. He wrote two interesting novels, *Schillers Heimatjahre* (2d ed., 3 vols., 1857; illust. ed., 1905) and *Der Sonnenwirt* (2d ed., 3 vols., 1862). Of his many excellent translations, those of Ariosto's *Orlando furioso* (1840; new ed., with Doré's illustrations, 1881) and of Gottfried von Strassburg's *Tristan und Isolde*, with an original conclusion of his own (1844; 3d ed., 1877), are the most important. His literary and historical essays include *Zu Shakespeares Leben und Schaffen* (1868) and *Aus den Tagen der Schmach: Geschichtsbilder aus der Melaozeit* (1871); and, with Paul Heyse, he edited *Deutscher Novellenschatz* (1870-74) and *Novellenschatz des Auslandes* (1872-74), two admirable collections of the best short stories in German and foreign literature. His collected

works, edited by Heyse, appeared in 10 volumes (1874-75); complete works, 12 volumes (1904). Consult I Kurz, *Hermann Kurz* (Munich, 1906), and article in the *Allgemeine deutsche Biographie*, vol. xvii (Leipzig, 1883).—His daughter ISOLDE (1853-), born in Stuttgart and later resident in Florence, also became a poet and story-teller of note. Her writings include: *Florentiner Novellen* (1890); *Italianische Erzählungen* (1895), *Von dazumal* (1900); *Die Stadt des Lebens: Schilderungen aus der florentinischen Renaissance* (1902); *Neue Gedichte* (1905); *Lebensfluten* (1907); *Die Kinder der Lith* (1908); *Florentinische Erinnerungen* (1909); *Genesung und andere Erzählungen* (1912).

KUS. See KHONDS

KUSAN (kōō'sān) **STOCK**. A small linguistic group of tribes on the Coos River and Bay and mouth of the Coquille River, on the coast of Oregon. They call themselves Anasitch. Most of the survivors are located under government care on the Siletz Agency. Various names have been given to them in the past: Ka-us or Kwo-Kwoos, by Hale; Ko-wes, by Milhau; Cook-Koo-oose, by Lewis and Clark; Ka-us, by Latham. While Gatschet mentions the following tribes or villages: Anasitch or Hau-nay-sitch, Melukitz, and Mulluk or Lower Coquille, Dorsey divides them into the following villages: Mulluks, mouth of the Coquille River; Naçumi or Masumi, south of the Coquille River, Melukitz, north of Coos Bay; and Anasitch, or Hannay-sitch, south of Coos Bay. The chief interest in the Kusan peoples is concerning their origin. They are wedged in between the Athapascan and Yakonan tribes and the Pacific Ocean, like many other fading stocks on this coast, and bear no known relationship with any other people. Consult *Indian Affairs Report* (Washington, 1860); Bancroft, *Native Races* (New York, 1874); *Twelfth Report of the Bureau of American Ethnology* (Washington, 1890), Lewis, *Tribes of the Columbia Valley and the Coast of Washington and Oregon* (Lancaster, Pa., 1906).

KUSI, kōō'sé, or **COOSY**. A northern tributary of the Ganges, India, rising in the Himalayas of Nepal and flowing at first south and then southeast through Nepal. At the confluence of the Arun it turns southward and, after entering Behar, joins the Ganges below Bhagalpur. Its length is 325 miles, but it is unfit for navigation on account of its rapid course and destructive floods.

KUSKOKWIM (kūs'kō-kwim) **RIVER**. A stream rising in the glaciers of the McKinley Range of mountains and flowing southwesterly into Bering Sea, the second largest river in Alaska, with drainage basin of nearly 50,000 square miles (Map: Alaska, G 5). It is about 700 miles in length and is navigable for steamboats to the forks, 500 miles from the mouth. The development of the Innoko mining district has greatly increased the importance of the Kuskokwim valley, which is now dotted with mining camps and trading establishments. The United States has subserved the interests of the natives by the establishment of schools and by the introduction of reindeer. The principal native settlements are Akiak, government school; Kinak, school, 423 deer; Quinhagak, school, 521 deer; and Bethel, school, and the largest number of reindeer in Alaska, the herds there and near aggregating 4714 head. The government railway system, lately authorized by Congress, will

bring the upper parts of the valley in railway communication with the south coast of Alaska.

KUSNETSK. See KUZNETSK.

KUSSEWITZKY, ku's'-vi't'ski, SERGEI ALEXANDROVICH (1874-). A Russian musical conductor and contrabass virtuoso, born at Vishni Volotchik. Having completed his education at the conservatory of the Moscow Philharmonic Society, he became a teacher there and a member of the Imperial Orchestra in 1900. After a concert tour of Germany in 1903 he was pronounced the greatest contrabass virtuoso since Dragonetti (q.v.), and a second tour in 1906 was almost sensationally successful. But instead of continuing this career he returned to Russia and there organized a symphony orchestra of 75 picked players, with which he gave every winter a series of concerts in Moscow and St. Petersburg (Petrograd). Beginning with the summer of 1909, he instituted a regular annual concert tour along the Volga, doing real pioneer work. He composed a concerto for contrabass and orchestra.

KUSSMAUL, ku's'moul, ADOLF (1822-1902). A German physician, born at Graben and educated at Heidelberg. There he was assistant for some time and wrote the valuable work, *Die Farbenerscheinungen im Grunde des menschlichen Auges* (1845). In 1857 he was made professor and director of the clinic at Heidelberg, and afterward he held chairs in Erlangen (1859-63), Freiburg (1863-76), and Strassburg (1876-89). He then retired to Heidelberg, where he was professor emeritus until his death. Kussmaul devised much apparatus for use in internal therapeutics and in 1867 introduced the use of the stomach pump. In the realms of physiology, psychiatry, toxicology, and especially internal medicine, he was an able and industrious investigator. Among his more important publications are: *Untersuchungen über das Seelenleben des neugeborenen Menschen* (3d ed., 1896); *Ueber den konstitutionellen Merkurialismus*, etc. (1861); *Zwanzig Briefe über Menschenpocken- und Kuhpockenimpfung* (1870); *Die Störungen der Sprache: Versuch einer Pathologie der Sprache* (1877), which by many is considered his most remarkable work, and a translation of which may be found in Ziemssen's *Cyclopædia of Practical Medicine* (New York, 1887); and an interesting autobiography, *Jugenderinnerungen eines alten Arztes* (8th ed., 1909).

KÜSSNACHT, ku's'nächt. A village in the Canton of Schwyz, Switzerland, situated on an arm of Lake Lucerne, at the foot of the Rigi, near the spot where William Tell is said to have shot Gessler (Map: Switzerland, C 1). It has a statue of Tell, and near by are the ruins of an ancient castle which tradition calls Gessler's. Pop., 1900, 3572; 1910, 3981.

KÜSSNER-LOUDERT, ku's'nër-kö'dër', AMALIA (?-). An American miniature painter. She was born (Küssner) in Terre Haute, Ind., and obtained her artistic training in New York City. In 1898 she went to London, where she soon achieved great success. Among her sitters were the Prince of Wales (Edward VII), the Duchess of Marlborough, Lady Warwick, and many other members of the nobility. She also spent some time in Russia, where she executed miniatures of the Czar, Czarina, and other members of the royal family, and in 1899 she went to South Africa to paint the portrait of Cecil Rhodes. After her mar-

riage in 1900 to Capt. Charles D. Coudert, of New York, she practiced miniature painting in that city.

KUSTENDJE, ku-stën'je, or CONSTANTZA. A seaport of Rumania, situated on the Black Sea, a little over 30 miles from the mouth of the Danube (Map: Balkan Peninsula, G 2). It has a number of churches and mosques and is the seat of many foreign consular agents. It is a place of great commercial importance as the maritime terminal of the Rumanian railway system and, since the completion of the harbor improvements begun in 1890, is one of the chief commercial centres of the Kingdom. Pop., 1899, 12,725; 1912, 26,628. Kustendje is the ancient Tomi, Ovid's place of exile, rechristened Constantiana in honor of the sister of Constantine the Great in the fourth century A.D. At Kustendje terminates Trajan's Wall, a remnant of the old Roman fortifications.

KÜSTENLAND, ku'sten-länt, COAST DISTRICTS, or LITTORALE. A name applied to the Austrian crownlands of Istria and Görz and Gradisca, and the city of Trieste, with its territory (Map: Austria, C 4). These crownlands have their own diets, but there is a common superior administration at Trieste, represented by a governor and judicial and financial departments. Area, 3077 square miles. Pop., 1900, 756,546; 1910, 894,457.

KÜSTNER, kust'nër, KARL THEODOR VON (1784-1864). A German theatrical manager, born at Leipzig. He studied law there and later at Göttingen and from 1817 to 1828 was manager of the Stadttheater (Leipzig). As director, subsequently, of the Court Theatre in Munich (1833-42), and as intendant general of the royal theatres in Berlin (1842-51), his artistic qualities and superior business ability proved of great value in bringing about important reforms in the technical and economic conditions of theatrical matters. Dramatic authors are indebted to him for the initiation, conjointly with Holbein, in 1845, of royalties. His *Vierunddreissig Jahre meiner Theaterleitung* (1853) is a valuable contribution to the history of the theatre. King Louis I of Bavaria made him Privy Councillor and conferred nobility upon him in 1837.

KÜSTRIN, ku's-trën', or CÜSTRIN. A town of the Province of Brandenburg, Prussia, and a fortress of the first rank, situated at the confluence of the Oder and Warthe, 52 miles east of Berlin (Map: Prussia, F 2). It consists of the main town within the fortifications, between the two rivers, one suburb on the left bank of the Oder and the other on the right bank of the Warthe. It has a handsome town hall and the church of St. Mary, with tombs of Margrave Johann and his wife Katharina. There are machine works and manufactories of copper and brass ware, fire-extinguishing apparatus, pianos, roofing paper, vehicles, furniture, cigars, lumber, creosoted block, bricks, malt, and potato meal. Pop., 1900, 16,473; 1910, 17,600. Frederick the Great was detained a prisoner here by his father. In 1806 Küstrin was surrendered without a blow to the French, who retained it until 1814.

KUTAJA, kö-ti'ä, or KUTAHIA. A town of Asiatic Turkey, situated in the Vilayet of Brusa, about 70 miles southeast of the town of Brusa (Map: Turkey in Asia, B 2). It is poorly built, but has a large number of mosques and

several Christian churches. The chief products are agricultural, the once extensive pottery industry being almost extinct. In the vicinity are obtained considerable quantities of meerschau. The trade is considerably facilitated by the railway lines connecting Kutais with Angora and Constantinople. Pop. (est.), about 25,000, consisting of Mohammedans, Greeks, and Armenians. Kutais is noted for the treaty of peace concluded here between Egypt and Turkey on May 4, 1833.

KUTAIS, koo-tis'. A government in the northwestern part of Transcaucasia, Russia, with an area of 8145 square miles (Map: Russia, F 6). The surface is extremely mountainous, and agricultural land is scarce. The region is watered chiefly by the Rion and its tributaries; it has a warm climate, the annual temperature averaging 58°. Kutais is known as one of the world's sources of manganese; it has also deposits of lead, copper, and coal. Corn, wine, and tobacco constitute the chief agricultural products. Stock raising is of great importance, while manufacturing industries are practically unknown, although a little silk is produced. Owing to its great fertility, this government is the most densely populated in Transcaucasia, having in 1912 a population of 1,025,300. Most of the inhabitants belong to various tribes of the Caucasus, the Russians constituting only about 1 per cent of the total. In religion the population is about 86 per cent Greek Orthodox and the remainder chiefly Mohammedan. Capital, Kutais (qv).

KUTAIS. The capital of the government of the same name, in Transcaucasia, Russia, situated on the Rion, 115 miles west-northwest of Tiflis, with which it is connected by rail (Map: Russia, F 6). It has two Gymnasias and a seminary for teachers. Its ruined eleventh-century cathedral is the finest piece of Georgian architecture known. Hats and silk are the chief manufactures. Pop., 1911, 57,361, including a number of Armenians and Jews, who are mostly engaged in trade. Kutais is one of the oldest towns of the Caucasus and is identified with the Kotatision of Procopius. It became Russian in 1810. In the vicinity are the ruins of several ancient fortresses.

KUTENAI, koo'te-nā (properly, KUTONÁQA). A small group or confederacy of tribes constituting a distinct stock (Kitunahan), formerly occupying the narrow valleys along Kootenai River and the Arrow Lakes, on both sides of the British Columbia-Montana boundary, and now chiefly gathered upon reservations in the same region. There is evidence that they formerly lived in the eastern plains and were driven into the mountains by the Blackfeet. Their extension southward into Montana dates from their peace with the Flatheads, about 100 years ago. Since then the two tribes have been friends and were formerly accustomed to make joint expeditions annually to the headwaters of the Missouri, for the purpose of hunting the buffalo. They lived in tepees. From their earliest acquaintance with the whites they were noted for their honesty and good qualities. No special study of these Indians has been published. They number in all about 1000, of whom 538 reside in western Montana and Idaho, the others in adjacent parts of Canada. Consult: A. F. Chamberlain, "Report of the Kootenay Indians of South Eastern British Columbia," in *Report of the British Association for the Advancement of Science*,

(London, 1892), and John Maclean, *Canadian Savage Folk* (Toronto, 1896).

KUTHA KANGIE. See HIMALAYA.

KUTTENBERG, kut'ten-bérk. A mining town of Bohemia, 45 miles east-southeast of Prague (Map: Austria, D 2). Of its churches, the most notable is the uncompleted Gothic church of St. Barbara, dating from the end of the fourteenth century. The old Wälscher Hof was for a time the residence of the Bohemian kings. In its mint the first *Silbergroschen* was coined in 1300. There are also an old town hall, barracks, an Ursuline convent, an artisans' and agricultural school, and manufactures of sugar, spirits, beer, vinegar, machinery, organs, and textiles. Pop., 1900, 14,799; 1910, 15,542.

KUTUSOV, koo-tso'sóf, MIKHAIL ILARIONOVITCH GOLENISHTCHEV, PRINCE OF SMOLENSK (1745-1813). A Russian field marshal, born in St. Petersburg. He entered the army when young and rose rapidly. He took part in the campaign against Poland (1764-69), fought the Turks in 1770, again in 1771-72, served under Suvarov in 1789 and 1790, and was made successively Ambassador at Constantinople, Governor of Finland, and Governor of St. Petersburg (1801). He was appointed in 1805 to the command of the First Army Corps against the French. In November of that year he was victorious over Marshal Mortier at Durnstein. He was in command of the allied army under the Emperor Alexander at Austerlitz (Dec. 2, 1805). After the defeat at Austerlitz he was appointed military governor of Kiev. In 1811-12 he commanded the Russian army in the war against the Turks and succeeded Barclay de Tolly in 1812 as commander in chief of the army against the French, lost the battle of Borodino (qv.), but gained a great victory over Davout and Ney at Smolensk. He carried on the campaign to its successful termination, but his strength was exhausted, and he died at Bunzlau, April 28, 1813. In Moscow and St. Petersburg monuments were erected in his memory. Consult Friedrich Von Bucholtz, "Der Feldmarschal, Fürst Kutusow Smolenskoi," in *Geschichte der europäischen Staaten*, vol. ii (Berlin, 1814), and J. H. Schnitzler, *La Russie en 1812: Rostoptchine et Koutousof* (Paris, 1863).

KÜTZING, ku'tsing, FRIEDRICH TRAUGOTT (1807-93). A German botanist, born at Ritteburg in Thuringia. He studied natural history at Halle and traveled in southern Europe, especially studying the flora of the Adriatic coast, and from 1838 to 1883 he taught natural science at Nordhausen. In his *Grundzüge der philosophischen Botanik* (1851-52) there are conclusions as to the origin of species similar to the ideas later advanced by Darwin. Besides the above, he published several other works of considerable importance.

KUTZTOWN, kuts'toun. A borough in Berks Co., Pa., 18 miles west-southwest of Allentown, on the Philadelphia and Reading Railroad (Map: Pennsylvania, K 6). The Keystone State Normal School is here, and there is a public park. The borough has a large foundry, marble and granite works, knitting mills, and manufactures flour, shoes, hosiery, silk goods, shirts, etc. The borough owns the electric plant. Pop., 1900, 1328; 1910, 2360.

KUVERA. See KUBERA.

KUXHAVEN, kuks-hä'fén. A seaport of Germany. See CUXHAVEN.

KUYPER, koi'pér, ABRAHAM (1837-

).

A Dutch statesman and theologian, born in Maassluis and educated at Leyden. His father was a pastor of the Reformed church; the son received a difficult country charge at Beest in 1863 and five years afterward went to Utrecht, where he began his struggle for the independence of the Reformed church. In 1870 he became pastor, in Amsterdam, of the largest congregation in Holland. There he grew more and more engrossed in politics. He undertook to edit *De Standaard* in 1872, and in this conservative secular journal, as well as in his religious organ, the *Herout*, opposed modernism, which he considered an enemy of Christianity, or, in his own phrase, of Calvinism. Thus he became the logical political successor of Groen van Prinsterer and was elected to Parliament in 1874, but was forced to resign soon afterward. His political purposes were sketched in *Ons Program* (1879). In 1880 he established the Free University of Amsterdam and in 1886 definitely broke with the national church and formed the Free Reformed church. He returned to Parliament in 1897, carried through the great Conservative and Clerical alliance between Calvinist and Catholic parties, and in 1901, as leader of this fusion, formed a cabinet in which he took the portfolio of the Interior. Owing to his reactionary policy in the matter of public education, his party was defeated at the polls in June, 1905, and he resigned in the following month. At various times thereafter he was in Parliament and in 1907 was Minister of State. He served as president of the Netherlands Council for Internationalism in 1911. Kuyper lectured in the United States at 20 places, his Stone lectures at Princeton (1898) on Calvinism being published the next year. He received various government decorations, and honorary degrees from several universities. His *Encyclopaedia of Sacred Theology* (*Encyclopaedie der heilige godgeleerdheid*, 1898; 2d ed., 1908-10) and his *Work of the Holy Spirit* (1900) were translated into English by H. DeVries. In Church history his important work is an edition (published in 1886) of the Polish reformer John à Lasco. Among Kuyper's other writings are: *In Jesus ontlopen* (2d ed., 1906); *Om de Oude Wereldzee* (1907-08); *Parlementaire redevoeringen* (1908-10); *Practijk der godzaligheid* (1910).

KUYUNJIK. See KOYUNJIK.

KUZNETSK, kooz-nyetsk', or **KUSNETSK**. The capital of a district of the same name in the Government of Saratov, Russia, situated on the river Truyev, over 280 miles north-northeast of Saratov (Map: Russia, G 4). It produces leather, rope, and tallow, and carries on some trade in grain. Pop., 1912, 22,605. There is a small town of the same name in the Government of Tomsk, West Siberia.

KVICALA, kvě-chá'la, JAN (1834-1908). A Bohemian classical scholar and politician. He was born at Münchengrätz in Bohemia, studied at Prague and at Bonn, and in 1859 was made professor of classical literature at Prague. His philological writings include: Czech translations of Herodotus and Sallust, *Beiträge zur Kritik und Erklärung des Sophokles* (1864-69); *Vergilstudien* (1878); *Studien zu Euripides* (1879); *Neue Beiträge zur Erklärung der Aeneis* (1881). In 1881, as a member of the Bohemian Diet, he introduced the so-called *Law Kvicala*, a bill providing for separate schools for German and Czech children, and was prominent in the agita-

tion which resulted in the division of the University of Prague into a German and a Bohemian university.

KWAKIUTL, kwā-kē-ootl' (incorrectly, KWAWKEWLTH and QUACOLTH). A group or confederacy of tribes of strongly differentiated Wakashan stock (q.v.), living in intimate association with the closely cognate Hailtzuk on both sides of Queen Charlotte Island, at the upper end of Vancouver Island, and on the opposite shore of British Columbia. Among more than 20 subtribes the best known are the Kwakiutl proper, near Fort Rupert, Nimkish, Koskimo, Mamalilikulla, Tsawatienuk, and Tanaktut. They are distinguished for devotion to the custom of *potlatch* (q.v.), which is by some believed to have originated with them, and for their peculiar social organization, according to which the whole active government is under the control of secret societies. They have the gentile or clan system, but with the descent in the male line. There are three social ranks—the hereditary chiefs, the middle estate or burghesses, and the third, who are chiefly slaves and their descendants. The middle class is made up of the members of the secret societies, and the greater the number of such societies to which a man belongs the greater is his standing and influence. The third or lowest class consists of those who are not members of any secret society, and who are in consequence shut out from any part in councils or other State affairs. The candidate for initiation must submit to severe vigil, fasting, and torture, and distribute numerous presents to each one taking part in the ceremony. The greatest of all is the *hamatsa*, or cannibal society, to which no one can be admitted until he has been a member of a lower society for eight years. Women may become members and have also their own societies.

Having an unlimited food supply of fish, venison, seal meat, and berries, and being comfortably housed after the manner of the Northwest coast tribes generally, and moreover regarded by all their neighbors as the guardians of the ancient priestly rites, the Kwakiutl are strongly conservative and opposed to all the methods and religion of the white man, although they are very law-abiding. Consult Franz Boas, "Social Organization and Secret Societies of the Kwakiutl Indians," in *United States National Museum, Annual Report* (Washington, 1895), and "The Kwakiutl," in *American Museum of Natural History, Memoirs*, vol. viii (New York, 1909).

KWANGCHOWFU, kwāng'chō'fōo'. The native name of the Chinese city called by foreigners Canton (q.v.).

KWANGSI, kwāng'sē' (Chin., broad west). An inland province of south China, lying to the west of Kwangtung. It is bounded on the south by a portion of Kwangtung and the northeast part of Tongking, on the west by Yunnan, and on the north by Kweichow and Hunan (Map: China, J 7). Its southerly parts are traversed by branches and spurs of the Nan-shan Range, an offshoot of the great mountain masses of Tibet, which stretches through Kwangtung to the coast range of Fukien. It is the least populous and the poorest province of China. It is watered chiefly by the Si-kiang, or West River, which has numerous tributaries, some of them of considerable length. This river rises in Yunnan, and after a course of 1000 miles debouches into the China Sea below Canton. All

the activity and the principal centres of population are in the east and southeast. Besides grain it produces for export cassia, cassia oil, and medicines. It has almost a world monopoly of aniseed. The province is rich in minerals, but these are undeveloped. The mountains to the northeast also furnish some timber. Its greatest trading centre is Wuchow (pop., 65,000), on the Si-kiang, near the border of Kwangtung, and 200 miles above Canton. This is an open port and has a Chinese maritime customs station. It has considerable steamer traffic. Nanning, a city of 100,000 inhabitants, was voluntarily opened by China in 1907. Another open port is Lungchow, on the Tongking frontier. The capital is Kweilin (q.v.). Area, 77,200 square miles; pop., 5,425,000, including many Hakkas (q.v.), but exclusive of many members of aboriginal tribes called Miaotse, who still maintain a sort of independence in the mountains. A number of these Miaotse are partly civilized and live in communities by themselves under government supervision. The people of Kwangsi are among the most turbulent in China. The great Taiping rebellion began in this province, and there was another serious rebellion in 1902-05.

KWANG-SÜ, kwáng'sü', or **KUANG-HSÜ** (brilliant succession) (1872-1908). The reign title of Tsai T'ien, the ninth and second-last Manchu Emperor of China. He was the son of Ch'un I-hwan (commonly known as Prince Ch'un), the seventh son of the Emperor who reigned as Tao-kiang and who died in 1850. Kwang-sü was born in 1872 and was selected as Emperor by the Empress Dowager Tzu-hsi in 1875, at the death of her son, the childless Emperor Tung-chih. During his minority the Empress Dowager was Regent, which she continued to be until 1889, when she voluntarily handed over the reins of government to Kwang-sü. Kwang-sü was throughout his life dominated by and in fear of the masterful Tzu-hsi, except for the brief era of reform in 1898. He was frail in health, rather timid, and extremely youthful-looking, even in middle age. Although ambitious for the welfare of China, his reign was a series of national humiliations. Chief among these was the war with Japan over Korea. China was overwhelmingly defeated on land and sea and was forced to acknowledge the independence of Korea, besides ceding the Liaotung peninsula (later retroceded by Japan through the intervention of Russia, France, and Germany in China's behalf), the Pescadores, Formosa, and to pay an indemnity of 200,000,000 taels. As the weakness of China was thus revealed to the world, Germany seized Kiaochow (Tsingtau), because of the murder of two priests, and leased it for 99 years. Russia followed by demanding and receiving Port Arthur and Dalny, England Weihaiwei and the Hongkong Extension, and France Kwangchow Wan. The Emperor was much affected by these disasters and saw that radical reforms were necessary to save China. He had read a number of foreign books, including the Bible, and was determined to model China on Western civilization. To aid him in this work, he appointed K'ang Yu-wei, a modern Chinese scholar and reformer, as his chief adviser. Unfortunately the reforms attempted were too sweeping and violent. The chief opposition came from the Manchus, who called upon the Empress Dowager to resume control, which she had relinquished in 1889. A plot of the Emperor to seize and imprison Tzu-hsi failed, and the

result was the coup d'état of 1898. A violent reaction set in; reformers were beheaded or banished, and Kwang-sü was practically deposed. In a decree he was forced to appoint the Empress Dowager as coadministrator, and with that act his reign was virtually ended. The forces of reaction continued until 1899-1900, when the Boxer rebellion proved to the Empress Dowager that the old system was no longer possible. The result was many reforms, such as Kwang-sü had tried to establish and failed, and which were now necessary in the effort to save the Manchu monarchy. Tzu-hsi continued in power until her death (Nov. 15, 1908), a day after the demise of Kwang-sü. His successor was Hsüan-tsung, a child three years old, and the last Manchu Emperor of China. He abdicated, Feb. 12, 1912, in favor of the Republic.

KWANGTUNG, kwáng'tung' (Chin., broad east) The most southerly of the six maritime provinces of China proper, bounded on the southeast and south by the China Sea, on the west by Kwangsi, and on the north by Hunan, Kiangsi, and Fukien (Map China, K 7). About two-thirds of its area of 79,456 square miles are covered by moderately high mountains, the chief ridges of which—known as the Nan-ling and Meiling—extend along the northern boundary, forming the watershed between the rivers Siang and Kan, which flow north to the Yang-tse and the North and East rivers, which have their origin in Kiangsi and flow south, the former joining the West River from Yunnan and Kwangsi at the town of Samshui (Three Rivers) to form the Chu-kiang, or Pearl River, on which Canton is situated, and the latter flowing into the Chu, a little lower down. Samshui stands at the apex of a great delta, which is intersected by numerous navigable branches and creeks of the West and Chu rivers and forms the richest and most fertile part of the province. The other important river of the province is the Han, which rises in the mountains back of Fukien and falls into the sea near Swatow (q.v.). The coast line is much broken, and islands are numerous. The largest of these is Hainan (q.v.). Another of importance is Hongkong (q.v.). There are two prominent peninsulas that on the south, separated from Hainan by only a few miles, is called Leichow and forms a department of the same name; that on the southeast forms the Department of Kowlung (or Kowloon), 376 square miles of which were leased to Great Britain in 1898 for 99 years, and are known as the Kowloon Extension.

The province is rich in minerals. Coal is found in three different places. It is now mined, it is of poor quality, but is much used by the natives, especially in the iron and steel works of Fatshan (q.v.). Iron ore is found in 20 places, and silver mines were worked at one time. The chief commercial products are silk and silk fabrics, which represent about 60 per cent of the foreign exports; tea, cassia and cassia buds, matting, 75 per cent of the annual output being exported to New York; firecrackers, palm-leaf fans, chinaware, and pottery, that of Shekwan being the best. Ginger is widely grown, both on the hillsides and in fields, and a great "preserving" industry is carried on at Canton, with large exports. Other noted preserves are chowchow (bamboo shoots), pineapple, and kumquat. Other products are sugar, tobacco, galangal, turmeric, betel nuts, coconuts, agar-agar, and fragrant woods from Leichow and

Hainan, Chinaroot and staraniseed, and various oils. Great quantities of rice are grown, but not enough for the population, and some half-million tons are imported annually.

The open ports of the province are Canton, Swatow, Samshui, Pakhoi, Kongmoon, and Kiungchow. The ceded territories are Hongkong and Macao. The leased territories are Kwangchow Wan and Kowloon Extension. There are two Chinese customs stations, at Kowloon City and at Lappa, for the control of the junk trade. Kwangchow Wan, opposite Hainan, was leased to France for 99 years in 1898 and declared a free port in 1902. Macao (q.v.), some miles below Canton, has been a Portuguese possession since the Treaty of 1887. The Canton-Hankow Railway line, when completed, will pass through the provinces of Kwangtung, Hunan, and Hupeh, a distance of 730 miles. The capital of the province is Kwangchowfu, better known as Canton. Kwangtung early became known to Europeans. The Arab voyagers came as early as the tenth century; the Portuguese first arrived in 1517, and a British fleet of merchantmen sailed into the Canton River in 1657. In 1684 was established the factory of the East India Company. The population is about 32,000,000, which includes about 3,000,000 Hakkas (q.v.) and a great many aborigines. The people are industrious and capable and pursue innumerable handicraft industries. For population and facts about important cities in the province, see separate titles.

KWANTO, kwán'tō' (Simco-Japanese, barrier east). A name loosely applied to that portion of the main island of Japan which lies east of the Hakone Mountains, referring more particularly to the Hasshu, or Eight Provinces, which were assigned by Hideyoshi to Iyeyasu. At the end of the seventh century the "barrier" lay farther west, in the vicinity of Kyoto, and in those days the Kwantō meant the whole region lying to the east of that.

KWANTUNG, kwán'tung' (Chin., barrier east). A name loosely applied to that part of China which lies east of the "barrier," meaning more particularly the barrier of Shanhaikwan, where the great wall juts into the sea, but probably also to the barrier which is supposed to divide Mongolia from Manchuria, and is commonly laid down on maps as "palisades," though no palisades exist. In this sense it would include the two provinces of Kirin and Shing-king.

KWAN-YIN, kwán'yēn' (Chin., sound-regarding, i.e., prayer-hearing, a translation of Skt. *avalokiteśvara*, down-gazing lord, pitying lord, misread *avalokitasvara*, down-gazing sound, sound-regarding). A mythical Bodhisattva, or Buddha elect, who is worshiped in Sikkim, Nepal, and Tibet under the name Avalokita, or Avalokiteshvara, in China under the name of Kwan-yin, or Kwan-shih-yin, and in Japan as Kwan-non, or Kwan-se-on. In the first-mentioned group of countries this deity is invested exclusively with male attributes, but in China and Japan with female attributes—a change of sex which seems to date, in China at least, from the twelfth century and has never been satisfactorily accounted for. The Grand Lama of Tibet is a living incarnation of Avalokita, the patron deity of the country and the protector of the faithful. One of his many names is Maha-Karuna (the great pitier). In China and Japan Kwan-yin (Kwan-non) is known as the Goddess of Mercy. Her worship is very popular. One of

her names is Pa-nan-kwan-yin, or the compassionate goddess who succors those who are exposed to the eight kinds of suffering. As the Sung-tse Kwan-yin, she is the Giver of Sons and hence is much worshiped by childless married women. Sometimes she is represented with 3 or 8 or 11 faces, or with 1000 eyes and 1000 arms; the faces and eyes indicating her omniscience and the arms her omnipotence. In China the island of Pu-to, near Chusan, is specially dedicated to Kwan-yin, and, as it dates from the year 915, many images with male attributes are found there. Thousands of monks and other worshipers from all parts of China, as well as from Tibet and Mongolia, visit the place annually. The worship of Kwan-yin is peculiar to that development of Buddhism which is called Mahayana, or the Great Conveyance. See MAHAYANA.

Consult: Eitel, *Handbook for the Student of Chinese Buddhism* (Hongkong, 1870); Edkins, *Chinese Buddhism* (London, 1880); Lloyd, "The Development of Japanese Buddhism," in *Transactions of the Asiatic Society of Japan*, vol. xx (Yokohama, 1894); Waddell, *The Buddhism of Tibet* (London, 1895); W. E. Griffis, *The Religions of Japan* (New York, 1895).

KWEICHOW, kwá'chou', Chin. pron. -chō', or **KUEICHOU** (Chin., honorable land). "The Switzerland of China," an inland province, bounded on the southwest by Yunnan, on the northwest and north by Szechwan, on the east by Hunan, and on the south by Kwangsi. Area 67,000 square miles (Map: China, J 6). About seven-tenths of the province is mountainous, with some fine grassy plains of no great extent. The population is sparse, about 168 to the square mile; cultivation is carried on only in the neighborhood of towns and villages. The chief crops are wheat, barley, and rice. Coal, iron, copper, silver, quicksilver, and antimony exist in great quantity. Coal is worked extensively for domestic use. Opium production is still considerable, but is gradually being reduced on account of the national prohibition, and its elimination is only a question of time. Wood oil, fibre paper, "rice paper," and white wax and gallnuts are the chief exportable products. The province supplies several considerable tributaries to the Si-Kiang, which flows through Kwangsi and Kwangtung. On the whole communications are difficult. The Wu-kiang rises north of the capital, and, after a course of 500 miles north-east and north, flows into the Yang-tse at Fuchow. Owing to its rapids, it does not become navigable until it approaches Szechwan, 100 miles from its mouth, where it is known as the Kung-tan River. The Yuen, which flows east and northeast into the Tung-ting Lake, in Hunan, waters the southeastern part of the province. Its upper courses are obstructed by numerous rapids, but it is navigable from its mouth to within 130 miles of the capital, Kweiyang (q.v.). Under the old régime Kweichow formed with Yunnan the governor-generalship of Yun-Kwei. The population numbers 9,265,000, according to the Chinese governmental census of 1910, published in the government Gazette of Feb. 27, 1911. There are many immigrants from the neighboring provinces. Kweichow has no treaty ports, and its exports go by way of Hunan and Kiangsi. The province has not yet recovered from the devastation caused by the war which existed in the first half of the nineteenth century between the Chinese and the Miaotse, who

still inhabit the mountains and maintain a sort of independence.

KWEILINFU, kwá'lén'fóo' (Chin., cassia forest city). The capital of the Chinese Province of Kwangsi (q.v.). It is a walled city, somewhat decayed, situated on the navigable river Kwei (Map: China, K 6), about 250 miles northwest of Canton, with which it has river communication.

KWEIYANGFU, kwá'yáng'fóo'. The capital of the Chinese Province of Kweichow. It is finely situated in a plain, full of trees and encircled by hills, near the centre of the province, and is surrounded by walls of white marble and contains monuments of the same material and many handsome memorial arches erected to the memory of women (Map: China, J 6). It is the smallest of all the provincial capitals of China, its walls having a circuit of only 2 miles. Its streets are fairly wide, its shops large and prosperous-looking, and its inhabitants civil. Their foreign goods are received through the Tung-ting Lake and the Yuen River. Its fuel supply is derived from the coal mines 10 miles west of the city. The hills in the . . . are covered with vegetation, and . . . have beautiful temples on the summits.

KYANIZING, kí'an-iz'ing. An efficacious method of preserving timber from dry rot (q.v.) by injecting into the pores of the wood a solution of corrosive sublimate, it was invented by John H. Kyan, who was born in Dublin, Nov. 27, 1774, and died in 1850.

KYD, kíd, THOMAS (c.1557-c.1595). An English dramatist, son of a London scrivener, born about 1557. He attended the Merchant Tailors' School and acquired some knowledge of Latin, French, Italian, and Spanish. He died about 1595. His two plays, having as hero Jeronimo (or Hieronimo), Marshal of Spain, were immensely popular. They are known as *The First Part of Jeronimo* (printed, 1605) and *The Spanish Tragedy* (printed, 1594). Upon the authenticity of these plays, or at least upon that of the first of them, some doubt has been cast. They were both performed probably as early as 1588. They were frequently quoted and abused by later dramatists, and to the second play Shakespeare seems to have been indebted for some of the machinery of *Hamlet*. Kyd wrote other tragedies and may have been the author of a lost *Hamlet*. Consult his *Works*, ed by Boas (Oxford, 1900), Ward, *History of English Dramatic Literature*, vol ii (London, 1881); Sarrazin, *Thomas Kyd und sein Kreis* (Berlin, 1882).

KYI, kyé. See KHASI.

KYLIN. See K'Y-LIN.

KYLLMANN, kíl'man, WALTHER (1837-) A German architect, born at Weyer-bei-Wald, Rhenish Prussia. He studied at the Academy of Architecture in Berlin and was a commissioner at the Paris exhibition in 1867. He formed a partnership with Adolf Heyden about 1868 and with him designed numerous public and private buildings in Berlin and vicinity, among them the Kaisergalerie (one of the handsomest arcades in Europe), the Johannis-kirche in Düsseldorf, the post offices in Breslau and Rostock, and the buildings of the German Empire at the Vienna Exposition of 1873.

KYLOE CATTLE. See HIGHLAND CATTLE

KYLPONT, kíl-pónt', or **KYNPONT**, kínpónt', ROBERT. See PONT, ROBERT

KYMBY, kí'm'ri, or **CYMBY**. See WALES, *History*.

KYOTO, or **KIOTO**, ká-ó'tó (Chin., capital); also called MIAKO, MIYAKO, SAIKYO. One of the three *fu* cities of Japan and the capital of the country from the year 794 until 1868, when the shogunate was abolished and the Mikado and his court removed to Yeddo (Tokyo) (Map: Japan, D 6).

The city stands on the island of Hondo, in lat. 35° N. and long. 135° 30' E., in a fertile plain, bordered on three sides by moderately high mountains, near the centre of the Province of Yamashiro. It is 47 miles by rail from Kobe via Osaka on the coast and 329 from Tokyo, and is also connected by rail with Tsuruga on the Sea of Japan on the north and westward 302 miles with Shimonoseki (q.v.), where the island of Hondo approaches Kiushu. The city, which is unwalled, is traversed from north to south by the Kamo-river which divides it into two unequal parts. The larger and more important part lies along the right bank of the river, the wide shingly bed of which is nearly dry except in the rainy season. The smaller and more picturesque part, where are found most of the hotels patronized by foreigners, rises gradually from the left bank to the wooded steeper slopes and spurs of the range of mountains, where many of the more famous temples and places of interest are situated. In general the plan of the city differs but little from that of 794, which Kwammu Tenno, its founder, called Hei-an-jo (the city of peace). It is about 4 miles in length from north to south and 2½ in breadth and is laid out with mathematical regularity. The streets are wide, well kept, neat, and clean. In the northeast part is the Go-Sho or Imperial Palace, which, with its fine gardens in true Japanese taste, covers 26 acres. The buildings are of wood and are characterized by a certain quiet elegance which is peculiarly Japanese. They contain many fine paintings by Japanese artists and much fine carving. To the southwest of this is the Niijo, the castle of the Shogun, built in 1601 and now the seat of the city government. Though one of the gayest of cities, Kyoto is a great religious centre, and temples and shrines abound. Shinto (q.v.) claims 93 and Buddhism about 950. In the southern part of the city are the Eastern and Western Hongwan-ji, the headquarters of the Shin sect, whose temples are noted for their great size, their magnificence and their accessibility. On the eastern hills are many fine temples, such as the Chi-on-in and the San-ju-san-gen-Do. In this neighborhood is also found a large mound—the Mimidzuka—containing the ears and noses of the Koreans slain in the wars of Hideyoshi (1592-98). To the northeast of the Imperial Palace, on the way to Otsu, at a height of 2000 feet, and overlooking Lake Biwa, are the famous Buddhist monasteries of Hiei-zan, founded about 800 A.D., and intended originally to shield the palace from the evil influences of the north.

Kyoto is the centre of many art industries. Here the finest silks, crapes, velvet, brocades, and embroideries, porcelain, cloisonné enameled ware, bronzes, etc., are produced, the manufacture giving employment to thousands of skilled hands. Much Satsuma and other ware is brought here to be decorated. Under the city government is an industrial department for the promotion of the industrial arts, established in

1870, which includes experimental gardening, an experimental farm, a weaving department where foreign looms are used, a physical and chemical department, a female industrial school, a pauper industrial school, a shoemaking establishment, etc. Kyoto is the seat of an Imperial university, with colleges of law, medicine, and engineering; and under the auspices of the American Board of Commissioners for Foreign Missions is a college of good standing called the Doshisha, where theology is also taught. There are many schools, including five of the higher middle schools, and a training college for teachers. Pop., 1898, 353,139; 1908, 442,462.

KYRIE ELEISON, kīr'ī-ē ē-lā'ī-sōn (Gk. *Κύριε ἐλέησον*, *Kyrie eleēson*, Lord have mercy). A form of prayer which occurs in both Greek and Latin liturgies, borrowed from the use of the phrase in both the Old and New Testaments. It appears as a regular formula as early as the Apostolic Constitutions. It seems to have been introduced into the Western church in the fifth or sixth century. In the modern Roman Catholic mass it follows immediately upon the introit (q.v.). In the Eastern churches it is used

very freely, being the ordinary response to each clause of the litany. In the Book of Common Prayer it is used, in the morning and evening services, but translated into English.

KYRLE, kērl, JOHN (1637-1724). An English philanthropist, famed by Pope's eulogy of him in his third *Moral Epistle* under the name "The Man of Ross." He was born in the Parish of Dymock, Gloucestershire, and was educated at Ross Grammar School and at Balliol College, Oxford, but never received a degree. His charity took the form very frequently of advancing money to a neighbor who intended to build, decorate, or alter, with the understanding that Kyrle should plan the work. In 1693 he leased a bit of ground in Ross for 500 years and made it a public park. The Kyrle Society, named after him, was founded in 1875; its aim is to better the common people, by laying out parks, giving concerts, and promoting house decoration and window gardening.

KYTHERA, kith'ē-ra. See CERIGO.

KYUSHU, kyū'shū. The southernmost of the four principal islands of Japan. See KIUSHU.

KYOTO

ENTRANCE TO TEMPLE OF CHION-IN

L

L THE twelfth letter of the English alphabet. Its form is derived from the North Semitic *L*, which became the Greek λ , and then, through the Latin, *L* (See ALPHABET.) The Greek name of the letter, *lambda*, may represent an Aramaic pronunciation of *lamed* with the emphatic ending *d*, or a Greek lengthening for the sake of euphony, or possibly a non-Semitic original name of the sign. The Hebrew *lamed* has been usually supposed to mean an oxgoad, because there is, in Judg. iii. 31, the solitary occurrence of a word *malmad*, which from the context has been taken to mean an oxgoad. This meaning, however, is extremely doubtful.

Phonetic Character. In general *l* is a semi-vowel, with a lateral character; it is made by a contact between the tongue and the roof of the mouth in the same general position as for *d*, *t*, *n*, but with a characteristic opening at the sides of the tongue, by which the breath escapes laterally. By differences in the position of the tongue are made the *l moullé* (palatal) of French and the lingual or cerebral *l* of Sanskrit. Popularly *l* is classed as a liquid with *m*, *n*, and *r*. In English the sound of *l* is very constant and, by virtue of its sonority and stability, is used with the value of a vowel in unaccented syllables, as *bottle*, *apple*. It is sometimes silent, as in *walk*, *calm*, *palm*. In other languages *l* is not so stable as in English. In Sanskrit *l* and *r* are almost alternative letters in older roots. In comparative philology an interchange of *l* and *d* is quotable, cf Lat *lacrima*, Gr. *δάκρυ*.

As a Symbol. In chemistry, *L* = *lithium*; in Roman notation, *L* = 50; \bar{L} = 50,000; in English money, *L* (written conventionally before the figures £) = pounds (from Lat. *libra*), as £2000 = 2000*L*.

LAALAND, *la'land*, or **LOLLAND**. An island of Denmark, in the Baltic Sea, between the islands of Falster and Langeland, separated from the first by the Guldberg Sund and from the second by the Langeland Belt (Map: Denmark, E 4). Area 447 square miles. The surface is very low, with a maximum 95 feet above the sea, and the coast line is broken. The soil is very fertile, and a considerable part is covered with forests. There are a few peat bogs. The chief occupation is agriculture. Maribo, the capital of the island, is connected by rail with the seaport of Nakskov, on the west coast, Brandholm and Rødby, on the north and south coasts respectively, and Nykjøbing, on the is-

land of Falster. Laaland forms, with Falster, the District of Maribo. Pop. (of the island), 1901, 70,596; 1911, 71,280.

LAAR, or **LAER**, *lär*, PIETER VAN (c.1600–60). A Dutch landscape and genre painter, called by the Italians Pietro dell' Elaeer, and also Il Bamboccio. He probably studied in France and Austria before he settled in Rome (1624), where he remained for 16 years. In that city he met Claude Lorrain and Poussin and founded a school of imitators, who were called bambocciate. His works are darkening rapidly, but his effects of light and shade are still notable. His subjects are landscapes or peasant scenes of a gay nature. He executed about 20 etchings of great merit, half of them of animals. There are old copies of many of his paintings. At Hampton Court in England, there are three of his paintings; and others are in Amsterdam, Cassel, Dresden, Florence, Munich, Prague, Vienna, St. Petersburg (Hermitage), Paris (Louvre).

LAAS, *läs*, ERNST (1837–85). A German philosopher and educator, born at Fürstenwalde. He studied theology first and then philosophy at Berlin under Trendelenburg and in 1872 became professor of philosophy at the University of Strassburg (newly organized in that year). His philosophy is positivism; his position comes near Hume's or, more exactly, between Comte's and John Stuart Mill's. His positivism admits logical principles to the same category with facts and perceptions. But his work is critical rather than constructive. His chief publication is *Idealismus und Positivismus* (1879–84), which exalts positivism at the expense of the idealism of Plato and Kant and puts a particular stress on the relation of his philosophy to ethics and pedagogics. His *Litterarischer Nachlass*, edited by Kerry (1887), contains these subdivisions: I, *Idealistische und positivistische Ethic*; II, *Oekonomische Mängel unseres nationalen Bildungswesens*; III, *Gymnasium und Realschule*. He wrote also: *Kant's Analogien der Erfahrung* (1876), *Der deutsche Unterricht auf höheren Lehranstalten* (2d ed., 1886); *Der deutsche Aufsatz in der oberen Gymnasialklassen* (3d ed., 1898). Consult Gjurits, *Die Erkenntnistheorie des Ernst Laas* (Leipzig, 1903), and P. Kohn, *Der Positivismus von Ernst Laas* (Bern, 1907).

LABADIE, *la'ba'de'*, JEAN DE (1610–74). A religious reformer and sectary. He was born at Bourg in Guienne, Feb. 13, 1610. He was educated by the Jesuits at Bordeaux, entered their order (1625), became priest (1635), and dis-

tinguished himself as a preacher. He urged the reform of what he deemed abuses in the Church, but, finding no encouragement in his order, he left it and joined the Fathers of the Oratory in 1639 and soon after the Jansenists. In 1640, appointed canon of Amiens, he made innovations, holding meetings for the reading of the Bible and administering the Lord's Supper in both kinds to the people. Finding himself in accord with Calvinism, in 1650 he became a Protestant and was for eight years pastor of the church at Montauban. In 1657 he was pastor in Orange and in 1659 in Geneva. In 1666 he became pastor of a Walloon church in Middelburg, Holland, but in 1669 went to Amsterdam, where his followers soon formed a distinct sect called Labadists. It included many of rank and education, among whom were two ladies, the learned Anna Maria von Schürman and the authoress Antoinette Bourignon. Expelled from the country as a Separatist, he went in 1670 to Herford, where he was protected by the Princess Elizabeth, who, through the influence of Anna Maria von Schürman, became a disciple. Driven from this place in 1674, he went to Bremen and then to Altona, where he died (Feb. 13, 1674). He left numerous works. The Labadists did not differ entirely from the Reformed church, but adhered to its doctrinal symbols. They were a set of mystics, who sought reform of life rather than of doctrine. They supported themselves by manual labor and, after the example of the primitive Church, held property in common; they laid great stress on the internal light as indispensable for the . . . of the Bible and rejected infant baptism and the observance of holy days. They honored the institution of marriage. After Labadie's death his followers settled in West Friesland, but made few converts, and in the . . . of the eighteenth century the sect . . . A few of them came to the United States and settled on the Hudson, but gained no permanence as a sect. Consult: Von Berkum, *De Labadie en de Labadisten* (2 vols., Sneek, 1851); B. B. James, "The Labadist Colony in Maryland," in *Johns Hopkins University Studies in History and Political Science* (17th series, no. 6, Baltimore, 1899), containing a bibliography; Dankers and Sluyter, *Journal of Jasper Danckaerts and Peter Sluyter, 1679-1680*, translated by H. C. Murphy (New York, 1913).

LABAND, lä'bänt, PAUL (1838-). A German jurist, born in Breslau and educated there and at Heidelberg and Berlin. In 1864 he went to Königsberg as professor and eight years afterward to Strassburg. His special provinces constitutional and commercial law, in 1886 he founded, with Stoerk, the *Archiv für öffentliches Recht*, and he was long editor of the *Deutsche Juristen-Zeitung*. His earlier works, on the sources of German law, include *Beiträge zur Kunde des Schwabenspiegels* (1861) and *Jura Prutenorum* (1866). More important are: *Das Budgetrecht nach den Bestimmungen der preussischen Verfassungsurkunde* (1871); *Das Finanzrecht des deutschen Reichs* (1873); and his masterpiece, *Das Staatsrecht des deutschen Reichs* (5th ed., 1911), which appeared in abbreviated form in Marquardsen's *Handbuch des öffentlichen Rechts der Gegenwart* (1883; 6th ed., 1912). *Direkte Reichssteuern* appeared in 1908.

LA BARCA, lä bär'kä. A town in the State of Jalisco, Mexico, situated east of Lake Cha-

pala and 60 miles southeast of Guadalajara, on the railroad between that city and Mexico (Map: Mexico, H 7). It is noted for its oranges. It was founded in 1529 by Nuño de Guzmán, and its streets were the scene of two battles in the Mexican War of Independence. Pop., 1900, 7101; 1910, 7437.

LABA'RIA. A Brazilian name for the powerful rattlesnake elsewhere described as bush master (q.v.).

LABARRAQUE'S (lä'bä'räks') **SOLUTION**, or **SOLUTION OF SODIUM HYPOCHLORITE**. A disinfecting and bleaching solution, obtained by mixing 150 parts of sodium carbonate (in solution) with 75 parts of calcium hypochlorite, or bleaching powder (in solution), making up with water to 1000 parts, and separating the precipitated mass. The liquid thus obtained has a pale greenish color, a faint odor of chlorine, and a disagreeable alkaline taste. Its specific gravity is 1.052. Its value as a disinfectant and as a bleaching agent is due to the chlorine which it contains. This, on being set free, unites with water and releases oxygen, an active bleaching and disinfecting substance. It is used as a gargle for sore throat, as a dressing for wounds, and in diluted form as a nose douche. It is also administered internally in small quantities in cases of zymotic diseases.

LA BARRE, lä bär', ANTOINE JOSEPH LE-FÈVRE DE (c.1625-88). A French naval officer and Governor of Canada. He was appointed Governor of Guiana in 1663 and in 1687 recaptured Cayenne from the Dutch and defeated the English in the Antilles. In 1682 he succeeded Frontenac as Governor of Canada, in which capacity he was conspicuous chiefly for cupidity and incompetence. He organized an expedition against the Seneca Indians in 1684 and proceeded, after much unnecessary delay, as far as La Famine, at the mouth of the Salmon River, in the present State of New York. Here, and at Fort Frontenac, across the lake, many of his soldiers were incapacitated for further service by malarial attacks, and, unable to proceed further, La Barre held a conference with a delegation of Iroquois on September 4 and agreed to a treaty of peace unsatisfactory to Louis XIV. Late in the same year, accordingly, he was recalled to France. La Barre was a steadfast opponent of La Salle (q.v.). Consult Francis Parkman, "Count Frontenac and New France under Louis XIV," in *France and England in North America*, part v (Boston, 1903), and "La Salle and the Discovery of the Great West," in *France and England in North America*, part iii (ib., 1907).

LABARRE, Louis (1810-92). A Belgian publicist and journalist, born at Dinant. His real name was Labar. He was a schoolmaster there until the revolution of 1830, when he came to the front as a Radical Republican, contributing to the *Courrier Belge*, the *Bombe*, the *Charivari Belge*, and the *Paris National*. In 1836 his *Satires et élégies* appeared. As editor of the *Brussels Nation* (1848), he had Mazzini, Kossuth, Hugo, Louis Blanc, Charras, Raspail, and others for contributors, and he himself was imprisoned 13 months for his defense of Orsini. He wrote strongly against Napoleon III in such works as *Napoléon III et la Belgique* (1860) and was the author of a comedy, *La bourse des amis* (1862), a five-act drama, *Montigny à la cour d'Espagne* (1864), an appreciatively critical biography of his friend the

painter Wiertz (1866), and collections of verses.

LAB'ARUM (possibly from Cantabrian *laburu*, having four members, or Basque *labarva*, standard). The famous standard of the Roman Emperor Constantine, designed to commemorate the miraculous vision of the cross in the sky, which is said to have appeared to him on his way to attack Maxentius and to have been the moving cause of his conversion to Christianity. As Eusebius describes it (*Vita Constantini*, i, 31), it was a long spear, overlaid with gold, forming the figure of a cross by means of a transverse bar at the top, from which hung a square purple banner, embroidered with gold and precious stones. At its summit was a gold wreath, inclosing the monogram of Christ formed of the first two letters of his name, X and P, intersecting each other. It was therefore a modification of the usual cavalry standard, the monogram merely taking the place of the emblem of the legion, such as a hand or an animal. This standard became the general one of the Roman army under Constantine and his successors. Its keynote, the sacred monogram, was also placed on the soldiers' shields and came into temporary use as a symbol of Christianity on tombs and works of art.

LA BASSÉE, là bā'sā'. A town of northern France, in the Province of Nord, 13 miles southwest of Lille. Pop, 1911, 4707. A series of canals gives it water communication with the coast. It is famous for the number and variety of its fairs. The chief productions of the town are oil, sugar, pottery, chicory, soap, tiles, and cotton goods. In the European War of 1914 La Bassée was the centre of continuous fighting. It was occupied by the Germans in their first offensive movement against France, and the battle for Calais was fought along a line from Ypres to La Bassée, in which encounter most of the allies' fighting force was composed of Anglo-Indian troops. Terrific artillery duels, followed by determined infantry attacks and counterattacks from trench to trench, continued throughout the winter of 1914-15. See WAR IN EUROPE.

LABAT, là'bā', JEAN BAPTISTE (1663-1738). A French missionary and author, born in Paris. He became a Dominican in 1685, was professor at Nancy in 1687, and in 1693 was sent to the Antilles. He spent two years at Martinique and returned thither after a stay in Guadeloupe, where he did much for the industrial development of the country and was appointed procureur général. He was frequently used as diplomatic agent by the governors of the Antilles, explored the archipelago, and in 1703 founded the city of Basse-Terre in Guadeloupe. The White Father, with a company of 60 negroes, did marvels in the defense of the island against the English. War and fever had so cut down the missionary force that in 1705 Labat returned to Europe, where his superiors detained him at Rome, Civitavecchia, and Paris until his death. His *Nouveau voyage aux îles de l'Amérique* (1722) is considered the most original of his works of travel. He also wrote *Voyage en Espagne et en Italie* (8 vols., 1730).

LABAZARES, G. DE. See LAVEZARIS, G. DE. **LABBE**, lāb, PHILIPPE (1607-67). A French Jesuit scholar. He was born at Bourges, entered the Society of Jesus (1623), attained high rank as a scholar, and distinguished himself by his collection of the acts in the Church councils

from 34 to 1417 (18 vols., Paris, 1672; completed by Cossart, vol. xviii added by Jacobatius), a work which served as the basis of the later collections of Hardouin and Mansi. A full list of his numerous writings is given in Backer, *Bibliothèque des écrivains de la compagnie de Jésus* (Paris, 1876; new ed., vols. i-ix, Brussels, 1890-1900).

LABÉ, là'bā', LOUISE, known as La belle Cordière (the beautiful ropemaker) (?-1566). The most celebrated of the sixteenth-century French women poets. She was born at Lyons between 1515 and 1524 and was highly educated. At the age of 18 she fought at the siege of Perpignan (1542) as Capitaine Loys. About 13 years after this she married Aymon Perrin, a rope manufacturer of Lyons, and her salon became a meeting place for cultivated people. She was the subject of much scandal, most of which seems to have been undeserved. Besides poems, she wrote a prose play, *Débat de folie et d'amour*. The first edition of her works appeared in 1555, and there was one in 1887. Consult Gonon, *Documents historiques sur la vie et les mœurs de Louise Labé* (Lyons, 1844), and Edith Sichel, *Women and Men of the French Renaissance* (New York, 1911).

LA BÉDOLLIÈRE, là bā'dō'lyār', EMILE GIGAULT DE (1812-83). A French publicist and historian, born at Amiens and educated at the Ecole des Chartes. After the publication of his first book, *Vie politique du marquis de La Fayette* (1833), he was engaged in compilation, translation, and journalism. His later works include: *Beautés des victoires et des conquêtes des Français* (2 vols., 2d ed., 1847); *Histoire des mœurs et de la vie privée des Français* (1847); *Histoire de la garde nationale* (1848); *Histoire d'Italie* (1859); *Le nouveau Paris* and *Histoire des environs du nouveau Paris* (1860); *Histoire de la guerre du Mexique* (1861-68); *Londres et les Anglais* (1862); *Le domaine de Saint-Pierre* (1865); *Histoire complète de la guerre d'Allemagne et d'Italie* (1866); *Histoire de la guerre 1870-71* (1872).

LABÉDOYÈRE, là'bā'dwā'yār', CHARLES ANGÉLIQUE HUGHET, COUNT (1786-1815). A French soldier. He was born in Paris and entered the army at an early age. He was adjutant to Marshal Lannes in Spain in 1808, received a wound at Tudela, joined the army in Germany after his recovery, was Murat's adjutant at the battle of Aspern, and fought well at Borodino, the Beresina, Lützen, and Bautzen. Returning to France in the autumn of 1813, he received the command of a regiment and was posted near Vizelle when Napoleon returned from Elba. He immediately joined him, and his desertion of the Bourbons was quickly followed by that of the whole army. As a reward, Napoleon made him lieutenant general and a peer of France. He fought with great gallantry at Waterloo. He intended to emigrate to America after the second return of the Bourbons, but imprudently went to Paris, was seized, tried, and shot (Aug. 19, 1815).

LA'BEL (OF. *label*, *labeau*, *lambel*, *lembel*, *lambeau*, Fr. *lambeau*, shred, from OHG. *lappa*, Ger. *Lappen*, rag, AS *leppa*, *lappa*, Eng. *lap*; probably connected with Gk. *λόφος*, *lobos*, lobe, Lat. *labi*, to fall, Skt. *lamb*, *ramb*, to hang down). In heraldry, the mark of cadency which distinguishes the eldest son in his father's lifetime. See CADENCY.

LABEL. In its ordinary sense, a ribbon or other narrow slip, as of cloth, parchment, or paper. In law, specifically applied (a) formerly to a narrow strip of paper attached as a rider to a document to supplement it, as a codicil to a will; (b) a strip of material attached to a deed to carry the seal; (c) the usual meaning now—a strip or small piece of paper, sheet metal, cloth, or other material, attached to a package to describe it in some way, as to tell its nature, the maker, the weight, destination, or any other information concerning it. A label is in itself not a trade-mark, although a trade-mark may consist of a label which has the qualities essential to constitute a trade-mark. A label as such cannot be patented or copyrighted unless it has those qualities that bring it within the subject matter for which the patent or copyright is granted. Practically speaking, this protection is afforded in any case where likelihood of fraud or deception of the public as a result can be shown. Of course, if the reading matter or design of the label is protected by copyright or patent, the usual protection against infringement will be afforded. See **TRADE-MARK**; **COPYRIGHT**; **PATENT**, and consult the authorities there referred to. See also **UNION LABEL**.

LA BELLA, là bĕl'la (It., the beauty). A renowned painting by Titian in the Pitti Gallery at Florence, considered the best of his female portraits. It was painted about 1535 and is probably an ideal representation of Eleonora, Duchess of Urbino. See **TITIAN**.

LA'BEŌ, MARCUS ANTISTIVS (c.53 B.C.—17 A.D.). A Roman jurist. He was the son of Pacuvius Antistivus Labeo, a lawyer of marked Republican sentiments, who killed himself after the battle of Pharsalus. The son was also a Republican and, according to Dio Cassius and Suetonius, dared to oppose Augustus. He was probably an innovator in private law, but very conservative in constitutional law. He had some fame as a philologist and applied his knowledge of old Latin forms to legal difficulties. He did not himself form a school, although he was strongly opposed to Ateius Capito; but his pupil Proculus was founder of the Proculian school. Down to the time of Hadrian he was regarded as the chief authority on law. He wrote *Libri ad Edictum*, a commentary on the edicts of the praetors and of the curule aediles, *Libri Posteriorum*, published after his death, a systematic exposition of the common law, and *Probabilium Libri Octo*, a collection of definitions and axiomatic legal propositions. His works are largely quoted in the Pandects (q.v.), and these excerpts are edited by Bremer, *Jurisprudentiæ Antehadrianæ quæ Supersunt* (1898). Consult Pernice, *M. A. Labeo: Das römische Privatrecht im ersten Jahrhundert der Kaiserzeit*, vols. i–iii (Halle, 1873–92; Sohm-Ledlie, *Institutes of Roman Law* (2d ed., Oxford, 1901); Teuffel, *Geschichte der römischen Literatur*, vol. ii (6th ed., Leipzig, 1910).

LABERIUS, là-bĕ'rĭ-ŭs, DECIMVS (105–43 B.C.). A Roman knight and celebrated writer of mimes (farces; see **MIME**). Having, as it is thought, offended Julius Cæsar, he was ordered by him to appear in person on the stage, at the age of 60, and to act in one of his own mimes—a great indignity to a Roman, since actors had no civil rights, indeed were usually slaves, freedmen or foreigners (45 B.C.). In delivering

the prologue and again in parts of the play Laberius boldly inserted verses expressing his sense of the insult. Cæsar, partly in retaliation, awarded the dramatic prize to Publilius Syrus, the rival of Laberius; but he gave back to Laberius the equestrian rank (see **EQUESTRIAN ORDER**) which he had forfeited by appearing as actor. The fragments of Laberius are collected by Otto Ribbeck in the second volume of his *Comicorum Romanorum Fragmenta* (Leipzig, 1873). Consult Schanz, *Geschichte der römischen Literatur*, vol. i (3d ed., Munich, 1909).

LA'BIALS (ML. *labialis*, relating to the lip, from Lat. *labium*, lip; connected with Pers. *lab*, lip, and probably with AS. *lyppa*, Eng. *lip*). Those sounds whose articulation is chiefly determined by the lips. The mutes *p*, *b*, the nasal *m*, and the semivowel *w* is the list given by most phoneticians. In articulating *f* and *v* the upper teeth and lower lip are brought together, so these are called labiodentals. The vowels *oo* and *o* are often classified among the labials, as they involve a rounding of the lips. Consult Rippmann, *Sounds of Spoken English* (London, 1910).

LABIATÆ, là'bĭ-a'tĕ (Neo-Lat. nom. pl, from Lat. *labium*, lip), the mint family. A family of herbaceous or half-shrubby dicotyledonous plants, containing about 150 genera and 3000 species, mostly natives of temperate climates. They have four-cornered stems; opposite branches and leaves, without stipules; flowers generally in cymes, heads, or whorls, but sometimes solitary; calyx inferior, 5 or 10 toothed or two-lipped; corolla hypogynous, two-lipped, the lower lip three-lobed, stamens four, two long and two short, or by abortion only two, inserted into the corolla; ovary deeply four-lobed, seated in a fleshy disk, each lobe containing a single ovule; style simple, with a bifid stigma. fruit one to four achenia, inclosed within the persistent calyx. The conspicuous feature of the family, which appears in its name, is the bilabiate corolla, the special type of irregularity (q.v.) which prevails among the Sympetalæ. A general characteristic of this family is an aromatic odor due to a volatile oil, which in many species is very agreeable and makes them garden favorites; in others it is unpleasant. Many are natives of America; some are weeds, some are used in medicine, some for perfumes; others in cookery for flavoring; one (*Stachys*) yields edible tubers. Mint, marjoram, rosemary, lavender, sage, basil, savory, thyme, horehound, balm, patchouli, germander, and dead nettle are examples of this family. The principal genera in the United States are *Teucrium* (germander), *Scutellaria* (skullcap), *Marrubium* (horehound), *Nepeta* (catnip), *Physostegia* (dragonhead), *Leonurus* (motherwort), *Stachys* (hedge nettle), *Salvia* (sage), *Monarda* (horsemint), *Hedeoma* (pennyroyal), *Satureja* (calamint), *Pycnanthemum* (basil), *Thymus* (thyme), *Lycopus* (water horehound), and *Mentha* (mint). See Plate of **MINT**.

LABICHE, là'bĕsh', EUGÈNE (1815–88). A French dramatist, born in Paris, May 5, 1815. His first drama, *M. de Coyllin* (1838), was a failure, but for nearly 40 years he continued to write farces and comedies, many of which attained great success, though unpublished. In 1876 he withdrew to Normandy, wealthy, but with no thought of fame. The higher literary recognition of Labiche as a literary artist,

whereas many had thought of him as a mere purveyor of fun, seems to have come first from his friend and fellow dramatist, Emile Augier. Labiche gathered his best in 10 volumes (1879) and found himself famous. In 1880 he entered the Academy, but never again essayed the stage. Some of his plays—*Le voyage de M. Perrichon* (1860), *La poudre aux yeux* (1861), *Les petits oiseaux* (1862), *Moi* (1864), *Le chapeau de paille d'Italie* (1851)—are pure comedies of a high order. In others, like *La cagnotte*, there is riotous fancy, and the humor is a battledore and shuttlecock of dialogue, not of situation and character. Labiche wrote usually in collaboration with one or another playwright; but the genius of the comedies is always his, and from a literary point of view the others' part is negligible. After his death French farce fell into its former coarseness. Consult: Augier, "Preface" to Labiche, *Théâtre complet* (10 vols., Paris, 1879); Hippolyte Parigot, *Le théâtre d'hier: études dramatiques* (ib., 1893); E. J. H. Pailleron, Eugène Labiche, in his *Pièces et morceaux* (ib., 1897); Eugen Zabel, *Zur modernen dramaturgie* (2d ed., 2 vols., Oldenburg, 1899); Brander Matthews, *French Dramatists* (4th ed., New York, 1905); Jules Woguc, "Labiche, romancier," in *Revue*, vol. cv (6th series, Paris, 1913).

LABID IBN RABIA, lā-bēd' 'b'n ra-bē'a, ABU 'AḲĪL (c.560-c.661). An Arabian poet, who lived at Medina after his conversion to Islam and died at Cufa. His poems were very popular and at the same time were highly esteemed by the grammarians; the commentary of al-Tusi on a score of them is preserved. As he was a great warrior in his youth, most of his poems refer to tribal disputes. One of his productions was received in the *Mu'allakāt*, edited by De Sacy (1816), by Peiper (1828), and without commentary by Abel in *Die sieben Mu'allakāt* (Berlin, 1891). The best translation is by Nöldeke, in the *Sitzungsberichte* of the Vienna Academy of Sciences (1900). Labid's *Diwān* was first edited by Yusuf al-Khalidi (Vienna, 1880). A. Huber had prepared an edition and a translation of Labid's poems. After his death these were published in two separate volumes by C. Brockelmann (Leyden, 1891). Consult Sloane, *The Poet Labid* (Leipzig, 1877), and Huber, *Das Leben des Labid* (Leyden, 1887).

LABIENUS, lā'hī-ē'nus, TITUS (98-45 B.C.). A Roman tribune in 63 B.C., when Cicero was consul, a lieutenant of Cæsar in the Gallic War, and afterward a prætor. In 63 B.C. he carried a plebiscite, through which Cæsar later was able to secure the office of pontifex maximus. In 54 B.C. he twice defeated the Treviri and in 52 distinguished himself in the campaign against Vercingetorix (q.v.), when Cæsar went from Gaul to Italy during his Gallic campaign, he left Labienus in charge in Gaul. When the Civil War broke out, he sided with Pompey and treated with cruelty Cæsar's soldiers who fell into his hands at Dyrrhachium. After the defeat at Pharsalus he went to Africa and thence, after the defeat at Thapsus, to Spain, where he fought against Cæsar at Munda; there, in a panic, his troops were routed, and he fell (45 B.C.).

LABILLARDIÈRE, lā'bē'yār'dyār', JACQUES JULIEN HOUTON DE (1755-1834). A French naturalist. He was born at Alençon and studied botany and medicine at Montpellier. He traveled widely in England, in Piedmont, in the

chief islands of the Mediterranean, and in Palestine. In 1791 he was sent on the La Pérouse expedition. He explored Tenerife, the Cape of Good Hope, and Van Diemen's Land and after various stops in the south seas went to Java, where he was held prisoner by the Dutch (1793-95). He was elected to the Institute in 1800. He became famous for his researches in the natural sciences and published *Icones Plantarum Syriæ Rariorum Descriptionibus. Illustratæ* (1791-1812), *Relation du voyage à la recherche de La Pérouse* (1800), and several other works, besides numerous papers on various scientific subjects.

LABLACHE, lāblāsh', LUIGI (1794-1858). A celebrated Italian operatic singer, born in Naples in 1794, whither his mother and his father, who was French, had fled from Paris during the Revolution. His voice, a deep bass, was of wonderful range, flexibility, and volume; and his acting, particularly in the characters of Figaro and Leporello, was almost as remarkable as his singing. His first engagement as a singer was at the San Carlino Theatre at Naples in 1812; he appeared afterward in La Scala, Milan, and in Vienna, and also at the San Carlo, in Naples, during the intervals of the Vienna season. On his first appearance in London, in 1830, he met with immediate success, and for a number of years he resided alternately in the French and English capitals, singing during both the Paris and London seasons. He died at Naples. Consult Couailhac, *Galerie des artistes dramatiques de Paris* (Paris, 1841).

LA BOÉTIE, lā bō'ā'sé', ETIENNE DE (1530-63). A French translator from the Greek and a political thinker, known chiefly through the friendship of Montaigne (q.v.) for him. His youthful *Contre un* is a democratic declamation, the first republican protest to spring from the French Renaissance. La Boétie translated the *Economics* of Xenophon. The latest edition of his *Works* is by Bonnefon (Bordeaux, 1888). Consult Bonnefon's chapter on Montaigne in Petit de Julleville, *Histoire de la langue et de la littérature française*, vol. iii (Paris, 1896-1901).

LA BOHÈME, lā bō'am' (Fr., The Bohemian Girl). 1. An opera by Puccini (q.v.), first produced in Turin, Feb. 1, 1896; in the United States, May 16, 1898 (New York). 2. An opera by Leoncavallo (q.v.), first produced in Venice, May 6, 1897.

LA'BOR (OF. *labor*, *labour*, Fr. *labour*, from Lat. *labor*, toil). Human activity put forth as a means to the production of goods. Two forms, forced or slave labor, induced by the fear of punishment, and contract or free labor, induced by the desire for goods as a means to the satisfaction of wants, are to be sharply distinguished.

The earliest civilizations were based on systems of slave labor, the slaves being either a subject people dominated by a conquering race or prisoners of war. Such systems led inevitably to the degeneration of the governing class and were overthrown as soon as the peoples establishing them came in contact with more vigorous races which had been forced by circumstances to depend more upon their own exertions. During the Middle Ages, and even down to modern times in some of the countries of Europe, the system of labor was a modified form of slavery known as serfdom. Serfs were bound to the soil and compelled to obey their feudal lords in

all important matters. At the same time they had certain customary rights and privileges which the lords, on their side, were bound to respect. Although adapted to the conditions of a slowly developing agricultural community, serfdom was not at all suited to a manufacturing or commercial people. For this and other reasons it gave place to the system of free labor, at first in England during the fifteenth century, then in France, Germany, and the other countries of western and central Europe during the eighteenth and early nineteenth centuries; and finally in Russia during the latter half of the nineteenth century.

With the discovery of America and the opening up of new lands suited to a semitropical agriculture, a new form of slavery was devised, that of African negroes, brought across the ocean in slave ships and made to bear the brunt of the heavy labor connected with the production of tobacco, cotton, and other crops. In the United States there ensued a period of development in which the country was "half slave and half free," which proved intolerable to both sections, and culminated in the Civil War and the subsequent abolition of slavery.

The different conceptions of free labor which have played a part in the development of economic thought can best be indicated by reviewing briefly the views of leading economists. It was characteristic of the Mercantilist writers to ignore labor and the other factors in the production of wealth and to ascribe exaggerated importance to the precious metals. The Physiocrats appreciated more truly the function of the precious metals; but they also gave slight attention to labor, as such, because they ascribed undue importance to the part which land and natural forces play in production. They even went so far as to characterize manufacturing and mercantile labor as unproductive (*sterile*) and to declare that agricultural labor is alone productive, since it alone creates a surplus of goods over and above those needed to satisfy the laborer's own necessities. Adam Smith, on the other hand, following Petty and Hume, represented labor as the principal factor in the production of wealth. In his treatment the division of labor is made the chief cause of industrial progress, and the part which nature plays in production is passed over with scant consideration. He distinguished productive from unproductive labor by defining the former as activity which realizes itself in some material form (i.e., commodities rather than services). Nevertheless, he followed the Physiocrats in ascribing peculiar productiveness to agricultural labor, for, he says, in agriculture "nature labors along with man." Ricardo gave his attention primarily to the distribution of wealth and based his theory on the proposition that value is always in proportion to the *quantity* of labor. He added little to Adam Smith's treatment of labor as a factor in production, except to point out that nature assists man in all his industrial pursuits and not merely in farming. John Stuart Mill went a step further towards giving scientific precision to economic analysis by pointing out that labor does not create commodities, but merely changes their forms and in so doing creates utilities.

The progress of economic thought since the days of Ricardo and Mill has been along two distinct lines. Socialists, led by Karl Marx, have accepted the proposition that value tends

to be in proportion to quantity of labor, and have deduced from it their "exploitation theory," i.e., the theory that labor, which creates all value, is deprived of the larger part of its products through the agency of the legalized but unjust institution of private property in land and capital. The other line of development has been away from the view that labor alone regulates value, and towards the conception that value is determined primarily by marginal utility, which measures the intensity of the demand for goods. Economists accepting the latter view recognize that value tends under certain conditions to correspond to the cost of production, as Ricardo argued, but find in the latter remuneration not merely for the sacrifice involved in labor, but also for that involved in saving and investing income in preference to spending it. Value, even under conditions of free competition, does not tend, therefore, to be in proportion to quantity of labor, but to quantities of labor and capital.

John Stuart Mill's observation that labor creates utilities, not matter, exposed the artificial character of Adam Smith's distinction between productive and unproductive labor. It is now recognized on all sides that the labor of physicians, lawyers, actors, etc., is just as productive as the labor of farmers and mechanics. All add to society's fund of consumable utilities, and this is the essence of production. To be sure, the utilities created by the actor are consumed as they are produced by his listening audience; but in this they differ only in degree from the utilities created by the fishman or the greengrocer, whose products must also be consumed promptly to be enjoyed at all. If permanence of results is the test of productiveness, the labor of all three must be considered unproductive in comparison with the labor of the pyramid builder. In short, the distinction which Adam Smith had in mind is more happily and accurately represented as pertaining not to the relation between labor and its products, but to that between the products themselves and further production. Whether products are destined to become capital (i.e., direct aids to further production), the means of maintaining the economic efficiency of workmen (i.e., indirect aids to further production), or the means of mere idle gratification, is still a matter of considerable importance in economics, but one not pertaining to labor.

With the broadening of the conception of productive labor, more attention has been given to the interdependence of different groups of workers. It is recognized that unskilled manual laborers owe much to skilled or mechanical laborers, and that both would be worse off but for the guidance and direction of the business men or *entrepreneurs* who perform the "labor of management." At the same time there is still a tendency to draw a distinction between workers who work for wages and independent business or professional men who work for profits. When such phrases as "the laboring class," "the labor problem," "the labor movement," "labor laws," etc., are used, reference is made to the wage-earning class, whose rise to its present prominence dates from the industrial revolution at the end of the eighteenth and the beginning of the nineteenth centuries. The most significant phases of this development have been the growth of labor organizations intended to promote the interests of the wage-

earning class (see TRADE-UNIONS) and the enactment of laws regulating the hours and other conditions of employment of certain members of this class, particularly women and children. See LABOR LEGISLATION.

Other aspects of labor to which increasing attention is given by economists are the circumstances which determine the worker's industrial efficiency. It is now recognized that the food, clothing, housing, etc., of the working classes are important, not merely because they affect the happiness of those classes, but because upon them depend the amount and quality of the work that can be performed. The standard of living influences wages not merely through the control which it may exercise over the rate at which population increases, but also because it determines the standard of efficiency. It is this consideration that has done most to transform economics from the "dismal science" that was taught by the classical economists to the hopeful study that is pursued to-day. If rising wages bring with them increased efficiency, which becomes in turn a cause of still higher wages, there is no assignable limit in a progressive country to the possible progress of the working classes.

The progress of economic thought is shown also in the greater attention that is now paid to the psychological side of labor. Adam Smith asserted that in a day's labor the laborer "must always lay down the same portion of his ease, his liberty, and his happiness." Later writers assumed also that labor was disagreeable, if not painful, and would only be undertaken in the hope of reward. Professor Jevons first stated clearly that different kinds of labor and different hours of labor involve different degrees of sacrifice. He emphasized the thought that some labor is a source of positive pleasure to the laborer, and that it is usually only because labor is carried to excess that it becomes painful. Following this lead, later writers have begun to speculate in regard to the relations that would prevail in an industrial society in which excessive hours were cut off and labor-saving devices were utilized for the performance of all tasks that are inherently disagreeable. Under such ideal conditions it is obvious that all labor would be pleasurable, and that the only ground for distinguishing different kinds of labor or different hours of labor would be that some would afford more pleasure to the laborer than others. Men would be paid in such a society, not because they did disagreeable things, but because they produced what men want, useful goods, and to do so refrained from other lines of activity or relaxation that promised even more pleasure than the work in hand. Production, instead of figuring in the economic calculus as a sum of pains to be weighed against the pleasures of consumption, would appear in such a society as a sum of pleasures to be added in determining the full joy of living. It is hardly necessary to point out that such a condition is far in advance of the real situation even in the most progressive communities; but the world has certainly advanced to a stage in which economists and other thoughtful people have definitely discarded the idea that labor is a "curse" and in its place have set up the ideal of labor as a necessary means to the fullest self-realization and self-development of the laborer. See LABOR LEGISLATION; MACHINERY, ECONOMIC EFFECTS OF;

DIVISION OF LABOR; TRADE-UNIONS; WAGES; COOPERATION; PROFIT SHARING; ETC.

LABOR, AMERICAN FEDERATION OF. A non-secret confederation of trade unions, having for its object the improvement in the conditions and wages of labor, the establishment of self-governing unions of wage-workers in every trade and legitimate occupation where none now exists; the formation of public opinion by the agencies of platform, press, and legislation; and the furtherance of a civilization based upon industrial progress, by securing to the toilers a reduction in the hours of labor. The American Federation of Labor originated in an attempt to found a general organization of American workmen, distinct from the Knights of Labor, on a trade-union basis. A preliminary convention was called by the Knights of Industry and the Amalgamated Labor Union—the latter composed largely of seceders from the Knights of Labor—and met in Terre Haute, Ind., Aug. 2, 1881. The first convention officially recognized as such met at Pittsburgh in November, 1881, at which the name of the Federation of *American* Trades and Labor Unions of the United States and Canada was adopted. This federation merged itself with an independent trade-union congress held at Columbus, Ohio, Dec. 8, 1886, when the present name and organization were adopted. The aggregate membership of affiliated unions, excluding duplicates, is about 2,100,000. The American Federation of Labor has practically taken the place of its former rival, the Knights of Labor (q.v.). Since 1900 the Socialistic elements in the American Federation of Labor have endeavored to control the policy of the association. Failing in this, a large number of the Socialists withdrew in 1905 and joined with the Trade and Labor Alliance, the American Labor Union, and other Socialistic associations, in forming a rival organization the Industrial Workers of the World (q.v.). In 1906, on the ground that Federal labor laws were not properly enforced, and that Federal legislation showed a tendency to disregard the interests of labor, the American Federation decided to enter upon political activity, endorsing or working against candidates for election to Congress according as they had proven friendly or hostile to organized labor. The Congress of the United States in 1914 passed a law demanded by the American Federation of Labor, recognizing the principle that the labor of a human being is not a commodity or an article of commerce. The officers in 1914 were: president, Samuel Gompers; secretary, Frank Morrison; treasurer, John B. Lennon. Its organ is the *American Federationist*, published in Washington. See LABOR ORGANIZATIONS; STRIKES; INJUNCTION; ETC.

LABOR, BUREAUS OF. The first bureau of statistics of labor in the world was created by Act of the Massachusetts Legislature in June, 1869. While political expediency may have had influence in establishing this bureau, its functions were defined by law for the general good of the State as follows:

"The duties of such bureau shall be to collect, assort, systematize, and present in annual reports to the Legislature, on or before the first day of March in each year, statistical details relating to all departments of labor in the Commonwealth, especially in its relation to the commercial, industrial, social, educational,

and sanitary condition of the laboring classes, and to the permanent prosperity of the productive industry of the Commonwealth." This expresses the purpose of every State bureau of similar character in this country, the United States Bureau of Labor (later the Department of Labor), and similar offices in other nations.

The United States Department of Labor was organized in 1885 as one of the bureaus of the Department of the Interior, and Carroll D. Wright, who had been signally successful as chief of the Bureau of Statistics in Massachusetts, was selected as Commissioner. He declared its policy to be chiefly educational, by judicious investigations and fearless publication thereof to enable the people to comprehend more clearly and fully problems which vexed them. In 1889 the bureau became the Department of Labor, in 1903 the Department of Commerce and Labor, and in 1913 again the Department of Labor (see below). Since its organization it has issued annual reports, many special reports, and the bimonthly bulletins. The more important annual reports have been the following Industrial Depressions, Convict Labor, Strikes and Lockouts, Railroad Labor, Cost of Producing Iron and Steel and Cognate Products, Industrial Education, Building and Loan Associations, Work and Wages of Men, Women, and Children, Economic Aspect of the Liquor Traffic, Hand and Machine Labor, Water, Gas, and Electric-Light Plants under Private and Municipal Ownership, Wages in the Principal Countries, Trade and Technical Education, Cost of Living and Retail Prices, Wages and Hours of Labor. The special reports deal with similar topics. Congress now appropriates more than \$175,000 annually for the administration of the department, exclusive of printing.

Thirty-nine of the States and Territories of the United States have offices similar to that initiated in Massachusetts in 1869. Thirteen of the State bureaus of labor publish a biennial report, and 18 an annual. The Association of Officials of Bureaus of Labor Statistics of America meets annually to promote the objects of the bureaus by discussing methods and presenting subjects for investigation. The Federal and State bureaus have published over 400 volumes. Several of the State bureaus conduct free employment agencies, notably those of New York and Connecticut, while the inspection of factories and mines is an important function of many of them.

Increased authority has recently been granted a number of State bureaus for conciliation and arbitration in labor disputes, by providing for special commissioners under the direction of the bureaus. The bureaus have been kept free from partisanship, and the exact information they have given has been extremely valuable in adjustments of labor difficulties.

France was the first European country to follow the example of the United States. A bureau for the collection of statistics and information concerning labor was created in 1891 and has become the general statistical bureau of the country.

In 1892 Germany established a labor commission which possesses to a large extent the permanency of a labor bureau. It has published more than 10 volumes of reports giving the results of its investigations relating to the condi-

tions of labor in various industries. In 1893 a labor department under the direction of a commissioner for labor was instituted in connection with the Board of Trade in England, and its duties are similar to those of other countries. Austria was the last of the continental countries to organize a bureau. This was done in 1898 and placed under the Ministry of Commerce. Belgium, Italy, Sweden, New Zealand, New South Wales, the Dominion of Canada, and Ontario also have bureaus. Some of these are largely employment bureaus, others concern themselves chiefly with publishing statistics, but all are modeled more or less closely after the American plan.

LABOR, DEPARTMENT OF. One of the executive departments of the United States government, created by Act of Congress of March 4, 1913, and presided over by a secretary, who is a member of the cabinet, but not one of the officers in line of succession to the presidency. His salary and tenure are the same as those of the other members of the cabinet. The Act of Congress creating the Department of Labor charges it with the duty of promoting the welfare of the wage earners of the United States, improving their working conditions, and advancing their opportunities for profitable employment. The following bureaus were transferred from the former Department of Commerce and Labor to the new Department of Labor: the Bureau of Immigration, the Bureau of Naturalization, the Bureau of Labor (to be known thereafter as the Bureau of Labor Statistics), and the Children's Bureau. The Secretary of Labor is given power to act as mediator and to appoint commissioners of conciliation in labor disputes whenever he judges this to be in the interest of industrial peace. He is also required from time to time to make such special investigations as the President or Congress may require, or as he may deem necessary.

LABOR, HARD. See **HARD LABOR.**

LABOR, lă'bôr, JOSEF (1842-). An Austrian composer and organist, born in Horowitz (Bohemia). While yet a child, he became totally blind and was educated at the Vienna Institution for the Blind. At the same time he studied music under Pirkhert and Sechter at the Conservatory. In 1863 he made his début as pianist in Vienna, where his soulful playing met with such warm recognition that he undertook tours of Germany, France, Russia, and England. In 1875 he began to study the organ and after 1879 toured as an organ virtuoso with immense success. In Austria he is

regarded as the unrivaled master of his instrument. He published a concerto for piano and orchestra, a piano quintet, a piano trio, a violin sonata, pieces for piano and for organ, and choruses.

LABOR, KNIGHTS OF. See **KNIGHTS OF LABOR.**

LABOR AND CAPITAL, RELATIONS OF. The evolution of the relations between employers and employees, or in the current phrase, capital and labor, presents a series of characteristic phases corresponding with the degree of industrial development. 1 In the first phase the labor contract is determined by direct negotiation between the employer and the individual workman. This is the purely competitive situation premised in classical economics, and to a certain extent in the common law of Anglo-Saxon communities. It is characteristic of an early stage in the development of industry, attended by influx of workers from the country to the city, or by emigration from nonindustrial to industrial nations. It tends to reappear in older industrial states where new classes of workers are drawn into industry, as, e.g., women workers. While in appearance it safeguards the interests of both classes, competition among employers tending to raise wages as competition of workers tends to reduce them, in fact it leaves the worker practically at the mercy of the employer, since competition among employers for workers is rarely so keen as competition among workers for employment. 2 In the second phase laborers associate themselves in more or less permanent organizations, which endeavor to impose such conditions as seem desirable to them upon the individual employers, enforcing their demands through strikes and lockouts, the boycott, etc. This phase of organization is usually characterized by disorder and violence; in it the law is frequently invoked by the employer. 3. In the third phase the associations of the workmen are confronted by associations of employers. Usually after a period of bitter struggle a working agreement is reached, under which the terms of employment are fixed by negotiations between the labor unions on the one hand and the employers' associations on the other. Such negotiation is commonly denominated collective bargaining, to distinguish it from the plan of individual bargaining of the earliest phase of development. Sometimes it is described as conciliation, or even as arbitration. But these terms are properly confined to certain other aspects of the labor-capital situation to be described below. Collective bargaining has been attained in the greater part of the skilled trades and the higher factory employments in England. In the United States it covers a fairly wide range of industry, notably in coal mining in the territory east of the Rocky Mountains, in transportation, in certain branches of the foundry trade, in the building trades of some of the most important cities, and even in the clothing trade of such cities as New York and Boston. While collective bargaining is the ideal of most labor organizations, it is repudiated by such revolutionary organizations as the Syndicalists of France and southern Europe and the I. W. W. in America. No binding agreements with employers are admitted by these organizations.

The machinery of collective bargaining consists in a periodical meeting of the representatives of labor and capital to determine the rate of wages and other conditions of employment for a specific period of time, varying from one

year to three years and in exceptional instances even longer periods. The two parties are given equal voting power in the conference, and arrive at an agreement usually only after prolonged discussion of points at issue. If an agreement cannot be reached, arbitration by an impartial outsider may be resorted to. It is of course impossible to determine all conditions in minute detail, accordingly occasion for dispute is sure to arise during the term of the general agreement. The better-organized systems of collective bargaining provide for a continuing board or commission, with representatives of both parties to settle such disputes as they arise.

Voluntary arbitration of labor disputes has proved most effective where it is a regular part of a scheme of collective bargaining. The principle of arbitration is, however, often invoked, especially after a prolonged struggle, in cases where collective bargaining cannot be said to exist. The pressure of public opinion often forces resort to arbitration while the disputants are still far from exhaustion, and public authority concerns itself in increasing measure with the promotion of arbitration of labor disputes, in some cases making such arbitration compulsory.

The earliest systematic arbitration of industrial disputes appears in France. Before the French Revolution there was a tribunal at Lyons for the settlement of disagreements arising in the silk trade. This tribunal was connected with the guild, and disappeared with the abolition of corporations (1791). It had worked so successfully that it was restored in 1806, forming the germ of the conseils des prud'hommes (boards of experts) which still perform this function in France and Belgium. The example of Lyons was soon followed by several cities in southern France, and with excellent success. These early boards contained no representative of the working classes, the one at Lyons being composed of five merchants and four overseers. By a law of 1809 workmen were admitted, but they were always in the minority until 1848, when they were given, for a short time, equal representation. At the present day the conseils des prud'hommes are found in all of the important cities of France. They are composed of a board of conciliation, consisting of a representative of the workmen and a representative of the employers, which has jurisdiction in disputes involving less than 200 francs, and a board of arbitration consisting of three employers and three workmen, whose findings are subject to appeal to the Tribunal of Commerce in cases involving more than 200 francs. The court of arbitration has power to summon witnesses and to take testimony under oath. Acceptance of the decision is voluntary. Nevertheless, two-thirds of the cases brought before the court are settled by the board of conciliation, only a small percentage are appealed to the Tribunal of Commerce. It is, however, only minor matters that are brought before the courts. They have proved unable to prevent strikes and lockouts, which in late years have seriously crippled French industry. In Prussia industrial courts were established in 1849, but did not prove to be of much use, and were later abolished. In 1890 an Imperial law authorized the municipalities to create such courts. The president is appointed by the commune; the assessors must be workmen and employers in equal numbers. They have power to summon witnesses and to take testimony; in cases involving 100 marks or

more, appeal to the regular courts is permitted. Few municipalities have availed themselves of the privilege. Moreover, unofficial arbitration has made little headway in the Empire. In Switzerland far greater progress has been made in this direction. Unofficial arbitration is carried on under the direction of trade unions, and several of the cantons have established conseils des prud'hommes, after the French model. Arbitration is compulsory in some of the cantons, notably Lucerne, where refusal to accept an award may be punished by fines and imprisonment; in some cantons it is optional, as in France.

In England voluntary and unofficial arbitration was instituted early in the nineteenth century, and has made greater progress than in any other country. In 1836 it was in the pottery trade were settled in this way, and within the following decades several important trades adopted the same practice. Committees of employers and employed meet informally to discuss grievances, and usually succeed in reaching an amicable agreement; and where these committees are best organized, as in the coal trade of Durham, the decisions of the committee are rarely rejected by the disputants. In the last decade of the century, upon the initiative of the London Chamber of Commerce and the trade unions, local boards not connected with any particular trade were created in large numbers, and were successful in diminishing the number of serious disturbances in industry. But in England, as in France, the more important disagreements have had to be adjusted by protracted and costly strikes and lockouts.

New Zealand by a law of 1894, and West Australia and New South Wales by later enactments, undertake systematically to prevent strikes and lockouts by compulsory arbitration. The New Zealand law created boards of conciliation and a court of arbitration, the latter having power to enforce its awards by penalties. The boards of conciliation consist of four to six members, one-half representing the labor associations, the other half representing associations of employers. They are elected every three years by the associations of employers and employed. Each board elects as chairman an impartial outsider, who votes in case of a tie. The arbitration court is composed of three members appointed by the Governor, one from a list nominated by the employers, a second from nominees of the laborers, and the third from the judges of the Supreme Court. Cases are tried before the court only upon the request of one of the disputants, and all means of conciliation are attempted before resort is had to arbitration. Strikes and lockouts are forbidden while the case is pending. Awards of the court may be extended to a whole district. Under the act trade unions are recognized as corporate bodies; and only by belonging to such a body does a workman secure standing in the court. Numerous disputes have been settled by the court, and light fines have hitherto been sufficient to enforce its awards.

The first noteworthy case of unofficial arbitration in the United States was in 1865, when a committee was appointed to arbitrate differences between the Sons of Vulcan and their employers. Since that date arbitration committees have been chosen in many trades, often operating with marked success. Much attention has been attracted by the signal success of an unofficial

board which operates in the coal-mining industry of Illinois. The activity of this board dates from 1898, and since that year innumerable grievances which might have led to strikes have been amicably adjusted. When such disputes arise representatives of the coal operators and of the United Mine Workers (q.v.) meet, together with the miners and operators immediately interested. The mere discussion of the points at issue frequently results in explaining away alleged grievances.

Official boards of arbitration were established in Massachusetts and New York in 1886. At present 29 States in the Union have made statutory or constitutional provision for industrial arbitration or conciliation. In addition to the State courts, temporary tribunals were created by Federal statute in 1888 to settle grievances between railroads engaged in interstate commerce and their employees. These tribunals consisted of one member chosen by each party and a third chosen by these two. The law was repealed in 1898, but a law was enacted in the same year with similar features. As amended in 1913 this law constitutes a board of mediation and conciliation consisting of a commissioner and two other government officials named by the President. This board may offer its services, or, upon the request of either disputant, act in a purely mediatory capacity. If an agreement is not effected, it seeks to induce the parties to accept arbitration by a board consisting of either three or six members, as the disputants prefer. These arbitrators are chosen in the same manner as the members of the temporary tribunal just described, except that in case of failure to agree upon representatives of the public, these are chosen by the board of mediation. The findings of the board of arbitration are binding, but either party may appeal to the Circuit Court of Appeals. An extremely successful plan of arbitration of disputes in mining and transportation and other public-service industries was inaugurated in Canada in 1907 under the Industrial Disputes Investigating Act, recommended by the Deputy Minister of Labor, Mr. W. L. MacKenzie King. Under severe penalties strikes and lockouts in the industries covered by the act are prohibited until an investigation of the dispute has been made by an official board created for each particular case. Each party is called on by the Minister of Labor to name a member of the board, and the two thus named appoint a third. It is the duty of this board to bring about an agreement if possible, but if the parties fail to agree, after publication of the findings of the board a strike or lockout is permitted. Nearly 90 per cent of the disputes submitted to such boards have been settled.

An examination of the workings of boards of voluntary arbitration shows that for the settlement of disputes which are due to misunderstandings, or which involve matters of minor importance, their usefulness is unquestioned. Wherever they have been judiciously conducted they have served to lessen friction between employer and employed, and have often averted strikes and lockouts. But there are certain questions of general policy which have defied settlement by voluntary arbitration. Such, e.g., are the recognition of labor organizations by the employer, exclusion of nonunion labor from employment, a general and material increase or lowering of wages. These questions are still

usually determined by the strength and endurance of the contending parties. Investigations by impartial boards of arbitration may direct public sentiment, and so may bring pressure to bear upon the party whose ethical position is the weaker. But this pressure has not proved sufficient to prevent prolonged strikes, causing widespread distress to the public as well as to the parties to the struggle. It is for this reason that a growing sentiment manifests itself in favor of compulsory arbitration. It is pointed out that under a system of industrial concentration a strike may wholly cut off the supply of one of the necessities of life—a condition which is manifestly intolerable. Advocates of compulsory arbitration point to the example of New Zealand, where for a number of years disputes have been adjudicated without cessation of industry. Opponents of compulsory arbitration are, however, no less decided in their views than are the advocates of it. It is pointed out that laborers will frequently demand terms to which employers can accede only by producing at a loss; and that courts of arbitration, under the influence of a public sentiment naturally favorable to the laborer, will often give awards which will discourage business enterprise. It is alleged that this is the case in New Zealand, although this is vehemently denied, and there is no evidence that capital is withdrawing from the Dominion. Moreover, it would obviously be difficult to force the laborers to abide by a decision unfavorable to them, since men cannot be compelled to continue to work against their will. The incorporation of laborers into associations with collective responsibility (see TRADE UNIONS) is advocated as a measure which will obviate this difficulty; but such a measure is strongly opposed by the better organized labor unions, as well as by those who view with suspicion any tendency away from individual freedom and responsibility. In spite of the difficulties which beset compulsory arbitration, however, it would appear to be obvious that social welfare demands that judicial means should be developed for settling peacefully those disputes which can now be settled only through strikes involving untold losses and suffering.

In recent years much stress has been laid upon the similarity between compulsory arbitration, as it operates in New Zealand, and the principle of judicially determined wages or minimum-wage laws in other Australasian states. Compulsory arbitration, and arbitration, voluntary or compulsory, imply the existence of unions. Such organizations, however, have not succeeded in commanding more than a minor part of the labor field. The laborers subject to the worst forms of exploitation cannot form effective organizations. For these relief is to be had, apparently, only through minimum-wage laws (q.v.). The final phase in the relations of labor and capital under the industrial system thus appears to be one in which the fundamental conditions of employment are determined by the state. See MINIMUM WAGE.

LABORATORY. A laboratory is literally a place of labor, a workshop, and the term is still frequently employed in this meaning in connection with the manufacturing of chemicals, drugs, explosives, etc. The word is ordinarily used, however, to designate a room or building equipped with means for conducting experimental investigations in some department of science or art. Research laboratories of chemistry, physics, engineering, biology, etc., are maintained in all the better colleges and universities, in the interest of pure and applied science, and in many hospitals, manufacturing establishments, etc., for the purpose of devising new methods of procedure and conducting tests of various kinds. In addition to these laboratories devoted to research, there are numberless laboratories connected with public and private schools, academies, and colleges, whose function is not the discovery of new truths, but rather the demonstration of facts already well established. Every high school, e.g., possesses a chemical laboratory in which experiments are performed by students, who are led in this way to a first-hand, and therefore better, knowledge of the facts and principles of this science.

The history of research laboratories can be best understood in the light of the development of all scientific thinking. There is at first a period of crude observation of the facts under the complicated conditions of practical life. Such observations have given to science many valuable facts, but serious errors have crept in at the same time. This is naturally followed by a period of reaction against observation, and in its stead there is an attempt to deduce all knowledge from already given general laws. This is the period of authority and the syllogism. The reaction to this method leads to the third and final stage of science, when the laws and facts of nature are determined by means of observation of phenomena, but now under control and known conditions. The sciences have not advanced with equal speed, so that while some are well along in the third stage of progress and are still growing rapidly through experimental research, other sciences are in the second stage, while a few still remain in the first stage. Laboratories of some sort have existed since the earliest times. The Chinese and Egyptians, as well as the Greeks and Romans, certainly possessed them; but they were in all probability similar to the better known laboratories of the physicians, apothecaries, alchemists, and astrologers of the Middle Ages, given over largely to the search for the philosophers' stone and to the manufacture of elixirs, drugs, charms, cosmetics, etc. With the fifteenth century came the reaction against Scholasticism, and men began to study nature rather than books; they began to observe rather than to deduce facts and principles, and by the end of

the sixteenth century the experimental method was well established.

In 1589 Galileo demonstrated the necessity of the experimental method at Pisa. Climbing the leaning tower, he let fall a weight of one pound and a weight of 100 pounds; starting simultaneously, the weights struck the ground together, at once and forever disproving the Aristotelian deduction that the speed of falling bodies was proportional to their weights. Francis Bacon, in 1620, and Comenius, in 1630, set forth arguments for the inductive method and the experimental investigation of facts. But prior to the nineteenth century all laboratories were private institutions devoted wholly to research. In 1824 Purkinje established a physiological laboratory in Breslau, in 1825 Liebig established a laboratory of chemistry, medicine, and physiology in Giessen; in 1845 Lord Kelvin—then William Thomson—opened a physical laboratory in the University of Glasgow; in 1849 a pharmacological laboratory was created by Buchheim; in 1856 Virchow opened a pathological laboratory in Berlin. As the work of the laboratories has developed, there has come about a specialization of the problems to be undertaken, and as a result new research laboratories are founded every year.

Laboratories for instruction do not differ materially from research laboratories as far as equipment and method is concerned.

Chemical Laboratories. The appearance of the earliest chemical laboratories is familiar, since they formed attractive subjects for the contemporary artists. Not merely were these laboratories used for experiment, but also for the teaching of pupils and assistants. At present any well-lit room, supplied with water, gas, electricity, and a hood communicating with a flue to carry off noxious gases, may serve for almost all chemical work. The water supply operates vacuum pumps and can be made to furnish air under pressure by means of a trompe; power can be obtained either from small water or electric motors, and the gas furnishes heat. Much chemical work, both scientific and technical, is carried out in such laboratories, originally built for other purposes. The most important chemical laboratories, however, are buildings, constructed entirely for chemical work, in connection with the great universities and schools of science and are intended both for investigation on the part of the instructors and advanced students and for the regular instruction of the mass of the students. The wide extension of this class of laboratories began with the famous laboratory erected by Liebig at Giessen in 1825, after which teaching laboratories, each showing an advance on the preceding, sprang up at almost all the German universities and quickly reached a high degree of excellence.

The laboratory buildings are divided into rooms of varying sizes, each room assigned to one or more branches of chemical science, so that each student passes, during his course, through most of the rooms. In France a less systematic arrangement, avoiding large rooms, is preferred by some chemists. The number of the rooms and the branch of chemistry to which each is dedicated vary with the size of the building and the importance assigned to different subjects and to teaching and investigation respectively. Many laboratories consist of a large lecture room; a large room for simple

inorganic preparations and qualitative analysis; another large room for quantitative analysis and inorganic research; a third large room for organic chemistry; and a number of small rooms to serve as classrooms, library, balance rooms, private laboratories and offices for the instructors, for gas and water analysis, for physical chemistry, as furnace room, combustion room, hydrogen-sulphide room, storerooms, toilet rooms, etc. In some cases separate buildings are provided for particular branches of chemistry.

In the larger laboratories almost every branch of chemistry has its separate room. Few general principles can be laid down for the plan of the building and the relation of the rooms to each other. The first consideration is to obtain abundant light. Everything should give way to this. Next, the office and private laboratory of each professor should be central with reference to the rooms under his care. However, when permanent and responsible assistants are in immediate charge of the large rooms, this consideration is of less importance. Of course such rooms as balance rooms, combustion rooms, and hydrogen-sulphide rooms must be close to the large rooms to which they belong. Special considerations will decide the position of various rooms. Thus, a furnace room is placed on the lowest floor, to get the advantage of a high chimney. All chemical laboratories are elaborately piped. There is usually one system for gas used in heating, another for gas used in lighting, and often a third for certain specially protected gas jets, which are required to burn continuously for long periods. This permits the rest of the gas to be turned off every evening at the close of work. Water is carried, not merely to each room, but commonly to each desk. Where the water is supplied under a strong pressure, injector vacuum pumps are used; but when this is not the case, the whole building must be supplied with pipes connected with a vacuum steam pump. In any case such a pump, with connecting pipes to each desk, is almost a necessity in the organic laboratory for distilling under reduced pressure. Another steam pump supplies a series of pipes, carrying air under pressure. There are steam or hot-water pipes for heating and pipes for steam at high pressure for heating stills, water baths, and steam closets. In addition, in some laboratories distilled water is distributed to the different rooms by a system of block-tin pipes. Formerly oxygen was distributed to several points by pipes, but the introduction into commerce of compressed oxygen in strong steel cylinders has made this system obsolete. Hydrogen-sulphide gas is also carried, in most cases, by pipes to several rooms. The system of pipes for carrying off waste water must be carefully planned. Ordinary plumbing is destroyed in a few years by acids and compounds of mercury. An excellent plan is to carry the waste water by open troughs to the vertical earthenware main pipes, so avoiding leadwork altogether. The system of flues for ventilation of the hoods must be carried over the whole building. This system may be connected with a lofty chimney or with a rotary fan. Electricity is usually supplied, for scientific purposes, from accumulator batteries.

Each student working in a room has a locked desk for his own use. The desks are usually supplied with gas, water, vacuum pumps, draft closets, apparatus, and reagents, so as to reduce to a minimum the cases in which it is necessary

LABORATORY

1 A LABORATORY OF ELECTRICAL ENGINEERING 2. A CHEMICAL LABORATORY FOR QUALITATIVE ANALYSIS

for the student to leave his desk. Space is economized in most laboratories, in the rooms set apart for beginners, by dividing the space under each desk into two independent closets, so that two students may use the same desk at different hours or on different days. In the larger laboratories much special apparatus is found, such as a machine for producing liquid air, grinding mills driven by power, working models of chemical industrial works, and apparatus for treating materials on an industrial scale.

With the growth of scientific methods in various fields there have been many special chemical laboratories, as those for pure-food determinations, water analyses, etc., maintained by official bureaus. These are usually well-arranged chemical laboratories with equipment adapted to the work in hand.

The technical laboratories maintained by industrial establishments may be simply for analytical work, in which case they may be modeled after the rooms for quantitative analysis in the teaching laboratories; but in cases where experimental work is carried on, the plan is quite different. Power must be supplied more freely, facilities provided for handling larger quantities of material, and liberal space left free to set up working models of apparatus on a large scale. See section on *Engineering Laboratories*.

Laboratories of chemical research are arranged either on the principle of each room being adapted to some special operation—there being a distillation room, a constant-temperature room, etc.—or on the principle of individual rooms, each worker having a room to himself, in which he may carry on practically all of his work. The two principles are often combined, and some such combination is likely to produce a reasonably near approach to an ideal research laboratory.

Physical Laboratories. Rooms specially equipped for physical experimentation were not provided until long after well-organized chemical laboratories were in use. Such early experimenters as Boyle, Newton, and Franklin made use of their own living apartments for their experiments, and it was not until well into the nineteenth century that professors of physics obtained separate rooms in which they could carry on work with due convenience. The next step was for these professors to admit students to their own laboratories and to direct their research. At Heidelberg the first physical laboratory was opened in 1846, two rooms being devoted to instruction in practical physics. The laboratory at the University of Glasgow, where original research was carried on by students under the direction of Lord Kelvin, was also one of the earliest of these laboratories. In France, in spite of the brilliant work done in private laboratories in the first half of the nineteenth century, the facilities for systematic work by students were hardly as ample as in Germany, but by 1868 it was realized that additional accommodations for students and research laboratories for professors and skilled investigators were essential. One result of this movement was the foundation, in the Sorbonne in Paris, of a physical laboratory, of which Jamin was made director, and which has been celebrated not only for his researches, but also for those of Lippmann. This laboratory was placed under the direction of the faculty of science in 1894 and was then remodeled. King's College, London,

also adopted regular laboratory training as part of its work in physics about this time, and three rooms in its building were used as a laboratory. The first building in England specially designed for the study of experimental physics was constructed at Oxford, under plans of Prof. Robert B. Clifton. This was followed by the Cavendish Laboratory at Cambridge, built in 1874 by Prof. James Clerk-Maxwell, who incorporated in it many of Professor Clifton's ideas. In the United States the progress was naturally slower than in Europe; but it is asserted that the first institution to make laboratory physics a part of its regular educational work was the Massachusetts Institute of Technology, in Boston. The systematic work begun at the Massachusetts Institute of Technology in practical physics furnished an example which was soon followed by other American colleges, including Cornell and Harvard, and even by many high schools, and so rapid was the progress made that in 1886 Harvard required experimental work in physics in its entrance examinations.

In elementary laboratory work in physics the apparatus is simple, and the results demanded are qualitative rather than quantitative. A laboratory for this purpose would be merely one or more rooms provided with suitable tables. The simple apparatus used should, where possible, be constructed by the student himself, the use of tools for the making, adjusting, and repair of apparatus forming not the least valuable part of the training. The ordinary manipulation of glass tubes, and the use of the more common woodworking tools, as well as of a few implements for cutting and shaping metal, must be learned by the student at an early stage.

The entrance requirements for the colleges have set the standard for the physical work to be done in preparatory schools. No elaborate instruments are required for such courses, and it is considered better practice to have the student work as accurately as possible with somewhat crude apparatus. In the college laboratory the equipment is of a much higher grade and should be as extensive as the means of the institution will permit. The student here begins to work quantitatively, and accuracy of observation and measurement is the prime essential of his work. The usual method of instruction is to have an elementary course which covers the essential features of physics. That is, a student will begin with the ordinary measurements of length, mass, and time. He will perform quantitative experiments in sound, heat, light, and electricity. There must be at his disposal measures of length and micrometers of various forms which will enable him to determine length or thickness to one-hundredth of a millimeter, or even less. He will also have analytical balances for determining the mass of substances with an accuracy of the one-hundredth of a milligram, and such other instruments as accurately calibrated thermometers, standards of electrical resistance carefully determined, and optical apparatus in which the graduated circles and other parts used for measurement are of high precision. As the construction of this apparatus involves considerable mechanical skill, it is, of course, impossible for the student to make it; but its test and calibration is one of his first tasks. He is taught the necessity of correcting his observations and looking for and compensating for such causes of error as can be detected

and, in short, to attain as great accuracy as the apparatus he uses is capable of.

For elementary laboratories no extensive and peculiar structural features are required in the building. Suitable brackets firmly fastened to brick walls furnish supports for the more sensitive apparatus, and convenient sinks and water and gas piping and electric fittings are provided. In most colleges and universities, however, these elementary laboratories are in the same building as research laboratories for the staff and advanced students, and, as a result, they contain many features not absolutely essential for work of this description. In building physical laboratories for research work every other consideration is, or should be, sacrificed to direct utility. Stone piers on which such instruments as galvanometers are set are independently founded and carried up through one or more floors, without any connection whatsoever with other parts of the building. Stone tables or slabs for similar purposes are built in the brick structural walls of the building. High towers for experiments with pendulums, pressures of liquids, and falling bodies are another feature of a modern laboratory, and in most cases they, too, are built on an independent foundation. The building is usually arranged so that it has the best possible light, especially as regards direct sunlight. For certain work electrical or other power is desirable, and a system of pipes, wiring, and shafting is carried about the building. Another feature is a constant-temperature room in the cellar, usually where the astronomical clocks and other instruments which must be maintained at or near the same temperature the year around are installed. Some provision on the roof or elsewhere should be made for the aerial wires used in radiotelegraphy. In short, the greatest care is observed in adapting the building for its use as a place of research, and every convenience is placed at the disposal of the student. It must be stated, however, that many physicists do not altogether approve of such refinements of laboratory construction and think that the ability to overcome difficulties is a valuable part of the training. Furthermore, the very nature of the work may in some cases constitute serious causes of error. For example, an independent tower or pier may act as an inverted pendulum and have a period of vibration of its own. But be this as it may, it is undoubtedly true that at the universities where the greatest facilities have been introduced into the buildings and are put at the disposal of the students, the best work is carried on. The laboratory belonging to the University of London and that of the University of Bonn are typical of the best progress in modern laboratory construction, although Berlin and a number of other German universities are not far behind.

But important physical research has also been carried on in laboratories outside of educational institutions, and the more celebrated of these deserve brief mention. The laboratory of the Royal Institution in London was founded in 1800 by Count Rumford, and, although the original intention of its founder was the furtherance of applied science, it soon became the home of the most brilliant and original investigations in the realm of pure science, carried on by such men as Sir Humphry Davy, Faraday, Tyndall, Rayleigh, and Dewar. In 1896 the research facilities of the Royal Institution were increased

by the opening of the Davy-Faraday Research Laboratory, which has been most successfully conducted by Lord Rayleigh and Sir James Dewar. In Germany important work has been carried on at the Reichsanstalt, or physicochemical institution, at Charlottenburg, near Berlin. Through the munificence of Werner Siemens, who in 1884 gave about \$125,000 to the institution, and through appropriations by the Reichstag, suitable buildings were erected. From 1888 to 1894 the laboratory was directed by Helmholtz, and this famous scientist was succeeded by F. Kohlrausch. The influence of the Reichsanstalt on industrial conditions in Germany has been most valuable. Various standards are here made, instruments are calibrated, and certificates which have a world-wide acceptance are given to the apparatus which complies with the standards of the bureau. Technical research is also carried on, and many valuable papers are published from time to time from the bureau. Various instruments of glass are examined, and the work of the Germans in this field has been raised to a high degree of excellence, with the result that the manufacture of optical instruments has greatly increased. The same holds true in the case of electrical apparatus, and the standards of resistance and other apparatus also have been made of a high grade of precision. This laboratory, as are those of France, Great Britain, and the United States, is also active in securing international standards, especially in the field of electricity, through co-operative action. In Paris there is the Conservatoire des Arts et Métiers. With the purchase of a physical cabinet, a department of physics was organized in 1829, which has since been increased and developed, and furnished a home for important researches. Perhaps the most celebrated laboratory in France is the International Bureau of Weights and Measures, organized in 1875 by the coöperation of 18 different nations. Here are prepared for distribution to the subscribing nations the various metric standards of length and mass, the meter and kilogram of the archives with which the secondary or national standards of the various nations have been compared are preserved. In this laboratory are carried on the most elaborate comparisons of standards and instruments, and the work of this bureau has been invaluable to workers in science in many departments. The National Physical Laboratory was established in Great Britain during the closing years of the nineteenth century, and to it in 1900 were given a building and site at Bushy House, near London, its control being given to the Royal Society. The work thus started rapidly spread, and in 1914 there were, in addition to the original building used for administration and separate laboratories, buildings for metallurgy, alloy testing, electrotechnics, optics, etc. In the United States in 1901, the National Bureau of Standards was established by Act of Congress, approved March 3, 1901; it is designed to possess a similar function to the Reichsanstalt and the National Physical Laboratory of England, and its scope and work are constantly broadening. By law the Bureau of Standards is given the custody of the national standards and will issue or certify secondary standards for the use of industrial and scientific workers. At the present time the bureau is doing a great deal of excellent testing work; but it is as a research institution that it is

most conspicuous and is doing work of the greatest value to the country. See STANDARDS, UNITED STATES NATIONAL BUREAU OF.

In connection with government physical laboratories, these institutions usually serve as depositories for the national standards of weight and mass, as well as of electricity, illumination, etc. Much of the work consists in the construction of secondary standards, or passing upon their accuracy, and issuing the necessary certifications, as well as providing or certifying measures and instruments for insuring accurate supervision by the state or local government and for providing high accuracy in commercial and other undertakings. Some of the various investigations, such as radium tests, can only be carried on at a laboratory with an elaborate equipment and ample resources, so that such work is properly a task of a central national organization. Also such institutions publish collected papers of research, carried on by members of their staff and other workers in their various departments, and thus form a means of diffusing knowledge in special fields.

Aërodynamical Laboratories. In practical aeronautics and the development of the aeroplane much valuable work has been accomplished in the laboratories maintained for this special purpose, e.g., that of Eiffel in Paris and similar institutions in Europe and the more recently established Langley Aërodynamical Laboratory of the Smithsonian Institution at Washington are extremely productive. These are discussed in the section on *Aeronautical Institutes* in the article AERONAUTICS.

Engineering Laboratories. The success which has attended chemical, physical, and other laboratories organized either for instruction or research has led to the establishment of engineering laboratories as departments of the State universities of the United States or of the engineering and technical schools of Europe and America. In these the student is taught to apply himself particularly to such problems as he would encounter in the actual practice of his profession. Such laboratories are also used by advanced workers to study experimentally such problems and processes as are encountered in daily life, with the hope of finding simpler and more economical methods. Accordingly there are laboratories for mechanical engineering, hydraulic engineering, mining engineering, electrical engineering, and chemical engineering, in which are installed machinery and apparatus similar to that found in actual practice. Such laboratories have been found essential for the best professional and technical education and are a distinct feature of well-equipped technical schools and universities in Europe and America. A laboratory contains machinery for studying different forms of motors and power transmission and for determining their most economical operation. This would include the ascertaining of friction losses, the study of various kinds of lubricants, etc. In order to carry on this work as successfully as possible, machinery of such size as will be found in a small plant is necessary, and the students are taught its actual operation and maintenance. In some schools there may be an independent steam-engineering laboratory, while in others it may be a part of the laboratory of mechanical engineering. Here the students are taught to use steam engines of different types under varying conditions of service. In the important

schools of mines are usually found the various machines used in mining and the preparation and reduction of ore. Locomotive engineering is now taught in the laboratory, and at least two universities in the United States, as well as several manufacturing works, are supplied with testing locomotives in which fuel friction, draft, and other tests can be made on a large scale. Electrical-engineering laboratories were among the first to be carried out on an extensive scale, as in the laboratory method of instruction machinery of more than model size was early found necessary for the student. In the best electrical-engineering laboratories are to be found motors and dynamos for direct and alternating current, transformers, storage batteries, etc.; and the various problems involved in the generation of the electrical power and its transmission are studied under conditions approaching actual practice as nearly as possible. In chemical laboratories the growth of large manufacturing establishments has led to a demand for practical chemists, and it is now considered that these can best be trained by having them as students carry out preparations on a considerable scale by using actual machinery. In the most modern of laboratories for the study of applied chemistry, such processes as dyeing, the manufacture of sugar, the manufacture of gas and sulphuric acid, electrolytic methods of preparing chemical substances, distillation, etc., are all carried on on a practical scale.

In engineering laboratories the practice will vary widely in different institutions and with different instructors, depending on adequacy of equipment and number of students. The machinery and apparatus at the disposal of the students and instructors will often influence the work done and will cause students desiring to follow a particular branch to select an institution where such facilities are the best. Engineering laboratories usually follow adequate manual training and work in chemical and physical laboratories, and the best results are secured when the work is properly coördinated. They have a distinct bearing on technical education and have played a large part in the industrial development of the United States.

Industrial Laboratories. Recently, in the United States, as has hitherto been the case in Germany, an increased amount of stress has been laid on industrial or commercial laboratory work and investigation. In large industrial and manufacturing corporations not only are large laboratories maintained for testing and for the controlling of processes of manufacture, but also for research, so as to secure improvements in method and to devise the new products. Accordingly many large corporations maintain research departments, where a scientific staff engages on work aside from the daily routine; and this is seen most preëminently in the chemical and electrical industries, though the former in the United States are still behind those of Germany in this respect. In these laboratories experimental work on a larger scale than in purely scientific institutions often is possible, and many valuable results are secured. In some cases an association or group of manufacturers may unite to maintain a laboratory to determine standards and to standardize processes, material, or carry on other investigations of common interest. These laboratories also may be organized for research in addition to the ordinary commercial tests. Such a laboratory

in the United States is that of the National Electric Light Association, maintained at Cleveland; while, as an example of a large commercial testing laboratory dealing with a wide range of products, might be cited the Underwriters' Laboratories under the auspices of the National Board of Fire Underwriters of the United States maintained at Chicago, Ill.

One of the best examples of an industrial-research laboratory in the United States is that maintained by the General Electric Company at Schenectady, in connection with its large plant. Here the most elaborate and extensive investigations can be carried on, involving all the refinements of pure science, with ultimate applicability to practical utility. For example, the increase in the efficiency of the incandescent electric lamp has been brought about largely through the work of the investigators in this laboratory, and gradually this has been increased, and new lamps of greater economy have been developed, which have revolutionized both indoor and outdoor illumination. Tungsten drawn wire, e.g., was first made at the General Electric Company's laboratory, and various other substances applicable for incandescent filaments have been submitted to searching investigation. The pressure within the lamps and within the vacuum tubes has also been studied, and a result of special work has been the Coolidge X-ray tube, which has contributed so much to Roentgenography. Over 50,000 square feet of space was provided for new laboratories on the occasion of the construction of a recent building, and the work since organization has constantly developed both in scope and value.

Biological Laboratories. An enormous impulse was given to the purely scientific advancement of biological science by the early foundation of laboratories for research in connection with the chief German universities in the third quarter of the last century. In the United States the first zoological laboratory, or, indeed, any in general biology in America, was established by Louis Agassiz at Harvard University, at the middle of the nineteenth century, when Wyman also taught to special students comparative anatomy. Agassiz gathered about him and trained specialists in zoology, most of whom became teachers and perpetuated his methods of instruction. In Europe, Johannes Müller established a laboratory at Berlin (1857-58) and trained many students, who afterward filled chairs in different universities. The impetus he gave to comparative anatomy, physiology, and embryology through his laboratory methods was deep and lasting. He was, perhaps, the father of modern morphological investigations and of laboratory methods. Other zoologists who exerted an influence which was felt by a later generation and led the way to the establishment of marine biological laboratories were the Norwegian naturalist Sars (1805-69), who carried on deep-sea dredgings and embryological researches on the coast of Norway; Rathke, of Dorpat; and Forbes, of Great Britain. During this period H. Milne-Edwards and De Quatrefages worked in temporary private laboratories on the French coast and in the Mediterranean.

The third quarter of the nineteenth century was a period of the installation of biological laboratories in connection with the leading universities, especially in Germany. The work-rooms were fairly large and well lighted, but the furniture was simple—tables, dissecting

implements, microscopes, aquaria, and in the basement perhaps a vivarium for mammals, forming the greater part of the furniture. Such a laboratory was that of R. Leuckart at Leipzig, who trained a large number of German, Swiss, American, English, and Dutch zoologists and morphologists. With the rise of more modern modes of investigation in comparative embryology and morphology, involving methods of cutting their sections for the microscope, of staining and mounting them, the use of various reagents and preservative fluids, the equipment of biological laboratories became more and more elaborate and costly.

Our modern *bacteriological laboratories* took their rise from the researches of Pasteur in France (1866-90). His studies led finally to the establishment of the great Pasteur Institute in Paris, which was followed by the installation of bacteriological laboratories in Germany, Italy, and other European countries, as well as in the United States and Canada—institutes either directly connected with universities and medical schools, or independent. In such laboratories as these, and other temporary laboratories established in Italy, west Africa, India, and Cuba, have been worked out the causes and preventives of the filth diseases, of yellow fever, and tuberculosis.

Marine laboratories have exerted a profound influence on biological science, besides training science teachers and aiding investigators. Müller in Germany spent his summers by the seaside studying the anatomy, and especially the development, of the lower animals, and so in France and on the shores of the Mediterranean did H. Milne-Edwards and De Quatrefages, and Gosse on the English coast. We owe, however, to Louis Agassiz the idea of the foundation of the modern seaside or marine laboratory, which has resulted in the establishment of the great zoological station at Naples, those of France and other countries. Agassiz and his students had for many years dredged and collected along the coast of New England and had spent several winters at Charleston, S. C., to study the marine fauna. In 1873, aided financially by a generous friend of science, he founded the Anderson School of Natural History at Penikese, an island situated at the mouth of Buzzard's Bay. Though, owing to Agassiz's death, it flourished only two years, its work was most important in itself, and because it led to the formation of similar laboratories. It led to the foundation of the Chesapeake Zoological Laboratory of the Johns Hopkins University, under the direction of Prof. W. K. Brooks, which was succeeded by temporary laboratories at Beaufort, N. C., and the Bahamas; also to the summer school which was maintained at Annisquam for several years by the late Prof. A. Hyatt, to a summer school carried on by the Peabody Academy of Science at Salem, Mass., in 1876-81, and to others, such as the summer school held under the auspices of the Brooklyn Institute at Cold Spring Harbor, Long Island. This latter passed to the jurisdiction of the Carnegie Institution and under the direction of Dr. Davenport has produced most excellent work. The same institution also supports the Tortugas Laboratory with Dr. A. G. Meyer as the very able head. Other similar laboratories are the Hopkins Seaside Laboratory of the Leland Stanford Junior University in California; the Tufts College Laboratory at Harpswell, Me., under the direction of Prof. J.

S. Kingsley; and that at Beaufort, N. C., a department of the United States Fish Commission. Alexander Agassiz for many years maintained a well-appointed private laboratory at Newport, where a number of investigators worked through the summer months.

Led by Louis Agassiz's example, Dr. Anton Dohrn in 1872 began to build, and in the following year opened, a costly zoölogical station at Naples, where gather zoölogists of different countries, whose researches, carried on under the most favorable auspices, have had a manifest influence on systematic, and more especially embryological and morphological, studies. This is a permanent institution established in a handsome structure built for the purpose near the sea, with a director and staff of assistants, and open to investigators throughout the year. Tables are offered to investigators of different countries, the expenses or rent being paid in some cases by the British, American, and other associations, universities, and other institutions. The basement is occupied by a series of large, well-stocked aquaria and is open to the public. There are a large library, separate workrooms for investigators, steamers for dredging, collection, and preparation, while the institution issues several publications of importance to zoölogists.

This great establishment has been the parent or forerunner of similar laboratories. The late distinguished French zoölogist, Baron H. Lacaze-Duthiers, founded and built at his own expense two well-equipped seaside laboratories, one at Roscoff, in northwestern France, and the other on the Mediterranean, near the Spanish line, at Banyuls-sur-Mer. These have been utilized not only by French, Swiss, American, and English investigators, but by a large number of French students of the Sorbonne and the Collège de France. There is also a laboratory at Concarneau, under the auspices of the Collège de France, and still another at Arcachon, maintained by the University of Bordeaux. The city of Paris supports a Laboratoire d'Evolution des Etres Organisés, 3 Rue d'Ulm, directed by Prof. A. Giard, who has a private laboratory at Wimpey, near Calais. These were followed by the Plymouth Laboratory, on the English Channel, at which work a small number of investigators, while in the summer season classes from Oxford, Cambridge, and Eton study under an instructor, one of the officers in charge. Other smaller seaside laboratories have been established by Professor Herdman near Liverpool, at Millport, one at Port Erin, on the Isle of Man; one near Bristol, another near Aberdeen, on the North Sea coast; and one near Dublin, on the Irish coast. These are associated together and controlled by the Marine Biological Association of the United Kingdom and in part are supported by grants from the British Association, the Royal Society, etc. The Germans largely patronize the Naples station, but have a small one at Helgoland, while the university at Vienna sustains a well-appointed one at Trieste. The Russians have one at Sebastopol and also at Ville Franche, on the Mediterranean; the Dutch on the coast of Holland; the Danes on their coast; while the University of Tokyo maintains one on the Japanese coast.

Floating marine laboratories, as they may be called (i.e., those on shipboard), were established on the British exploring ship *Challenger* during her five years' voyage around the world, and

fully equipped laboratories have been furnished on the various exploring oceanic expeditions, including the five recently sent out to the Antarctic seas by the German, Swedish, English, and Dutch governments.

The laboratories in connection with the fisheries commissions of the United States, Germany, Norway, and Great Britain have been productive of excellent results, both scientific and practical. Early in the seventies of the nineteenth century Prof. S. F. Baird, the founder of the United States Commission of Fish and Fisheries and its first commissioner, was wont to establish at his summer headquarters, in different seasons, at various points along the coast of New England, from Woods Hole to Harpswell, Me., temporary laboratories, at which students were hospitably entertained. This led to the permanent establishment of two institutions at Woods Hole. The Woods Hole Laboratory has exerted much influence. To this school large numbers of investigators and college students have flocked, and it has been a most important means of training science teachers. The laboratory of the United States Fish Commission at Woods Hole is a permanent institution, open winter and summer to experts. It is well equipped and frequented by a large number of investigators and advanced students. Its official organs are the reports and bulletins of the United States Fisheries Commission, and the entire plant is probably the most elaborate and extensive in the world. A marine laboratory, at which much valuable research work has been done, was established in 1902 at Beaufort, N. C., by the United States Fish Commission. The Floating laboratory of the Rhode Island Commission of Inland Fisheries has carried on important work on the development and artificial culture of the clam and lobster, and the results have been published by the State.

Several summer laboratories for the study of aquatic life, insects, fishes, etc., as well as for educational purposes, have been established in the central United States. Of these, the first to be founded, and the one which has been the most productive of results advantageous to science, is that at Havana, Ill., founded by Prof. S. A. Forbes. It has published a bulletin and has from the first shown great activity. In Europe a well-known fresh-water laboratory has for several years been maintained by Prof. Dr. O. Zacharias at Plön in Germany.

All botanical laboratories equipped for elementary instruction are practically the same. It may be assumed that such establishments provide equipment for fundamental courses in morphology, physiology, ecology, and perhaps taxonomy. In provision for research work, however, botanical laboratories vary widely. There is probably no complete botanical laboratory in the world, in the sense that it provides for every phase of botanical investigation. Each prominent laboratory is strong in one, or perhaps a few, of the many phases of botanical research, and this is recognized by graduate students in selecting a laboratory for definite work. Since the chief opportunity of any botanical laboratory is the staff of men in charge of the work, every laboratory has developed about certain men rather than along theoretical lines. While worthy morphological and physiological laboratories can be developed in connection with any university that has money enough to employ suitable men and furnish them equipment,

worthy taxonomic equipment is a matter of historical development. It involves the accumulation of large collections, whose chief value lies in sets of plants that are not in the open market. For example, while there are possibly 10 botanical laboratories in the United States in which the opportunities for research in morphology, physiology, and ecology may be regarded from fair to excellent, there are only three, or at most four, points where great historical collections of plants have made valuable research work in taxonomy possible. See BOTANIC GARDEN.

Psychological Laboratories. The first institutional laboratories for the pursuit of researches in psychophysics and experimental psychology (q.v.) were founded by Wilhelm Wundt (University of Leipzig) in 1879 and by G. Stanley Hall (Johns Hopkins University) in 1883; a private laboratory was conducted by William James at Harvard in 1874-76. Laboratories are now the rule rather than the exception in colleges and universities of the United States and have been established also in practically all the German universities; they are found in the principal universities of the other European states, and they exist also in Canada, New Zealand, Japan, and South America. In general they are separately organized, under the title of psychology; but in some cases they are connected, more or less closely, with educational, psychiatric, and physiological foundations.

The recent development of psychology as a science, the multiplicity of problems that crowd upon the investigator, the varied training of the men who have devoted themselves to psychological experiment, and the makeshifts to which psychologists are forced by inadequate laboratory accommodation, render it exceedingly difficult to give any typical description of the arrangement and furnishing of the psychological laboratory. We may, however, say, without much fear of contradiction, that the "ideal" laboratory would present at least the following features. There should be (1) a large lecture room or auditorium, capable of seating some 300 hearers, with a good demonstration table and arrangements for lantern projection. Behind the lecture room, and opening into it, should be (2) a museum or storeroom, in which are displayed not only all the demonstration instruments required for a general lecture course, but also series of standard pieces illustrating the historical development of experimental method. (3) For work in optics there should be two dark rooms, adjoining and connected, and it would be well if the larger of the two, the anteroom, should have a window opening into the general lecture room. This anteroom is necessary for the demonstration of certain phenomena of contrast (q.v.), for work on visual adaptation, on association of ideas, etc.; while the inner room is useful for more refined investigation—e.g., for spectrometric research. The window in the side of the lecture room gives the lecturer a black background against which certain demonstrations can be made, without darkening the lecture room itself, far more effectually than against a black screen. (4) For acoustics there should be available a suite of three rooms, one of which should be made, as far as possible, sound proof, as well as light proof, and all of which should be connected by acoustic tubes for the transmission of auditory stimuli. (5) For work upon the sense of smell there should be a

special room, with tiled floor and glazed walls and especial ventilating arrangements. The rest of the laboratory proper should be taken up with large rooms, well aired and lighted, for class work in the practice courses; a set of small, closet-like rooms, occupied by advanced students; a series of rooms devoted to observations upon the lower animals; a centrally situated room, containing the measuring instruments (chronoscopes, chronographs, etc.), upon which a call may be made from any part of the laboratory; the private laboratories of the instructing staff; and a library and writing room. The only other feature of the laboratory that demands separate mention is (6) the workshop, which should be adequately fitted with the tools needed for wood and metal work and should have an abundant power supply. An excellent laboratory of this type, based upon the recommendations of Titchener (1900; see *Bibliography*), has recently been opened at the University of Moscow under the direction of Tchelpanow.

The instrumental outfit of the laboratory is described under the heading **PSYCHOLOGICAL APPARATUS**. A few points as regards furniture and fixtures may be noticed here. Every room should be supplied with gas, compressed air, and electricity, and certain rooms (for which absolute quiet is not essential) with water. The rooms employed for class work should have small low tables, accommodating each a pair of students, and shallow, glass-fronted wall cases to contain the instruments when not in use. Comfort on the part of the observer is essential to good introspection; for this reason there should be special narrow tables for experiments upon smell and taste, couches or reclining chairs for work upon the cutaneous sensations, and high desks for certain experiments upon visual contrast and after-images. The whole laboratory must be wired for telephone or bell signals, so that any two available rooms may be connected together for a particular investigation without disturbance to other workers by passage to and fro between them.

Research Laboratories. Aside from general physical, chemical, and other laboratories maintained by educational institutions or by national governments, mention should be made of special and private laboratories which have been established for investigations in certain fields. These usually are restricted in their scope to a certain problem or certain classes of problems, and usually their foundation and maintenance have been made possible by private interest. Thus, the Carnegie Institution of Washington (q.v.) maintains in that city the Geophysical Laboratory, concerned with problems involved in the formation of rocks and the structure of the earth, and also the Laboratory of Terrestrial Magnetism, both with complete instrumental and other equipment for the work in hand. The Carnegie Institution has in Boston a laboratory for the study of problems connected with nutrition, in Arizona a Desert Botanical Laboratory, and at Tortugas, Florida, a Marine Biological Laboratory. Likewise, the Rockefeller Institute for Medical Research maintains in New York a group of laboratories where investigations are carried on in various departments of experimental medicine and surgery, together with allied problems in physiological chemistry and similar fields. The tendency of these special laboratories is to emphasize not only aptitude for investigation, but also equipment and conditions

for efficient work, relieving the investigators from any financial or administrative worries, and placing at their disposal adequate resources, as well as providing suitable compensation while they are engaged in investigation.

The Rockefeller Institute (q.v.) is typical of a large laboratory for medical research, but there are also many others varying in size and scope in the different parts of Europe and the United States. There are such institutions devoted to cancer research, to the study of tuberculosis, to investigations on tropical diseases, on the diseases affecting domestic and other animals, and similar fields of activity. In addition laboratories are now an essential part of every well-equipped hospital, and routine investigations involving chemical analysis, pathological examinations, bacterial cultures, and other studies are conducted in properly equipped quarters, with adequate apparatus, especially light-power microscopes. Indeed the necessity for the laboratory in medical practice has grown beyond the facilities and possibilities of the private practitioner, and for purposes of diagnosis he now sends the specimens collected from patients to laboratories of one sort or another, where for a fee, in the case of private laboratories, expert investigators will make special examinations and reports, or examinations may be made at the laboratories of some board of health or other official body.

Municipal Laboratories. In recent years it has been found necessary and desirable for cities to maintain well-equipped laboratories, where various chemical, physical, biological, and other investigations may be made, with the object of safeguarding the health of the inhabitants of the city and securing increased economy in its various business activities. Thus, in practically every large city the water supply is regularly analyzed, in order to guard against possible contamination and impurities. This is usually done in a special laboratory equipped for the purpose, so that ordinary routine tests may be made rapidly and accurately. Likewise the gas for street lighting and for the domestic lighting of the city is every day photometrically determined, in order that its quality may be kept up to the standard specified by statute or contract. Furthermore, laboratories are provided in many cities for the regular testing of supplies, such as food to charitable and penal institutions, stationery, such as paper, hose supplied to a fire department, asphalt for paving, fuel, and a host of other articles that are obtained by the city through its purchasing department. Not only is it possible through these laboratories to examine the goods and determine whether they answer the specifications of the original contract or not, but also to provide more accurate and intelligent specifications, leading to the city securing the best article for the purpose at the most reasonable price. In fact, standardization is possible only through the work of the laboratory and technical experts.

LABOR CHURCH. An organized effort to develop the religious life in the labor movement. The founder of the Labor church was John Trevor, a singularly gifted and devoted man. The first services were held in a hall at Manchester, England, Oct. 4, 1891, and in November the church was organized. Five principles were adopted. The service included the Lord's Prayer, hymns social in character, readings from Whitman, Emerson, Lamennais, Lowell, Whittier, Ruskin, Carlyle, and Maurice, and an address. In 1892 the *Labor Prophet* was started, and the *Labor Hymn Book* and tracts were published. The demand for similar churches was local and spontaneous. In July, 1893, a Labor Church Union of 14 churches was organized. By the next November there were 24 churches. The movement has not shown continued vitality.

LABOR COLONIES. Public or philanthropic institutions designed to relieve unemployment through provision of work and more especially to regenerate, by the discipline of labor, persons who are commercially unemployable or, where reformation is impossible, as in the case of epileptics or feeble-minded, to provide them with a permanent refuge. Among the classes most frequently cared for in labor colonies are discharged convicts, habitual vagrants, and drunkards. But other substandard workmen also drift to the colonies: persons who are thrown out of employment late in life by industrial inventions, neurasthenics and persons of insufficient will power to hold steady employment.

Reliable statistics of the number of unemployables and substandard laborers in a modern industrial state are wanting, but a safe estimate would assign from five to ten per cent of the adult population to these classes. It is probable that the proportion tends to increase, partly as a result of the breakdown of those who are men-

tally or morally weak under the increasing complexity of industrial and social life, but more especially as a result of the more severe requirements made by modern industry as a condition to regular employment. The establishment, either by trade-union activity or by public authority, of minimum standards of wages excludes from private employment additional classes, who have no other recourse than charity or the labor colony.

Of the public labor colonies (1914) the most important are those of Belgium. There are three of these colonies—Merxplas, Hoogstraeten, and Wortel. Under Belgian law, vagrancy and begging are penal offenses; persons arrested for such offenses are committed to the labor colonies for terms ranging from two to seven years. Degenerates, inebriates, professional vagrants, and others of the criminal type are committed to Merxplas; those whose destitution is due to no fault of their own are committed to the other two colonies. The number committed varies with industrial conditions, being somewhat larger in periods of depression, especially in the case of the latter class. The inmates of Merxplas number, as a rule, between 5000 and 6000; those of the other two colonies together between 6000 and 7000. The record of regeneration at Merxplas is low. In five-sixths of the cases, persons discharged from the institution drift back to it again. In 1904, 72 per cent of the inmates had been returned at least four times. In Hoogstraeten and Wortel only a small percentage is restored to economic independence. This is partly due to the advanced age of the male inmates, three-fourths of whom are over 40 and two-fifths over 60.

In Holland three colonies are maintained for beggars and vagrants: Veenhuizen and Hoom, with inmates ranging from 3000 to 4000, for men; and Leyden, for women. These colonies are practically a detention place for the permanently unemployable. There are also colonies supported chiefly by the charitable societies, open to all who apply for admission, of which Wilhelmsoord, Wilhelminasoord, and Frederiksoord are the most important, the last dating from 1818. Frederiksoord and Wilhelmsoord have an aggregate area of 1000 acres and care for over 3000 inmates. After a training period of two years colonists may be given holdings of between six and seven acres at a moderate rental, practically under life tenure, to work on their own account. Others acquire the necessary training for independent farming only after a residence of four years or more in the colony. Over 150 small farms have thus been established at Frederiksoord, and most of them are fairly successful.

The most significant experiment in labor colonies is the system under the control of the German Labor Colony Central Association, which has over 30 colonies in various parts of Germany. The movement was instituted by Pastor Frederick von Bodelschwingh, who in 1882 established a colony at Bielefeld in Westphalia. The principle adopted was that of offering work to all who might apply. Applicants are required to sign an agreement to remain at least two months and to abide by all the rules of the colony. Expulsion is the only penalty for infraction of the rules. The inmates are provided with abundant plain food, body linen, and shelter. They are worked under trained overseers and, while inefficient, prove for the most part willing and docile. The management at-

tempts to secure employment for as many as possible after they leave the colony. A very small bonus is credited to those who do satisfactory work and serves to provide them with clothes, tools, and perhaps a little ready money when they leave the colony. No segregation is attempted; discharged convicts, inebriates, confirmed vagrants, and those who are merely suffering under temporary misfortune are accepted upon equal terms. The same plan is followed in all the other colonies of the system. The colonies are under religious and philanthropic auspices, but are in part financed by the communes. Similar colonies have been established in Switzerland at Tannenhof and Herdern. The record of reformation in these colonies is excellent. In view of the mixed character of the material, it is natural that the majority, after leaving the colony, lapse again into their former habits. But there are numerous instances of men who have been restored to independence and self-respect.

In England the seriousness of the unemployment problem has led to great interest in the labor colony, but the results down to the present have been meagre. There is a colony for epileptics, caring for about 150 inmates, at Chalfont, and a colony for unemployables at Dunton, accommodating approximately an equal number. The Salvation Army maintains several colonies, of which the labor colony of Hadleigh is the best known. France has an important colony, La Chalmelle, in the Forêt de Traconne, about 50 miles from Paris, where wanderers picked up at the police stations in Paris are sent. As a rule those thus committed to La Chalmelle are not hopeless vagrants, but countrymen stranded in Paris, etc. The majority of them secure positions before leaving the colony.

In the United States three colonies have been founded by the Salvation Army: Fort Herrick, near Cleveland, Ohio; Fort Amity, in southern Colorado; and Fort Romie, Soledad, Cal. The last two are farm colonies, the first an industrial colony. For the farm colonies the practice prevails of sending, not single men, but entire families. Fourteen families were brought from Chicago to Fort Amity upon the establishment of the colony in 1898; the number was later increased to about 40. The history of the colony has been one of mixed success. Many of the original colonists soon left, and shifting about of population has characterized its experience. The highest degree of success has been obtained by renting land to the colonists. Fort Amity was at first wholly unsuccessful. The colonists brought from the city soon dispersed; later it was repopled by the poor from the surrounding country. In 1909 it accommodated some 25 families, who appeared to be contented and fairly prosperous.

In practically all instances labor colonies have made agriculture their chief occupation. The variety of tasks and the wholesomeness of work in the open air are important considerations; furthermore, the products can be made to supply a great part of the wants of the inmates. Agriculture cannot be the sole resource, since the population of a labor colony is continually fluctuating in volume and is likely to be smallest at the sowing and harvest seasons and largest in winter, when there is little work to be done. Most of the European labor colonies have been founded on unpromising land—bog and heath and waste—a circumstance arising out of the lim-

ited means at the disposal of the founders, but which turned out to be favorable to the enterprise, since surplus labor could be set at ditching, clearing, and fertilizing the land in open weather. Many colonies have developed subsidiary indoor occupations, such as basketwork, broom making, the making of boxes and crates, etc. From a financial point of view the industrial labor colony is a flat failure, but it is an open question whether, from the point of view of regenerating the substandard workman, a greater diversity of employments than the agricultural colony affords would not be desirable. The labor colonies have been least successful in dealing with the urban workman, and it is the latter who presents the more serious social problem.

The labor colony, whether under public or private auspices, cannot be made self-sufficing. Although the Bielefeld colony makes every effort to keep expenses at a low level, each inmate represents a net outlay of between \$1.50 and \$2 per week to be made up by subscriptions and donations. The French Colony of La Chalmelle costs the city about \$3 weekly per inmate. The Dutch colony at Wilhelmsoord makes a better financial showing than any other, costing the charity authorities hardly more than 20 cents a week per inmate. It is, however, to be borne in mind that a large proportion of the inmates of labor colonies would have to be supported at greater expense by public or private charity.

The existence of numerous labor colonies in Germany is said to have notably reduced vagrancy and mendicancy. Charitable persons, instead of giving alms, direct beggars to the labor colonies, where their primary wants are satisfied, but in return hard work is exacted. On account of its tendency to discourage indiscriminate giving and hence the maintenance of a vagrant class, the labor colony undoubtedly justifies its claim upon generous public support.

Bibliography. The labor colony is treated in most of the standard works on charities and corrections (q v) and on unemployment (q v). Excellent articles on the subject are given in the *Handwörterbuch der Staatswissenschaften*, "Arbeiterkolonien" (Jena, 1901), and in Bliss, *New Encyclopedia of Social Reform*, "Labor Colonies" (New York, 1908). Consult also: Berthold, *Die Entwicklung der deutschen Arbeiterkolonien* (Leipzig, 1887); Hobson, *Co-operative Labor upon the Land* (London, 1895); Department of Labor, *The Poor Colonies of Holland* (Washington, 1896); Dawson, *Social Switzerland* (London, 1897); id., *The German Workman* (ib., 1906); Lamb, *Social Work of the Salvation Army* (New York, 1909); Rowntree, *Land and Labor Lessons from Belgium* (London, 1910).

LABOR CONGRESSES. Assemblages of the representatives of organized labor. They owe their origin to the association of laborers in trade-unions. The congresses have been both international and national. The first International Labor Congress was called by the International Association of Laborers at Geneva, Switzerland, in 1866. About 60 delegates from England, France, Germany, and Switzerland were present, representing many kinds of labor. This congress urged the necessity for a firm alliance of laborers in order to maintain wages. Strikes, while a temporary necessity, were alleged to be due to transitory and abnormal conditions. The crux of the social question was

declared to be the question of equal exchange. The congress favored the supplanting of interest by means of mutual-credit organizations, condemned the industrial employment of women, and advocated technical education. The second International Labor Congress was held at Lausanne, Switzerland, in 1867, with delegates from the countries represented at Geneva and from Italy and Belgium. Attention was called to the close connection existing between political liberty and social reform. Coöperative associations were opposed on the ground that they were selfish in character, while social reform could only be brought about by an agency acting upon the whole society. In 1869 the Third International Labor Congress was held at Basel, Switzerland. At this Russia, Austria, Germany, Spain, England, Italy, France, and Switzerland were represented. This congress by a vote of 54 to 4 declared, "Landed property should be abolished, the soil belongs to society and is inalienable." It went further and demanded "the destruction of all states, national and territorial, and on their ruins the founding of the International State of Laborers." Other international labor congresses of less importance were held at Dresden (1871); The Hague (1872), the latter marked by a violent schism between the followers of Marx and those of Bakunin; Paris (1886); Berlin (1891); Zurich (1897).

In 1889 two Socialist labor congresses were held in Paris, with an attendance of 606 and 407 respectively. Arrangements were made for the calling of similar international congresses from time to time, and May 1 was appointed for a fête day for Socialistic organizations throughout the world. The majority of the persons in attendance were French, but, in the two congresses of 1889, 82 and 184 respectively came from other countries. The following table indicates the increasing attendance of foreign delegates at the succeeding congresses:

YEAR	Country	Total attendance	From country in which congress was held	From other countries
1891	Brussels	363	187	175
1893	Zurich	440	117	323
1896	London	714	475	239
1900	Paris	789	473	316
1904	Amsterdam	509	33	476
1907	Stuttgart	884	289	595
1910	Copenhagen	896	146	750

In 1912 an extraordinary congress was convened at Basel to protest against the Balkan War; 555 delegates, representing 23 countries, were in attendance. Questions of international polity, peace, and war have since 1900 occupied an increasing part in the deliberations of the congresses.

Associations admitted to representation in these congresses include not only those that are avowedly Socialistic, but also all labor organizations basing their activity on the class-struggle theory and recognizing the necessity of political and parliamentary activity. Purely economic labor organizations are not represented, nor are anarchistic associations. Originally the basis for voting in the congresses was the country, each nation having one vote. At present voting power is based roughly upon the strength of the Socialist labor movement in the several coun-

tries. Germany, France, Great Britain, Austria-Bohemia, and Russia have each 20 votes; Italy, 14; the United States, 12; Belgium and Sweden, 10 each; Denmark, Poland, and Switzerland, 8 each; Finland, Holland, and Hungary, 6; Spain and Norway, 5; Turkey, 4; Argentina, Bulgaria, Rumania, Servia, Luxembourg, Bosnia, and Herzegovina, each 2. The apportionment may be changed at any congress. In the interim between congresses the International Socialist Bureau, established in 1900, acts for the organization. See SOCIALISM; TRADE-UNIONS

LABOR DAY. A day set apart as a legal holiday in all of the States of the Union (except Maryland and Wyoming, in which States it is customarily observed by proclamation) and in Alaska and the District of Columbia. In 1882 the Knights of Labor held their general assembly in New York City during the month of September, and on the 5th a parade was organized by the Central Labor Union of that city. The next year a parade was held on the first Monday in September, and in 1884, on the resolution of George R. Lloyd, one of the Knights of Labor, it was decided that all future parades should be held on that day, and that the day should be known as Labor Day. Workingmen's organizations all over the country then began an agitation to induce the State legislatures to declare the day a legal holiday, and on March 15, 1887, Colorado enacted a law to that effect and was followed by New Jersey, New York, and Massachusetts. The great majority of the States have selected the first Monday in September as Labor Day. In European countries labor organizations celebrate on the first day of May. This custom started in 1890, but was at first opposed, because of the rioting and disturbance which often attended it. At present it is observed generally without trouble or interference.

LABORDE, lâ'bôrd', ALEXANDRE LOUIS JOSEPH, COUNT DE (1774-1842). A French author and politician, born in Paris. At the outbreak of the French Revolution he joined the Austrian army and until 1797 fought against the Republic. He returned to France after the Peace of Campo Formio and went to Spain in 1800 as military attaché to Lucien Bonaparte. His *Voyage pittoresque et historique en Espagne* (2d ed., 1823) and *Itinéraire descriptif de l'Espagne* (3d ed., 1828) show his close study of the country and its people. In 1822 he was elected from Paris to the Chamber of Deputies, where he consistently supported the Liberal side. During the Revolution of 1830 his vigorous protests against the ordinances of Charles X won for him the regard of Louis Philippe, who subsequently made him his aid and subprefect of the Seine. His other works include: *Les monuments de la France classés chronologiquement* (1816-26); *Voyage pittoresque en Autriche* (1821-23); *Description des nouveaux jardins de la France et de ses anciens châteaux* (1808-15), *Versailles, ancien et moderne* (1840).

LABORDE, LÉON EMMANUEL SIMON JOSEPH, COUNT DE (1807-69). A French archaeologist and author, born in Paris, son of Count Alexander Louis Joseph Laborde. After a course of study at the University of Göttingen, Germany, he traveled in the Orient with his father, and, owing to his remarkable ability as a draftsman, rescued from oblivion many ancient monuments in Asia Minor and Syria. He afterward explored alone Arabia and the valley of the Nile. On his

return in 1828 he became for a few months Secretary of the French Embassy at Rome, was elected a member of Parliament in 1840 and 1842, and was called to the Senate in 1868. From 1845 to 1848 he was curator of the Museum of Antiques at the Louvre and in 1857 director general of the archives of the Empire. He wrote many magazine articles and books, perhaps the most important of which is the *Ducs de Bourgogne* (Paris, 1851). Others are *Voyage de l'Arabi Pétrée* (1833); *Voyage en Orient* (1837-64); and numerous volumes on the history of engraving and painting, Paris libraries, the ancient monuments of Paris, French archives, and the jewels of the Louvre.

LABOR EXCHANGES. 1. A class of institutions founded by the followers of Robert Owen (1832-35), which were designed to bring about the exchange of the products of labor without the intervention of money. Stores were founded which were to buy and sell commodities for "labor notes," the amount of time spent in producing a commodity being the basis on which it was valued. No difference was made for different kinds of labor. The plan was soon found to be impracticable. 2. The term is frequently used to designate an ideal employment bureau under public management, which should obviate the common evil that at one and the same time a need for labor exists in some occupations or localities, while many men are unemployed. It is generally recognized that labor, owing to the ignorance and inertia of the laboring classes, does not readily respond to the competitive laws which tend to place productive forces where they are most efficient. The better distribution of labor, it is held, ought to be one of the cares of the state, since under present conditions society loses much productive energy, while bearing an unnecessarily large burden of pauperism and crime.

So-called labor exchanges (*bourses de travail*) exist in numerous European cities, as well as in some of the American States and in Australasia, but they are not equipped with machinery efficient enough to grapple with the larger problems of the distribution of labor. See EMPLOYMENT BUREAU

LABORI, lâ'bô'rê', FERNAND GUSTAVE GASTON (1860-). A French lawyer. He was born at Rheims, studied law at Paris, in England, and in Germany. He was called to the bar of the Court of Appeal in 1884 and in 1887-88 was secretary of the Conference of Advocates. In 1911-13 he was president of the Barrister's Society of Paris. He conducted several notable cases, among them the defense of the assassins Duval and Chevallereau, the anarchist Pini, and the dynamiter Vaillant. He was advocate for Gabriel Compayré in his famous libel action against Numa Gilly and defended Alfred Dreyfus (q.v.). On Aug. 14, 1899, during the final trial of Dreyfus at Rennes, he was shot in the back while on his way to the court and was dangerously wounded, but recovered sufficiently to resume his defense of Dreyfus. He had charge of several literary cases, notably those of *La Plume* and the *Théâtre Réaliste*. His defense of M. Zola (1898), who was charged with libeling the President and the army, was the occasion for a display of marked ability. He also represented Thérèse Humbert in the well-known Crawford case, and, in 1914, Madame Caillaux, whose acquittal he secured (see CAILLAUX, CALMETTE). With others, M. Labori under-

took the publication of the *Répertoire encyclopédique de droit français* (12 vols.). In 1906 he was elected to the Chamber of Deputies for Fontainebleau. He founded the *Grande Revue* and the *Revue du Palais* (1897), for a time was editor in chief of the *Gazette du Palais*, and wrote *Affaire Zola: Plaidoirie* (1898).

LABOR LAW. See CONTRACT LABOR LAW.

LABOR LEGISLATION. An inclusive term used to denote the body of statutes which in any way affect the labor contract or the relation of the employer and the employed. The first step was taken in the so-called factory acts of Great Britain, designed to improve the sanitary conditions prevailing in workshops and factories and safeguard the health of the laboring population. In the subsequent development many other points in the mutual relations of employer and employed have been the subject of legislative and administrative regulation, so that to-day the mass of statutory enactment on these topics is almost

In the industrial population developed later than in England, and labor legislation is of a later date. With the growth of modern industry together with the prevalence of universal suffrage the enactment of such laws did not encounter the same difficulties as in England. There has been no lack of legislation, though it has frequently been assumed that such laws would enforce themselves, and no adequate machinery was provided to insure their execution. In later years factory inspection has been widely introduced, though in many States it is not equipped with adequate machinery for the discharge of the duties imposed upon it. On the other hand, the progress of unionism has made the workingmen alert in the maintenance of their legal rights, and their officials have done much to render labor legislation effective.

Labor legislation is a matter of State concern, and while in America the laws of one State have frequently been enacted bodily by other States, there is still much diversity among the States. In reviewing the labor legislation in force in the United States we must content ourselves with a general account of the various types of enactments without attempting to specify where such laws are in force. The most usual subjects of legislation concern the hours of labor, mode of paying wages, and protection of machinery to avoid accidents.

Hours of Labor. Twenty-four States have laws on the subject of hours of labor in general employments, which laws are of course limited to women and minors. Laws restricting the hours of labor in employments involving danger to health or life of the employee or to the public safety are less general, but are increasing in number. The employments in question include mines and smelters, caissons, brickyards, bakeries, railroads, street railways. On a somewhat different basis are laws restricting hours of labor on public works and on work done for the public authorities by private contractors.

Most of the States prohibit the labor of children in factories, workshops, and mines before a certain age is reached. In most States this age is 12 or 14 years, the latter age gaining upon the former. Limitations of the hours of labor per day and per week for minors who have not reached the age of 18, or sometimes as much as 21 years, are frequent. This limit is usually 10

hours per day. Some States with a 10-hour day provide that the weekly work shall be less than 60 hours (55 in Ohio and New Jersey, 54 in Massachusetts). Some of the States impose further restrictions. For children under 16, whose attainments do not reach certain standards, hours must generally be so adjusted as to permit of school attendance for a portion of the year, or to permit attendance at night schools.

Several of the States which regulate the labor of minors as above stated make no restrictions upon the labor of adult women. In others, however, such labor is subject to the same rules as that of minors. Absolute prohibition of woman's labor in mines exists in several of the States.

Payment of Wages. Laws fixing the intervals at which wages shall be paid have been enacted in several States, but they are of doubtful validity. More frequent is the attempt to prescribe that all payments shall be made in money, by declaring illegal payments in store orders and the like.

Protection of Health, etc. Laws designed to protect the workmen against accident or disease are especially applicable to labor in inclosed places, in workshops and factories, and in recent legislation in so-called sweatshops. Among other things, such laws aim to require adequate fire escapes, outward-opening doors, guards for dangerous machinery, elevators, belting, etc., connection of rooms where machinery is used with engine rooms by tubes or bells. Other laws provide that machinery shall not be cleaned while in motion, and frequently that women and minors below a certain age shall not be employed in cleaning machinery; that a certain number of cubic feet of air space for each person employed shall be provided, that fans and other contrivances shall be used to rid the air of noxious vapors and dust. Similar in character is the legislation in regard to sweatshop production—i.e., the manufacture of goods, particularly clothing, in dwellings and tenements—which aims to restrict the production of goods in unsanitary places. These laws either place such restrictions as a part of the general factory law or seek to prevent overcrowding by restricting such labor to members of the family living in the dwelling, or requiring a license for all persons engaged in such production.

Employers' Liability. Under the common law the employer is liable in pecuniary damages for the bodily injury or death of his employees by accident when in his employ, in so far as such accident is not due to the negligence, direct or contributory, of the employee. But the rigor of this rule was greatly modified by the principle which relieved the employer of liability in case the accident was traceable, not to his negligence, but to that of another employee. (See FELLOW SERVANTS; EMPLOYERS' LIABILITY.) Strictly construed, this doctrine made it practically impossible for the laboring man to avail himself of this liability, as he was forced to prove the negligence of the employer. This difficulty has been invoked in England and in many States to remove this difficulty. Such laws declare the employer directly liable for all accidents except in case of negligence of the person injured, or in a less extreme form attempt to define who are fellow servants. The effect of such legislation is to place upon the employer the burden of proof that the injured workman was negligent. Such laws apply in a number of States to railroads, but in a very few cases to employees

generally. In Europe such laws are more frequent and are especially favorable to the workman in England and Switzerland. In recent years it has come to be recognized that employers' liability, even broadly interpreted, cannot adequately protect the workman against occupational risks. Following the lead of Germany and other European countries, American States have enacted workmen's compensation laws, requiring indemnification for all injuries not the result of gross negligence on the part of the injured. Such laws applying either generally or to specially hazardous industries were enacted in 24 States in the period 1910-14.

The labor legislation of England has not only been imitated in the United States, but has been widely copied in the industrial countries of continental Europe and in the English colonies. While certain general features, such as factory inspection and limitation of the hours of labor of children and women, are common to all, the labor codes of the various countries show marked individuality, as the result of peculiar conditions or of historic tradition. Hence we find the different aspects of the labor laws in different stages of development in the different countries.

Germany. In Germany (and this is true of continental Europe generally) the main interest in labor legislation has centred about the question of employers' liability and the evils it is designed to meet. After struggling for some time with a liability law which gave very unsatisfactory results, Germany was led to introduce the insurance principle as a means of alleviating the suffering caused by accidents to workmen in industrial pursuits. From protecting the workman and his family from the effects of accidents directly attributable to his occupation, it was an easy step to extend this protection to sickness, which in many cases was also incident to the occupation. A still further step has been taken in providing by insurance against the incapacity of old age. This dominant feature of the legislation of continental countries is treated more fully in the article **WORKINGMEN'S INSURANCE**.

Australia. Of all countries, the Australasian colonies of Great Britain have been most radical in their labor legislation. Industrial labor is most directly affected by the laws providing for compulsory arbitration of all labor disputes. See **LABOR AND CAPITAL, RELATIONS OF; TRADE-UNIONS; CHILD LABOR**.

Bibliography. The most complete guide to the labor legislation of the United States is contained in the *Report on Labor Legislation* (Washington, 1900), which forms vol. v of the *Report of the United States Industrial Commission*. The compilation of labor laws issued in 1892 as the *Second Special Report of the United States Department of Labor* is fuller in its citation of laws. The United States Bureau of Labor Statistics issued a full summary, *The Labor Laws of the United States, with Decisions of the Courts Relating thereto* (Washington, 1914). *The Annual Summaries of State Legislation* issued by the New York State Library can also be consulted with profit. Valuable information on current legislation is published by the American Association for Labor Legislation. Details of labor legislation are also found in the *Bulletins of the United States Department of Labor* (Washington, 1898 et seq.), where especial attention is given to foreign labor laws; Florence Kelley, *Some Ethical*

Gains through Legislation (New York, 1905). Among foreign sources attention may be directed especially to the *Archiv für social Gesetzgebung und Statistik* (Tübingen, 1888 et seq.); *Annuaire de législation de travail*, issued since 1897 by the Belgian Office du Travail (Brussels); Ignaz Jastrow (ed.), *Textbücher zur Studien über Wirtschaft und Staat*, vols. i-iii (Berlin, 1912-14).

LABOR ORGANIZATIONS. Under this head are included those more or less prolonged associations of productive workers whose principal purpose is the improvement of the conditions of employment. The labor organization is thus differentiated on the one hand from the strike—a temporary association—and on the other hand from friendly societies and Socialist organizations which, though frequently recruited exclusively from the ranks of labor, are chiefly devoted to other ends than the improvement of the conditions of employment. Among labor organizations two distinct classes are discernible—those organized on the trade or occupational principle and those which transcend occupational bounds and attempt to amalgamate in a single, homogeneous organization all classes of labor. The former—the trade-union—is treated in detail in the article on **TRADE-UNIONS**, where a further discussion of the relation of the trade-union to the general labor organization is given. The latter class alone is considered in the present article, and for brevity the term "labor organization" will be restricted to this group, the nontrade organizations.

In England the first great wave of labor organization came about 1830. The repeal of the Combination Acts in 1824 had been followed by an unprecedented activity among trade-unions, which resulted in an outburst of strikes that were as generally unsuccessful as they were violent and costly. The conviction became general among wage earners that the old trade-union was too exclusive in membership and too conservative in policy, and this conviction was increased by the Socialistic agitation of Robert Owen, William Thompson, and others. In 1829 a Grand General Union of the United Kingdom was established among the textile workers. In 1830 some 20 organized trades united in the formation of the National Association for the Protection of Labor. In January, 1834, came Robert Owen's Grand National Consolidated Trades Union.

The character of this organization was strikingly similar to that of the Knights of Labor. Both began as secret organizations with elaborate ritual and fantastic ceremonies, and both abandoned at a subsequent period the policy of extreme secrecy. Both admitted trade-unions as units, but both placed the greater emphasis upon amalgamation and established local unions of mixed membership, known in the Grand National Consolidated as miscellaneous lodges. Both laid special emphasis upon the organization of women and unskilled laborers, both looked forward to the supersession of the wage system by some scheme of coöperative production, and both conducted disastrous experiments in coöperation. Finally, both grew with unhealthful rapidity; "within a few weeks the union appears to have been joined by at least half a million members."

The Grand National had contemplated a universal strike as the first step towards general coöperation, but the strikes which it inaugu-

rated proved unsuccessful, and in August, 1834, it was transformed into the British and Foreign Consolidated Association for Industry, Humanity, and Knowledge. This in turn spent its strength in cooperative experiments, and from that time until the appearance of the new unionism English labor organizations were chiefly, though not exclusively, characterized by the attempt to foster cooperative production.

With the reawakening of English Socialism in the early eighties came another determined assault upon the conservative methods of the old trade-unions. The feeling became prevalent among those trade-unionists who were also Socialists that the progress of the masses was actually hindered by the aristocratic exclusiveness of the skilled trades, whose unions were inclined to build up extensive systems of insurance benefits and avoid politics, particularly Socialism. Among labor leaders the struggle centred largely about the control of the Trade Union Congress; in the world at large the efforts of the new unionists were characterized by the attempt to organize the unskilled workers of the cities, with the ultimate object of forming a large party in favor of municipal ownership and later of introducing municipal Socialism. In London the efforts of the new leaders—John Burns, Tom Mann, Benjamin Tillet, and others—were crowned with unexpected success. In 1888 the match girls organized and won a strike. In 1889 the gas stokers were organized into the Gasworkers' and General Laborers' Union and succeeded in winning an eight hour day with a slight increase of wages. In 1890 came the famous strike of the London dock laborers, which, under the able leadership of John Burns and with the generous support of the public, resulted in an epoch making victory. The result of these successes was the complete victory of the new unionists in the Trade Union Congress and a large crop of organizations among the unskilled workers, all of which are marked by the common characteristics of low dues, few or no insurance benefits, aggressive trade policy, political activity, and a strong leaning towards Socialism.

In the United States, as in England, labor organizations first appeared in considerable numbers about 1830. The earliest manifestations of the new movement were political. In 1829 a workingman's ticket was placed in nomination in New York, and one delegate to the State Assembly was elected. This political movement spread into Pennsylvania and Massachusetts and contributed to the formation of the Loco Foco party (q.v.), which played an important part in the political movement of that period. Political organization hastened organization for trade purposes, and about 1833 we hear of numerous municipal federations of trade-unions, one of which, the General Trades Union of the City of New York, succeeded in having its president elected to Congress. In 1832 the New England Association of Farmers, Mechanics, and Workingmen was organized at Boston, a typical labor organization of the period, which seems to have devoted itself to debate and educational work.

The three most important labor organizations which appeared before the Civil War were all organized in 1845: the New England Workingmen's Association in March, the New England Protective Union in September, and the Industrial Congress of the United States in October. The first two were closely identified, the Protec-

tive Union being largely devoted to cooperation. All three exhibited the familiar characteristics of the early labor organization. Unskilled laborers, women, farmers, and even other employers were admitted. The most diverse reforms were championed: abolition of slavery, women's rights, land nationalization, the withholding of supplies from the American army in Mexico. The Socialistic character of the movement is shown by the fact that George Ripley and Charles A. Dana were prominent among the founders of the New England Workingmen's Association, while the initial meeting of the association was addressed by Robert Owen and Albert Brisbane, the father of American Socialism.

All three of these associations became moribund in the early fifties, and from that time until the end of the Civil War the most striking phenomenon is the multiplication of trade-unions of the narrower kind. But during this period, also, there were not lacking men, even among the prominent trade-union leaders, who characterized the trade-union as exclusive and warmly advocated the formation of broader organizations which would elevate the masses by other means than the strike and the regulation of apprenticeship. In 1866 their efforts resulted in the formation of the National Labor Union, which, starting with a large membership and good prospects, wasted its strength on the attempt to found a Labor Reform party and died in 1870 "of the disease known as politics." A slight connection may be traced between the National Labor Union and the International Workingmen's Association, which was founded in London in 1864 and moved its headquarters to New York in 1872, soon after which it disappeared. The International, however, came under the domination of Karl Marx and was rather a Socialistic party than a labor organization.

The work laid down by the National Labor Union fell into the hands of a remarkable labor organization, the Noble Order of the Knights of Labor (See KNIGHTS OF LABOR). Although it began as a local union of garment workers and in the course of its existence chartered many national unions, it contemplated from the very beginning something essentially hostile to the exclusive trade-union. Following out this policy, no effort is made to restrict the membership to wage earners, a universal practice among trade-unions, but in general persons over 16 years of age are eligible to membership. In their district assemblies, and even in the local assemblies, the members of different trades are amalgamated without respect to occupational limits. Finally, the government of the Knights is far more centralized than any federation of trade-unions; the general executive board, to take a single illustration, may suspend any local or district officer, expel any member, revoke any charter, and by a unanimous vote may settle any strike. In other words, the Knights of Labor is a centralized national union of mixed trades and not a federation.

The latest phase in the development of labor organizations is represented by the Industrial Workers of the World (q.v.).

Historically considered, the labor organization is distinguished from the trade-union by an absence of exclusiveness, by the effort to secure the benefits of organization for the unskilled workers, by a more emphatic note of altruism

by a decided preference for coöperation, for legislative and political action over strikes and boycotts, and, it must be admitted, by a general tendency to take short cuts to universal reform. On the whole the labor organization has been far less productive of tangible results than the trade-union. But its work has not been in vain. The trade-union of to-day is far less exclusive, far less monopolistic than it was before the appearance of the Knights of Labor and the new unions of England. Most important of all, the trade-union now realizes the truth of that fundamental thesis of the Knights of Labor—that machinery is fast obliterating the line between the skilled and unskilled trades—and devotes a large share of its strength and funds to the organization of the lower classes of labor. This is the primary object of the American Federation of Labor. See **LABOR, AMERICAN FEDERATION OF.**

For an account of a momentous struggle, which bears much resemblance to the contrast between the labor organization and the trade-union, see *Problems of Organization* under **TRADE-UNIONS**, where a general bibliography is also given. See also *Socialist Parties* under **SOCIALISM**.

LABOR PARTY, BRITISH. A political party organized on its present basis in 1906. The origin of the party is traceable to a resolution adopted by the Trade Union Congress at Plymouth in 1899 to call a conference of trade-unions, Socialistic, coöperative, and other labor bodies to consider the problem of securing adequate parliamentary representation for labor. The conference, held in February, 1906, created a committee, known as the Labor Representation Committee, under the secretaryship of J. Ramsay Macdonald. The aim of the committee was to secure, where possible, the election of candidates identified with labor interests, where this was impracticable, to throw labor support to candidates of regular parties who were sympathetic to labor. The committee was composed chiefly of representatives of the trade-unions, but the Fabian Society and the Independent Labor party were given each one representative on the executive committee.

In 1900, 15 candidates were indorsed by the committee, of whom two were returned. Two candidates in by-elections between 1900 and 1904 were elected with the indorsement of the committee. In 1904 the committee adopted the policy of paying its representatives in Parliament £200 a year to overcome the handicap under which labor representatives would suffer in giving unpaid parliamentary service. In the general elections of 1906, 30 out of 50 candidates indorsed by the party were elected. As there were a considerable number of other representatives elected who were avowedly sympathetic with labor, it was felt that the time was ripe for the organization of a labor party. This was effected later in the same year. The labor party thus organized continued the tactics and the aims of the Labor Representation Committee.

The representatives of the Labor party numbered 39 out of 670 in the House of Commons. In view of the practical equality in strength of Unionist and Liberal parties in the House, the Labor party has, since 1910, been able to exert an influence upon legislation quite out of proportion to its numbers and has played a prominent part in shaping recent social legislation in the United Kingdom. Consult: Joseph Burgess, *John Burns: The Rise and Progress of a Right*

Honourable (Glasgow, 1911); Fred. Henderson, *Socialism and the Labor Party* (London, 1912); G. S. Penfold, *Labour Party under a Search Light* (ib., 1912); A. W. Humphrey, *A History of Labour Representation* (ib., 1912); Gerhart Guetler, *Die englische Arbeiterpartei; ein Beitrag zur Geschichte und Theorie der politischen Arbeiterbewegung in England* (Jena, 1914).

LABOR PROBLEMS. The rise of capitalistic industry, creating a social class whose only resource is the sale of their labor, has brought to the front a new group of social problems, which are commonly known as labor problems, or, more simply, as the labor problem. The determination of the just portion of labor in distribution, the social enforcement of the canons of distribution established, and the assurance to the laborer of tolerable conditions of life are the essence of the problem.

In the first quarter of the nineteenth century educated opinion viewed free competition as a force capable of bringing about the best possible solution of the problem. The greatest freedom of contract would place each individual where his productivity was greatest and assure him of the greatest reward compatible with the maximum of social happiness. It was soon perceived, however, that the freedom of contract between employer and laborer was largely illusory, owing to the ignorance and helplessness of the latter. Especially was this true in the case of children, who were often bound to the employer by parish authorities or placed under his control by unnatural parents. A party arose demanding the state regulation of the labor contract in favor of the weak. (See **LABOR LEGISLATION.**) The extent of government regulation was the concrete form assumed by the labor problem in England from the second decade of the nineteenth century.

Contract relations between the adult laborer and the employer were on an unsatisfactory basis so long as the individual laborer dealt with the employer, or perhaps a few employers. Partially as a result of this disadvantage of position, laborers began to combine in trade-unions (q.v.), believing that thus they might better their position without the tardy intervention of the state. The struggles between combined labor and the employer gave a new impetus to Socialism. Many students of social science believed it to be necessary to eliminate the employer by founding an organization based upon free association (see **FOURIER, FOURIERISM**), on coöperation (q.v.; see also **OWEN, ROBERT**), or on the appropriation by the state of the means of production. (See **SOCIALISM, MARX, KARL**.) Later the view came to be widely held that the true solution of the labor problem lay in the merging of the interests of employer and employed by a system of profit sharing (q.v.), by inducing laborers to purchase shares in the corporation employing them, or by the development of an ethical relation between employer and employed, the employer making it his care to provide for the moral and material welfare of his laborers, both in the factory and in their homes (See **KRUPP FOUNDRIES, SOCIAL WORK AT.**) State and corporate provision of funds to insure against invalidity and old age (see **OLD-AGE PENSIONS; WORKINGMEN'S INSURANCE**) represents a new development of thought, aiming to free the laborer from the constant danger of pauperism and so to render him less discontented with the prospect of remaining a wage-earner throughout his life. Industrial arbitration, vol-

untary and compulsory, represents another comparatively recent solution for the evil of industrial discord.

The modern tendency is to treat the labor problem as an exceedingly complicated one which cannot be solved by any single remedy. Extension of factory legislation, encouragement of the formation of responsible trade-unions, arbitration, identification, wherever possible, of the interests of employer and employed, are recognized to be among the more important factors of the solution of the problem. Whatever has hitherto been accomplished, however, in behalf of labor, and whatever measures are advocated for further improvement, concern almost exclusively the factory laborer. There remains a large class consisting of the day laborer of the cities and the agricultural laborers, who have hitherto been unable to combine successfully to better their positions, and whose conditions of employment are so varied and uncertain that little can be done for them by legislation. These classes are, however, diminishing in numbers relatively to the laborers employed in factories, and with the progress in public education and consequent improved mobility of labor, may be expected to share in some measure the advantages secured by the factory laborers.

LABOR REPRESENTATION COMMITTEE. See LABOR PARTY, BRITISH

LABOR UNION, THE AMERICAN. A Socialistic labor organization whose membership is largely confined to the States of Colorado, Idaho, Montana, Washington, and Wyoming. It was organized in May, 1898, as the Western Labor Union, but widened its scope at the Denver Convention of 1902, when the present name was adopted. In composition it is a federation of trade-unions, but it has pronounced the familiar methods of the old trade-unions unsatisfactory, and formally declared itself in favor of political action and international Socialism. The officers consist of a president, vice president, secretary treasurer, and an executive board of nine members, including the president and vice president. The officers are elected biennially by a referendum vote of the general membership. The government is more centralized than the ordinary federation of trade-unions, the executive board, e.g., may depose any general officer, and affiliated organizations are not permitted to strike without the approval of the executive board. Probably the most important organization affiliated with the American Labor Union is the Western Federation of Miners. The official organ is the *Voice of Labor*, published weekly at the headquarters in Butte, Mont. See LABOR ORGANIZATIONS

LABOUCHÈRE, la'bōō'shâr', HENRY, BARON TAUNTON (1798-1869). An English statesman of Huguenot descent. The eldest son of Peter Cæsar Labouchère, of Hylands, Essex, he was born on Aug. 15, 1798. His father, a partner in the banking house of Hope & Co., of Amsterdam, settled in England and married the daughter of Sir Francis Baring. Henry was educated at Winchester and at Christ Church, Oxford, where he graduated B.A. in 1821 and M.A. in 1828. He also studied law at Lincoln's Inn, but

did not enter the profession. In 1824 he made a visit to Canada and the United States to study the working of their institutions. In 1826 he was elected M.P. for St. Michael, from 1830 to 1858 he sat for Taunton, and in 1859 he was made Baron Taunton. He became a strong Liberal in English politics and for many years was identified with the support of the measures and the initiation of the policy of the party of progress. From 1832 to 1858 he occupied successively the offices of Junior Lord of the Admiralty, Master of the Mint, Vice President of the Board of Trade, Privy Councilor, Colonial Undersecretary, Undersecretary of State for War, President of the Board of Trade, Chief Secretary for Ireland, and Secretary of State for the Colonies. He had no direct heir, and his title became extinct at his death, on July 13, 1869.

LABOUCHÈRE, HENRY DU PRÉ (1831-1912). An English journalist and politician, the eldest son of John Peter Labouchère. He was born in London, Nov. 9, 1831, was educated at Eton and at Trinity College, Cambridge, and entered the diplomatic service under the auspices of his uncle, Lord Taunton. He was in the diplomatic service from 1854 to 1864, part of the time as a member of the British Legation at Washington. From July, 1865, to April, 1866, he was in Parliament for Windsor, till he was ousted on petition. In 1867 and 1868 he sat for Middlesex. He represented Northampton from 1880 to 1906. Under the signature "The Besieged Resident," his letters from Paris during the siege (1870-71) to the London *Daily News* attracted considerable attention. They were published in book form (3d ed., London, 1872). In 1876 he established *Truth*, a society and political journal, and afterward became also one of the proprietors of the *Daily News*. *Truth*, celebrated for its acute censorship of public matters, involved him in numerous libel suits, without slackening, however, his zeal as an enemy of sham and corruption. He was an earnest advocate of the Irish Home Rule cause, but in 1890 refused to follow Parnell in his attacks upon the English wing of the party. As a member of the royal commission to inquire into the Jameson raid of 1896, his pertinent queries and incisive criticism were particularly disconcerting to the party of Cecil Rhodes, and his pro-Boer sympathies were marked during the South African War. He retired from political life in 1905 and died in Florence, Jan. 15, 1912. Consult McCarthy, *British Political Portraits* (New York, 1903), and Thorold, *The Life of Henry Labouchère* (ib., 1914).

LABOULAYE, la'bōō'lâ', EDOUARD RENÉ LEFEVRE DE (1811-83). A French jurist and publicist, born in Paris. He was a student of law, devoting himself early in life to continental legal history with singular energy and intelligence. At the age of 28 he became known by an elaborate work, entitled *Mémoire sur l'histoire de la propriété foncière en Occident* (1839). In 1841 he published an essay on the life and doctrines of Frederic Charles de Savigny and became an advocate in the Royal Court of Paris. In 1843 appeared *Recherches sur la condition civile et politique des femmes*, and this was followed two years later by *Essai sur les lois criminelles des Romains*. Each of these works attracted great attention among the learned and contributed to revive in France the study of the history of law. In 1849 he became professor

of comparative jurisprudence in the Collège de France. Under Napoleon III he associated with the men who endeavored to revive public spirit in France. He wrote with enthusiasm and intelligence on the institutions of free America, and his lectures on this subject, during and after the war for the preservation of the Union, were extremely popular in Paris. Laboulaye had the advantage of a handsome personal presence and winning address, and his lectures on law had attraction even for those who had no interest in its study. In 1863 he published *Paris en Amérique*, in which he humorously employs a supernatural agency to transport a Frenchman with his family into the midst of American family life and town excitements at a period when disaster had come to the national arms during the War for the Union. The veiled drollery of the situations by which he lampoons some of the peculiarities of the Napoleonic government, making them ridiculous while defending them with all the ardor of French patriotism, is among the finest specimens of irony extant. This book went through upward of 30 editions in Paris and was translated into English. In a similar vein of political satire were his tales *Contes bleus* (1864), *Nouveaux contes bleus* (1865), *Le prince Canuche* (1865). The last ran through many editions and did much to pave the way to the easy dropping out of the Napoleonic dynasty in 1870. The following list of Laboulaye's works exhibits the intellectual activity and scope of his life: *Histoire politique des Etats-Unis 1620-1789* (1855-66); *Etudes contemporaines sur l'Allemagne* (1856); *La liberté religieuse* (1858); an introduction to Fleury's *Institution au droit français* (1858); *Abdallah* (1859), an Arabian romance; *La propriété littéraire au XVIIIème siècle* (1859); *Les Etats-Unis et la France* (1862); *L'Etat et ses limites* (1863); *Etude sur la politique de M. de Tocqueville* (1863); *La république constitutionnelle* (1871). Laboulaye likewise translated, from English into French, Walter, *On the Law Proceedings of the Romans*, Channing's social works, and Channing *On Slavery in the United States*, with an essay on his life and doctrines; also Franklin's *Memoirs and Correspondence*, with an introduction. His contributions to French reviews, legal and political, and to the journals of Paris, were very numerous. He died May 24, 1883. Consult John Bigelow, *Some Recollections of the Late Edouard Laboulaye* (New York, 1889), containing a bibliography.

LABOURDONNAIS, la'bōōr'dō'nā', COMTE BERTRAND FRANÇOIS MAHÉ DE (1699-1753). A French naval officer, born in Saint-Malo. He entered the service of the French East India Company as a lieutenant in 1718 and was promoted to the position of captain in 1724. In 1735 he became Governor-General of Ile de France and Ile de Bourbon and received command of a squadron in 1741. In the war between England and France he gained a victory over an English fleet, near Madras, and captured that town in 1746. Owing to his disagreement with Duplex (q.v.), Governor-General of the French Indies, concerning the terms offered to the English, he was recalled to France in 1748 and imprisoned in the Bastille for three years. Some authorities ascribe his disgrace to Duplex's jealousy. In 1751 he was tried by a commission appointed by the Council of State and acquitted. He was restored to liberty, but

his spirit was crushed, and he died in poverty in 1753.

LAB'RADOR'. A dependency of Newfoundland (q.v.), and the most easterly part of the mainland of British North America, consisting of a strip of coast, with the adjacent chains of islands, extending from the southwesterly extremity of the Strait of Belle Isle northeasterly to Cape Chidley at the entrance to Hudson Strait (Map: Canada, S, T, 4, 5, 6). The coast strip varies from about 10 to 50 miles in width and is indented with numerous inlets, bays, and fiords, behind groups of small rocky islands. On the Atlantic side it presents an abrupt wall of rocky cliffs from 1000 to 6000 feet in height. The climate, excepting the brief summer, is very cold and stormy; but even in winter its dryness makes it endurable and healthful. The chief inlet is the Hamilton, into which the Hamilton or Grand River empties, and whose Grand Falls (q.v.) are 302 feet high, although not equal in volume to Niagara Falls. The fisheries, especially the cod, salmon, and trout, are important. The inhabitants are mainly Eskimo in the north and Indians in the south. A few whites, mostly fishermen, are scattered along the settlements; and the Moravian Brethren, who first came in 1764, have several missions in the north. There are a few posts of the Hudson's Bay Company. The population in 1913 was 3965.

The name Labrador was long popularly applied to the whole territory bounded by the Atlantic Ocean, Hudson Strait, and Hudson Bay, which included not only the Labrador strip of coast, but also a portion of the Northwest Territories. Later the name was given to the whole peninsula lying between the Gulf of St. Lawrence and Hudson Bay. In the latter description what was once called Labrador is now, excepting the coast strip, included in the Province of Quebec. The exact boundaries of the coast strip have long been in dispute between Canada and Newfoundland, and the territory has several times changed hands. The Labrador coast was first discovered by the Northmen in the tenth century. Cabot sailed along it in 1498 and Conte-Real in 1500, but the interior was practically unexplored until traversed by officers of the Hudson's Bay Company about 1840.

LABRADOR DUCK. See DUCK.

LABRADORITE. A variety of feldspar, consisting of aluminium, calcium, and sodium silicate, that crystallizes in the triclinic system. It is commonly found in dark-gray cleavable masses. It is an essential constituent of the early rocks and is found in northern Europe and in Labrador. The cleavable varieties show a beautiful change of color, especially when polished, and are used for ornamental purposes and for table tops, snuffboxes, etc.

LABRADOR TEA. See LEDUM.

LABRIDÆ (Neo-Lat. nom. pl., from Lat. *labrum*, lip). A family of spiny-rayed fishes living mostly in the warm seas among rocks or kelp. There are 60 genera and 450 species, many of them brilliantly colored. Some of them are valuable for food; among others the tautog (q.v.) is very important. To this family belong the wrasses.

LABROUSTE, là'brōōst', HENRI PIERRE FRANÇOIS (1801-75). A French architect, born in Paris, and the brother of Théodore Labrouste (1799-1885), also an architect. He was a pupil of Vaudoyer and Lebas, and won the Grand Prix de Rome for architecture in 1824. After his return to Paris from his studies in Rome and travels in Italy, he was associated with Duban in the construction of the Ecole des Beaux-Arts. His best-known works are the Hospital at Lausanne (1831), the Library of St. Genevieve in Paris (1843-50), and the National Library in Paris (1855-75), which he partially reconstructed. In both these last-named buildings Labrouste was very successful in his use of metal for interior construction and decoration. In the buildings of the Ecole des Beaux-Arts and especially in the Library of St. Genevieve he exemplified the ideals of the so-called Néo-Grec movement, displaying a most refined taste and much originality.

LABRUNIE, là'brū'nē', GÉRARD The real name of the French novelist Gérard de Nerval (q.v.).

LA BRUYÈRE, là brū'yâr', JEAN DE (1645-96). A French essayist. He was born in Paris, Aug. 16, 1645. His father was a city officer, in easy circumstances. The son was educated for the bar and bought a fiscal office at Caen in 1673 from a relative of Bossuet, who introduced him in 1683 to the great Condé, in whose family as tutor to his grandson or at court the rest of his life was passed. The impression he made in society seems to have been slight but pleasant, as of a quiet and inoffensive observer and "fort honnête homme" (Racine). His observations are enshrined in his *Caractères* (1688), which, as had been predicted by Malezieu, brought him many readers and many enemies, for the fancy portraits hardly needed the numerous "keys" that were soon in circulation. Chief of these enemies were Thomas Corneille, Fontenelle, and Benserade, and each new edition brought them reinforcements from the newly wounded. From any downright injury Bossuet and the Prince de Bourbon defended him; but he was thrice defeated for the Academy, which he did not enter till 1693. His *Works* comprise, besides the *Caractères*, a translation of a similar work of the Greek Theophrastus, his academic *Discours*, a few *Letters*, and posthumously

printed *Dialogues sur le quétisme*, the genuineness of which has been questioned. The *Caractères*, alone of primary importance, take the ethical generalizations of Theophrastus and specialize them into "portraits"—a peculiar product of the literature of the century. His unique quality is in treating this portrait in the manner of Montaigne and with the epigrammatic incisiveness of Pascal and La Rochefoucauld, though the characters are not always both individual and typical, and the maxims seem shallow beside those of La Rochefoucauld. La Bruyère will always be prized as one of the most correct writers of classical French—rarely affected, always well-bred, never obscure, an ideal school classic. Editions (best by Servais, 3 vols., Paris, 1866-78) and translations (best by Helen Stott, London, 1890) are numerous. There were nine during La Bruyère's life, each with additions. The Quietist *Dialogues* appeared in 1698, the *Letters* not till 1867. The best edition is that of Chassang (Paris, 1876). The literature of the "keys," obscure but amusing, is well threshed in Fournier's *Comédie de La Bruyère*. Consult: Rahstede, *La Bruyère und seine Charaktere* (Oppeln, 1886); Allaire, *La Bruyère dans la maison de Condé* (Paris, 1886); Pelisson, *La Bruyère* (ib., 1893); Morillot, "La Bruyère," in *Les grands écrivains français* (ib., 1904).

LABUAN, là'bōō-ān'. An island constituting a "settlement" of the British Colony of the Straits Settlements and situated off the west coast of British North Borneo, in lat. 5° 16' N. and long. 115° 15' E. (Map East Indies, D 4). Its area is 28.6 square miles. The nearest point on the coast of Borneo is 6 miles distant; the town of Brunei, about 40 miles; and the city of Singapore, 725 miles. The average annual rainfall is about 168 inches, and the temperature varies from 71° to 93°. The surface is mountainous and the soil productive, but only about 2000 acres are under cultivation. There are rich coal deposits, but their exploitation has not met with great success. Labuan coal was exported in 1902 to the amount of 27,467 tons and, in 1910, 86,689 tons, but at the beginning of 1911 the mines were closed. A narrow-gauge railway, about 10 miles long, extends from Victoria Harbour to the coal mines; it was in 1914 closed to passenger traffic. Victoria Harbour (pop., about 1500) is a fine, safe port; vessels drawing 15 feet can go alongside the old jetties, and those drawing 23 feet alongside the outside jetty. There is a considerable transit trade, Victoria Harbour being a market for much of the produce of the neighboring coasts of Borneo and the Sulu Archipelago, such as sago, edible birds' nests, beeswax, camphor, rubber and gutta-percha, rattans, trepang, and tortoise shell. These products are sent to Singapore. When Labuan was ceded to Great Britain in 1846 by the Sultan of Brunei (in order that the British might make use of the excellent port), the island was uninhabited; the inhabitants now are chiefly Malays from Brunei and Chinese, the latter being mostly small traders. The population in 1891 was 5853 (of whom 28 Europeans); in 1901, 8411 (of whom 51 Europeans and 1615 Chinese); in 1912, 6634. From 1848 until the end of 1889 Labuan was governed as a separate crown colony; at the beginning of 1890 the administration was intrusted to the British North Borneo Company; this arrangement terminated at the beginning of 1906, when

the Governor of the Straits Settlements became Governor of the Colony of Labuan; a year later the island was annexed to the Colony of the Straits Settlements, becoming a part of the settlement of Singapore; and in December, 1912, it was constituted a separate settlement.

LABURNUM (Lat., broad-leaved bean trefoil), *Laburnum vulgare*. A small tree, a native of the Alps and other mountains of the south of Europe, much planted in shrubberies and pleasure grounds on account of its glossy foliage and its large, pendulous racemes of yellow flowers, which are produced in great abundance in May and June. It is often mixed with lilac, and when the latter preponderates, the combination has a fine effect. Under favorable circumstances laburnum sometimes attains a height of 40 feet. It is of rapid growth, yet its wood is hard, fine-grained, and very heavy, of

LABURNUM.

a dark-brown or dark-green color, and much valued for cabinetwork, inlaying, turning, knife handles, musical instruments, etc. The leaves, bark, etc., and particularly the seeds, are nauseous and poisonous, containing cytisine, an emetic, purgative, and narcotic principle, which is also found in many allied plants. Accidents to children from eating laburnum seeds are not infrequent; but to hares and rabbits laburnum is wholesome food, and they are so fond of it that the safety of other trees in a young plantation may be insured by introducing laburnum plants in great number, which spring again from the roots when eaten down. A fine variety, Scotch laburnum, by some botanists regarded as a distinct species (*Laburnum alpinum*), is distinguished by broad leaves and darker yellow flowers, which are produced later in the season than those of the common or English laburnum. These species are extensively planted as ornamental trees on account of their hardness and beauty. In America they are commonly called golden chain, or bean tree. The species formerly called *Laburnum adami*, now referred to as *Cytisus adami*, bearing both yellow and purple flowers, is met with sometimes. It is believed to be a graft hybrid of *Laburnum vulgare* and *Cytisus purpureus*, originated in France about 1826. This form is now called a pericyclic chimera, the central part of the stems being of

one and the outer part of the other plant. See CYTISUS.

LABYRINTH. The internal ear, or labyrinth, consists of the vestibule, semicircular canals, and cochlea, in the latter of which the delicate terminal filaments of the auditory nerve are distributed. The labyrinth is inclosed in a dense bony capsule which protects it under ordinary circumstances from injury or disease. It may be attacked, however, through violence, through the blood stream, and through two vulnerable points in the vestibule, viz., the oval and round windows, the former closed by the footplate of the stapes, the latter by a thin membrane only. The principal symptoms of disease of the labyrinth are extreme deafness, due to injury or destruction of the auditory nerve endings; tinnitus; and nystagmus, a spasmodic side-to-side or rotatory movement of the eyeball. Labyrinthine deafness is essentially an affection of the nerve. This may be brought on in various ways. 1. Hemorrhage into the labyrinth often accompanies fractures of the base of the skull, or the rupture of a blood vessel may depend on other forms of violence or upon disease of the vessel walls. 2. Purulent diseases of the middle ear may destroy the function of the labyrinth, either by extension through its walls or by penetrating the oval or round windows. This condition is dependent on violent inflammations of the middle ear, such as occur in scarlet fever or grippe. 3. Syphilis is a common cause both of the acute and chronic forms of internal ear disease. 4. The labyrinth may be attacked through the blood stream by metastasis (q.v.), as in mumps (q.v.). 5. Many drugs, the most notable of which is quinine, may affect temporarily or permanently the function of the nerve. Chronic auto-intoxication is also capable of producing a localized neuritis with disturbance of hearing and tinnitus. Lead poisoning and rheumatism may also be factors. 6. Rarefying osteitis of the labyrinthine capsule, resulting in fixation of the stapes, is a chronic affection, the etiology of which is not thoroughly agreed upon. 7. Arteriosclerosis with fatty degeneration and deposition of calcareous salts in the labyrinthine artery is believed by many to be the cause of progressive deafness in elderly people, but this again may be dependent on certain factors above enumerated. 8. The function of the labyrinth may be destroyed suddenly by the detonation of large cannons, or the auditory nerve may undergo gradual degeneration when subjected to long-continued traumatism such as occurs among boiler makers. 9. Labyrinthine deafness in young children is usually due to congenital defect or to cerebrospinal meningitis. The functions and various affections of the labyrinth, especially the symptom nystagmus, have been the subject, during late years, of careful investigation, particularly by the Vienna aurists, among whom may be mentioned Neumann and Barany, as a result of which the diagnosis of this class of diseases has made great advances. For anatomy of the labyrinth, see EAR.

LABYRINTH. The name of several celebrated buildings of antiquity, consisting of many chambers or passages difficult to pass through without a guide; hence the name is applied to a complicated mass of constructions. In antiquity the Egyptian, Cretan, and Samian labyrinths were famous. The name might be supposed to have an Egyptian etymology, as stated

by Diodorus (i, 61-97), but at present Greek scholars prefer to derive it from Greek *laura* (lane, i.e., a construction with many lanes). Evans was disposed to connect it with *labrys*, the Carian word for axe, from the fact that the double axe occurred so frequently at Cnosus. The Egyptian labyrinth was situated close to Lake Mæris, near the city Crocodilopolis, called in Ptolemaic times Arsinoe, not far from the modern Medinet-el-Fayum. It seems to have been the largest temple of ancient Egypt. The descriptions of the classical writers are very contradictory and give no clear idea of the construction; they agree, however, in describing the main building as a series of chambers (about 20), each roofed with a single stone slab of immense size. In front of the chambers were covered passages, with large monolithic columns, and adjoining them large courts filled with other buildings. The fondness of the Egyptians for using immense stones is said to have been specially manifest in this temple. According to a rude sketch in a hieroglyphic papyrus of Roman times, it was dedicated to Souchos (Sobk), the god of Crocodilopolis, though all the principal gods of the other Egyptian nomes were also worshiped in it. It is not improbable that Herodotus was right in saying that sacred crocodiles and some favored men were buried in the crypts of the temple, but this was not the principal purpose of the temple. A large cemetery of crocodiles existed northwest of the structure, and the founder had his tomb in a brick pyramid at the north side of the building. The name of this builder is variously given by classical writers, the best tradition being that of Manetho—that the fourth (better the sixth) King of the twelfth dynasty, Amenemês, or Amenemhat III, built the labyrinth as a tomb for himself. His name is given in Manetho as Lamarês (i.e., hieroglyphic Ne-ma(t)-rê, the official name of the king), which to the ear of the Greeks sounded like labyrinth, and which was corrupted by later writers to Menes, Mendes, Ismandes, etc. The Mæris of Herodotus is the same King. The temple, however, was not his burial place, although it probably served for the cult of the founder, who must have been associated with the gods worshiped there. (See MÆRIS.) Later the Queen Sebk-nefru (Skemiochris) seems to have built on the temple. This immense building, which was still standing in the first century A.D., has disappeared so completely that Petrie could find little more than traces of the foundations. Lepsius erroneously considered as remnants of it a few miserable ruins of brick houses erected there in late Roman times. The limestones of the temple must have been used as building material for the numerous cities and villages of the Fayum or else burned to lime.

The Cretan labyrinth, famous in Greek mythology as the abode of the Minotaur whom Theseus slew, was reputed to have been built by Dædalus. It is probable, however, that no such structure ever existed and that the myth referred to the natural fissures in the rocks near Cnosus, unless, indeed, it refers to the royal palace recently excavated in this locality. The Lemnian labyrinth was an ancient structure in the Isle of Samos, partly due to nature. Pliny used the term "Italian labyrinth" to designate the gigantic tomb of Porsenna near Clusium. Consult the classical quotations in regard to the Egyptian labyrinth which have been col-

lected in Wiedemann, *Herodots zweites Buch* (Leipzig, 1890); for the ruins, consult W. M. F. Petrie, *Hawara, Bahmu and Arsinoe* (London, 1889); H. R. Hall, "The Two Labyrinths," in *Journal of Hellenic Studies*, vol. xxv (ib., 1905); Paul Wolters, "Darstellungen des Labyrinths," in *Königliche-Bayerische Akademie der Wissenschaften, Sitzungsberichte, philosophisch-historische Klasse*, 1907 (Munich, 1907).

LABYRINTHODONT (from Gk. λαβύρινθος, *labyrinthos*, labyrinth + ὀδός, *odous*, tooth). A member of an order, Labyrinthodontia, of extinct amphibians. An extinct reptile found in rocks of Carboniferous, Permian, and Triassic age, having peculiar labyrinthine structure of the teeth. See STEGOCEPHALIA.

LAC (Pers. *lak*, Hind. *lakh*, from Skt. *lākṣā*, lac insect, from *lakṣa*, hundred thousand; so called from the great numbers of the insect in a single nest). The general name under which the various products of the lac insect (*Coccus lacca*) are known. The insects live upon the twigs of certain trees and soon become covered with a secretion, from certain pores, which increases in thickness, protecting the body and the eggs, and which constitutes the lac of commerce. It is said that to each of the males there are at least 5000 females, and the winged males are at least twice as large as the females. When a colony, consisting of a few adult females and one or two males, find their way to a new branch, they attach themselves to the bark, and, having pierced it with holes, through which they draw up the resinous juices upon which they feed, they become fixed or glued by the superfluous excretion, and after a time die, forming by their dead bodies little domes or tents over the myriads of minute eggs which they have laid. In a short time the eggs burst into life, and the young, which are very minute, swarm all over the twig or small young branch of the tree in such countless numbers as to give it the appearance of being covered with a blood-red dust. They soon spread to all parts of the tree where the bark is tender enough to afford them food, and generation after generation dwells upon the same twig until it is enveloped in a coating, often half an inch in thickness, of the resinous exudation, which is very cellular throughout, the cells being the casts of the bodies of the dead females. During their lifetime they secrete a beautiful purple coloring matter, which does not perish with them, but remains shut up in the cells with the other results of decomposition.

In districts like the Province of Assam, in northern India, where the gathering of lac is an important industry, the natives do not depend upon the natural crop, but regulate and increase the amount by cultivation. Two crops are gathered each year—one in May or June and the other six months later. The first is gathered principally for seed purposes, and the second for commerce. The twigs gathered at the first harvest from the tree covered with live insects still in the larval stage, and called *stick lac*, are tied on to the fresh trees; or the stick lac is placed in little bamboo baskets, which are fastened to the trees. Soon the insects crawl out of the twigs, fasten on to the branches, and the resinous formation begins. It is stated that usually a tree, after furnishing food for the lac insect for three or four years, requires a rest, although some trees will produce lac for 12 years and continue to thrive. The trees best

suited to the insects are such as are only moderately vigorous.

The principal lac-producing trees are several species of *Ficus*, including the *Ficus religiosa*, or religious tree of the Hindus; the *Cajanus indicus*, *Palas*, *Kusum*, and some other trees which are natives of India, China, and Japan.

The usual method of separating the resinous matter from the dye and other contents of the stick lac is as follows: The covered twigs are broken up or coarsely pulverized, and placed in hot water, which melts the resinous matter, liberates the pieces of wood and the remains of the insects, and also dissolves the coloring matter. This is facilitated by kneading the melted resin while in the hot water; it is then taken out and dried. The process of washing and drying is repeated a number of times until the resin is well separated from the coloring matter. The resin is then put into strong and very coarse cotton bags, which are held near enough to charcoal fires to melt the resin without burning the bags. By twisting the bags the melted resin is then forced through the fabric and received in thin curtain-like films upon strips of wood. This hardens as its surface becomes acted upon by the air and, being broken off in fragments, constitutes the shellac of commerce. The best shellac is that which is most completely freed from impurities and approaches most to a light orange-brown color. If the coloring matter has not been well washed out, the resin is often very dark. Much that is squeezed through the bags falls to the ground, without touching the sticks placed to catch it; small quantities falling form button-like drops which constitute the *button lac*; while larger ones, from 1 inch to 2 or 3 inches in diameter, constitute the *plate lac* of commerce.

Below the lac-bearing trees there is always a very considerable quantity of the resin in small particles, which have been detached by the wind shaking and chafing the branches; this also is collected, and constitutes the *seed lac* of merchants. The name of *seed lac* is also applied to the resin after it has been freed from coloring matter and is ready to be fused. See "Lac Industry of Assam," in *Journal of the Society of Fine Arts*, Feb. 8, 1901.

The water in which the stick lac is first softened contains, as before mentioned, the coloring matter of the dead insect. This is strained and evaporated until the residue is a purple sediment, which, when sufficiently dried, is cut in small cakes about 2 inches square, and stamped with certain trademarks, indicating its quality. These are then fully dried, and packed for sale as *lac dye*.

Another method of separating the resin from the dye consists in passing the twigs through crushing rollers. The powdered matter, mixed with water, is put into a stirring cylinder, where resinous and coloring matters are separated. The coloring matter is precipitated from the water by the addition of lime. The water is then drawn off and the precipitate strained and pressed into cakes which are dried in the sun. The resin is fused in closed vessels by steam heat, drawn off into a shallow trough, and then spread on hollow zinc columns, filled with warm water, which extend from the trough at an angle of 45°. Here the shellac rapidly congeals, assuming a leather-like texture. While still hot, it is removed and after drying and cooling is ready to be packed and shipped.

The shellac of commerce varies in appearance, according to the thoroughness with which it was separated from the coloring matter, from a dark red brown, called *ruby shellac*, to a pale gold, called *blonde shellac*. *White shellac* is shellac which has been bleached with chlorine. The process is a delicate one, and the product is likely to deteriorate.

The great value of the lacs is found in their adaptability for the manufacture of varnishes, both in consequence of their easy solubility and also because of the fine, hard coating, susceptible of high polish, which they give when dry.

All the varieties of lac are translucent, and some of the finer kinds, which are in flakes not much thicker than writing paper, are quite transparent. If a quantity of shellac be softened by heat, it may, by continually drawing it out into lengths and twisting it, be made not only quite white, but also opaque; in this state it has a beautiful silky lustre, and if melted and mixed with vermilion, or any other coloring matter, it forms some of the fancy kinds of sealing wax. The more usual kinds are, however, made by merely melting shellac with a little turpentine and camphor and mixing the coloring matter. Shellac has the property of being less brittle after the first melting than after subsequent meltings, hence the sealing wax manufactured in India has always had a high reputation, and hence also the extreme beauty and durability of those Chinese works of art in lac, some of which are very ancient. These are usually chowchow boxes, tea basins, or other small objects made in wood or metal, and covered over with a crust of lac, colored with vermilion, which, while soft, is molded into beautiful patterns. In India lac is used as a coating for wooden toys, and many articles of personal adornment are made from it. It is also used as a cement and by goldsmiths as a filling for hollow ornaments.

In 1914, 16,719,756 pounds of shellac, valued at \$2,689,269, were imported into the United States. This was less than in 1913, when the imports aggregated 21,912,015 pounds, valued at \$3,046,919.

LAC (Hind. *lak*, *lakh*, *lākh*, from *Skt lakṣa*, hundred thousand) In the East Indies, a word signifying a sum of 100,000 rupees. One hundred lacs, or 10,000,000 rupees, make a *crore*.

LACAILLE, lă'kî'y', NICOLAS LOUIS DE (1713-62) A French astronomer, born at Rumigny. He was a protégé of the Duke de Bourbon and under his patronage became connected with the scientists Cassini and Maraldi and later was actively engaged in meridional measurements in France. He was elected to the Academy in 1741, and about the same time professor of mathematics at the Collège Mazarin, where he established an observatory in 1746. His *Leçons élémentaires de mathématique* (1741), *Leçons de mécanique* (1743), *Leçons élémentaires d'astronomie géométrique et physique* (1746; 5th ed., 1780), and *Leçons élémentaires d'optique* (1750) were composed for the use of the students there. From 1750 until 1754 he was in charge of an astronomical expedition at the Cape of Good Hope, where he made many valuable discoveries among the southern stars and constellations. His other works include *Astronomiæ Fundamenta* (1757), *Tabulæ Solares* (1758), *Cælum Australe Stelliferum* (1763), and some *Tables de logarithmes* (1760; 4th ed., 1804). His *Journal historique*

du voyage fait au cap de Bonne-Espérance was published in 1763.

LA CALPRENÈDE, là kâl'pre-nèd', GAUTIER DE COSTES DE (1610-63). A prominent French novelist of the seventeenth century, born at the Château de Tolgon, near Cahors, in Quercy. In his youth La Calprenède appears as a frank, free, overbold gallant, an officer of the Guards, then royal chamberlain. From this function he withdrew on making a rich but not congenial marriage with a noted bluestocking, herself an author and president of a literary salon. La Calprenède wrote 10 plays and three novels, in 29 volumes of over 500 pages each. The plays are in the style of Corneille and would be conspicuous were they not outshone by such masterpieces. The best of them are: *La mort de Mithridate* (1637); *Bradamante* (1637); *Jeanne d'Angleterre* (1637); *Le comte d'Essex* (1639). *Edouard, roi d'Angleterre* (1640). *Cassandre*, the first of his novels, was published during the years 1640-43, in 10 volumes. Its popularity was such that the first volumes were twice reprinted before the completion of the last, and the whole reprinted twice during La Calprenède's life (1650-54). It was again printed in 1731 and condensed into three volumes in 1752. This novel is interesting because it shows that La Calprenède was well acquainted with the romances of chivalry as well as with Greek novels. *Cassandre* was followed by *Cléopâtre* (1647) in 12 volumes (begun in 1647), and this by *Faramond, histoire de France* (begun in 1661), which La Calprenède left unfinished at its seventh volume. Five more volumes were added by Pierre de Vaumorière. All these purport to be historical novels. *Faramond* has also the interest of being the first attempt at a novel of national history. La Calprenède is the first French novelist who had a conscious and defined plan in writing. *Cassandre* was rendered into German, Italian, and Dutch. In England *Cléopâtre* was the favorite, yet three English dramas are based on *Faramond*. If priority be taken into account, La Calprenède is the most significant, if not the best, of the idealist novelists of the century. Consult Körtling, *Geschichte des französischen Romans im XVIIIten Jahrhundert*, vol. 1 (Oppeln, 1891), and H. W. Hill, *La Calprenède's Romances and the Restoration Drama* (Chicago, 1911).

LACANDON, là'kân-dôn'. One of a tribe of Mayan stock (q.v.), formerly occupying a considerable territory upon the Lacandon and Usumacinta rivers of Chiapas (Mexico) and Guatemala, but now confined to the more inaccessible region at the head of the former stream in a region of dense forests. Their language is a dialect of the standard Maya of Yucatan. For a long time they maintained an aggressive resistance to the Spanish power and still retain a large measure of independence, with many of their ancient customs and religious rites, avoiding contact with the white man so far as possible, although nominally subject to Guatemala. The stories formerly current of large aboriginal cities and great temples still extant in their territory are now known to have been false. The Lacandones hold the ancient ruins sacred and still burn incense in the temples. They practice weaving and pottery making and are very skillful at shooting fish with stone-tipped arrows. They number less than 300, widely scattered through the jungle in small family groups. Consult A. M. Tozzer, "Comparative

Study of the Mayas and Lacandones," in *Archæological Institute of America, Report, 1902-05* (New York, 1907).

LACAZE-DUTHIERS, là'káz-du'tyā', HENRI DE (1821-1901). A French comparative zoölogist, author of a series of elaborate and richly illustrated memoirs on mollusks, parasitic crustacea, and the red coral. He was born at Montpezat, was appointed in 1865 to the chair of zoölogy at the Museum of Natural History, and three years later he was called to the Sorbonne. Elected a member of the Academy of Sciences in 1871, he afterward became its president. He was founder of the marine zoölogical laboratories of Roscoff and of Banyuls-sur-Mer, on the Mediterranean, and he founded (1873) and edited *Archives de la zoologie expérimentale*. During the last 30 years of his life he was the animating spirit of French zoölogy.

LACCADIVES, lāk'kā-divz (Skt. *Lakṣa Dvīpa*, hundred thousand islands). A group of small coral islands in the Arabian Sea, about 200 miles west of the Malabar coast of the Presidency of Madras (Map: India, B 7). Of coral formation, they are low and flat and mostly barren, and but few of them are inhabited. Pop., 1901, 10,274, 1911, 10,600, consisting chiefly of Moplahs, people of mixed Arabian and Hindu descent, professing Mohammedanism. The islands are divided into two groups—the northern, or Amandivi Islands, belonging to the Madras district of South Kanara; the southern, or Cannanore, being administered by the collector of Malabar. The chief product is coconuts, the fibre of which is almost the only article of export. As the numerous coral reefs in the vicinity of these islands make navigation dangerous, the commerce is carried on almost exclusively in native vessels, manned by the daring sailors of the islands.

LAC'COLITE, or **LAC'COLITH** (from Gk *λάκκος*, *lakkos*, pit + *λίθος*, *lithos*, stone). A mass of intrusive rock (see ROCK) having the general shape of a mushroom and supposed to be formed as the result of molten rock material being forced up from below through a fissure or crevice until, by taking a new direction along more nearly horizontal planes of bedding, it forces the overlying beds upward into a dome. Laccolites constitute a variety of batholite (q.v.) or boss. They were first described from the Henry Mountains of Utah, where the erosive agencies of the atmosphere have removed the inclosing arched roof of sedimentary strata and revealed the igneous core of the laccolite. Laccolites have since been described from many other localities, the best known, however, being in the western United States. For illustration, see GEOLOGY.

LAC DU BOURGET. See BOURGET, LAC DU.

LACE (ME. *las*, Fr. *lacs*, OF. *laz*, It. *laccio*, Sp. *lazo*, Portug. *laco*, Eng. *lasso*, Lat. *laqueus*, all meaning 'noose'; equivalent to *lace* as used in this article, are Fr. *dentelle*, *guipure*, *point*, Ger. *Spitzen*, *Kanten*, Dutch *Kant*, Sp. *encaje*, It. *trina*, *merletto*, *punto*, *pizzo*, ML. *opus reticulatum et denticulatum*; interesting to compare with the Fr. *lacs* are its diminutive *lacet*, cord, and *lakis*, network). Decorative openwork of threads, usually linen or cotton, but sometimes of silk or aloe fibres. The word developed this sense in the sixteenth century, before which it was restricted to shoe, corset waist, and sleeve laces, and to the gold and other fancy braids used in trimming hats and clothes.

HAND LACE

Probably the earliest use of the word was in an ancient rule for English nuns dating from 1210, which, modernized in form and abbreviated, reads: "Make no purses or lace (laz), but shape and sew and mend church clothes and poor men's clothes." A clear idea of the *braid* meaning of the word in the fifteenth century can be had from the directions given in an Harleian manuscript dating from 1471, for making "lace Bascon, lace indented, lace bordered, lace covert, a brode lace, a round lace, a thynne lace, an open lace, lace for hattys," etc. The illuminated initial letter shows a woman busy making such lace. As is explained in the text, threads in combinations of two, four, five, up to 10 and 15, are twisted and plaited together. No pillow, bobbins, or pins are used. Instead the fingers serve as pegs, upon each of which is placed a ball of thread. The fingers are lettered, the first finger being called A, the second B, and so on. A "thynne" lace can be made with only three threads, requiring the use of only three fingers, A, B, and C, on one hand. By occasionally dropping some of the threads, braid with openwork or with indented edge is produced. For very broad laces the fingers of assistants must also be used. The most ancient specimens of lace in existence are knotted hair nets and breast nets from the tombs of Thebes and other parts of Egypt—some dating from as far back as 2500 B.C., and some not only made with loose tassels and meshes in ornamental groups, but also adorned with heads and tiny porcelain figures strung among the meshes. Also from the tombs of Egypt come the Coptic (Roman-Egyptian) laces dating from the third to the seventh century A.D. Some of these are bobbin laces; others are embroidered warp laces. Mrs. Pollen (see *Bibliography*, below) in her illustrated folio volume illustrates examples of both. The bobbin lace illustrated by her resembles torchon, was unearthed in 1903, and is now in the Cluny Museum. The bobbins were found with it. It was probably made, not on a lace pillow, but on a wooden frame, with pegs to hold the threads apart. An interesting example of Coptic lace net for the hair is the coil in the Poldi-Pezzoli Museum, Milan, illustrated by Ricci, also included in this work.

The oldest large pieces of lace in existence are on two albs, the first of which, still preserved in Assisi, is said to have been woven and ornamented by St. Clare and her nuns and to have been worn by St. Francis of Assisi (1181-1226). The lace is a fundamental part of the linen robe, being drawn work, a polygon made up of squares containing gammadions (swastikas) and other derivatives of the cross. Mrs. Pollen regards the design and technique as showing traces of Coptic origin. The other alb is said to have been worn in 1298 by Pope Boniface VIII and is preserved in the treasury of the Sistine Chapel in the Vatican. The linen of which it is made is crisp and wiry, though much worn, resembling, not Italian linen, but that of Egypt, the *linum usitatissimum*, called in early Christian times *byssus* of *Alexandria*. The linen of this alb is slightly finer than that of the Assisi alb and is heavily adorned with lace of an Oriental character. The rosettes symmetrically grouped in squares are needlework in *punto a rammendo*, and the curious *punto treccia* (tress work) is introduced as well

as the *punto a stuora* (matting stitch). But in this as well as other very early lace the *punto a festone* (buttonhole stitch) does not appear, although afterward it came to be almost the only stitch used in needle lace, until the advent of the *réseau* (looped mesh). In the alb of Pope Boniface the lace was inserted in squares, the surrounding linen cloth being developed into rows of drawn work. The flounce and insertions of bobbin lace were added at a later date.

Painted evidence of the ecclesiastical use of lace at the beginning of the fourteenth century is afforded by the fresco of Giotto (1276-1337) in St. John Lateran, where one of the two priests supporting Boniface VIII wears an alb with lace on the sleeve; by Giotto's "St. John the Baptist" in the Louvre, with lace on the bed linen and the long towel; by Giotto's fresco in the basilica of Assisi, where the shirt of the Christ Child is adorned with reticella lace.

However, even if the Assisi and the Pope Boniface albs are as ancient as claimed, it is certain that the amount of lace worn either by ecclesiastics or laity previous to the sixteenth century was comparatively small, and that the development of needle lace and bobbin lace, made without using warp or web or net, did not take place until then. Only then does lace begin to appear frequently in paintings and in illustrations of manuscripts and books. From the middle of the sixteenth century well into the eighteenth is the age of lace as an article of personal adornment for both gentlemen and ladies. But of course the amount of lace worn now, though less conspicuously, since the invention, and enormous development in recent years, of inexpensive power-machine laces, is thousands of times greater than ever before, while the use of all-lace curtains that became practicable only with the development of machine net has within the past 25 years become common in the United States, Great Britain, and France, and not uncommon in Germany and Italy.

The primitive origin of lace is from nets and embroidered warps or knotted fringes. Lace nets are finer and more decorative than fish nets or hunting nets and are used to adorn the body or drape the home. Embroidered warp laces are those made, like the ancient Coptic and Peruvian and some of the early Italian ones, by omitting the weft from a section or sections of a cloth on the loom or weaving frame, and then with needle or bobbin working a lace pattern on the warps thus left exposed. Another way of getting exposed warps to use as a foundation was to pull out some of the wefts. This is *drawn work*. Still another way of getting lace into the body of a fabric was to cut out sections of the fabric, edging the small openings with embroidery and filling in the large ones with needle lace. This is *cutwork*. As a basis for lacework figured by darning or filling in with the needle, square-mesh knotted net was also used. This is *filet italien*, called *laci* or *filet brodé* by the French and *modano* by the Italians. Another basis for similar lacework was *buratto*, or bolting cloth, coarse and open like a sieve. Lace fringes were made by knotting warps left unwoven at the ends of a cloth. This is *macramé* lace. All of these laces date from before the Renaissance. Other laces are made by *knitting*, *crocheting*, and *tatting*. (See *KNITTING*.) Crocheting is looping done with a crochet hook, and tatting

is knotted lace made with a tatting shuttle. But the laces par excellence, and those that most appeal to the imagination as derived from the delicate and wonderfully beautiful laces of the spider and caterpillar, are made with needle or bobbin and without any cloth or net or warp ground to start with. These are the laces the development of which in the sixteenth century brought fame and fortune to lace makers and established the art as one of the great decorative arts.

Here it is well to remark that the attempt to make point lace a synonym of needle lace or of needle-point lace is a gross error. Point means bobbin lace (sometimes called pillow lace from the pillow on which much of it is made) just as much as it means needle lace. In other words, point is a general word for lace in English as well as in French and Italian (*punto*). General terms that cover all laces, machine as well as hand, are *sewed laces* and *woven laces*—the former including all laces made with the needle and the latter all laces made in any other way. Laces made on embroidery machines class, of course, with sewed laces, those made on the Leavers machine or the lace-curtain machine or the dentellière with woven laces.

Needle lace of the *punto in aria* type is worked on loose threads that have no coherency until the needlework binds them together. This needlework is executed with a single thread. First the pattern is drawn, usually on parchment. A piece of heavy linen is sewed to the parchment to hold it straight. The threads in groups of two, three, four, or more are laid along the main lines of the pattern and basted down through parchment and linen.

The entire pattern is then executed, in five stitches, the buttonhole stitch being much used except for the net ground. The accompanying plate shows how Alençon lace is made, the different classes of work being assigned to different workers successively, each an expert in her particular part. Fig. 1 shows the design, which is drawn on white paper. It is then pricked with a needle on a piece of green parchment on which the grounding is indicated (Fig. 2). A colored design in which the portions to be worked out by the different workers are indicated is next employed and is shown in Fig. 3. The first worker traces out the design on the parchment (*la trace*) as shown in Fig. 4. The next supplies the coarser groundwork (*bride*), indicated on the color scheme by yellow and shown in Fig. 5. Next the finer grounding (*réseau*), which corresponds in the color plan to the green, is worked in, and then the design itself is worked in solid buttonhole stitch (*rempli*). This is indicated by the white on the color plan. Next the fine stars of the openwork (*modes*) are added, corresponding to the red on the diagram, and the final process consists in working a heavy outline around the design, as is indicated by the black. Fig. 9 shows the finished lace after it has gone through these successive stages.

Bobbin lace is made from a large number of threads attached by pins to an oval cushion or pillow, each thread being wound on a small bobbin. The design, as in needle lace, is drawn on stiff paper or parchment, which is carefully stretched over the pillow and pricked out along the main lines. Then small pins are inserted at close intervals, around which the threads turn to form the various meshes and other openings.

The thread on the bobbins is lightly wound and tied at the top in a loop that slips easily when the bobbin is needed. The plaiting or weaving is exceedingly intricate, but the bobbins are passed over and under each other with remarkable rapidity and accuracy. The laces are usually made, not in large pieces that would require a huge cushion and a bewildering number of pins and bobbins, but in separate motifs that are joined together afterward.

The early pattern books indicate not only that early needle-lace designs are based on embroidery designs, but also that they are Venetian. They first appear definitely in *Il Burato*, published about 1527, and continued their career in the pages of Tagherite and Zoppino, until in Mathio Pagan's book, published in 1543, we find *punto tagliato* (cutwork), which is nothing more or less than *reticella* lace. The novelty of this lace depends upon the *tagliato*. The linen not only has threads drawn, but it is also cut. The process is splendidly illustrated by a piece of reticella lace in the Palermo Museum that has lain unfinished since the sixteenth century (Plate 102 of vol. i of Ricci; see *Bibliography*). The main lines that border the cut squares are in threads left undrawn and covered with matting stitch, and the squares themselves are filled in with needle lace, at first consisting of triangles in buttonhole stitch, attached by the three corners to the linen or to crossbars, and with brides to lighten the general effect. Later, openwork squares, wheels, and picots were introduced, and before long flowers, foliage, animals, and personages. Reticella lace has often been called by the various names of Gothic, Greek, Venetian, Spanish.

Punto in aria (point in air) is made with the needle out of thread only, without warp or net or web to start with. It comes in logical and historical sequence after reticella lace, from which it is derived. It is needle lace par excellence.

Italian bobbin lace is the younger sister of Italian needle lace, and while all the Italian needle laces, except Sicilian drawn work, are of Venetian origin, there are pillow laces from Genoa, Milan, and the Abruzzi as well as from Venice. In character they are decidedly more popular and more provincial and have less individuality than the aristocratic needle laces. But while bobbin laces lack the accuracy of design, the interesting relief, and the delicate perfection of needle laces, they are both softer and stronger. That the making of bobbin laces was well established in Venice before the middle of the sixteenth century is clear from the preface to Froschower's book of designs for bobbin lace, published in Zurich in 1560. He says: "Among the divers arts invented and practiced for the good of humanity, ought justly to be mentioned the Art of Bobbin-lace, which arose in our country about 25 years ago and quickly became common amongst us. It was imported into Germany from Italy for the first time by Venetian merchants in 1536." This would seem to settle definitely the claim of Barbara Uttmann to be regarded as the inventor of bobbin lace, despite the fact that in 1834 a monument was erected to her in Annaberg, in the Harz Mountains, Germany, bearing the inscription "inventor in 1567 of bobbin lace, which made her the benefactress of the neighborhood."

One reason for the rapid development of bob-

bin lace, i.e., its cheapness, is brought out by Froschower, who says: "When, years ago, cut-work and relief work were much in vogue, there is no telling how much time was taken in making a collar or bib or anything of the sort, joined to heavy expense to the person by whom it was ordered. On the contrary now, a bobbin lace may be acquired for little money and applied in little time, so that the cost is much less. Formerly, too, collars and other articles were adorned with cords of gold and colored silk, occasioning vast expense for soap and cleaning; now the work is done much more expeditiously because all these things are made of linen that is not injured by lye."

A primitive lace that deserves especial notice because of its revival in recent years in both hand and machine forms is *filet italien*. (See above.) Anciently it was called *lacs* in English as well as French, one of the "laureate" Skelton's verses (1460-1529) reading:

"The sampler to sew on, the lacs to embrand."

In a painting (1488) by Lorenzo Costa, at San Giacomo in Bologna, the square openings of the robes of the three personages are filled in with lacs. The most influential and famous designer for both lacs and reticella was Vinciolo, the first edition of whose work was published in Paris in 1587 under the title *Les singuliers et nouveaux pourtraicts et ouvrages de l'ingerie*. There are a number of ancient specimens of lace extant after Vinciolo's designs, notably a bedspread in the Victoria and Albert Museum, composed of squares picturing the months of the year, male and female heads, figures and groups. In early Italian lacs (modano) the designs are classic renaissance with figures and foliage of the type called grotesque after the underground caverns from which the ancient Roman frescoes and mural ornament were excavated. In German lacs eagles and heraldic emblems, oak leaves, acorns, thistles, and hunting scenes predominate.

Towards the end of the sixteenth century Flemish paintings and drawings begin to show the use of Flemish bobbin lace, and during the seventeenth century an immense quantity of it was produced in Flanders. The industry here was much helped by the superior quality of Flemish linen, "fyner than any other part of Europe yealdeth." The designs were apt to be crowded, and composed of bold scrolling tapes, called *guipure de Flandres* when the motifs were joined with *brides à picots*, and *point d'Angleterre* when the ground consisted of fine net. Hardly any needle lace was made in Flanders before 1720, when Brussels began to produce an imitation of Alençon lace, but less firm and precise and with looser toil than the French work. Some of the thread used is so fine that it has to be spun underground in damp air to keep it from breaking. Much of the Brussels eighteenth-century work is extremely naturalistic, and at the court of Louis XV it was popular, being sometimes preferred to Alençon. The designs were uniformly French in character, with the Chinese influence strong, as in French decorative art of the first half of the eighteenth century. Other Flemish cities famous for lace are Bruges, Mechlin (Malines), Valenciennes, Lille, and Arras, the last three of which became French by conquest and treaty in the seventeenth century.

In the reign of Louis XIV Paris became the

centre of style. Art industries of every kind were established and encouraged by Colbert, among them tapestries at the Gobelins and needle lace at Alençon. A company was formed Aug. 15, 1665, with the exclusive privilege for 10 years of making *points de France* (French lace). On Nov. 17, 1667, was published a special prohibition against selling or wearing "passements, lace, and other works in thread of Venice, Genoa, and other foreign countries." The French were so determined to promote and protect the home industry that in 1670, wrote an Englishman then traveling in France, "there was publicly burnt by the hangman a hundred thousand crowns worth of point de Venice, Flanders lace, and other foreign commodities that are forbid." By 1673 Colbert, in acknowledging the receipt from the French Ambassador to Venice of a point collar in high relief, was able to write that "those made in France are quite as fine."

The lace industry of Honiton, England, is supposed to have been founded by Flemish refugees escaping from the persecutions (1568-77) of the Duke of Alva, and names undoubtedly of Flemish origin occur at Honiton, Colyton, and Ottery St. Mary. That bobbin lace was made here in the reign of James I is shown by the inscription on the gravestone of "James Hodge, *Bonelace siller*," and by Westcote's mention of it in 1620. A petition submitted to the House of Commons in 1698 asserts that "the English are now arrived to make as good lace in fineness and all other respects as any that is wrought in Flanders." However, the petition adds: "The Flemish send it to Holland, Germany, Sweden, Denmark, France, Spain, Portugal, etc., whereas we made it chiefly to serve our own country and plantations." The chief centres of production of modern handmade laces are France and Belgium, England and Ireland, and Italy. The industry was inaugurated in Ireland about 1870 and revived in Italy at Burano (a suburb of Venice) about a few years later.

MACHINE LACE

The *first lace machine* was based on Lee's stocking machine (see KNITTING), as modified by Strutt and Frost to produce in 1764 a web with interstices, otherwise net. By 1769 Frost was able to make figured net and by 1777 net with square meshes that were fast. The *second lace machine* is the warp frame, so called because it employed a set of warp threads for each of which there was an individual needle looping its thread first to the right and then to the left and back again. By 1795 this machine was producing plain net and soon afterward figured lace in an almost endless variety of meshes and patterns. The *third lace machine*, brought to perfection by constant improvement during the past century, is the so-called Leavers machine, developed by John Heathcoat (1809) and John Leavers (1813). The application to the Leavers machine of the Jacquard attachment vastly increased the range and intricacy of patterns possible, and the operation by water and later by steam power vastly increased the speed and the quantity produced. In the Leavers machine warp threads and bobbin threads are used, sometimes more than 9000, making 60 pieces of lace at once, each piece requiring 100 warp and 48 hobbin threads. The warp threads are stretched perpendicularly, just far enough apart to admit

the passage between, edgewise, of a 25-cent piece. The bobbins are very thin and flat, so that they pass without difficulty. Ingenious mechanism varies the tension of warp and bobbin threads as desirable. As the bobbins swing like pendulums through the warp threads, they are made to vacillate and twist around the warps, the twistings being compressed by combs. If the bobbin threads are made tight and the warp threads loose, the warps will twist on the bobbin threads, and vice versa.

The kinds of embroidery machines used in making machine laces are: (1) the *bounaz machine*, a sewing machine that leaves a trail of V's on net or cloth, thus producing Swiss laces and lace curtains, (2) the *hand-embroidery machine*, that multiplies automatically the work of the operator who executes the master pattern; (3) the *schiffle* or *power embroidery machine*, that works with shuttle as well as needle and has an output many times larger than that of the hand machine. The *schiffle* machine, though of delicate and complicated construction, easily getting out of order, is indispensable for the cheap production of low and medium grades of embroidery and lace. On these two embroidery machines are made the world's imitation guipure laces, such as *point de venise*, *rose point*, *point de genes*, etc. The centre of the branch of the lace industry is Plauen in Germany. Nottingham in England and Calais in France are the centres of the production of woven laces, the French nets being particularly fine. In the production of lace curtains woven in one piece (the so-called Nottinghams), the United States is coming rapidly to the front, as well as in other branches of the machine-lace industry. The production of machine laces and lace curtains in the United States increased from \$3,585,138 in 1899 to \$7,203,422 in 1904 and to \$8,922,082 in 1909, not including about one-ninth as much more made by manufacturers primarily engaged in making carpets and rugs.

Bibliography. Mrs. Bury Palliser, *History of Lace*, often cited as the ultimate authority, the third edition of which was published in 1875, should be consulted cautiously, as it contains a mass of confused information and misinformation, even in the fourth edition, revised, with the addition of many important illustrations, by Jourdain and Dryden (London, 1902). A scholarly work, elaborately illustrated with laces, most of which are in the Imperial Austrian Art Industrial Museum, is Dr. Moritz Dreger, *Entwicklungs-geschichte der Spitze* (Vienna, 1901). Mrs. J. H. Pollen, *Seven Centuries of Lace* (London, 1908), is a folio volume with invaluable illustrations of precious laces that are well described. The standard work on Italian laces is Elisa Ricci, *Antiche trine italiane*, in two huge folio volumes superbly illustrated, with authoritative text (Bergamo, 1908, 1911). The American edition, entitled *Old Italian Lace* (Philadelphia, 1913), is useless as far as the text is concerned because badly translated. A small but valuable book on French laces is Ernest Lefebvre, *Les points de France*, translated by M. T. Johnson (New York, 1912) and well illustrated. An exhaustive work on Alençon laces is by G. Despierres, *Histoire du point alençon* (Paris, 1886). The history of English machine laces is told by William Felkin in his *Hosery and Lace* (London, 1876). On lace curtains G. L. Hunter has an important chapter in his *Home Furnishings* (New York, 1913). A convenient handbook

is F. Nevill Jackson's *Hand-Made Lace* (London, 1900). Another and better one is M. Jourdain's *Old Lace* (ib., 1909). Books showing how to make lace are: L. A. Tebbs, *Bobbin Lace* (London, 1907); Mincoff and Marriage, *Pillow Lace* (ib., 1907); Carita, *Lacis* (ib., 1909). Convenient and well illustrated is the little *Lace Dictionary* by C. R. Clifford (New York, 1913).

LACE/BARK' TREE (*Lagetta lintearia*). A lofty tree of the family Thymelaeaceae, native of the West Indies, with ovate, entire, smooth leaves and white flowers. It is remarkable for the tenacity of the fibres of its inner bark, which may be separated after maceration in water into layers resembling coarse lace. A Governor of Jamaica is said to have presented a cravat, frill, and ruffles made of it to Charles II. It is also used in making ropes, whips, etc. The plant is sometimes grown in greenhouses as a curiosity.

LACE BUG. A bug of the family Tingitidae. The wings and body are covered by a lacelike meshwork of fine lines. These bugs feed upon the juices of plants, clustering usually upon the leaves. Their eggs are fastened to the leaves by a brown sticky substance. *Corythuca arcuata* is especially abundant on hawthorn trees and *Corythuca ciliata* on the sycamore.

LACÉDEMON, lās'ē-dēmōn (Lat., from Gk. Λακεδαίμων, *Lakedaimōn*). The ancient name of Laconia, sometimes applied to Sparta (q.v.).

LA CEIBA. See CEIBA.

LACE/LEAF'. A Madagascar aquatic plant. See LATTICE-LEAF.

LACÉPÈDE, lās'sā'péd', BERNARD GERMAIN ETIENNE DE LA VILLE, COMTE DE (1756-1825). A French naturalist, born at Agen. He early showed his love for natural history and at the same time cultivated music and composed several operas, which, however, were never produced. Gluck encouraged his talents in this direction, and Lacépède wrote a treatise on *La poésie de la musique* (1781-85), which was favorably received. After the appearance of his *Essai sur l'électricité* (1781) and *Physique générale et particulière* (1782-84), Buffon appointed him subdemonstrator in the Jardin du Roi. His *Histoire des quadrupèdes ovipares et des serpents* (1788-89) and *Histoire naturelle des reptiles* (1789), for many years the standard work on the subject, despite its inevitable errors, are continuations of Buffon's *Histoire naturelle*. He was a member of the Legislative Assembly in 1791, but did not remain in Paris during the Reign of Terror; his life was in danger there because of his conservatism. After his return he was appointed to a special chair for instruction in the history of reptiles and fishes at the Jardin des Plantes and in 1796 became a member of the Institute. His *Histoire naturelle des poissons* (1798-1803) and *Histoire des cétaqués* (1804) are also continuations of Buffon's great work. From 1799 until the end of his life Lacépède took a prominent part in politics. He was made Senator in 1799; in 1803 he became Grand Chancellor of the Legion of Honor and in 1809 Minister of State. After the Restoration of 1814 he was made a peer. His other works include: *Histoire générale physique et civile de l'Europe depuis les dernières années du Vème siècle jusque vers le milieu du XVIIIème* (18 vols., 1826); *Les âges de la nature et l'histoire de l'espèce humaine* (1830); and numberless articles contributed to miscellaneous publications. His works on natural history were collected and published in 1826, 1830, and 1840.

LACERTILIA, lās'ēr-tīl'ŷ-ā, or **LACERTIDÆ**, lā-sēr'ti-dē (Neo-Lat., from Lat. *lacertus*, *lacerta*, lizard). The lacertilians or lizards constitute an order (Autosauri or Lacertilia or Lacertoidea) of saurians, comprising the lizards as distinguished from the snakes. One suborder is known as Lacertæ and includes all the forms except the geckos on the one hand and the chameleons on the other. The typical family of this suborder is Lacertidæ, and its type genus *Lacerta*. This expresses the views of Cope, Boulenger, and Gadow. See LIZARD.

LACER-TO, LAGAR-TO. See LIZARD FISH.

LACE-WING. Any insect of the neuropterous family Hemerobiidæ. The most common forms belong to the genus *Chrysopa*, the golden-eyed flies. They are green or yellowish-green insects, with gauzelike net-veined wings, and emit a very disagreeable odor. The eggs are supported upon a long threadlike peduncle and are thus protected from the depredations of their own larvæ, which prey upon insect eggs, small

A LACEWING (*Chrysopa oculata*).

a, adult fly, enlarged about four times; b, larva, devouring a pest; c, three stalked eggs; d, cocoon, showing the hinged cap lifted by the emerging imago.

larvæ, and especially upon aphids, and for this reason are called aphid lions. The mature larva spins a cocoon from which the pupa escapes before the final molt by means of a circular lid or opening. They are commonly parasitized by the chalcids flies (q.v.) of the genus *Isodromus*. About 40 species have been recorded from temperate North America.

LACHAISE, lā'shāz', FRANÇOIS D'AIX DE (1624-1709). A Jesuit priest, the confessor of Louis XIV. He was born at Aix in what is now the Department of Loire. He had been rector of the Jesuit academies at Grenoble and Lyons and was head of the latter province when Louis called him to be his confessor on the death of Father Ferrier (November, 1675). In the most important questions of his time Father Lachaise avoided extreme courses. He sustained among his contemporaries the reputation of a man of mild, simple, and honorable character. He did not favor violence against the Jansenists, was a friend of Fénelon, and, though partially responsible for the revocation of the Edict of Nantes, regretted the atrocities that followed. He was opposed to the marriage of Louis XIV with Madame de Maintenon, but finally performed the secret ceremony. In spite of the difficulties of his delicate position at court, during

the 34 years that he filled his office of confessor he never lost the favor of the King. He was a man of some learning and fond of antiquarian pursuits. In 1701 he was elected a member of the Académie des Inscriptions et Belles-Lettres, for which he wrote some dissertations. Louis XIV built him a country house to the northeast of Paris, the large garden of which was in 1804 converted into a burial place, known as the Père-Lachaise, the largest and most remarkable cemetery in the world, containing 20,000 monuments, 700,000 graves, and holding the remains of France's greatest men. Consult R. de Chaulantze, *Le père de la Chaise* (Paris, 1859).

LA CHALOTAIS, lā shā'lō'tā', LOUIS RENÉ DE CARADEUC DE (1701-85). A French magistrate, procureur général of the Parliament of Brittany, where he was a decided opponent of the Jesuits. His memoirs, *Comptes rendus des constitutions des Jésuites* (1761, 1762), presented to his Parliament, led to the suppression of the order in France. He also published a work on the reorganization of education, entitled *Essai d'éducation nationale* (1763). This was a remarkable treatise for the times, received high praise from Voltaire, and was widely translated. Later he was subjected to long political persecution, but in 1775 was restored to his place in the Parliament of Rennes. Consult J. Dehaille, *La Chalotais, éducateur* (Paris, 1910).

LACHAMBEAUDIE, lā'shān'bō'dē', PIERRE (1807-72). A French writer of fables, born at Sarlat, Dordogne. He was of humble parentage and received only a rudimentary education, but became known after he went to Paris among the disciples of Saint-Simon. His *Essais poétiques* appeared in 1829, and 10 years afterward, with the financial assistance of Enfantin, he published *Fables populaires*, which were crowned by the Academy and often reprinted. He used to recite them himself at club meetings or concerts. Arrested for his participation in the revolution of 1848, he was with difficulty liberated through Béranger's influence, while the Duke de Persigny saved him from transportation to Cayenne in 1851; but he was banished from France for eight years. While in Brussels he published *Fleurs d'œil* (1851) and afterward *Fleurs de Villemomble* (1861) and *Hors d'œuvre* (1867).

LA CHAPELLE (lā shā'pél') **MAN.** See MAN, SCIENCE OF, *Ancient Types*.

LACHAUD, lā'shō', GEORGES (1846-96). A French advocate, publicist, and romancer, born at Paris, distinguished at the bar. He wrote: *Essai sur la dictature* (1875); *L'Empire devant l'ouvrier* (1876); *L'Empire* (1877); *Les bonapartistes de la République* (1877); *Que vont devenir les bonapartistes?* (1879); *Le prince Napoléon et le parti bonapartiste* (1880); *Bonapartistes blancs et bonapartistes rouges* (1885); and the lighter works, *Choses d'amour* (1881); *Mieux vaut en rire* (1882); *Pour l'argent* (1883); *Impitoyable amour* (1884); *Oh! mesdames* (1885); *Cabotinage* (1886).

LA CHAUSSÉE, lā shō'sā', PIERRE CLAUDE NIVELLE DE (1692-1754). A French dramatist who first merged tragedy and comedy in France and so created the *drame*, or melodrama. There was already a tragedy of common life (*tragédie bourgeoise*) and a pathetic comedy (*comédie larmoyante*). La Chaussée combined these, as, e.g., in *Le préjugé à la mode* (1735), and thus furnished a basis for the dramaturgic theories

LACHINE RAPIDS

of Diderot. His best works are: *Mélanide* (1741), in which he developed the best type of *comédie larmoyante*; *L'Ecole des mères* (1744); *La gouvernante* (1747). But though these beginnings of a large and important section of the modern drama are of great interest, intrinsically the work of La Chaussée is of small value. The heatregoing public of his time, however, thought that he was a great dramatist. Voltaire in the eighteenth century and Villemain in the nineteenth have severely criticized him. Consult: J. Uthoff, *Nouvelle de la Chaussée's Leben und Werke* (Heilbronn, 1883); Lanson, *La Chaussée et la comédie larmoyante* (Paris, 1887); Brunetière, *Epoques du théâtre français* (ib., 1892).

LACHELIER, lăsh'lyă', JULES (1832-). A French philosopher, born at Fontainebleau. From 1864 to 1875 he was professor of philosophy at the Ecole Normale Supérieure, where he did much to encourage philosophic study. He was also closely connected with educational work and was director of the Normal conferences till 1877, when he became inspector of the Paris Academy. Two years afterward he was appointed instructor general of public education, and in 1901 this appointment was made honorary. He wrote *Du fondement de l'induction* (last ed., 1898) and *De Natura Syllogismi* (1871). His philosophy is neo-Kantian.

LACHES, lăsh'ez (OF *lachesse*, remissness, from *lache*, *lasche*, Fr *lâche*, lax, remiss, from Lat. *laxus*, slack). In law, such an unreasonable delay in asserting a right or prosecuting a remedy as will be available, as a defense in a suit of equity, to a person prejudiced thereby. For the defendant to make out a defense of laches on the part of the plaintiff, he must prove (1) that the plaintiff, knowing all the facts concerning his alleged rights, has negligently or willfully neglected to prosecute his suit; (2) that the defendant has never recognized any rights in the plaintiff to the subject matter in question; (3) that the defendant, relying on the apparent acquiescence of the plaintiff or in ignorance of his claims, has altered his position in consequence of the delay, to such an extent that he will suffer loss if the plaintiff's alleged rights are sustained.

It is a defense resting in the discretion of the court and in this respect differs from that of the statutes of limitations, which provide fixed limits of time within which an action must be commenced. Therefore a reasonable excuse for delay or apparent neglect will always be considered by the court. Thus, severe illness of the plaintiff, the fact that he was ignorant of his rights, that negotiations for settlement had been pending between the parties bona fide, or that the delay was caused by fraud or concealment on the part of the defendant, have all been held to be reasonable excuses for delay in enforcing equitable rights. A person under a legal disability, as an infant, an idiot or lunatic, a married woman at common law, or other person legally incompetent to bring an action, will not be considered as guilty of laches until the disability ceases.

In courts of admiralty substantially the same principles as the above are followed, but the court is not bound by precedents in state courts. See **LIMITATION OF ACTIONS**, and consult the authorities referred to under **PRACTICE; EQUITY**.

LACHES, lă'kěz (Lat., from Gk. *Λάχης*, 475-418 B.C.). An Athenian general in the

earlier part of the Peloponnesian War. With Charades he was sent to Sicily with a fleet, in 427 B.C., to support Leontini in her struggle with Syracuse. On the death of his colleague he came to sole command, but accomplished little, as the Sicilians soon reconciled their differences. As leader of the moderate party, Laches was opposed by Cleon and lost much of his influence until Cleon's death, but in 421 he induced the Athenian assembly to agree to the Peace of Nicias (q.v.). Three years afterward he was put in command of the Athenian forces and was killed at Mantinea (418). One of Plato's dialogues is named after him.

LACHES, lă'kěz. A dialogue of Plato. Ly-simachus and Melesias, desiring a better education for their boys than that which they have enjoyed, consult Nicias and Laches about the importance of fencing. Socrates is appealed to and leads the discussion to a consideration of the nature of courage. The dialogue is enlivened by irony and witty repartee.

LACHESIS, lăk'ez-sis (Lat., from Gk. *Λάχης*). In Greek mythology, one of the three Fates. See **PARCE**.

LACHINE, lă-shēn'. A town in Jacques Cartier Co., Quebec, Canada, on Lake St. Louis and the Grand Trunk and Canadian Pacific railways, 8 miles south-southwest of Montreal (Map: Quebec, E 5). It is a favorite summer residence of many Montreal citizens and a popular winter resort of pleasure parties. The Lachine Canal, built to avoid the famous Lachine rapids on the St. Lawrence, connects the town with Montreal, and all the water commerce between that city and the West passes through this canal. The town is the starting and landing place for the Ottawa line of steamers for Kingston, Ottawa, Toronto, and Hamilton. It is the seat of extensive electric-power works which supply Montreal, and it has electric-railway connection with that city. Its industrial establishments include electric-lighting companies, manufactories of wheels, drainpipes, wire rope, screws, doors and sashes, boats, and radiators. In 1910 the value of the manufactured output was \$6,295,716. The name Lachine was given to the site in 1669, in derision of early explorers who after reaching this point returned to their companions at Montreal, whom they had left four months previously, hoping to reach China by way of the St. Lawrence. In 1689 the Iroquois burned Lachine and massacred all the inhabitants. Pop., 1901, 5561; 1911, 10,699.

LACHISH, lă'kish (Heb. *Lākish*). A city of Judah, which several times played a part in Hebrew history (Map: Palestine, B 4). The King of Lachish and four allies are said to have been routed by Joshua (Josh. x. 1-33) and Lachish taken. The city was given to the tribe of Judah (xv. 39) and in the time of Rehoboam became a strong fortress (2 Chron. xi. 9). It was to Lachish that King Amaziah fled when a conspiracy obliged him to leave Jerusalem, and he was slain there (2 Kings xiv. 19). There is a remarkable reference to the city in a discourse of the prophet Micah (i. 13), who denounces the place as "the beginning of sin to the daughter of Zion," in which all the transgressions of Israel were found. Sennacherib in his raid on the Kingdom of Judah (in 701 B.C.) took Lachish, together with other fortified cities, and on his return to Assyria had a sculpture prepared in which he depicts himself seated on his throne at Lachish and receiving the Jewish captives.

It was to Lachish that King Hezekiah of Judah sent messengers with gifts and promises in the hope of inducing Sennacherib to spare Jerusalem (2 Kings xviii. 14-16) and abandon the campaign. Lachish was besieged by Nebuchadnezzar on his invasion of Palestine (Jer. xxxiv. 7) and is mentioned among the cities resettled by the Jews in the Persian period (Neh. xi. 30). Flinders Petrie and Bliss have identified Lachish with Tell el-Hesi, a mound of ruins, the situation of which corresponds to that required for Lachish, 16 miles east of Gaza. The remains of eight cities, one above another, were found on excavating this mound, and the history they indicate for the spot agrees with what is known of Lachish to such an extent as to make the identification all but certain. Consult: Schrader, *Cuneiform Inscriptions and the Old Testament*, vol. ii (London, 1885-88); Petrie, *Tell el-Hesi* (ib., 1891); Bliss, *A Mound of Many Cities* (ib., 1894); Rogers, *Cuneiform Parallels to the Old Testament* (New York, 1913).

LACHLAN, lăk'lan. A river of New South Wales, Australia (Map: New South Wales, C 3). It has its source in the Cullarin Range, 175 miles southwest of Sydney, and flows first northwest through an uneven forest region, then southwest through the great treeless plains, where in the dry season it is sometimes reduced to a chain of ponds. It joins the Murrumbidgee after a course of 700 miles, and through the latter it discharges into the Murray on the south boundary of the state.

LACHMANN, lăg'măn, KARL KONRAD FRIEDRICH WILHELM (1793-1851). A celebrated German critic and philologist, born at Brunswick. He studied at the universities of Leipzig and Göttingen, became professor in the University of Königsberg in 1818 and in that of Berlin in 1825. He is regarded as one of the founders of modern philology. His literary activity was extraordinary. He was equally devoted to classical philology and to old German literature and illustrated both with a profound and critical sagacity. The list of his published works is exceedingly long. Among his more important productions were editions of the *Nibelungenlied* and the works of the minnesinger Walther von der Vogelweide and Wolfram von Eschenbach; editions of Lucretius (4th ed., 1832), Catullus, Tibullus, Propertius, Lucilius, Terentianus Maurus, Babrius, Avianus, Gaius, the *Agri-mensores Romani*; and the text of the New Testament (1831), of which, in collaboration with Buttmann, he published a larger edition in two volumes, with the Latin Vulgate translation, in 1842 and 1850. His greatest work is his edition of Lucretius. He died in Berlin. For his place in Germanic philology, consult Von Raumer, *Geschichte der germanischen Philologie* (1870). Consult his *Life*, by Hertz (Berlin, 1851), and Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

LACHNER, lăc'nēr, FRANZ (1803-90). An eminent German orchestral composer and contrapuntist, born in Rain, Bavaria. He studied under his father (piano), and Eisenhofer (composition), and, becoming very proficient on the pianoforte, organ, and violoncello, he went to Vienna in 1822 to study composition and counterpoint under Stadler and Sechter and was fortunate enough to become intimate with Schubert. In 1836 he became court kapellmeister in Munich and in 1852 was appointed director general of music, but retired in 1868, dissatisfied

with the growing fondness of the court for the music of the Wagnerian school. Lachner is regarded as a classic composer in Germany and is universally esteemed for his skill in contrapuntal work. His works include operas, symphonies, chamber music, pianoforte music, songs, and part songs. His suites for orchestra are his masterpieces and show great skill in harmony and counterpoint. He died in Munich. Three of his brothers, THEODOR (1798-1877), IGNAZ (1807-95), VINCENT (1811-93), also achieved distinction as composers and conductors.

LACHRYMÆ CHRISTI, lăk'ri-mē kris'ti (Lat., tears of Christ). A muscatel wine of a sweet but piquant taste and a most agreeable bouquet, which is produced from the grapes of Mount Somma, near Vesuvius, the name being derived from that of a near-by monastery. There are two kinds, the white and the red, the first being generally preferred. The demand for this wine being greater than the supply, large quantities of that produced in Pozzuoli, Istria, and Nola are sold under this name.

LACHRYMAL (lăk'ri-mal) **ORGANS**. The lachrymal organs consist of the gland which secretes the tears and is situated in the anterior upper and outer part of the orbit; of the puncta, the canaliculi, the lachrymal sac, and the nasal duct. The diseases of these organs are limited to growths affecting the gland, inflammation of the sac (dacryocystitis), excessive secretion of tears, and impediments to their escape in the nose. See EYE.

LACHRYMATORY, lăk'ri-mă-tō-rī (from ML. *lacrimatorium*, *lacrymatorium*, vessel for tears, from Lat. *lacrima*, tear). The name applied to small bottles of glass or earthenware found in ancient tombs. Such bottles were really used to contain perfumes, but the name "lachrymatory" was given to them under the erroneous supposition that they were used to contain the tears of the friends of the deceased.

LACHUTE, lă-shōōt'. A town and the county seat of Argenteuil Co., Quebec, Canada, on the North River, 45 miles west by north of Montreal, on the Canadian Pacific and the Canadian Northern railroads (Map: Quebec, D 5). Its industrial establishments include saw mills and manufactories of builders' materials, pulp, paper, furniture, knitted goods, and woollens. Pop., 1901, 2022; 1911, 2407.

LACIN'IUM PROMONTORIUM (now Capo delle Colonne). A promontory on the Italian coast, 7 miles southeast of Crotona; famous in ancient times for the worship of Juno. Of a temple of Juno, dating from the fifth century B.C., one Doric column, 26½ feet high, survives together with the massive substructures on which it stands. Excavations were made here, in 1886-87, by the Archaeological Institute of America. Later, a dedicatory inscription to Juno, of the sixth century B.C., was found. Consult *Notizie degli scavi* (1897), and Koldey-Puchstein, "Die griechischen Tempel," in *Unteritalien und Sicilien* (Berlin, 1899).

LAC INSECT. Any one of the several scale insects of the coccid genus *Carteria*, which secretes lac (q.v.). *Carteria lacca*, of Asia, secretes the gum lac or stick lac of commerce and is found upon fig trees (*Rhamnus*, *Croton*, and *Butea*). *Carteria larrea*, of the southwestern United States and Mexico, feeds on the creosote bush (*Larrea mexicana*) and secretes quantities of lac, which, however, has not been commercially used. A third species (*Carteria mexi-*

cana) occurs in Mexico upon the mimosa, but its product has not been used in commerce. The body of the adult female is saclike in form, with no legs, and is embedded in a mass of lac. The anal end of the body is furnished with three prominent tubercles, of which one, the largest, is really the terminal segment of the body, each of the others bearing a perforated plate which is presumably the organ through which the lac is excreted. If a bit of commercial stick lac be examined, it will be found to consist of an incrustation, one-fourth to three-eighths of an inch in thickness, upon small twigs. This incrustation is filled with elongated cells in each of which are the shriveled remains of the insect which originally filled the cell and determined its size and shape. The insect is of the shape of a jug with three necks, and each of the necks fits into a tubular opening from the cell and really forms a lac tube, each being provided with a spiracle for breathing purposes. The females are viviparous, and the young, reddish in color and provided with functional legs, issue from one of the tubes, crawl out upon the twig, and settle. The males, as with other scale insects, become winged. The lac produced by *Carteria larrea* upon the creosote bush is chemically identical with the commercial Asiatic product, but the masses produced by the individual insects are not crowded together as compactly and preserve a rather globular form. Consult: O'Connor, *Lac: Production, Manufacture, and Trade* (2d ed., Calcutta, 1876); Stillman, "Origin of the Lac," in *The American Naturalist*, vol. xiv (Philadelphia, 1880); Comstock, *Annual Report of the United States Department of Agriculture for 1881-82* (Washington, 1882).

LA CIOTAT. See CIOTAT, LA.

LACKAWANNA, lăk'ă-wŏn'nă. A city in Erie Co., N. Y., 5 miles by rail south of Buffalo, on the Pennsylvania, the Buffalo, Rochester, and Pittsburgh, the Lake Shore and Michigan Southern, the Lehigh Valley, the South Buffalo, and the Buffalo and Lake Erie Traction railroads (Map New York, B 5). It contains St. John's Rectory, the St. Joseph Orphan Asylum, and the Moses Taylor Hospital. The city has a large steel plant, extensive bridge works, coking plants, and blast furnaces. Pop., 1910, 14,549; 1914 (U. S. est.), 19,012.

LACKAWANNA RIVER. A small river of Pennsylvania. It rises in the northeastern corner of the State and flows southwesterly through a narrow valley formed by the Shawnee and Moosie mountains, emptying, after a course of 50 miles, into the North Branch of the Susquehanna at Pittston (Map: Pennsylvania, K 3). It derives its importance from the fact that its valley with its southwest continuation, known as the Wyoming valley, contains the largest and most important anthracite coal beds in the United States. On the banks of the river are numerous cities and towns, the largest of which is Scranton, and the valley is filled with collieries, rolling mills, blast furnaces, and factories.

LACKAYE, lăk-ŷ', WILTON (1862-). An American actor, born in Loudoun Co., Va. He was educated at Georgetown University (which gave him an honorary B.A. in 1914) and for a year studied law. In 1883 he entered on his theatrical career in New York City with Lawrence Barrett in *Francoesca da Rimini* at the Star Theatre. His best-remembered rôles

include those in *Jocelyn* (1889); *Featherbrain* (1889, 1907); *The Idler* (London, 1891); *Aristocracy* (1892, 1907); *Tribby* (1895, 1907, 1915); *The Children of the Ghetto* (1889); *Quo Vadis?* (1901); *The Pit* (1903-04); *The Pillars of Society* (1905); *Law and the Man* (1906); *The Battle* (1908); *The Stranger* (1911).

LACK'EY MOTH. A name given in England to a bombycid moth (*Chasmodon neustria*) on account of the color and marking of its wings, which remind one of a lackey's livery. It is closely related to the American tent caterpillars. See TENT CATERPILLAR.

LACLÈDE, lă'klăd', PIERRE LIGUESTE. See LIGUESTE, PIERRE LACLÈDE.

LA CLOCHE, JAMES DE (c.1644-69). An English adventurer, born in Jersey. He moved to London in 1665 and in 1668 registered with a Jesuit House of Novices at Rome. During his life he was supposed to be a natural son of Charles II—he carried documents pretending acknowledgment of the fact—and indeed as late as 1862 Lord Acton deduced evidence to show that such was the case. But it is now generally acknowledged that La Cloche was an impostor, and that his documents were forged.

LACLOS, lă'klô', PIERRE AMBROISE FRANÇOIS CHODERLOS DE (1741-1803). A French novelist, best known as the author of *Les liaisons dangereuses* (1782), the most remarkable of many literary revelations of the moral dry rot in the pre-Revolutionary French aristocracy.

LAC'OBRI'GA. An ancient Roman town in Portugal. See the last LAOS.

LACOMBE, lă-kôm'. A town in the Red Deer District, Alberta, Canada, on the Calgary-Edmonton branch of the Canadian Pacific Railway, 80 miles south of Edmonton and 112 miles north by east of Calgary (Map: Alberta, G 6). It is the seat of the Alberta Industrial Academy and of a Dominion experimental farm. Its industrial establishments include grain elevators, grain warehouses, lumber yards, flour mill, pump works, foundry and machine shop, harness works, and creamery. The town owns its electric-light plant. Pop., 1911, 1029.

LACON, lă'kon. A city and the county seat of Marshall Co., Ill., 27 miles by rail north by east of Peoria, on the Illinois River and on the Chicago and Alton Railroad, and having bridge connection with the Rock Island Railroad at Sparland (Map. Illinois, F 3). It has a fine high-school building and a school library. There are grain elevators, woolen mills, marble works, and considerable grain trade. The water works are owned by the city. Pop., 1910, 1495.

LA CONDAMINE, lă kôn'dă'mên', CHARLES MARIE DE (1701-74). A French traveler and mathematician. He was born in Paris, passed an adventurous youth, and after serving in the army began to study science. As a chemist, he made some reputation, and in 1731 traveled through the Mediterranean, exploring the coasts of Africa and Asia Minor and making scientific collections. Having studied mathematics for the purpose, he was sent by the Academy of Sciences, with Bouguer and others, to Peru, to measure a meridional arc on the equator to show more accurately the shape of the earth. In Peru he remained from 1735 to 1744. He wrote: *Distance of the Tropicks* (1738); *La figure de la terre* (1749); *Journal du voyage fait par ordre du roi à l'équateur* (1751); *Mémoires sur l'immolation* (1754-65). His account of caoutchouc, published in 1751, caused

the introduction of this valuable substance into Europe. He became a member of the Royal Society of London in 1748 and in 1760 of the Academy of Sciences of Paris. He promoted inoculation for smallpox and urged the adoption as a universal measure of the length of a second pendulum at the equator.

LACONIA. An ancient geographical division of Greece. See SPARTA.

LACONIA. A city and the county seat of Belknap Co., N. H., 102 miles by rail north of Boston, Mass., between Lakes Winnesquam and Winnepesaukee, on both banks of the Winnepesaukee River, and on the Boston and Maine Railroad (Map New Hampshire, G 6). It is closely connected with other popular summer resorts of this lake region, is laid out with broad streets, and has a State home for feeble-minded children, county farm, home for the aged, opera houses, a cottage hospital, and public library and park. The city is a prosperous manufacturing centre with car shops, lumber mills, hosiery mills, foundries and machine shops, a paper-box factory, and manufactures of knitting machinery, friction clutches, needles, etc. Pop., 1900, 8042. 1910, 10,183; 1914 (U. S. est.), 11,094.

LACONICUM. See BATH, Rome.

LACORDAIRE, lá'kór'dâr', JEAN BAPTISTE HENRI (1802-61). A distinguished French preacher and publicist, the restorer of the Dominican Order in France. He was born at Reccy-sur-Ouche, near Dijon, in which town he was educated, taking up ultimately the study of the law. When he went to practice in Paris, his studies of the evidences of Christianity gradually drew him away from the following of Rousseau, which had marked his earlier youth and he decided to become a priest. He studied at the Seminary of St. Sulpice, and was ordained in 1827. He entered upon his work with zeal, but, meeting with discouragement, almost decided to accept the invitation of Bishop Dubois, of New York, to come to America as his vicar-general. He had already come much under the influence of Lamennais (qv) and after the revolution of 1830 threw himself enthusiastically into the work of the *Avenir*. Its editors, at his suggestion, founded a "general agency for the defense of religious liberty," as a practical support of their ideas, its most significant result was the winning of a moral victory for the cause of religious education. When the *Avenir* was condemned by Gregory XVI, Lacordaire submitted and for a time withdrew from political affairs. He had gone to Rome with Lamennais, but he saw the logical consequence of his old master's position and parted company with him finally at the end of 1832. Two years later he began a series of apologetic *conférences* which laid the foundation of his fame as a preacher, such men as Chateaubriand, Berryer, and Hugo were already among his regular hearers. His lectures were suspended for a time, owing to the suspicion aroused by his former association with Lamennais; but in 1835 the Archbishop selected him as the Lent preacher at Notre Dame, where his sermons once more caused an extraordinary sensation, not less than 6000 people sometimes attending them. His decision to enter a monastic life caused an interruption (1836-43). He defended the right of the Dominicans (the order of his choice) to French citizenship in his *Mémoire pour le rétablissement des Frères Prêcheurs en*

France (1839) and entered the order a few weeks later. At the end of 1840 he returned to France in the Dominican habit, which had not been seen there for half a century. His *Vie de Saint Dominique* appeared at the same time, and he presently returned to Rome with 10 more novices. In 1843 he was able to found at Nancy the first new house of the order in France. He gave much of his time to preaching in various parts of France. In 1845 were delivered the eight conferences on the divinity of Jesus Christ, which Montalembert considered the greatest triumph of modern Christian oratory. He still maintained his interest in political affairs and was chosen deputy from Marseilles to the Assembly after the revolution of 1848, but soon resigned. His courses of sermons were continued till 1850. His health began to decline in 1854, and he withdrew to the convent of Sorèze. In 1860 he published his pamphlet, *De la liberté de l'église et de l'Italie*, in which he protested vigorously against the interference of Napoleon III with the States of the Church. In the same year he was elected to the French Academy, and made his last public address there, on his predecessor, De Tocqueville. He resigned his office as provincial of the Dominicans in August, 1861, and died on November 20. His works appeared in nine volumes (Paris, 1873 et seq.) Three supplementary volumes of sermons and addresses were published in 1884 et seq., and *Lettres inédites* in 1881. Consult lives by Montalembert (Paris, 1862), Foisset (2d ed., ib., 1874), Greenwell (ib., 1877), Mrs. Sidney Leat (London, 1882), Chocarne (8th ed., ib., 1894, trans., 9th ed., ib., 1901), D'Haussonville (Paris, 1895), Ledos (ib., 1901); Nicolas, *Le père Lacordaire et le libéralisme* (Toulouse, 1886). Fesch, *Lacordaire journaliste* (Paris, 1897), Marcel Foulon, "Lacordaire et Madame Swetchine," in *Revue de Lille*, vol. xxv (ib., 1913), and many important letters in *Correspondance de Lacordaire et de Madame Swetchine* (ed. Falloux, 4 vols., ib., 1865).

LACORDAIRE, JEAN THÉODORE (1801-70). A prominent French naturalist and traveler, brother of the preceding, best known for his entomological studies. He was born at Reccy-sur-Ouche and gave up his legal studies at Dijon to devote himself to natural science. Between 1825 and 1832 he made four voyages to South America and one to Senegal, some account of which he gave in the *Temps* and the *Revue des Deux Mondes*. The chair of zoology at Liège was voted him in 1835 and in 1838 a professorship in comparative anatomy. He wrote: *Introduction à l'entomologie* (1834-37), *Faune entomologique des environs de Paris* (1835), with Boissduval, and the great work on Coleoptera, *Histoire naturelle des insectes, genres des coléoptères* (12 vols., 1845-76), which describes more than 8000 genera.

LA COSA, JUAN DE. See COSA, JUAN DE LA.

LACOSTE, lá'kóst', SIR ALEXANDRE (1842-) A Canadian jurist. He was born in Boucherville, Quebec, was educated at St. Hyacinthe College and Laval University, and was admitted to the bar in 1863. In 1880 he was appointed queen's counsel and from 1882 to 1884 was a member of the Legislative Council of Quebec. He was called to the Dominion Senate in 1884 and served as Speaker in 1891. In the latter year he was appointed Chief Justice of Quebec. In 1892 he became a Privy

Councilor of Canada and was knighted. For several years he was professor of civil law in Laval University. He retired from the bench in 1907 and became a consulting counsel in Montreal.

LACQUER, lāk'ēr. See LAC; LACQUER WORK; VARNISH.

LACQUER AND LACQUER WORK (lacquer is a variant of the Eng. *lac*, Ger. *Lack*, Fr. *laque*, It. *lacca*, ML. *laca*, Pers. *lak*, Hind. *lākḥ*, Skt. *lakṣa*, the same as the Indian numeral *lac*, a hundred thousand, suggested by the number of the insects that produce the substance). In general, any of the resinous varnishes used in India, China, and Japan, to finish with a hard polish furniture and other decorated objects of wood.

In Europe and America *lacquering* means varnishing metallic surfaces with a protective coat of shellac. (See VARNISH.) The so-called lacquers of China and Japan are not made from *lac* (q.v.) at all, but are obtained by tapping the *Rhus vernicifera*, or varnish tree. This tree is native to China and, like the art of lacquering, was introduced from China into Japan in remote antiquity. The varnish tree is found wild in the woods of China and is also cultivated along the margins of fields. It is especially abundant in the mountains of Central Asia, having an altitudinal range of from 3000 to 7500 feet. In Japan it does not grow wild, it is cultivated principally from Tokyo northward, and it is tapped when about 10 years old.

Chinese Lacquer Work. Lacquer work is one of the earliest of the Chinese industrial arts, but there exist no records of its origin, or of its development from a mere preservative coating to an almost indestructible surface of the highest artistic merit. The three processes in the manufacture of Chinese lacquer work are (1) the preparation and coloring of the lacquer, (2) the application by spatula and brush in successive layers, from 3 to 18, each layer being allowed to dry completely before the next is put on, (3) the decoration of the lacquered surface. The lacquered objects are usually of wood well seasoned and carefully prepared so that the shell is sometimes as thin as a sheet of paper. Joints or accidental cracks are filled in with a lute of chopped hemp and other materials, a sheet of broussonetia paper or silk gauze is pasted on; a coating of burnt clay and varnish is applied; and the surface is then worked smooth with a whetstone. After the various layers of lacquer have been applied the work of the decorative artist begins. He selects for his motif a landscape or figure scene, birds and flowers, fishes and water weeds, etc.; sketches it in with a paste of white lead, fills in the details with gold and polychrome, and superposes a coat of transparent lacquer. If parts of the design are to be in relief, they are built up of a putty composed of lacquer colored and tempered with other ingredients. In most fine lacquers there is so much gold that the effect is warm and rich. The very finest gold lacquers are left undecorated, their beauty depending upon the multitude of tiny metallic grains shining from the depths of a pellucid ground.

Japanese Lacquer Work. Although the Japanese borrowed the art of lacquering from China, they brought it centuries ago to a height of perfection never attained by the Chinese.

Indeed by some authorities it is ranked first among Japanese art industries on account of the many thousands to whom it gives employment and the extreme patience and artistic skill displayed. A large proportion of the furniture and utensils used in a Japanese household owe their strength and durability to the lacquer that covers and protects them. The earliest mention of lacquer work in the records of ancient Japan is in the reign of Emperor Ko-an, who ascended the throne in 392 B.C., the next mention is in the reign of Emperor Ko-toku, who ascended the throne in 645 A.D. At that time lacquered articles were accepted by the government in payment of taxes, and it was ordained that Imperial coffins should be covered with lacquer. The invention of red lacquer is credited to the reign of Emperor Temmu (673-686). During the reign of the three emperors who ruled from 708 to 748 the industry made great progress, five different colored lacquers being used, and the practice of inlaying with mother-of-pearl and of lacquering gold, silver, copper, and leather being adopted. In the tenth and eleventh centuries the industry flourished, particularly in Tokyo; and also in the fifteenth century under the Shogun Yoshimasa, who bothered little about the affairs of state, but devoted himself to the encouragement of the fine arts, particularly of lacquer work. At the time Chinese patterns and methods of working were much copied. Quin gives a list of 33 Japanese workers in lacquer from 1175 A.D. down to the present day. Among them the greatest artist in incrustated and embedded lacquer is Korin, born at Tokyo in 1661. He was not only a consummate artist in lacquer, but a designer and painter of singular power and originality. Audsley illustrates a panel by him, the ground of which is deep green streaked and spotted with red, the mountains and water in low relief in gold and *koban*, the bank of the stream in incrustated lead. The lower part of the panel is filled with large iris flowers and leaves, the leaves alternating lead and gold, the flowers executed with broad margins of richly tinted mother-of-pearl and depressed centres of gold lacquer.

European Lacquer Work. As early as the fifteenth century small pieces of lacquer ware—cups, trays, boxes—began to find their way from Japan and China to western Europe. Indian cabinets, as they were then called, are occasionally mentioned in English inventories of the reign of Elizabeth, and during the first 30 years of the seventeenth century a number of lacquered cabinets and screens were imported from the Far East to England via Holland. Before long English and Dutch craftsmen were inspired to attempt to imitate Oriental lacquer on furniture, and by 1689 the art of *japanning*, as it was then called, was widespread, even being considered a fashionable pursuit and taught as an extra accomplishment in girls' schools. The garrets of many old English country houses still contain many worn-out boxes and tables adorned with this amateur decorative work. However, even the most skillful imitations did not attain the brilliancy and smoothness of the Oriental originals; and the lustre of the different golds was less metallic, while the design lacked the individuality and harmonious proportions characteristic of the Oriental artist. Frequently unmounted lacquer panels were imported from the Orient to be made up into

furniture in the Netherlands, France, and England, but cabinets entirely of Oriental manufacture continued to be preferred. In the household accounts of Charles II there is an entry of £100 paid for "two jappan cabinets." These were probably of cut lacquer, in which the hollowed-out designs are filled in with polychrome that contrasts brilliantly with the black ground. MacQuoid illustrates a number of pieces of lacquer furniture made in England in the last third of the seventeenth century and reproduces extracts from several of the numerous handbooks on lacquering.

The art continued to flourish in England till about 1760 and in 1740 was still regarded as a polite occupation, for in the descriptive catalogue of the contents of Strawberry Hill Sir Horace Walpole enumerates a cabinet "japanned by Lady Walpole." The book of lacquer designs published by Edwards and Daryl in 1754 should have given the art substantial help; but Robert Dossie only 10 years later, in 1764, in his *Handmaid to the Arts* writes of japanning as "not at present practiced so frequently on chairs, tables and other furniture of houses except tea-waiters, as formerly." After 1725 the importation of Dutch lacquer, that during the reign of William and Mary had been considerable, declined almost to nothing. But lacquered panels for doors and drawer fronts, ready to be made into cabinets in Europe, continued to come from China and Japan, some of them made to order in prescribed designs. MacQuoid illustrates many eighteenth-century pieces of English lacquer furniture, among them a most beautiful commode designed by the great architect, Robert Adam, for Osterly. The serpentine front consists of one long door with Chinese landscape, house, and warriors in black and gold, the top drawer and side panels having smaller landscape pictures.

Imitations of Oriental lacquers were also common in France during the last half of the seventeenth century in the reign of Louis XIV, and the process was brought to perfection in the reign of Louis XV by the brothers Martin under the name "verniss-martin" (q.v.).

LACRETELLE, là'kr'-tèl', HENRI DE (1815-99). A French politician and writer, son of J. C. D. de Lacretelle, born in Paris. He was deputy for Saône-et-Loire in the National Assemblies of 1871, 1876, 1877, and every succeeding four years up to 1893; belonged to the Left Radical party, opposed the Broglie faction, and inter-

ested himself specially in education. His principal works are a volume of verse, entitled *Les cloches* (1841); *Dona Carmen* (1844); *Nocturnes* (1846); *Contes de la méridienne* (1859); *La poste aux chevaux* (1861); *Lamartine et ses amis* (1878); and the three-act play *Fais ce que dois* (1856), in collaboration with M. Decourcelle, which was produced at the Théâtre Français. He was the friend of Lamartine and the promoter of the George Sand Memorial (1876).

LACRETELLE, là'kr'-tèl', JEAN CHARLES DOMINIQUE DE, called LE JEUN (1766-1855). A French historian and publicist, born in Metz, the brother of Pierre Louis de Lacretelle. He was educated for the bar at Nancy and went to Paris in 1787, where he wrote for the *Encyclopédie méthodique* and the *Journal des Débats*, for which he reported the sessions of the Assembly. In 1790 he became secretary to the Duke of La Rochefoucauld-Liancourt, whom he assisted in promoting the King's attempted escape. Afterward he joined the army and was one of the most prominent of the jeunesse dorée (q.v.). On account of his Royalist sympathies he was imprisoned for about two years (1797-99). During this term he completed Rabaut Saint-Etienne's *Précis de l'histoire de la Révolution* (1801-06). In 1809 he was made professor of history at the University of Paris, a post he held until 1848. He was twice censor of the press—in 1810 under Napoleon and in 1814 under Louis XVIII—and was made a member of the Academy in 1811. As an historian, he is not sufficiently critical or impartial; but his works contain much that is interesting, from the personal part he played in the events he describes. They cover the period of the Revolution very thoroughly and include the following: *Histoire de France pendant le XVIIIème siècle* (1808); *Histoire de France pendant les guerres de religion* (1814-16); *L'Histoire de l'Assemblée constituante* (1821); *L'Assemblée législative* (1824); *La convention nationale* (1824-25); *Histoire de France depuis la Restauration* (1829-35); *Histoire du Consulat et de l'Empire* (1846); *Dix années d'épreuves pendant la Révolution* (1842); *Testament philosophique et littéraire* (1840); *Histoire du Consulat et de l'Empire* (1846).

LACRETELLE, PIERRE LOUIS DE, called L'AÎNÉ (1751-1824). A French lawyer, politician, and publicist, born in Metz. He studied law at Nancy, and later he came to Paris, where his journalistic writings attracted the attention and friendship of such men as D'Alembert, Condorcet, Turgot, Malesherbes, and others. His essays *Eloge de Montausier* (1781) and *Discours sur le préjugé des peines infamantes* (1784) were widely discussed. During the Revolution he was a member of the Feuillants in the Legislative Assembly and was one of the chief advocates of the constitution of 1791. He took little part in politics under Napoleon's administration, but after the Restoration joined the party of opposition and was part editor, with Constant, of the *Minerve Française*, later suppressed. His works include: *De l'établissement des connaissances humaines et de l'instruction publique dans la constitution française* (1791); *Idée sommaire d'un grand travail sur la nécessité, l'objet et les avantages de l'instruction* (1800); *Mélanges de philosophie et de littérature* (1802-07); *Fragments politiques et littéraires* (1817).

LACROIX, la'krwä', (ANTOINE FRANÇOIS) ALFRED (1863-). A French mineralogist, born at Mâcon, France, and educated at Paris (D.Sc., 1889). In 1893 he was appointed professor of mineralogy at the Muséum d'Histoire Naturelle of Paris and later became also director of the laboratory of mineralogy at the Ecole des Hautes-Etudes. He became a Chevalier of the Legion of Honor and a member of the Academy of Sciences. Lacroix conducted scientific expeditions to the United States, Canada, England, to Martinique in 1902-03 after the eruption of Mont Pelée, to Italy after the violent eruption of Vesuvius in 1906, and to Madagascar in 1912. He became known especially for his researches on volcanic geology. His writings include. *Minéralogie de la France et de ses colonies* (1893-1903); *Le granite des Pyrénées* (1898); *La montagne Pelée et ses éruptions* (1904); *Les syénites néphéliniques de l'archipel de Los et leur minéraux* (1911).

LACROIX, FRANÇOIS, VISCOUNT (1774-1842). A French general, born at Aymarques and educated at Montpellier. He saw active service when very young, won a victory over the Austrians at Friedberg (1796), and was a brigadier general when but 27 years old. He was a personal friend of both Macdonald and Moreau. (See MACDONALD, ETIENNE; MOREAU, JEAN VICTOR) Disgraced in 1802 by Bonaparte, who bore him enmity, Lacroix sailed for Santo Domingo, where he upheld the French standard, was created major general, and won the good will of the . . . helped him in his strife with the . . . under Christophe. On his return to Europe he took part in the Belgian campaign during the Hundred Days, and in 1820 received command of the division which arrested the Grenoble insurrection, while in 1823 he joined the Spanish expedition, but retired the following year. Disgusted with "legitimacy" as expounded by Louis XVIII, he retired after the revolution of 1830. He published an important work, *Mémoires pour servir à l'histoire de la révolution de Saint Dominique* (2 vols., 1810-20).

LACROIX, JEAN BAPTISTE MARIE ALBERT (1834-1903). A Belgian author and editor, born in Brussels. He took a law course at the university of that city and became known through his prize essay, *Influence de Shakespeare sur le théâtre français* (1855). In order to publish the works of his friends, Socialist refugees from France, he set up a small printing establishment, and it was his enterprise that started the international library of Brussels, forerunner of those in Paris, Leipzig, and Louvain. He published editions of *Les misérables* (1862) and other works of Victor Hugo, of Quinet, Louis Blanc, Michelet, and Charras. He got himself into trouble in Paris for his production of proscribed literature, and Bougeart's *Marat* brought him one month's imprisonment, while Proudhon's *Evangelies* caused his confinement for a year (1866). He rendered important service to French-speaking Europeans by his editions of Gervinus, Mommsen, Grote, Prescott, Bancroft, Washington Irving, and others, while with Jottrand he translated Motley's *Rise of the Dutch Republic*. He began an *Histoire de France* which was left incomplete at his death.

LACROIX, JULES (1809-57). A French novelist and dramatist, brother of Paul Lacroix, born in Paris. He wrote a number of novels, including *Flour à vendre* (1835) and *Un grand*

d'Espagne (1845); *Pervenches* (1834), sonnets; translations of Juvenal and Horace; and plays, which include *Le testament de César* (1849); *Valéria* (1851), with Maquet; *La Fronde* (1855), an opera with Maquet, music by Niedermayer; *Macbeth* (1863) and *King Lear* (1868), translations; *La jeunesse de Louis XI* (1859); and *Edipe roi* (1858), translated from Sophocles, which was crowned by the Academy and still keeps its place on the French stage.

LACROIX, PAUL (1806-84). A French author, known by his nom de plume, Bibliophile Jacob. He was born in Paris, was educated there in the Bourbon College, and at the age of 18 brought out an edition of Clément Marot's *Œuvres complètes*, in three volumes. This was the beginning of his tremendous literary activity, exhibited in the improvement of public libraries, the making of catalogues, and the production of such works as *Costumes historiques de la France* (10 vols., 1852), *Les arts au moyen âge et à l'époque de la renaissance* (1868), *Mœurs, usages et costumes au moyen âge* (1871), and *La vie militaire et la vie religieuse au moyen âge* (1872). In 1854 he became editor of the *Revue Universelle des Arts* and the following year was made also curator of the Arsenal Library. Famous as an historical romancer and specialist in the lore of the Middle Ages, Lacroix was likewise a noted translator, bibliographer, editor, and collaborator with Henri Martin in the history of France and his *Histoire de Soussons* (1837-38), and with Ferdinand Séré in *Le moyen âge et la renaissance* (1847-52). An edition of his essays was published in 1867, in three volumes, called respectively *Enigmes et découvertes*, *Mélanges*, and *Dissertations bibliographiques*. He sometimes wrote under the names of Pierre Dufour and Antony Dubourg.

LACROIX, SYLVESTRE FRANÇOIS (1765-1843). A French mathematician, born in Paris. At the age of 16 he was teacher of mathematics at the naval school at Rochefort; he was afterward teacher in the military school at Paris (1787), professor in the artillery school at Besançon (1788), and examiner of the artillery officers (1793). He was made adjunct professor of descriptive geometry in the Ecole Normale in 1794 and later became professor of mathematics at the Ecole Centrale des Quatre-Nations. He held the chair of analysis in the Polytechnic School (1799), going from there to the Sorbonne and the Collège de France (1815). He was not a discoverer, but he composed some excellent textbooks. His chief works are: *Traité du calcul différentiel et du calcul intégral* (2 vols., 1797; 7th ed., 1867; Ger. ed., 3 vols., 1830-31); *Traité des différences et des séries* (3 vols., 1800; 2d ed., 1810-19); *Essais sur l'enseignement en général et sur l'enseignement en particulier* (2d ed., 1816); *Traité de l'assurance du calcul des probabilités* (1816; 4th ed., 1864; Ger. ed., 1818); *Cours des mathématiques* (9 vols., 1797-1816).

LACROSSE, là-krös'. An American outdoor game, played with a small ball and a hooked stick fitted with a loose net. It . . . originated among the North Ameri . . . and was widely played by them. It was frequently of a ceremonial nature, in the preparation of the young men of a tribe for the war path. The general character of the game was the same among all the tribes, with various minor differences, especially in the size and

shape of the stick, or crosse. The original ball was of hide stuffed with hair, of bark, or of the knot of a tree. The goals were often any convenient rocks or trees; but at grand matches a single pole or two-pole goal was used, situated from 500 yards to half a mile or more apart, the ball to pass the line, strike the pole, or pass between two poles, according to local custom. The Choctaws (according to Catlin) used two poles 25 feet high and 6 feet apart, with a crossbar, suggestive of the football goal. Games lasted for hours. The players, who were put through a long course of training, were, as a rule, almost nude, and often decorated with paint and feathers; old medicine men usually acted as umpires. Catlin saw the game played by from 600 to 1000 at a time and described the Olympic beauty of the contest as beyond all praise. The night before an important game a ceremonial dance occurred.

Modern Lacrosse. The name "lacrosse" was given to the game by the French explorers, from the crosse, or crooked, stick with which it is played. It was taken up by white men about 1840, when a club in Montreal was formed. About 1860 the game became popular in Canada, and in 1861 a notable game between the Montreal and Beaver clubs, and the Caughnawaga and St. Regis Indians—25 players a side—was played before King Edward VII, then Prince of Wales. In 1867 practical rules were formulated by Dr. W. G. Beers, the originator of modern lacrosse, and in the same year the National Lacrosse Association of Canada was formed. A club was formed in Glasgow, Scotland (1867), by a Canadian player, and an Indian team was taken to England and France, where exhibition games were played. A second club was formed in London. Lacrosse was for a long time not much played in England, but it is now very popular there. There are several lacrosse associations in Canada, and the game has been developed by club and college players to a high point of excellence. Lacrosse was introduced into the United States in the early seventies. The Crescent Athletic Club of Brooklyn, N. Y., has the only team of worth in the United States outside of the colleges, many of which have teams.

The Game. The crosse is a light stick, 5 or 6 feet long, crooked at the end so as to allow a loose network of catgut or deerskin to be stretched across—not so tightly as in a tennis racket nor so loosely as to form a bag. The ball, $2\frac{1}{2}$ inches in diameter, is now made of India rubber. The game is usually played on a field about 125 feet long and any convenient width. The fundamental principle of the game is to drive the ball through the opponent's goal, while defending one's own goal from a similar attack. The form of the goal is shown in the accompanying illustration. There are usually 12 players on each side, and the ball is put in play by being placed on the exact centre of the field, after which the two centres stoop down and place the backs of their crosses on either side of the ball, and at the word "play" the crosses are drawn in towards the holders of them. The ball comes to one or the other. The players of the opposing teams at once begin a struggle for the possession of the ball. When scooped up from the ground it is carried horizontally on the stick, the player running towards one of the goals and endeavoring to elude his opponents, being helped on by his own team. If

it seems prudent, he pitches the ball off his stick towards a colleague who may be in a better position to convey it towards the goal. The ball is not touched by the hand. The player with the ball, skillfully dodging his opponents, may succeed in shooting it between the goal posts, thus scoring a goal; or the ball thus thrown may be intercepted and returned by the goal keeper, when the play continues as before. The game is divided into two halves of half an hour; but the teams change sides after each goal is made, the ball being again put in play in the centre of the field. The side scoring the most goals during the game is the winner. Lacrosse is essentially a game of combination. Individual or "star" play is usually fatal to success, and among the best clubs a selfish player is regarded as preferable only to a blind one. Consult: Beers, *Lacrosse, the National Game of Canada* (New York, 1869); *Lacrosse*, in Spaulding's "Library of Sports," issued annually (New York), and Schmeisser, *Lacrosse: An Expert's Instructions* (ib., 1904).

LA CROSSE. A city and the county seat of La Crosse Co., Wis., 198 miles by rail west-northwest of Milwaukee, at the confluence of the La Crosse and Black rivers with the Mississippi, and on the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, the Chicago, Burlington, and Quincy, the La Crosse and Southeastern, and the Green Bay, and Western railroads (Map: Wisconsin, B 5). It is the centre of a great dairy and stock-raising region, is an important tobacco market, has a large wholesale trade, and is noted for its manufactures, which are valued at \$20,000,000 annually and include sash, doors and blinds, boots and shoes, plows and other agricultural implements, bridges, violins, automobile parts, gasoline engines, boilers and heavy machinery, stoves, threshing machines, tents and awnings, hammocks, rubber goods, crackers, knit goods, candies, flour, woolen goods, tanned leather, beer and ale, cooperage products, bed springs, mattresses, brooms, cigars, etc. The city ships also considerable quantities of seeds. Sand, gravel, red clay, limestone, and peat are found in the vicinity. La Crosse is surrounded by cliffs, 600 feet high, and has a large public library, a fine city hall, courthouse, post office, high school, State normal school, hotels, four hospitals, United States Weather Bureau Station, county jail, opera houses, wagon bridge across the Mississippi River, and Myrick, Copeland, Riverside, and Pettibone parks, the latter on an island in the Mississippi River. First permanently settled in 1841, La Crosse was incorporated as a city in 1866, its present government being administered, under a revised charter of 1891, by a mayor, elected every two years, and a unicameral council, which elects the health officer, board of education, weighmaster, city attorney, and assessors. Other officials are chosen by popular election. The city owns and operates its water works, rebuilt at a cost of \$500,000. Pop., 1900, 28,895; 1910, 30,417; 1914 (U. S. est.), 31,367.

LACTANTIUS, lāk-tān'shī-ūs. In several manuscripts designated LUCIUS CÆLIUS (or CÆCILIUS) FIRMIANUS LACTANTIUS, an eminent Christian author, who flourished in the third and fourth centuries. He was perhaps of Italian descent, but studied at Sica in Africa, under the rhetorician Arnobius (q.v.). About 300 he settled as a teacher of rhetoric in Nicomedia.

LACROSSE AND SCULLING

He was invited to Gaul by Constantine the Great (312-318 A.D.), to act as tutor to his son Crispus, and is supposed to have died at Treves about 325 or 330. Lactantius' principal work is his *Divinarum Institutionum Libri VII*, an introduction to Christianity, a production of both a polemical and an apologetic character. The first three books criticize heathen views; the last four maintain that apart from Christianity true wisdom and true virtue are not to be found. In his middle and later life he was an ardent Christian, and a bitter opponent of the paganism in which he had been brought up, but his tendencies seem to have been towards Manichaeism and certain views held as unorthodox by the Church. Among his other writings are treatises, *De Ira Dei* and *De Mortibus Persecutorum* (the latter, however, may be from another's hand). Some elegies have also been ascribed to him, but erroneously. His style is remarkable and has deservedly earned for him the title of the *Christian Cicero*. He was, besides, a man of very considerable learning, but, as he appears not to have become a Christian till he was advanced in years, his religious opinions are often very crude and singular. Lactantius was a great favorite during the Middle Ages. The *editio princeps* of this writer is one of the oldest extant specimens of typography (Subiaco, 1465). His works are published in Migne, *Patrologia Latina*, vols vi and vii (Paris, 1844), and Laubmann and Brandt, *Corpus Scriptorum Ecclesiasticorum Latinorum* (Vienna, 1890). There is an English translation by Fletcher in the series of the Ante-Nicene Fathers, vol vii (1896). Consult Schanz, *Geschichte der römischen Literatur*, vol iii (2d ed., Munich, 1905).

LACTARIN, lak'tā-rin. See CASEIN.

LACTASE. See ENZYME

LACTATES. See LACTIC ACID.

LACTEAL (from Lat. *lacteus*, milky, from *lac*, Gk. γάλα, *gala*, milk), or **CHYLIFEROUS VESSEL**. One of the lymphatic (q.v.) vessels of the small intestine, which absorb or take up the chyle. They were discovered in 1622 by Aselli (q.v.) and received their name from conveying the milklike product of digestion, the chyle (q.v.), during the digestive process, to the thoracic duct (q.v.), by which it is transmitted to the blood. These vessels commence in the intestinal villi and, passing between the layers of the mesentery (q.v.), enter the mesenteric glands and finally unite to form two or three large trunks, which terminate in the thoracic duct.

LACTIC (from Lat. *lac*, milk) **ACID**. A name applied to several organic acids having the composition corresponding to the formula $C_3H_5O_3$.

1. *Ordinary lactic acid*, or ethylidene-lactic acid, $CH_3CH(OH)COOH$, is a characteristic constituent of sour milk, in which it was discovered by Scheele in 1780. It really consists of a mixture, or compound, of equal quantities of sarcolactic and levulactic acids, which are described below. It is formed, in general, whenever sugar or starch undergoes lactic fermentation in the presence of decaying nitrogenous matter, or when sugar is heated with alkalis. It is found in the stomach and intestines as well as in the brain and in muscles. It may be readily prepared by keeping a mixture of cane-sugar solution and sour milk, to which a little decaying cheese and some chalk have been added, for two weeks at a temperature of about 40° C.

(104° F.). The transformation is caused by the activity of the so-called *lactic ferment* (*Bacillus lacticus* Huepffel), and as this activity ceases as soon as the medium becomes strongly acid, chalk must be added to neutralize the lactic acid produced. Further, the process must not be kept up too long, as another fermentation may set in, by which the lactic acid would be transformed into butyric acid. Lactic acid has been obtained perfectly pure by distillation under very low pressure. It forms colorless, hygroscopic crystals melting at 18° C. (64.4° F.). The ordinary pharmaceutical product is an aqueous solution containing about 75 per cent of lactic acid. It has been used, in diluted form, to dissolve the membrane in diphtheria and as an ingredient of stomachic mixtures. Chemically lactic acid, or rather each of its constituents, is at once an acid and a secondary alcohol, its molecule containing both a carboxyl group ($COOH$) and a secondary alcohol group ($CHOH$). It is a comparatively unstable substance, and when heated with dilute sulphuric acid readily decomposes into formic acid and ordinary aldehyde, according to the following equation:

Among the salts of lactic acid may be mentioned the lactate of calcium, $(C_3H_5O_3)_2Ca + 5H_2O$, and the lactate of zinc, $(C_3H_5O_3)_2Zn + 3H_2O$, which are readily soluble in hot water and almost insoluble in cold alcohol. A method of separating the different varieties of lactic acid is based on the different solubilities of their zinc and calcium salts.

2. *Sarcolactic acid*, or paralactic acid, is found in blood, and under certain conditions in urine, as well as in various pathological fluids, it is a characteristic constituent of muscles and is therefore contained in considerable quantities in Liebig's meat extract. Sarcolactic acid possesses considerable importance from a physiological point of view. The energy of an active muscle is found to be proportional to the acidity of the muscle; and as that acidity is due to a great extent to the formation of sarcolactic acid, it is clear that the production of muscular energy is due largely to the transformation of nitrogenous matter into sarcolactic acid. Sarcolactic acid has precisely the same chemical properties as ordinary lactic acid, from which it differs, however, in certain physical properties, unlike ordinary lactic acid, it is optically active, turning the plane of polarized light to the right, the solubility of its zinc and calcium salts is different from that of the lactates. Sarcolactic acid may be prepared from Liebig's meat extract. The fact that it forms one-half of ordinary lactic acid has already been mentioned.

3. *Lavorotatory-lactic acid* may be obtained from ordinary lactic acid, of which it forms one-half, by subjecting the strychnine salt of the latter to a process of fractional crystallization. The relation between the above three varieties of lactic acid is explained by the theories of modern stereochemistry (q.v.).

4. *Ethylene-lactic acid*, or β -hydroxy-propionic acid, $CH_3(OH).CH_2.COOH$, often called *hydraerylic acid*, is a sour, sirup liquid readily breaking up into acrylic acid and water, according to the following equation:

Hydracrylic acid was formerly supposed to occur in the animal body, but this has been shown to be incorrect.

LACTIC FERMENTATION. See FERMENTATION; LACTIC ACID.

LACTOglobULIN. See GLOBULINS.

LACTOLASE. See ENZYME

LACTOMETER (from Lat. *lac*, milk + Gk. μέτρον, *metron*, measure). A special form of hydrometer (q.v.) used for determining the specific gravity of milk, for the purpose of detecting adulteration with water. Experience has shown that the specific gravity of mixed milk from healthy cows, when taken at least 12 hours after milking, will not fall below 1.029. However, the lactometer test alone is far from being reliable. See MILK ADULTERATION.

LACTOSE. See SUGARS.

LACTUCARIUM (Neo-Lat., from Lat. *lactuca*, lettuce, from *lac*, milk). A drug consisting of the concrete juice of the *Lactuca virosa* (natural order Compositæ), or lettuce. It appears in the market in two forms. The English lactucarium is in irregular pieces the size of a pea, while the German variety is in pieces about 1 inch by ½ inch in measurement. It is dark brown or light yellowish brown, with a faintly narcotic odor and bitter taste. The chief constituents of lactucarium are lactucon, lactucin, and lactucic acid. It owes its efficiency to a crystallizable bitter principle, lactucin, probably first discovered by Abergier. It is a very feeble antispasmodic and hypnotic. It has been called lettuce opium and in the form of sirup was once popular. There is also an official tincture of the drug.

LACUNAR (Lat. *lacunar*, panel, from *lacuna*, pit, from *lacus*, lake). A sunken panel or coffer in a ceiling or in the soffit of a classic cornice. The ceiling of the Parthenon portico affords examples of the lacunar in antiquity. The ceilings of many Christian churches were so decorated during the Renaissance—as, e.g., the gilt ceiling of Santa Maria Maggiore in Rome. The word is synonymous with caisson, but some authorities restrict its use to panels in horizontal ceilings, employing coffer and caisson to designate sunken panels in vaults, arches, and domes, as in the Pantheon at Rome or the Arch of Titus. Lacunars are seldom found except in Roman, Renaissance, and modern neo-classic buildings.

LACUS BENACUS. See GARDA.

LACUS LARIUS. See COMO, LAKE.

LACUS LEMANUS, or **LEMANUS.** See GENEVA, LAKE.

LACUS LUCRINUS. See LUCRINO, LAKE.

LACUS NEMORENSIS. See NEMI.

LACUS SEVINUS. See ISEO, LAKE.

LACUS VERBANUS, or **VERBANUS.** The ancient name of the lake now known as Lago Maggiore. See MAGGIORE, LAKE.

LACY, lă'sé, FRANZ MORITZ. An Austrian field marshal. See LASCY, FRANZ MORITZ.

LACY, HUGH DE (?-1186). One of the English conquerors of Ireland. He was probably a son of Gilbert de Lacy and before 1163 was in possession of his father's estates. In October, 1171, he went over to Ireland with Henry II and soon was playing an important rôle. He received the grant of Meath and was also in charge of Dublin Castle. While Governor of Ireland, he was accused of seeking to become King of Ireland, having married in 1181 the daughter of Roderic, King of Connaught. But

whatever his intentions were, before they could be realized he was murdered by a native (July 25, 1186).

LACY, JOHN (?-1681). An English actor and playwright. He began his London life in 1631, as apprentice to John Ogilby, a dancing master, held a commission in the Royalist army during the Civil War; after the Restoration became a favorite actor; played Teague in Howard's *Committee* and was the original Bayes in Buckingham's *Rehearsal* (1671). His experiences as soldier he turned to good account in *The Old Troop*, a farce. Consult his *Dramatic Works* (London, 1875), with memoir and notes.

LADAKH, lá-dák'. A district in the east-central part of Kashmir (q.v.), British India, forming part of the upper valley of the Indus, between the Western Himalayas and the Karakorum Range (Map: India, C 1). The area of Ladakh proper is about 8000 square miles, but the name is applied to a wider region. Pop., (with Mansir), 1911, 186,656. The whole district is highly elevated, ranging from 9000 to 14,000 feet, and is crossed by a number of lofty mountain spurs, with narrow valleys between them. The air is very dry, and the climate is severe, with great variations in temperature. Good crops of wheat, barley, millet, and buckwheat are raised. The mineral products are sulphur, iron, borax, silver, and gold; woollen manufactures are important. The transit trade is extensive, being carried mostly on mules and sheep. The capital is Leh. Ladakh was originally a province of Tibet, after which it was for a time independent until 1839, in which year it was annexed to Kashmir. Consult Sir Francis Edward Younghusband, *Kashmir* (London, 1911), and Arthur Neve, *Thirty Years in Kashmir* (New York, 1913).

LADAKHI, lá-dák'hé. The natives of Ladakh. They are reputed to be peaceful and industrious. Some of their settlements are 14,000 feet above sea level. Their dress is peculiar in several respects, and their women paint their faces in Indian fashion. They speak an Aryan dialect closely related to Kashmiri, but are thought by some authorities to have a large strain of Mongolian blood. The Ladakhi are Buddhists, with an interesting folk religion behind the adopted one. The folk poetry of the Ladakhi is extensive. A brief collection of Ladakhi proverbs has been published by Rev. H. Kranke, a missionary at Leh, in the *Journal of the Asiatic Society of Bengal* for 1900. Consult K. E. von Ujfalvy, *Les Aryens au Nord et au Sud de l'Hindou-Kouch* (Paris, 1896), and A. H. Francke, "A Language Map of West Tibet," with notes, in *Asiatic Society of Bengal, Journal*, vol. lxxiii (N. S., Calcutta, 1904).

LADAS (Lat., from Gk. Λάδας). A swift runner of Laconia, of the fifth century B.C., whose speed became so proverbial that he is frequently mentioned by both Greek and Roman writers. Consult Gardiner, *Greek Athletic Sports and Festivals* (London, 1910).

LADD, GEORGE TRUMBULL (1842-). An American psychologist and philosopher, born at Painesville, Ohio. He graduated from Western Reserve University in 1864 and from Andover Theological Seminary in 1869, occupied pastorates until 1879, was professor of philosophy at Bowdoin College for two years, and from 1881 until his retirement in 1905 held the chair of philosophy at Yale. Upon the invitation of the Imperial Educational Society and of the Univer-

sity of Tokyo, he lectured in Japan in 1892 and 1899; in 1899-1900 he lectured in India and in 1907 in Honolulu. In the latter year also he was the guest and unofficial adviser of Prince Ito in Korea. Numerous honors were conferred on him at home and abroad—he was decorated with the Order of the Rising Sun (third and second class), received honorary degrees from Western Reserve and Princeton, and was president of the American Psychological Association in 1893 and a vice president of the American Association for the Advancement of Science in 1911. His writings include, besides a translation of Lotze's *Outlines of Philosophy* (6 vols., 1887): *Principles of Church Polity* (1881); *Doctrine of Sacred Scripture* (2 vols., 1884); *Practical Philosophy* (1885); *Elements of Physiological Psychology* (1887; new ed., with R. S. Woodworth, 1911); *What is the Bible?* (1888); *Introduction to Philosophy* (1890); *Outlines of Physiological Psychology* (1891); *Psychology, Descriptive and Explanatory* (1894); *Philosophy of Mind* (1895); *Philosophy of Knowledge* (1897); *Outlines of Descriptive Psychology* (1898); *Primer of Psychology* (1898); *Essays on the Higher Education* (1899); *A Theory of Reality* (1899); *Philosophy of Conduct* (1902); *Philosophy of Religion* (2 vols., 1905); *In Korea with Marquis Ito* (1908); *Knowledge, Life, and Reality* (1909); *Rare Days in Japan* (1910); *Teacher's Practical Philosophy* (1911); *What Can I Know?* (1914); *What Ought I to Do?* (1915).

LADD, WILLIAM (1778-1841). An American philanthropist and peace advocate, born in Exeter, N. H. After graduating at Harvard (1797), he took to the sea and came to be known as a capable New England captain. A disbeliever in war for any purpose, he turned landsman at the outbreak of the War of 1812 and devoted both tongue and pen to preaching nonresistance. He was president of the American Peace Society, editor of its organ, *The Friend of Peace*, afterward *The Harbinger of Peace*, and published separate addresses to the peace societies of Maine (1824), of Massachusetts (1825), and *An Essay on the Congress of Nations* (1840).

LADDER SHELL. See WENTLETRAP.

LADEGAST, lă'de-găst, FRIEDRICH (1818-1905). A German organ builder, born at Hochhermsdorf, near Rochlitz, in Saxony. He served an apprenticeship with his elder brother and then established himself at Weissenfels in 1846. He first became known through the cathedral organ at Merseburg, which he rebuilt in 1855. In conjunction with his son, Oskar (1856-), he built more than 150 organs, most of them of large size.

LADENBURG, lă'den-bŭrk, ALBERT (1842-1911). A German chemist, born at Mannheim and educated at Heidelberg, Berlin, Ghent, and Paris. He carried out the synthesis of the alkaloid conine (see ALKALOIDS) and published a series of brilliant and justly celebrated papers on the constitution of benzene. He wrote several works on the history of chemistry, including *Entwicklungsgeschichte der Chemie in den letzten hundert Jahren* (2d ed., 1887). His popular writings include: *Naturwissenschaftliche Vorträge in gemeinverständlicher Darstellung* (1908).

LADIES' CATHOLIC BENEVOLENT ASSOCIATION. A society of Roman Catholic women, established for the purpose of providing benefits to be paid to the families of members after death. It was organized at Titusville, Pa.,

in April, 1890, and received a charter in Erie Co., Pa. The central office of the association is at Union City, Pa., and the government is vested in a supreme council, which has jurisdiction throughout the United States. At the close of the fiscal year 1914 there were 1226 subordinate branches in existence, with a total membership of 147,025. The amount paid during the year to beneficiaries was \$1,197,040, and the total benefits disbursed since organization amounted to \$11,985,234. The charter is perpetual, and the association has no capital stock, claims being provided for on the assessment plan.

LADIES OF THE QUEEN'S HOUSEHOLD. In Great Britain these comprise the mistress of the robes, the ladies of the bedchamber, the bedchamber women, and the maids of honor. The office of mistress of the robes is of considerable antiquity. It is her duty to regulate the rotation and times of attendance of the rest of the ladies of the household, who are all subordinate to her. She has the superintendence of all duties connected with the bedchamber and the custody of the robes. On state occasions she must see that the ceremony of robing the Queen is properly performed. In public ceremonials she accompanies the Queen in the same carriage or walks immediately before her Majesty. The ladies of the bedchamber and the bedchamber women are personal attendants, ministering to the state of her Majesty. The maids of honor, of whom there are nine, are immediate attendants on the royal person, and in rotation perform the duty of accompanying the Queen on all occasions.

LADIES' TRESSES. See Colored Plate of AMERICAN ORCHIDS with article ORCHID.

LADINO, lâ-dě'nô (from Lat. *Latinus*, Latin). 1. A term of various ethnological applications, denoting the Romansch dialect and the closely related dialects spoken in the Tirol and Friuli. 2. The old Castilian language in Spain. 3. A Ili-pano-Portuguese dialect of Latin, spoken by Turkish and other Jews. 4. A name applied in the Central American States to the descendants of Latin-American fathers and Indian mothers. As in the mulattoes in the United States, their color is a blend of the two races, and the hair is wavy.

LADISLAS, lăd'is-lăş, or LADISLAUS (Hung. *László*, and for the kings of Poland and Bohemia *Ulászló*). The name of several kings of Hungary, of whom one ruled also over Poland and two over Bohemia.—**LADISLAS I THE SAINT** (died 1095) was the son of Béla I and, after acquiring fame by his victories over the Cumans, succeeded his brother Gejza as King of Hungary in 1077. He subdued the Croats (1091) and established the Christian religion among them. He forced the Cumans likewise to embrace Christianity. He died in the midst of preparations for a crusade to the Holy Land and was canonized by Pope Celestine III in 1198.—**LADISLAS IV**, surnamed **THE CUMAN**, succeeded his father, Stephen V, in 1272. He attacked the Cumans and defeated them; but, reinforced by hordes of the Nogai Tatars, they swept over Hungary in a wave of invasion (1285), and Ladislav was forced to make terms with them. He adopted some of their customs and put away his wife to marry one of their princesses. He was assassinated by a Cuman in 1290.—**LADISLAS** (*Uladiślas*), King of Hungary (1440-44) and Poland (1434-44). See **LADISLAS III**, King of Poland.—**LADISLAS VI** (V),

POSTHUMUS, King of Hungary and Bohemia. He was the posthumous son of Albert II, the third Hapsburg King of Germany, by Elizabeth, the heiress of the Emperor Sigismund, and was born in 1440. He was King of Bohemia from his birth and at the age of five was made King of Hungary. His guardian, the Emperor Frederick III (of the house of Austria), would not allow him to repair to his realms until he had reached the age of about 13 years. The great general János Hunyady (q.v.) conducted the government of Hungary during the minority of Ladislas, while in Bohemia the government passed into the hands of George Podiebrad (q.v.). Ladislas died in 1457, in his eighteenth year.—**LADISLAS** (Uladislas) VII (VI) was elected King of Hungary in 1490, 19 years after his accession to the throne of Bohemia. He died in 1516 and was succeeded by his son Louis II. His daughter Anna married Ferdinand I of Hapsburg. Consult: Szalay, *Geschichte Ungarns*, vols. i-iii (Ger. trans., Budapest, 1866-73), Horváth, *Geschichte Ungarns*, vol. i (Ger. trans., Budapest, 1876); Vámbéry, *Hungary* (New York, 1894).

LADISLAS, or **LADISLAUS** (c.1379-1414). King of Naples from 1386 to 1414, of the house of Anjou. He was the son of Charles III (of Durazzo) and on his father's death succeeded to the crown under the regency of his mother. From the beginning he was forced to contend against a faction on the nobility, led by the powerful family of Sanseverino, who set up Louis II of Anjou as a rival candidate for the throne. In 1391 Louis invaded Naples, but after eight years of warfare was driven out by Ladislas, who from an early age had evinced remarkable military talents and a restless energy. He had succeeded, besides, in gaining the support of Pope Boniface IX and winning over the Angevin party. Once freed from his rival, Ladislas turned upon the turbulent nobility and crushed them into nonresistance. He then gave his attention to foreign conquests, for which central Italy, rent by the great schism, offered a fair field. Playing both with the Pope and the people of Rome, he succeeded in inciting the populace against Innocent VII, who in 1405 was forced to flee from the city, but Ladislas' attempt to gain possession of the city failed, and in 1406 he was forced to come to terms with the Pope. In 1408 he made himself master of Rome without meeting resistance, and forced Gregory XII to sell to him for 25,000 florins the States of the Church with Rome itself. In 1409 a league was formed against him by Pope Alexander V, Florence, Siena, Bologna, and Louis of Anjou, and in the following year Ladislas was expelled from Rome. The war against the King of Naples was carried on vigorously by Pope John XXIII, whose forces, under the command of Paolo Orsini, defeated Ladislas at Roccasecca in May, 1411. The King, nevertheless, succeeded in detaching Florence from the alliance and made his peace with the Pope. This was but to gain time. In June, 1413, he took Rome and compelled John XXIII to flee. His plans for establishing a powerful Italian kingdom seemed well on the way towards realization when he was struck down by disease and died at Castelnuovo, Aug. 6, 1414. In 1403 he had been crowned King of Hungary at Zara, a title which had soon to be laid down. Consult Mandell Creighton, *History of the Papacy*, vol. i (London, 1882), and Gregorovius, *History of*

the City of Rome in the Middle Ages, vol. vi (ib., 1898).

LADISLAS, or **VLADISLAV**, vlá-dis'laf. The name of several kings of Poland.—**LADISLAS I**, surnamed **LOKIETEK** (the short) (1260-1333), was the son of Duke Casimir of Cuiavia and in 1288 made himself King of Poland with the assistance of a party among the nobility. He was compelled, however, to wage war against the Duke of Silesia and the King of Bohemia and was driven by the latter from the country. After the death of the Bohemian King Venceslas in 1305, he succeeded in making himself master of Cracow and in 1312 completely crushed his enemies, thus reuniting the Polish territories under his rule. In 1320 he was crowned King of Poland, with the sanction of the Pope. The marriage of his son Casimir with Anna, daughter of Gedimin, Prince of Lithuania, prepared the way for the union of that country with Poland.—**LADISLAS II** (1348-1434) was the son of Olgerd, Prince of Lithuania, and succeeded his father in 1377, being known before his acquisition of the Polish throne as Jagello. In 1386 he was converted to Christianity, adopted the name of Ladislas, and married Hedwig, heiress of Louis the Great, King of Hungary and Poland, ascending the throne as Ladislas II. He became the founder of a dynasty which ruled over Poland until 1572. (See **JAGELLONS**.) His efforts were directed towards preserving the union between Lithuania and Poland and extending the power of the latter country. He carried on long wars against the Teutonic knights and in 1410 gained a decisive victory over them at Tannenberg. He founded the University of Cracow in 1400.—**LADISLAS III** (1424-44) was the son of Ladislas II and succeeded his father in 1434, assuming personal charge of the government in 1439. In the following year he was elected King of Hungary, but was compelled to make good his title by force of arms against Elizabeth, widow of the late monarch, Albert II, who claimed the throne for her son, Ladislas Posthumus, born after the father's death. In 1442 he married Elizabeth, who died three days after the wedding. Under the great Hunyady (q.v.) the Hungarian armies were successful for a time in the struggle against the Turks; but at Varna, on Nov. 10, 1444, the Hungarian army was overwhelmed and the King with the greater part of his nobility perished.—**LADISLAS IV** (1595-1648) was the son of Sigismund III. In 1610 he was elected Czar by a part of the Russian nobility and took up his residence in Moscow; but his father's ambition to bring Russia under the Polish crown led to a national uprising, and Ladislas was expelled from Moscow in 1612. He succeeded his father in 1632 and carried on war with marked success against the Russians and the Turks. He sought to vindicate the royal power against the powerful nobility, but with little success. The last years of his reign were disturbed by a formidable uprising of the Cossacks under Bogdan Chmielnicki (q.v.).

LA'DLEWOOD. A South African tree. See **HARTOGIA**.

LADMIRAULT, lăd'mér'ô', **LOUIS RENÉ PAUL DE** (1808-98). A French general. He was born at Montmorillon in the Department of Rhône, entered the army in 1831, served in Africa, distinguished himself in the Italian war at Melegnano and Solferino (1859), and, as commander of the Fourth Army Corps, was or-

dered to defend the lines between Metz and Thionville, upon the outbreak of war with Prussia. He was with Bazaine in Metz and went a prisoner to Germany. On the outbreak of the Commune (see COMMUNE) Ladmirault was made commander of the troops ordered to take Paris. On May 22 he forced an entrance into the city by the Porte Saint-Ouen, the following day gained possession of the heights of Montmartre, and thence, with obstinate fighting on both sides, took possession of the city part by part. On July 1, 1871, he was made military governor of Paris. From 1876 to 1891 Ladmirault was a member of the Senate.

LADOGA, lá'dó-gá The largest lake of Europe, situated in the northwestern part of Russia, its southwest corner being 40 miles east of St. Petersburg (Map: Russia, D 2). It is bounded by Finland and the governments of St. Petersburg and Olonetz. It is 129 miles from north to south, 81 miles from east to west, 585 miles in circumference, and covers an area of somewhat over 7000 square miles. The south shore is a low, boulder-strewn region of glacial origin, while the north shore is steep with granite cliffs. The depth in the southern and central parts is less than 300 feet, while in the north it is mostly over 400 feet and occasionally reaches about 800 feet. Its water is cold, but abounds in fish. It is fed by a number of streams, the chief of which are the Svir, the outlet of Lake Onega, and the Volkhov from Lake Ilmen, and has for its outlet the Neva. Navigation on the lake is attended with considerable danger, owing to the numerous shallows, sand banks, and hidden rocks. Its position at the northern terminal of the great water system which connects the Caspian Sea with the Gulf of Finland through the Volga, and the three feeders of the Ladoga, the Volkhov, the Sias, and the Svir, gives the lake great commercial importance, and, in order to make it available for navigation, a number of canals have been constructed along its south and southeast shores. The chief of these are the Ladoga Canal, about 70 miles long (1718-31), Neva with the Volkhov, the new running parallel to the former; and the Sias and the Svir canals, connecting the mouths of these two rivers with the Ladoga Canal. These canals are navigated annually by thousands of vessels and rafts. The lake is also connected by water with the White Sea and is ice-free on the average for 191 days in the year, from May to October. The most interesting of its numerous islets are Valaam and Konevets, both occupied by monasteries, the former being among the most popular places of in Russia. The chief towns on the lake famous fortress of Schlüsselburg, at the entrance of the Neva and Novaya Ladoga, at the mouth of the Volkhov.

LADOGA STARAYA, lá'dó-gá stá-rá'yá. A town of Russia. See STARAYA LADOGA.

LADRONE (lá-drón', *Sp. prom. lá-drón'ná*)

ISLANDS, MARIANA OR MARIANNE ISLANDS. A group of islands in the Pacific Ocean, belonging, with the exception of Guam (q.v.), the southernmost and largest, to Germany (Map: Australasia, G 1). They are situated between lat. 13° N. and 21° N. and between long. 144° E. and 146° E., about 1500 miles east of the Philippines. They are disposed in a row from north to south; their number is about 16, of which eight, including Guam, are inhabited;

their aggregate area is about 440 square miles. The largest islands, next to Guam, are Saipan, Tinian, and Rota, all in the southern part of the group, those in the north being only small volcanic islets, and all of them mountainous. The climate is humid, but moderately warm and not unhealthful. The coconut and breadfruit trees are indigenous, but rice, sugar, maize, coffee, tobacco, and indigo are cultivated. The native fauna is very poor, including no mammals except a few rats and bats and hardly any reptiles or insects. All the domestic animals of Europe, however, have been imported and thrive there. The aboriginal inhabitants consisted of Chamorrios, a tribe of Micronesians; they decreased rapidly after the Spanish occupation, and Tagalogs were imported from the Philippines, who mixed with and almost supplanted the earlier race. The source of the megalithic monuments, principally found on Tinian as parallel rows of evenly spaced pillars with bowl-shaped capitals, is still in doubt; some authorities regard them as quite recent, but in general they appear to be the work of the prehistoric race in the Pacific who built so many structures. (See MEGALITHIC MONUMENTS.) In 1904 the population of the islands numbered 2646, exclusive of Guam, whose population was (1912) 12,517. They were discovered in 1521 by Magellan, who named them Ladrone (Sp., robbers) on account of the thieving propensities of the inhabitants. They were settled in 1667 by Spanish Jesuit missionaries, who called them the Mariana Islands. As a result of the Spanish-American War, the island of Guam was ceded to the United States in 1898, and the remaining islands, together with the Carolines, were sold to Germany in 1899 for 25,000,000 pesetas (\$4,875,000). During the European War which began in 1914 Japan occupied the Ladrone Islands for strategic purposes. (See WAR IN EUROPE.) The Ladrone form a division of the German New Guinea Protectorate; the seat of administration is on the island of Saipan.

LADYBIRD (*lady*, with reference to Our Lady, the Virgin Mary + *bird*, perhaps a variant of *bug*), or **LADYBUG**. A beetle of the family Coccinellidae. Ladybirds are pretty little beetles, well known to every one, often of a brilliant red or yellow color, with black, red, white, or yellow spots, the number and distribution of which are characteristic of the different species. The form is nearly hemispherical, the under-surface being very flat, the thorax and head small, the antennae are short and terminate in a club, the legs are short. When insects emit from their joints a yellowish fluid having a disagreeable smell. They and their larvæ feed chiefly on scale insects and plant lice, in devouring which they are very useful to agriculturists and fruit growers. They deposit their eggs under the leaves of plants on which the larvæ are to find their food, and the larvæ run about in pursuit of aphids. Ladybirds are sometimes to be seen in immense numbers, which, from ignorance of their usefulness, have sometimes been regarded with a kind of superstitious dread.

Ladybirds are great benefactors to the American fruit growers. An Australian ladybird (*Ve-dalia*, or *Novius*, *cardinalis*) was introduced in 1886, to feed on the cottony cushion scale of the orange and lemon groves of California, and in less than a year it practically exterminated the pest. It has since been introduced with

equal success into South Africa, Portugal, Egypt, and Italy, where it has exterminated the same scale or a congeneric species. The two-spotted ladybird (*Coccinella bipunctata*), a black beetle with two red spots, which occurs all over the United States, is also of inestimable value in protecting vegetation from plant lice and scale and other insects. One genus of ladybirds (*Epilachna*), is herbivorous and feeds on the leaves of the squash, pumpkin, melon, bean, and other plants. Consult: T. L. Casey, "Revision of the American Coccinellidae," in *Journal of New York Entomological Society* (New York, 1899); L. O. Howard, "Beneficial Work of *Hyperaspis signata*," in United States Department of Agriculture, *Division of Entomology, Bulletin* (N. S., 26, Washington, 1900); C. L. Marlatt, "Preliminary Report on the Importation and Present Status of the Asiatic Ladybird," in *United States Department of Agriculture, Division of Entomology, Bulletin* (N. S., 37, ib., 1902), id., "Predatory Insects which Affect the Usefulness of Scale-Feeding Coccinellidae," in *United States Department of Agriculture, Division of Entomology, Bulletin* (N. S., 37, ib., 1902). See Colored Plate of INSECTS.

LADY BOUNTIFUL. In Farquhar's *Beaux' Stratagem*, an old gentlewoman with benevolent instincts, who devotes herself to the curing of maladies. The name is used, sometimes with the added idea of condescension, to denote a woman who dispenses relief or favors in a community.

LADY CHAPEL. A chapel dedicated to the Virgin Mary (Our Lady). It was generally an elongation of the choir eastward of the church, directly behind the high altar, or at the end of the aisles of the choir. In a number of important cases, however, it was a detached building, though connected by a passage with the choir, as at Gloucester. In either case it was often the most richly decorated part of the church. Its use was most extensive in England, where nearly all the cathedrals and great abbey churches had lady chapels. Henry VII's chapel at Westminster was originally designed to be the lady chapel of that abbey. A very beautiful French example is the lady chapel of the church of St. Germer-de-Fly. That of the cathedral of St. Patrick at New York is a notable American example.

LADY CRAB. A local name of the large edible crab (*Callinectes hastatus*) of the American Atlantic coast, due to the dim outline on its back of a woman's head and shoulders. As other crabs (notably *Platyonchus ocellatus*) are similarly marked, they have also received the same name. See CRAB.

LADY DAY. In England, the feast of the Annunciation of the Virgin Mary. It occurs on the 25th of March and has by custom become one of the regular quarter days on which rent is generally made payable.

LADY FERN (*Asplenium filix-femina*). A beautiful fern common in moist woods in Europe and North America, with bipinnate fronds sometimes 2 feet long. The whole plant has an extremely graceful appearance. It is said to possess the same antihelmintic properties as the male fern (*Aspidium filix-mas*).

LADYFISH. A shapely and very beautiful fish (*Albula vulpes*), representing alone the family Albulidae, allied to the tarpons and moon-eyes and found in all tropical seas. It is 1½ to 3 feet long and is brilliantly silvery, faintly streaked, and becoming olivaceous along the

back. In Bermuda and the West Indies it is called bonefish or banana fish and sold for food, although not very good. Gilbert says that the young pass through a metamorphosis analogous to that of conger eels. For a period they are elongate, band-shaped, and have very small heads and loose, transparent tissues. Afterward they gradually become shorter and more compact. This fish is very common in the Gulf of California.

LADY OF ENGLAND. A name given to Matilda, daughter of Henry I and mother of Henry II.

LADY OF LYONS, THE. A play by Bulwer-Lytton (1838). The play was originally called *The Adventurer* and was suggested by a story called *The Bellows-Mender*.

LADY OF MERCY, ORDER OF OUR. A Spanish order founded in 1223 by Pedro Nolasco, the tutor of James I of Aragon. (In the order's chronicles the date is given as 1218.) Sometimes called in the early days the Order of St. Eulalia. In 1235 Gregory IX approved the order, which was instituted to redeem Christian captives from among the Moors; each knight at his inauguration vowing that, if necessary for their ransom, he would remain himself a captive in their stead. In 1318 dissensions arose in the order, and a part of the knights joined the Order of Montesa. The order extended to Italy, France, Ireland, and Africa, and, abandoning its original purpose, became a missionary order, especially in South America. A third order for women was founded in 1265 and extended later to South America, Ireland, and South Africa. Some of the sisters did excellent services as nurses at Mafeking during the Boer War. Consult Heimbucher, *Orden und A. . . .* vol. ii (Paderborn, 1907).

LADY OF MONTESA, mōn-tā'sà, ORDER OF OUR. An Aragonese order founded by King James of Aragon, who had urged Pope Clement V to allow him to employ all the estates which had belonged to the Templars within his territory for the benefit of this new knightly order intended to protect Christians against the Moors. His request was acceded to by the following Pope, John XXII, in 1316, who granted him for this purpose all the estates of the Templars and of the Knights of St. John situated in Valencia. Out of these was founded the new order, which King James named after the town and castle of Montesa, which he assigned as its headquarters. In 1399 the Order of St. George of Alfama was united to Montesa. In 1587 the crown became grand master. The order was abolished in 1872, but reinstituted in 1874. The order is now conferred merely as a mark of royal favor, though the provisions of its statutes are still nominally observed in new creations. The badge is a red cross, edged with gold; the costume, a long white woolen mantle, decorated with a cross on the left breast. Consult Heimbucher, *Orden und Kongregationen*, vol. ii (Paderborn, 1907).

LADY OF SHALOTT', THE. The heroine of a poem of the same name by Tennyson (1832).

LADY OF THE AROOSTOOK, à-rōō's'tuk, THE. A tale by W. D. Howells, originally published in the *Atlantic* in 1878-79.

LADY OF THE LAKE, THE. A poem by Sir Walter Scott (1810). This is the most popular of Scott's long narrative poems. It took its name from the heroine, Ellen Douglas, whose home is on an island in Loch Katrine.

LADY OR THE TIGER? THE. A short story by F. R. Stockton (1884), which gained great popularity from the unsolved problem presented at its close. The title has become a common phrase denoting a dilemma.

LADY'S FRIEND. The name given to an officer of the House of Commons who was charged with the duty of protecting the interests of a wife against whom a divorce bill was pending in Parliament, by seeing that no bill of divorce passed until provision by alimony had been made by the husband. The office became obsolete in 1857, on the transfer of the practice of granting divorces from Parliament to the courts of justice.

LADY'S-MANTLE (mantle of Our Lady; so called from the shape of the leaves), *Alchemilla*. A genus of herbaceous plants of the family Rosaceae. The common lady's-mantle (*Alchemilla vulgaris*) is abundant on banks and in European pastures. Its root leaves are large, plaited, many-lobed, and serrated; its flowers, in corymbose terminal clusters, usually yellowish green. Still more beautiful is the Alpine lady's-mantle (*Alchemilla alpina*), which grows on mountains and has digitate serrated leaves, white and satiny beneath. A common European plant of very humble growth and unpretending appearance, field lady's-mantle, or parsley piert (*Alchemilla arvensis*), found in pastures and introduced into the eastern United States, is an astringent and diuretic, said to be sometimes useful in cases of stone in the bladder by producing a large secretion of lithic acid. It is, however, not official.

LA'DYSMITH. A town and capital of a district of the same name in the Province of Natal, South Africa, on the Klip River, 189 miles west-northwest of Durban, at the junction of two railways entering the Transvaal and Orange River colonies (Map: Africa, H 7). Pop., 1911, 5340. Prior to the Transvaal War of 1899-1902 it was chosen as a depot for military stores and supplies—a choice which has been condemned as a strategical error and which considerably prolonged the war. In its defense 9000 English troops under General White sustained a siege of 118 days from Nov. 2, 1899, until relieved by General Buller on Feb. 28, 1900. It has large railway shops, a good water supply, and electric light.

LADYSMITH. A city in the Nanaimo District, Vancouver Island, British Columbia, Canada, on Oyster harbor, east coast of Vancouver Island, and on the Esquimalt and Nanaimo Railway, 18 miles by rail southeast by south of Nanaimo (Map: British Columbia, D 5). The Canadian Pacific Railway ferries freight trains to Ladysmith from Vancouver, and the trains are transferred to the Esquimalt and Nanaimo Railway. The industrial establishments include a copper smelter, stove works, brewery, boat-building works, shingle mill, and aerated-water works. The Extension Coal Mines are located near Ladysmith. The city owns its electric-lighting plant and water works. Pop., 1911, 3295.

LADY'S-SLIPPER, or MOCCASIN FLOWER (so called from the shape of the labellum), *Cypripedium*. A genus of plants of the family Orchidaceae, of wide distribution throughout the temperate parts of the globe, except Africa and Australia. *Cypripedium insigne* is a native of Nepal; *Cypripedium debile* of Japan; *Cypripedium calceolus* of Europe, where it is the only

species. In North America there are about 10 species, of which *Cypripedium hirsutum*, the showy lady's-slipper, a plant 2 feet high, is the most conspicuous, and *Cypripedium acaule*, the stemless or pink lady's-slipper, is the most common. The species of *Cypripedium* are terres-

A FLORIST'S LADY'S-SLIPPER.
(*Cypripedium insigne*.)

trial plants, in distinction from the tropical epiphytes. There are about 20 species or more, and numerous hybrids, some of which have flowers of great beauty. They are of easy and extensive cultivation. See Plate of MONOCOTYLEDONS, and Colored Plate of ORCHIDS, AMERICAN.

LADY'S-SMOCK. See CRESS.

LAËKEN, lä'ken. A town of Belgium, a suburb of Brussels, with which it is connected by street railways (Map: Belgium, C 4). It contains the royal palace, built in 1782, bought by Napoleon in 1806 for Josephine, and restored since the fire of 1890. He resided there for a time with Maria Louisa. In 1812 he exchanged it for the Elysée Bourbon. Afterward it became the property of Belgium and served as the residence of the royal family. On a hill outside the town is the huge memorial pile to Leopold I, with a statue by W. Gelfs. Pop., 1900, 30,438; 1910, 35,024.

LÆLAPS, læ'lāps (Neo-Lat., from Lat. *Laelaps*, name of a dog, from Gk. λαίλαψ, *laílaps*, hurricane). A fossil dinosaurian reptile. See MEGALOSAURUS.

LÆLIUS, læ'lī-ūs. 1. GAIUS, a Roman general and statesman, friend of Scipio Africanus Major. He served with success in Sicily and Africa (205). In 203 he defeated Syphax (q.v.). In 202, serving under Scipio, in command of the cavalry, he contributed largely to the defeat of Hannibal at Zama. He was consul in 190. He died after 170. 2. GAIUS, surnamed SAPIENS (the wise) (186-115 B.C.), son of 1. In early life he studied philosophy with the Stoics Diogenes and Panætius, and afterward law, taking a high rank among the orators of his time. He was the intimate friend and companion of Scipio Afri-

canus the Younger and accompanied him in his expedition into Africa, displaying great valor at the siege of Carthage (149-146 B.C.). When prætor in Lusitania, he made a successful campaign against the powerful chieftain Viriathus (q.v.). He was consul 140 B.C. At the beginning of his career he favored plans for raising the masses to become landed proprietors, but was repelled by the extravagance of the elder Gracchus. After his political career closed he spent his time in the country, partly in study and partly in rural occupations. The equanimity of his temper is noticed by Horace in the words *mitis sapientia Læli* (*Sermones*, II, 1, 72; the passage testifies also to his intimacy with Scipio Africanus Minor). The titles of many of his orations are known, but the orations have been lost. Lælius is best known as the principal speaker of Cicero's *Lælius de Amicitia* and as one of the speakers of his *De Senectute* and his *De Republica*. Consult the article "Lælius," in Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

LAEMMER, lēm'mēr, HUGO (1835-). A German divine, born at Allenstein in East Prussia. From 1852 to 1856 he studied Protestant theology at the universities of Königsberg, Leipzig, and Berlin, but afterward became a convert to Catholicism. He justified his conversion by a pamphlet, *Misericordias Domini* (1861). After 1864 he was professor of Catholic theology at Breslau. In 1882 he was made prelate prothonotary, and he lectured for many years on the history and law of the Church, becoming professor at Breslau. His publications include *Clementis Alexandrini de Logo Doctrina* (1855); *Die vortridentisch-katholische Theologie des Reformationszeitalters, aus den Quellen dargestellt* (1858), a prize essay; *Zur Kirchengeschichte des 16 und 17. Jahrhunderts* (1863); *Institutionen des katholischen Kirchenrechts* (2d ed., 1892); *De Caesaris Baronii Literarum Commercio Diatriba* (1903).

LAËNNEC, la'ën'něk', RENÉ THÉOPHILE HYACINTHE (1781-1826). A distinguished French physician, born at Quimper in Lower Brittany. He studied medicine in Nantes and in Paris, where he attended the practice of Corvisart. In 1816 he was appointed chief physician to the Hôpital Necker, and it was there that he created a rational system of diagnosis of diseases of the heart and of the lungs, by adding the art of auscultation by means of the stethoscope (q.v.) of his own invention to the method of percussion discovered by Auenbrugger. In 1823 he was appointed professor of medicine in the Collège de France. In 1819 he published his *Traité de l'auscultation médiate* (4th ed., 1836), which has probably done more to advance the art of diagnosis than any other single book. Consult Saintignon, *Laennec, sa vie et son œuvre* (Paris, 1904).

LAER, lār, PIETER VAN. See LAAR, PIETER VAN.

LAERTES, lā-ēr'tēz. 1. The son of Acrisius, husband of Anticlea and father of Odysseus, who hence bears the name Laertiades. He participated in the Calydonian hunt and in the Argonautic expedition. 2. In Shakespeare's *Hamlet*, the son of Polonius and brother of Ophelia. He is himself wounded by the poisoned sword with which he kills Hamlet, and dies with his victim.

LÆSA MAJESTAS (Lat., injured majesty). A phrase transferred from the Roman to

the common law and denoting any offense against the king's person or dignity. The expression *crimen læsæ majestatis* is used by Glanvil as the equivalent of treason, but the offense was not clearly defined until the enactment of the statute of 25 Edw. III, upon which the modern English law of treason is based. Speaking or publishing words derogatory to the king or to the royal dignity is not a special offense in English law, but is covered by the ordinary law of libel and slander. The king has the same rights as the ordinary citizen to be protected against such offenses and no more. In certain continental countries, however, as Germany, speech or acts which show a lack of respect for the ruler are punishable summarily as *lèse-majesté*.

LÆSTRYGOES, lēs-trig'ō-nēz (Lat., from Gk. Λαιστρυγόνες, *Laistrygonēs*). A race of cannibalistic giants whom Odysseus is fabled to have met in the Farthest North in the course of his wanderings (*Odyssey*, x, 80 ff.) Odysseus escaped with but one ship; with rocks the giants sank the others. Their King, called Lamus, has been regarded as the masculine correlative to Lamia (q.v.) According to the later Greek tradition, the seat of the Læstrygonēs was at Leontini in Sicily, but the Romans supposed them to have lived at Formiæ in Latium (e.g., Horace, *Carmina*, iii, 16, 34). Consult Woermann, *Die Odyssee-Landschaften von Esquilm* (Munich, 1876), and Harrison, *Myths of the Odyssey* (London, 1882).

LÆTARE (lê-tā'rē) **MEDAL**. A gold medal presented each year by the University of Notre Dame, Indiana, to some Roman Catholic layman in recognition of distinguished services rendered by him to the cause of religion or education. It is given on Mid-Lent or Lætare Sunday, whence the name, and is an adaptation of the papal custom of conferring the golden rose (q.v.).

LA FARGE, lā'färzh', CHRISTOPHER GRANT (1862-). An American architect, son of John La Farge, born at Newport, R. I. He studied at Massachusetts Institute of Technology (1880-81) and in 1882 in the office of H. H. Richardson (q.v.). With George L. Heins (q.v.) he began practice in Minneapolis in 1883, and from 1886 to 1910, three years after Mr. Heins's death, the firm had New York as its headquarters. The designs of Heins and La Farge for the new Protestant Episcopal cathedral of St. John the Divine were accepted, but after the choir had been built general supervision was intrusted to Cram and Ferguson. (See ST. JOHN THE DIVINE, CATHEDRAL OF.) La Farge collaborated also on the church of the Blessed Sacrament, Providence, R. I.; St. Matthew's, Washington; St. Paul's, Rochester, N. Y.; the Houghton Memorial Chapel, Wellesley, Mass.; the Roman Catholic Cathedral, Seattle, Oreg.; the Packard Memorial Library, Salt Lake City; New York subway stations; buildings in the New York Zoological Park; and mausoleums. In 1910 the firm of La Farge and Morris was formed, La Farge becoming in the same year an Associate National Academician. He was also a president of the Architectural League, New York, and became a fellow and director of the American Institute of Architects.

LA FARGE, JOHN (1835-1910). One of the foremost American mural painters and decorative designers. He was born in New York, March 31, 1835, the son of a French officer who came

to America in 1806. He studied drawing with his grandfather Binase, a miniature painter, and, after receiving a liberal education, went abroad in 1856. With no intention of becoming a painter, he entered the studio of Couture in Paris, and upon his return to America went into a lawyer's office in New York. At this time he met William M. Hunt, who helped him to appreciate color as well as to overcome many technical difficulties. In 1860 he married Margaret Perry, a great-granddaughter of Benjamin Franklin. In 1876 he was engaged for the whole mural decoration of Trinity Church, Boston, which was completed in 1877. In 1878 he commenced works in glass painting and window designing and, with the assistance of Saint-Gaudens, built the King sepulchral monument at Newport, R. I. In 1886 he went to Japan and the islands of the Pacific Ocean, where he made many water-color sketches of native life and scenes. He painted in 1887 a large altarpiece, "The Ascension," in the church of that name in New York—one of his finest works. He was elected to the National Academy in 1869, was president of the Society of American Artists and of the Society of Mural Painters, was created an Officer of the Legion of Honor in 1901 and became one of the seven first members of the American Academy of Arts and Letters. He contributed extensively to the magazines. His most important published works include *Considerations on Painting* (1895), *Great Masters* (1903), *The Higher Life in Art* (1910), *Reminiscences of the South Seas* (1912). He died Nov. 14, 1910.

La Farge is one of the most influential and important figures in the development of American painting. He was one of the earliest representatives of French influence and a real pioneer in mural painting. His versatility was great. In his religious subjects he was the only American who worked in the real spirit of the old masters, but he also painted portraits, landscapes, and flowers, he worked in oil, in water color, on wood, and on glass. He has an individual style, and his technique is careful, though broad in brushwork. His color is varied, sometimes expressed with a charm that suggests all the opalescent qualities of a pearl, then again it is strong, with sharp and striking contrasts. His drawing is not always good. His greatest contribution to art, besides the mural paintings, is his successful experiments in the manufacture and designing of stained glasses. They were epoch making in American art—the first work of the kind produced in the United States—and were distinguished by peculiar opalescent qualities.

Among the best of his canvases, besides those already mentioned, are "Christ and Nicodemus," Trinity Church, Boston; "The Three Kings," Boston Art Museum; "The Muse of Painting" and a Samoan landscape, in the Metropolitan Museum, New York; "The Arrival of the Magi," Church of the Incarnation, New York. Among his great mural decorations are those of the Brick Church, New York; Congregational Church, Newport, R. I.; the Church of the Paulist Fathers, New York; and, perhaps most important of all, the decorations of the lunettes of the Supreme Court room of the Minnesota State Capitol at St. Paul. His works in glass include: "The Infant Samuel," Judson Memorial Church, New York; "The Old Philosopher," Crane Memorial Library, Quincy, Mass.; a circular mosaic window in the Second Presbyterian Church, Chi-

cago; Watson memorial window, Trinity Church, Buffalo; "Battle Window," Memorial Hall, Harvard University; "Paul Preaching at Athens," in the choir of Columbia University Chapel; and the "Peacock Window," in the Worcester (Mass.) Museum. Consult: C. H. Caffin, *American Masters of Painting* (New York, 1892); Waern, *John La Farge: Artist and Writer* (London, 1896); Samuel Isham, *History of American Painting* (New York, 1905); E. L. Cary, *International Studio*, vol. xxxviii (ib., 1909); Royal Cortissoz, *John La Farge: A Memoir and a Study* (ib., 1911).

LAFARGE, MARIE CHAPELLE (1816-52). A Frenchwoman who was a victim of circumstantial evidence. Her conviction as a poisoner (1830) was a public scandal for the virulence of the prosecution, the contradiction of expert testimony, the prejudice of the judge, and the failure of the police to arrest a proved knave, who alone could have profited by the death. Lafarge was sentenced to imprisonment for life. In prison she wrote *Mémoires* (1841). She wrote also *Heures de prison* and *Une femme perdue*, a drama, both in a spirit of melancholy resignation. She was pardoned in 1852, but soon died of the effects of her imprisonment.

LAFARGUE, la'farg', PAUL (1842-1911). A French Socialist, born at Santiago, Cuba. He studied medicine in Paris and in London, where he met Karl Marx (q.v.), whose daughter he married. He was a member of the International Workingmen's Association (q.v.), participated in the Paris Commune of 1871, and fled to Spain and Portugal. After the amnesty of 1880 he returned to France, where with Jules Guesde (q.v.) he organized Marxian Socialism. His journalistic agitation and revolutionary propaganda brought him into conflict with the authorities, and he was imprisoned in 1883 and 1891. On the latter occasion he was elected deputy to the Assembly for Lille while still in prison, but failed of reelection in 1893. He opposed the Jaurès faction who approved of the entrance of Socialists into the Waldeck-Rousseau cabinet of 1899. Lafargue believed that old age and failing physical forces were sufficient justification for taking one's own life, and on Nov. 25, 1911, after careful preparations he, together with his wife, committed suicide. He is author of *Le matérialisme économique de Karl Marx* (1884); *Cours d'économie sociale* (1884); *Le droit à la paresse* (1887); *The Evolution of Property from Savagery to Civilization* (1891, new ed., 1905); *Le socialisme utopique* (1892); *Le communisme et l'évolution économique* (1892); *Le socialisme et la conquête des pouvoirs publics* (1899); *Les trusts américains* (1903); *Le déterminisme économique de Karl Marx* (1909).

LA FARINA, la fá-ré'ná, GIUSEPPE (1815-63). An Italian statesman and historical writer, born at Messina, July 20, 1815. He displayed great precocity in his youth and received the degree of doctor of laws from the University of Catania at the age of 19. Trained for the law, he gave much of his time to literature and became active in the secret revolutionary movement. In 1837 he was implicated in revolutionary disturbances in his native city and fled from Sicily. In 1838 he returned, began practice as a lawyer, and started several political journals, which were all successively suppressed. In 1841 he removed to Florence, where he published several historical works. In 1848 La Farina

took a prominent part in the movement in Tuscany, where he edited the first democratic and antipapal journal, the *Alba*. He then returned to Sicily and was elected a member of Parliament, and on the deposition of the Bourbons was dispatched by the provisional government on a mission to Rome, Florence, and Turin. On his return to Palermo he discharged the duties of Minister of Public Instruction, of Public Works, and of the Interior. After the suppression of the Sicilian revolution in 1849, La Farina lived in France and Turin and returned only when Garibaldi's famous expedition liberated Sicily from the Bourbon rule (1860). In the intervening time he advocated union under the house of Savoy, even before Cavour, and was the secretary of the National Italian Society, of which Pallavicino was president and Garibaldi vice president. When the War of 1859 gave the propaganda of the society over to the Sardinian government, La Farina was employed by Cavour as a royal commissioner in the provinces. After the Peace of Villafranca he reorganized the National Society, at first with Garibaldi as president, and then with himself in the chief place. Like Garibaldi and Manin, he was a Republican by conviction, but he regarded the unity of Italy as more important than the particular form of government. In 1860 he was sent to Palermo by Cavour as the representative of Victor Emmanuel. There he antagonized Crispi and the Republicans. From 1861 till his death he represented Messina in the Italian Parliament. He died in Turin, Sept. 5, 1863. Of his works the most important is *Storia d'Italia dal 1815 al 1850* (1851-52; 2d ed., 1860). Others deserving mention are: *Studi sul secolo XIII* (1841); *Storia d'Italia, della discesa dei Longobardi, narrata al popolo* (1841 et seq.); *Storia della rivoluzione siciliana nel 1848 e 49* (1851). He also wrote dramas and tales. His *Epistolario* (1869) and *Scritti politici* (1870) were edited and published at Milan by Ausonio Franchi.

LAFAYETTE, là-fà-yét'. A town and the county seat of Chambers Co., Ala., 47 miles northwest of Columbus, Ga. on the Central of Georgia Railroad (Map: Alabama, D 3). Lafayette College (q.v.) was opened here in 1885. The town is of importance as a distributing centre and has a considerable trade in cotton. The town owns the water works and electric-light and ice plants. Pop., 1900, 1629; 1910, 1632.

LAFAYETTE. A city and the county seat of Tippecanoe Co., Ind., 74 miles by rail northwest of Indianapolis, on the Wabash River, and on the Cleveland, Cincinnati, Chicago, and St. Louis, the Lake Erie and Western, the Chicago, Indianapolis, and Louisville, and the Wabash railroads (Map: Indiana D 4). It is the seat of Purdue University (q.v.) and has a public library, a fine high school, courthouse, city hall, St. Elizabeth and Home hospitals, St. Joseph's Orphan Asylum, Wabash Valley Sanitarium, Indiana State Soldiers' Home for both veterans and their wives, several monuments, the beautiful Columbian Park, and several handsome church edifices. There are foundries and machine shops, breweries, soap factories, lumber mills, carriage works, flour mills, large steering gear, automobile truck, electric meter and transformer, automobile accessory, and cardboard factories, an agricultural implement plant, iron and wire works, and many other industrial es-

tablishments. The government is administered by a mayor, elected every four years, and a unicameral council, which elects the school trustees. The city clerk and treasurer are chosen by popular election, and the boards of health and of public works and the comptroller are appointed by the mayor. The water works are owned by the municipality. Pop., 1900, 18,116; 1910, 20,081; 1914 (U. S. est.), 20,896. Lafayette is a few miles northeast of the site of the old French fort, Post Oniatanon, built in 1720, the first military post established in the Wabash valley or probably in Indiana. It was surrendered to the English in 1760 and in the same year (June 1) was captured by the Indians. Seven miles north of Lafayette General Harrison defeated the Indians on Nov. 7, 1811, in the famous battle of Tippecanoe (q.v.). First permanently settled in 1820, Lafayette was laid out in 1826 and was incorporated in 1854.

LAFAYETTE. A fish. 1. The harvest fish (q.v.). 2. The spot (q.v.). This name was applied to this fish in the neighborhood of New York, because it first became well known about the time of the visit (1824) of the Marquis de Lafayette, but has long disappeared from popular use.

LAFAYETTE, or **LA FAYETTE**, MARIE JEAN PAUL YVES ROCH GILBERT DU MOTIER, MARQUIS DE (1757-1834). A French general and statesman, and one of Washington's most faithful officers during the American Revolution. He was descended from an ancient family of Auvergne and was born Sept. 6, 1757, in the castle of Châteauneuf in the Department of Haute-Loire. He was killed at Minden in 1759, and in 1770 his mother also died, leaving him in possession of large family estates. In 1774 Lafayette married and in the same year entered the army. At the first news of the American Revolution Lafayette was seized with enthusiasm for the cause of the colonists. Evading the vigilance of the government officials, he fitted out a ship, and, sailing from Passages in Spain, landed on April 24, 1777, at Georgetown, S. C., with 11 companions, among them Baron de Kalb. His arrival in America did much to give new hope to the supporters of the Revolutionary cause, whom the ill success of the preceding campaign had greatly discouraged. On July 31, 1777, Congress bestowed on him the rank of major general, and he was soon after attached to the staff of General Washington, who speedily came to regard the young volunteer with the deepest affection and esteem. In the battle of Brandywine (Sept. 11, 1777) he was wounded while rallying the American troops. In December he was appointed to the command of an army destined for the invasion of Canada; but the expedition was abandoned for lack of resources, and Lafayette rejoined General Washington at Valley Forge in April, 1778. On the night of May 19 he was surprised by General Grant with a force of 5000 men, more than twice his own, at Barren Hill, some 12 miles from Valley Forge, but effected his retreat with the utmost skill. He fought brilliantly under Lee at Monmouth (June 28) and in August commanded with Sullivan and Greene the land expedition dispatched to cooperate with the French fleet in an attack on Newport. On the breaking out of war between France and England, Lafayette sailed for his native country (January, 1779), and it was largely through his exertions that the King dispatched a land force as well as

a fleet to the aid of the Americans. In May Lafayette was back in service and was stationed with a corps of observation on the Hudson. He was a member of the court-martial that condemned Major André to death. In February, 1781, he was sent with 1200 New England troops to operate against Benedict Arnold in Virginia, and later, when the British strength in Virginia was increased by the arrival of Cornwallis at Petersburg with 5000 troops (May 20), Washington showed his confidence in Lafayette by continuing him in the command. On May 24 Cornwallis set out from Petersburg in pursuit of Lafayette, who was stationed near Richmond. "The boy cannot escape me," said Cornwallis. The "boy" retreated rapidly to the Rappahannock, effected a junction with 1000 Pennsylvanians under Wayne, and, reinforced by the militia from the mountains, offered Cornwallis battle near Albemarle. Cornwallis retreated to Richmond, and then to Williamsburg, with Lafayette at the head of 4000 men in pursuit. On July 6, he came in touch with the British at Green Springs; but the action was indecisive, and Cornwallis continued his retreat—to Yorktown. On the day after Cornwallis' surrender Lafayette was publicly thanked by Washington. In December, 1781, he sailed from Boston for home. On a visit to North America in 1784, after the conclusion of peace, he was received with tremendous enthusiasm.

After his return to France he devoted himself to improving the position of the French Protestants. His liberal views as displayed in the National Assembly in 1789 displeased the court, and he lost his rank as field marshal. He took an active part in the proceedings of the Assembly, of which he was vice president for some time. On the day after the storming of the Bastille he was made commander in chief of the National Guard in Paris. He perfected the organization of the National Guard throughout France and brought about the adoption of the tricolor, and on Oct 5 and 6, 1789, when the King and the royal family were escorted back to Paris by the people, Lafayette accompanied them for their protection.

His popularity increased when he refused the command of the Garde Nationale in 1790, and it seemed for some time as if Lafayette held the destinies of France in his hand. With Bailly he founded, in 1790, the Club of the Feuillants (q.v.), representing the conservative element in the Constituent Assembly, whose efforts were directed towards the establishment of a constitutional monarchy. Upon the flight of the King in June, 1791, he gave orders for his arrest; but his popularity vanished shortly afterward, when he ordered the soldiers to shoot upon the people on the Champ de Mars. He took part, however, in the proclamation of the constitution in the autumn of 1791, but tendered his resignation as commander of the National Guard soon after. In November, 1791, he was defeated for the office of mayor of Paris by Pétion, his failure being due to the opposition of the extreme Republicans and to the treachery of the court. He joined with the party of the Gironde in demanding war against Austria and Prussia and on the outbreak of war received the command of the army of Ardennes, with which he won the first victories of Philippeville, Maubeuge, and Florennes. Nevertheless the attacks of the Jacobins rendered his position precarious. The storming of the Tuileries by the

people in June, 1792, disappointed him deeply, and he left the army to return to Paris to protest against the excesses of the populace, but found his influence gone and his life in danger. He was accused of treason and acquitted, but soon after commissioners were dispatched to seize him at the head of the army with which he intended to free the King and reestablish the constitution. He fled to Flanders and on Aug. 19, 1792, was taken prisoner by the Austrians, who confined him in the citadel of Olmütz and subjected him to the most cruel treatment. He remained in captivity till Bonaparte obtained his liberation in 1797. He returned to France in 1799, but took no part in public affairs during the ascendancy of Napoleon, being opposed both to the Consulate and to the Empire. He sat in the French Second Chamber in 1815 during the Hundred Days and in the Chamber of Deputies from 1818 to 1824, as one of the Extreme Left. From 1825 to 1830 he was a leader of the opposition. In 1830 he took an active part in the revolution of July and figured again as commander of the National Guard. His last speech in the Chamber was made in 1834 shortly before his death, on behalf of the Polish political refugees. His visit to the United States in 1824-25, on invitation of Congress, was a memorable event. Congress voted him a grant of \$200,000 and a township of land. He died in Paris May 20, 1834. Lafayette's son, George Washington Lafayette (1779-1849), and his grandsons and their descendants figured in French Republican politics of the nineteenth century. At the one hundredth anniversary of the battle of Yorktown and the surrender of the British army, celebrated in 1881, a representative of the Lafayette family was present as a national guest. Monuments have been erected to him in various cities of America and France.

LA FAYETTE, MARIE MADELEINE PICHÉ DE LA VERGNE, COUNTESS DE (1634-93). A French novelist. She was the daughter of Aymar de la Vergne, Governor of Havre, and was a friend of La Rochefoucauld (q.v.). Her marriage with the Count de la Fayette was one of "convenience" soon ended by his death. This luckless wedlock afforded the experience necessary for a similar situation in her most famous novel, *La princesse de Clèves*. Her literary salon was the most aristocratic in Paris. Only Madame de Maintenon's instinct served her truly in suspecting the duplicity of Madame de la Fayette's nature, as appears in Perrero's *Lettre inédite de Madame de Lafayette* (1880). The letters seem to prove that the Countess

played an important political rôle at the court of Louis XIV. All the published works of Madame de la Fayette show a supersensitive delicacy in matters of honor. They consist of a short story, *Mlle. de Montpensier* (1660), a novel, *Zayde* (1670), *La princesse de Clèves* (1677 or 1678), two volumes of *Mémoires*, and a second short story, posthumously published, *La comtesse de Tende*. She had been on intimate terms with Henriette d'Angleterre, Duchess of Orléans, and wrote a *Histoire de Madame Henriette d'Angleterre*, which appeared posthumously (1720). Her novels appeared under the name of her friend Segrain, who never claimed them. *La princesse de Clèves* tells of a struggle between duty and passion in an aristocratic wife, who esteemed but did not love her husband. The early part of the novel is dull and clumsy, but the climax has an intensity and power till then unapproached in French fiction. This was the first attempt, and for a long time the best, to transplant psychic conflict from the drama to the novel. It did not, however, as is often asserted, open a new era, for it had no followers. The psychologic novel of later time had a wholly independent origin. Her work was rather a culmination, a blending of the realistic and idealistic efforts of the first three-quarters of the century. Madame de la Fayette's Works are in five volumes (1882). The best edition of *La princesse de Clèves* (Paris, 1881) has a critical study by Lescure. There is an American edition (Boston, 1898) containing some critical material. The *Mémoires* are best edited by Asse (Paris, 1890). Consult: Körting, *Geschichte des französischen Romans im XVII. Jahrhundert* (Oppeln, 1891); Haussonville, *Madame de la Fayette* (Paris, 1891); Lillian Rea, *Life and Times of Marie Madeleine, Countess of Lafayette* (New York, 1909).

LAFAYETTE COLLEGE. An institution of higher learning at Easton, Pa., chartered in 1826. Owing to the failure of the Legislature to make any appropriation, the college was not opened till 1832. The original plan contemplated the training of teachers, and courses were for a time maintained in this department, but were discontinued for lack of students. In 1850, after a period of depression, the college passed under the control of the Presbyterian Synod of Philadelphia. Its work was carried on with many difficulties until the period of the Civil War, since which the college has had a notable growth. Its work is divided into a classical and a scientific department, the latter embracing a general scientific course, a Latin scientific course, and courses in civil, mining, and electrical engineering and chemistry. The scientific department was organized in 1866 with an endowment by Ario Pardee, of Hazelton. There are also courses for graduate students. The degrees conferred are bachelor of arts, philosophy, and science; civil, mining, mechanical, and electrical engineer; master of arts and master of sciences. The college retains courses in biblical instruction as part of the regular curriculum. In 1914 the number of instructors was 50, and the student enrollment 580. The libraries contained 30,000 volumes. The student publication is *The Lafayette*. The college grounds of about 60 acres are situated on the summit of a hill overlooking the city. There are 30 buildings, including modern dormitories, a gymnasium, a memorial library, the Gayley Laboratory of Chemistry and Metallurgy, erected in 1902, and Pardee

Hall, containing the engineering departments, museums, and the rooms of the college literary societies. In 1915 John H. McCracken was chosen president of the college.

LAFENESTRE, là'fe-ně'tr', GEORGES EDOUARD (1837-). A French poet and art critic, born at Orléans. In 1864 he became connected with the administration of the Beaux-Arts, in which he was later appointed inspector. He was commissary to different universal exhibitions, was appointed curator of the department of paintings and drawings in the Louvre (1888), professor in its school, and also in the Collège de France. He was elected a member of the Academy of Fine Arts in 1892. His writings include: *Espérances* (1863) and *Idylles et chansons* (1874), poems; *L'Art vivant* (1881); *Les maîtres anciens* (1882); *La peinture italienne jusqu'au XVIIe siècle* (1886); *Tutien, sa vie et son œuvre* (1886; new ed., 1910), which was crowned by both the French Academy and the Academy of Fine Arts, *Le livre d'or du salon de peinture et sculpture; La peinture en Europe* (5 vols., 1893-97), with Eugene Richtenberger, *Peinture à l'exposition universelle de Paris* (1894); *La traditions dans la peinture française* (1895); *Jean de la Fontaine* (1895, 3d ed., 1910); *Artistes et amateurs* (1902); *Les images fugitives* (1904), verse; *Les peintres de Barbizon* (1907); *Molière* (1909); *Saint François d'Assise et Savonarole, inspirateurs de l'art italien* (1911; 2d ed., 1912).

LA FÈRE, là fâr. A fortified city in France in the Department of the Aisne, on the Oise River, 40 miles northwest of Rheims. It is a fortress of the second class and has a church, built in the fifteenth century, an artillery school, arsenal, college, theatre, museum, and machine shops. Pop.; 1901, 4952, 1911, 5095. La Fère was captured by the Germans in 1814 and was bombarded by them in 1815. In 1870 it was again bombarded and occupied by the German army. For the third time within the century La Fère was taken by the Germans, when they occupied it during the European War which broke out in 1914. See WAR IN EUROPE.

LA FERRIÈRE-PERCY, là fêr'yâr-pêr'sê', HECTOR, COUNT DE (1811-96). A French writer and antiquary, born at Lyons. He began publication with *Le journal de la comtesse de Sanzay* (1855), and two years afterward his *Histoire du canton d'Athis* (Orne) appeared, followed by *Marguerite d'Angoulême* and *Une fabrique de faïence à Lyon sous Henri II* in 1862. He was a member of the General Council of the Department of Orne and also of the Society of Antiquaries in Normandy, and he was sent on special missions to Russia and England to search for historical documents lost to France during the Revolution. At St Petersburg he collected the letters of Catharine de' Medici, which were published in 1880-95, and he gave an account of his own experiences in *Deux années de mission à Saint Pétersbourg* (1867). From papers in the record office of the British Museum he compiled *Le seizième siècle et les Valois* (1878), and his contributions to the *Revue des Deux Mondes*, the *Nouvelle Revue*, and other periodicals were collected under the titles *Trois amoureuses au XVIème siècle* (1885), *La jeunesse de Henri III* (1888), *Henri IV, le roi, l'amoureux* (1890), and *Les deux cours de France et d'Angleterre* (1893).

LAFERTÉ, là'fâr'té', VICTOR. The pen name

of Czar Alexander II's favorite, Ekaterina Mikhailovna Dolgorukova (q.v.).

LAFFAN, lâ'fan, WILLIAM M (ACKAY) (1848-1909). An American newspaper publisher and editor and art connoisseur. He was born in Dublin, Ireland, and was educated there at Trinity College and at St. Cecilia's School of Medicine. Removing to the United States, in 1868 he took up newspaper reporting in San Francisco, where he was later city editor of the *Chronicle* and managing editor of the *Bulletin*. In 1870 he became a reporter on the Baltimore *Daily Bulletin*, of which he subsequently became editor and part owner; later he was full owner of that paper and of the *Sunday Bulletin*. With the *Evening Bulletin*, in which he had merged the *Daily Bulletin*, he fought vigorously the political ring controlling the city government. For a time he left newspaper work to be general passenger agent of the Long Island Railroad. In 1877 he joined the staff of the *New York Sun*, writing essays, art criticism, and general articles. In 1881 he became art agent of Harper and Brothers, whom he represented in London until 1884. He then returned to New York to become publisher of the *Sun*. He established the *Evening Sun* in 1887, bought the interest of the Charles A. Dana estate in the *Sun* in 1900, and in the latter year became president of the Sun Printing and Publishing Company. He founded the Laffan News Bureau. Laffan modeled in clay, painted in oils and water colors, and had considerable skill in etching. He published *American Wood Engravers* (1883) and edited *Oriental Porcelain* (1906) and *Chinese Porcelain in the Metropolitan Museum of Art* (1906).

LAFITTE, lâ'fit', JACQUES (1767-1844). A French financier and statesman. He was born at Bayonne, Oct. 24, 1767, son of a poor carpenter. Going to Paris, he had the good fortune to be employed by the banker Perregaux, whose confidential clerk he became. Soon he was taken into the firm and in 1809 succeeded Perregaux and became a regent of the Bank of France and in 1814 governor of that institution, in which he gained a great reputation as a financier and a very large fortune. He was also president of the Chamber of Commerce, and his great wealth and high personal qualities gave him a European reputation. During the years 1814-15 he signalized himself by his patriotic generosity towards the people of Paris and rendered important financial services to both Napoleon and Louis XVIII, who insisted on including him in the Commission on Public Finances, although his liberal views were distrusted in Royalist circles. After the second Restoration he became one of the opposition in the Chamber of Deputies and enjoyed the highest popularity in Paris, falling out of favor with the court, however, during the last year of Charles X. His house was the meeting place of the opposition, but when the revolution of 1830 broke out he strongly supported the claims of Louis Philippe, financed them with his wealth, and was instrumental in placing him on the throne, being President of the Chamber which decreed the erection of the July monarchy. He became a member of the first ministry of the new King, and in November, 1830, was intrusted with the formation of a cabinet in which he was Minister of Finance as well as Premier. Not finding himself in agreement with the other ministers, however, he resigned his office March 13, 1831, and was replaced by Casimir-Périer.

Meanwhile his banking affairs had fallen into confusion, and he was obliged to sell all his property to pay his debts, amounting to 50,000,000 francs. A national subscription preserved him his house in Paris, and, being again elected to the Chamber as a deputy for Paris, he became a leader of the opposition. From the ruins of his fortune he founded a new discount bank in 1837. As the government receded further from the principles of the revolution of 1830, Lafitte became more active in opposition. In 1843, to the great displeasure of the court, he was elected President of the Chamber of Deputies. He died May 26, 1844. Lafitte was the author of several pamphlets on finance and politics, especially *Réflexions sur la réduction de la rente* (Paris, 1824), but the work entitled *Souvenirs de J. Lafitte, racontés par lui-même* (Paris, 1844) was in reality written by Marchal. Consult P. Thureau-Dangin, *La monarchie de juillet* (Paris, 1884).

LAFITAU, lâ'fê'tô', JOSEPH FRANÇOIS (1670-1746). A Jesuit missionary in America, born at Bordeaux, France. He lived among the Iroquois Indians from 1712 until 1717, when he returned to France and became a professor of literature. He wrote a number of books, the most important of which is *Mœurs des sauvages américains comparées aux mœurs des premiers temps* (1723), a work that was highly praised by Parkman. His other works are a *Mémoire concernant la précieuse plante gin-seng de Tartarie* (1718), in which he describes the American ginseng, which he discovered, and which afterward became a valuable article of export to China; an *Histoire des découvertes et des conquêtes des Portugais dans le nouveau monde* (1733); and an *Histoire de Jean de Brienne, roi de Jérusalem, empereur de Constantinople* (1727). Consult *The Jesuit Relations*, edited by R. G. Thwaites (Cleveland, 1896-1901).

LAFITTE, lâ'fê', CHATEAU. The name of one of the finest of the old wines of France, so called from a château on the Gironde.

LAFITTE, JEAN (1780-c.1826). A noted pirate of the Mexican Gulf. He was born in France and held a commission as a privateer from the French government and subsequently from Cartagena. This service degenerated, however, into piracy, and Barataria Bay in Louisiana became the rendezvous of a horde of adventurers and unscrupulous sailors, among whom Jean Lafitte and his brother Pierre were pre-eminent, becoming the terror of traders in the Gulf of Mexico. On the outbreak of the War of 1812 the British made overtures to Lafitte, who refused to join them. In the meantime an expedition was sent out by the Americans, under Commodore Patterson, designed to break up the stronghold at Barataria Bay, resulting in the flight of the pirates. The anticipated attack on New Orleans by the British troops induced the Governor of Louisiana and General Jackson to accept Lafitte's offer of himself and his men for the defense of the city. The outlaws conducted themselves during the battle with such courage and fidelity that President Madison issued a proclamation early in 1815 recounting their services and according them free pardon for their past misdeeds. In 1816 one of the Lafittes established himself on the island of Galveston, but his unruly colony aroused the hostility of the authorities, who were taking steps for its suppression when the colonists abandoned the place, burning all the houses (1820). Later

Lafitte was heard of in Yucatan, where he is supposed to have died. The Lafittes were audacious smugglers as well as pirates. They brought cargoes of slaves into the country after 1809 and disposed of them by means of a finely organized system of traffic that included many very respectable merchants of New Orleans and its vicinity.

LAFLAMME, la'flam', TOUSSAINT ANTOINE RODOLPHE (1827-93). A Canadian statesman, born in Montreal. He was educated at Sulpice College and in 1849 was called to the bar. He became an aggressive adherent of the Rouge or advanced reform party in Quebec, the opponents of the Bleu or Conservative party in that province. He was editor of a leading newspaper of his party, but kept up the practice of his profession and was appointed a professor of law in McGill University. In 1872 he was elected a member of the Dominion Parliament, and in 1876-78 he was a member of the cabinet during the premiership of Alexander Mackenzie, first as Minister of Inland Revenue and afterward as Minister of Justice.

LAFLECHE, la'flesh', LOUIS FRANÇOIS RICHER (1818-99). A Canadian Roman Catholic bishop and author. He was born at Ste. Anne de la Pêrade, Province of Quebec, and was educated at Nicolet College. Ordained a priest in 1844, he was sent the same year as a missionary to the Indians in the Northwest, where he labored until 1856. He was then appointed professor of mathematics and philosophy in Nicolet College, of which later he became Superior. In 1866 he became coadjutor to the Bishop of Three Rivers and in 1870 succeeded to the bishopric, coming to be regarded as one of the strongest Ultramontane prelates of Quebec. He published *Quelques considérations sur les rapports de la société civile avec la religion et la famille* (1866) and *Conférences sur l'encyclique "Humanum Genus"* (1885).

LA FOLLETTE, la fôl'et. A city in Campbell Co., Tenn., 5 miles northeast of Jacksboro, on the Southern and the Louisville and Nashville railroads. The principal industrial interests are ironworks and coal mines. In the vicinity is Indian River Bluff, the scene of an engagement in the Civil War. La Follette has adopted the commission form of government. Pop., 1900, 366; 1910, 2816.

LA FOLLETTE, la fôl'et, ROBERT MARION (1856-). An American political leader and statesman, born at Primrose, Wis. He graduated in 1879 from the University of Wisconsin, where he had shown great oratorical ability; thereafter he advocated a close relationship between the university activities and the life of the State. Admitted to the bar in 1880, in the same year he was elected district attorney of Dane County on the Republican ticket. He served in this capacity until 1884, when he was elected to Congress from the third district. Although then the youngest member of the House of Representatives, he attracted attention and praise as an able speaker. He was reelected in 1886 and 1888, but defeated in 1890. During his period of service he made important speeches on the Mills Tariff Bill and the Lodge Force Bill—his reply to Speaker Carlisle on the tariff question (1888) became famous. During his last term in Congress he was a member of the Ways and Means Committee and assisted in drafting the McKinley Tariff Bill. He was responsible for the schedule on agricultural products; in-

deed, with reference to the entire bill, it was often said that he had as much to do with the framing of it as had McKinley. Although he resumed the practice of law at Madison, his interest in politics brought him the leadership of the younger group of Wisconsin Republicans in a campaign against the exclusive privileges of corporations and against the control of politics by bosses. In 1897 La Follette wrote a pamphlet on "The Menace of the Machine" and later one on "The Nomination of Candidates by Australian Ballot" which received much attention and comment. They outlined his ideas and demands for electoral reform in Wisconsin. In 1900, after a bitter struggle between his followers, the "Half-Breeds," and the "Stalwarts," or machine politicians, he was nominated and elected Governor. To this office he was reelected in 1902 and 1904. As Governor, La Follette was the aggressive champion of such reform measures as the nomination of candidates by direct primaries (Wisconsin was the first direct primary State), the equalization of taxation, and railroad rate control. Elected United States Senator in 1905, he took his seat as an avowed radical. In 1911 he was reelected. In the Senate he was affiliated with the insurgents who demanded progressive legislation. His denunciation of the control of committee appointments by reactionary Senators and his advocacy of the regulation and physical valuation of railroads made him widely known. His reputation caused him to be prominently mentioned for the presidential nomination in 1908, and in 1912 it enabled him to become an avowed candidate. Alienated from President Taft, in tariff legislation between 1910 and 1912 he joined the Democrats in passing bills revising the wool and steel schedules which were vetoed by the President. La Follette remained Republican in 1912, when many of the more radical members withdrew to form the Progressive party. Although not in favor of Taft, he was strongly opposed to Roosevelt. During the Wilson administration he was frequently consulted about legislation. He edited *The Making of America* (10 vols., 1906), established (1909) *La Follette's Weekly Magazine*, "to aid in bringing government back to the people," and is author of *La Follette's Autobiography: A Personal Narrative of Political Experiences* (Madison, Wis., 1913).

LAFONTAINE, la'fôn'tân', AUGUST HEINRICH JULIUS (1758-1831) (Pen names, Gustav Freier, Miltenberg, Selchow, etc.) A German novelist, born in Brunswick and educated in Helmstedt, where he studied theology. He was a private tutor for several years, acted as chaplain to the Prussian army in 1792, and in 1800 settled in Halle. He became canon of the Magdeburg Cathedral as a reward for the dedication of one of his books to Friedrich Wilhelm III and Luise. The popularity of his novels, which are sentimental and sometimes didactic, now and then also piquant, tales of domestic life, was remarkable, especially in view of his great fertility. He wrote more than 160 volumes and soon ruined what style he had originally possessed. He was sharply attacked by the Romantic school, especially by A. W. Schlegel. Among his more popular works are: *Der Sonderling* (1793); *Der Naturmensch* (1791); *Saint Julien* (1798); *Fedor und Marie* (1805). Consult Gruber, *A. Lafontaine's Leben und Wirken* (Halle, 1833).

LA FONTAINE, HENRI (1854-). A Belgian jurist. He was born in Brussels, the son of a banker, and studied law in the University of Brussels. In 1878 he became secretary of an association for the promotion of technical schools for girls and in 1889 secretary of the Belgian Peace Society. In 1892 he was head of the International Peace Bureau. He became professor of international law in the University of Brussels in 1893 and a Senator of Belgium in 1895. In 1907 he was secretary of the Union of International Association and president of the Interparliamentary Peace Congress at Bern. His work for international peace was rewarded in 1913 by the Nobel prize. La Fontaine wrote: *Les droits et les obligations des entrepreneurs des travaux publics* (1885); *Traité de la contrefaçon* (1888); *Pasicrisie internationale* (1902); *Bibliographie de la paix et de l'arbitrage* (1904).

LA FONTAINE, JEAN DE (1621-95). A French poet, noted for his tales (*Contes*) and fables. He was born at Château-Thierry in Champagne, July 8, 1621, of good though not noble family, for his father was a superintendent of streams and forests. Jean began to study for the priesthood, but, with the dreamy irresponsibility that characterized his life, he forsook this career after 18 months, and, though the father resigned in Jean's favor (1643) and even provided him with a wife, the 15-year-old Marie Héricart (1647), his life was still that of a happy-go-lucky idler. La Fontaine's poetic talent was awakened by the reading of Malherbe and Racan. For his amusement he adapted unsuccessfully the *Eunuchus* of Terence (1654), and by . . . a narrative poem, *Adonis*, to Fouquet . . . he won the patronage of the then powerful Minister, who received him into his household. On Fouquet's fall he had as successive patronesses the Duchess of Bouillon (1662), the Duchess of Orléans (1667), Madame de la Sablière (1671), and Madame d'Hervart (1693). To please the first of these, he began to write *Contes et nouvelles en vers* (1665). To these he added at intervals until his election to the Academy (1683), which the King had sanctioned only on his promise to be "proper" (*sage*); for the *Contes*, as a rule, were not. The *Fables*, whose humor was quite without such Gallic spice, La Fontaine had begun to write in 1668 and in 1671 had given further illustration of his versatile talent as editor of a volume of mystically religious verse. He wrote also, in this his most productive period, *Les amours de Cupid et Psyché* (1669), an epic *La captivité de Saint Malo* (1673), and the *Poème du Quinquina* (1682), with several slight if not weak comedies collected in 1702. In his last year (1695) he seems to have become sincerely religious. La Fontaine was a spoiled child of nature, simply guileless and carelessly absent-minded, exasperating the friends who tolerated and could not but love him. Racine, Boileau, and Molière were his closest intimates, but Molière alone realized the permanent value of his work in the development of French literature through the *Contes* and especially through the *Fables*. The former are essentially fabliaux (q.v.), most skillfully told and with a delicate feeling for style and prosody that conceals the highest art under its apparent spontaneity. Here La Fontaine is the follower of La Salle, Des Périers, and the *Heptameron*, the imitator of Boccaccio and the Italian story-tellers, none of whom recognized what are now regarded as

fundamental conventions of decency. The poet was assailed by contemporary adversaries on the score of impropriety. The *Fables*, on the other hand, could shock no reader's modesty, though they reveal a total incapacity for moral indignation and a boundless tolerance of the "natural." The graceful liveliness of their narration, the restrained naturalism of their description, the homely wisdom of their unobtruded moral, the boldness of their covert political teaching, especially in later years, the shrewd analysis and observation of human motive, has been a perennial delight to generations. The fact that every French schoolboy knew the *Fables* influenced and aided the emancipation of poetry by the Romantic school of 1830. In mind La Fontaine is akin to Molière. None of his imitators has approached him, and with Molière he is the most widely liked French writer of the seventeenth century. La Fontaine's works are in many editions. The most elaborate is by Regnier (9 vols., Paris, 1888-92). Useful also are those of Moland (7 vols., ib., 1872-76) and Marty-Laveaux (5 vols., ib., 1857-77). Regnier's edition has a good biography by Mesnard. Consult: Lafenestre, *La Fontaine* (ib., 1885); Emile Faguet, *Jean de La Fontaine* (ib., 1900); Taine, *La Fontaine et ses fables* (15th ed., ib., 1901); and for further bibliography, consult Brunetière, *Manuel de l'histoire de la littérature française* (ib., 1897), translated by Derechef (London, 1898).

LAFONTAINE, lă'fôn-tân', Fr. pron. là'fôn-tân', SIR LOUIS HIPPOLYTE (1807-64). A Canadian jurist and statesman. He was born at Boucherville, Lower Canada (Quebec), and was educated at the College of Montreal. He studied law, was called to the bar, and began the practice of his profession in Montreal. In 1830 he was an unsuccessful candidate for the Provincial Assembly, but later was elected. At first he was a supporter of L. J. Papineau (q.v.). The rebellion of 1837, which disturbed both Lower and Upper Canada, brought Lafontaine into political notice. For several years there had been a conflict between the executive and the Legislative Assembly of Lower Canada, and the knowledge that a rebellion was contemplated in Upper Canada induced a French-Canadian party, headed by Louis J. Papineau, to strike for independence and the establishment of a French nation on the banks of the St. Lawrence. Lafontaine in 1838 was arrested for high treason, but his guilt was not established, and it was afterward known that he was not prepared to support Papineau's extreme measures. He subsequently went to England, but, having been led to expect arrest, fled to France and did not return to Lower Canada until after the failure of the rebellion. His subsequent position in Canadian history was creditable and important. The act of union in 1841 helped to accomplish a change by which the ministry was held accountable to the popular branch of the Legislature and remained in office only so long as it could command a majority. Lafontaine, though at first opposed to the union of the two provinces, was a firm supporter of responsible government and became the political ally of Robert Baldwin in establishing it firmly in Canada. The Baldwin-Lafontaine ministry lasted two years (1842-44), when it was compelled to resign, but four years afterward Lafontaine came into power again as Premier, and the Lafontaine-Baldwin ministry, often called in Canada "the great ministry," by reason of its

important reforming measures, held office during 1848-51. It procured the final acceptance of the principle and practice of responsible government. Lafontaine, after retiring from the premiership, was in 1853 appointed Chief Justice of Lower Canada, retaining office until his death. In 1854 he was made Baronet. As a jurist, he was one of the ablest that Canada has produced. Consult Stephen Leacock, *Baldwin, Lafontaine, Hincks*, in the "Makers of Canada" Series (Toronto, 1906).

LAFONTAINE, LOUIS MARIE HENRI THOMAS (1826-98). A French actor and playwright, born at Bordeaux. He studied for the priesthood, but ran away to sea, afterward engaged in the silk trade, and then went on the stage under the name of Charles Rooch. From the provinces he went to Paris, where he played at the Gymnase and afterward at the Théâtre Français. He met with further successes at the Vaudeville (1857), the Odéon, the Gaité, and the Porte Saint-Martin, in such plays as *Dahla* (1857), *Les ganaches* (1862), *La jeunesse de Louis XIV* (1874), *Frou-Frou* (1883), *Un fils de famille* (1886), and *L'Abbé Constantin* (1888). He acted in his own plays, *Pierre Gendron* (1876) and *La servante* (1886), besides *Jack* (1881), a collaboration with Daudet; and his essays, *Les petites misères* (1881), were crowned by the French Academy. He published also *L'Homme qui tue* (1882), souvenirs of the theatre under the title *Thérèse, ma mie* (1883), and *Nos bons camarades* (1885).

LA FORCE, la förs. A former prison of Paris, so called from the dukes of La Force, in whose residence, on the Rue du Roi-de-Sicile, it was established in 1780, to take the place of the prisons of For-l'Evêque and the Châtelet. It was the chief scene of the September massacres of 1792. The prison is described in Hugo's *Les misérables*. It was suppressed in 1850, and the prisoners were transferred to Mazas, a house of detention, which also disappeared in 1898.

LA FORGE, la förzh, ANATOLE DE (1820-92). A French politician and journalist, born in Paris. In 1846-48 he was in Spain on a government mission, which gained him the cross of the Legion of Honor. Subsequently he became one of the editors of the *Siccle*, which defended liberal ideas and the principle of nationalism. During the Franco-Prussian War he was Prefect of Aisne and rendered notable service in the defense of Saint-Quentin (October, 1870), where he was severely wounded. He was appointed to the Prefecture of the Basses-Pyrénées in 1871, was director of the press under the Minister of the Interior in 1877-79, and in 1881 was elected from Paris to the Chamber of Deputies, of which he became Vice President in 1885. He was president of the Confederated Patriots (1883-85) and inclined to radicalism in politics but was highly esteemed by all parties. His published works include: *L'Instruction publique en Espagne* (1847); *Des vicissitudes politiques de l'Italie dans ses rapports avec la France* (1850); *Histoire de la république de Venise sous Mann* (1853); *La Pologne en 1864* (1864); *La révolution française et l'église* (1882); *Les serviteurs de la démocratie* (1883).

LAFORGE, FRANK (1879-). An American pianist, born in Rockford, Ill. He received his first musical instruction from his sister and H. M. Wild. From 1900 to 1904 he studied piano with Leschetizky in Vienna and composi-

tion with Labor and Navratil. Then he went with Madame Sembrich as her accompanist on concert tours through Germany, Russia, France, and the United States. His masterly accompanying won him such fame that he came to be in constant demand by the greatest singers. He proved the utter absurdity of the old adage "A good pianist is never a good accompanist." On the contrary, such work as his demonstrates that only an excellent pianist can do justice to the difficult piano parts written by modern composers. He invariably accompanies without music. As a composer, he became known through songs and piano pieces.

LA FOSSE, la fös, or LAFOSSE, CHARLES DE (1636-1716). A French painter, born in Paris, son of the famous court jeweler. He was one of Lebrun's best pupils and received a scholarship, which enabled him to spend some years in Italy. His frescoes executed in Rome brought him quick fame, and he was called to Lyons to paint in a chapel 10 huge pictures, of which two have survived. For Louis XIV he executed important work at the Tuileries, at Marly, and at the Trianon. In the Académie des Beaux-Arts, just founded, he became professor and later rector. In London he decorated the residence of Lord Montague and was invited by William III to remain permanently in England. But his protector, the architect Mansart, advised him to return and gave him all the decorations of the Invalides. Owing to the death of Mansart, the work was divided with Coppel, Boulogne, and Jouvenet, and he painted only the dome and four panels. La Fosse's best work is at Versailles—on the ceiling of the throne hall, Augustus, Vespasian, Coriolanus; in the hall of Diana, Jason, Alexander; in the chapel an immense "Resurrection"; and many paintings in the galleries. His style was the style of Lebrun, with perhaps even more leaning towards the bold reliefs and deep shadows of Rubens.

LA FOURCHE, la föörsh. A bayou in southeast Louisiana and one of the outlets of the Mississippi (Map: Louisiana, J 8). It leaves the right bank of that river at Donaldsville and flows southeast, emptying into the Gulf of Mexico through Fourchon and Timbalier passes, about 50 miles west of the Mississippi Delta. Its length is 150 miles, and it is navigable for 100 miles from its mouth, being the channel of an extensive commerce with the interior.

LAFUENTE Y ALCÁNTARA, la-fwän'tä ä ä'l-kän'tä-rä, MIGUEL (1817-50). A Spanish historian, born at Archidona (Málaga). He was deputy to the Cortes from Archidona (1846) and then fiscal of the island of Cuba, where he died a few days after his arrival. This post, like his election to the Royal Academy of History (Madrid, 1847), was in recognition of his services as historian and politician. His important *Historia de Granada* (4 vols., 1843-46) was again printed in Paris (1852), with a biography by José Zorrilla. He also prepared an edition of the hitherto unedited chronicle of Andrés Bernaldez, *Historia de los reyes católicos Fernando é Isabel* (Granada, 1856).—His brother EMILIO (1825-68), born at Archidona, was a well-known Arabic scholar, and at the time of his death held the position of director of the library of San Isidro. He wrote, among other volumes, *Inscripciones árabes de Granada, precedidas de una reseña histórica y de la genealogía de los reyes Alahmares* (1859); and his *Cancionero popular: colección escogida de seguidillas y cop-*

las (2 vols., 1865) was the first work of its kind in Spain.

LAFUENTE Y ZAMALLOA, thä'mäl-yō'ä, MODESTO (1806-66). A Spanish historian and critic, born at Ravanal de los Caballeros, May 1, 1806. Trained in philosophy and theology, he obtained a chair in philosophy at the University of Astorga in 1832, and two years later in a second competition obtained at the same university a chair in theology. Later he went to Madrid to engage in journalism. Under the pseudonyms of Fray Gerundio (the hero of a famous work by Isla) and Pelegrín Tirabeque, he interpreted in a popular and easy style most important political questions. His critical and satirical powers were manifested in the series of essays termed *Capitulas* (1837-40) and a second series called *Teatro social del siglo XIX* (1846). His most important production was the *Historia general de España* (1st ed., 30 vols., 1850-67, as a 2d ed., 13 of these volumes, scattered through the set, were reprinted in 1869; 3d ed., 13 vols., 1874-75; 4th ed., with continuation by Juan Valera, assisted by Andrés Borego and Antonio Pirala, 25 vols., 1887-90). Lafuente died Oct. 25, 1866. Of his other works there may be mentioned the *Viaje aerostático de Fray Gerundio y Tirabeque* (1847) and the *Revista europea* (1848-49). Lafuente's verse was of mediocre quality.

LAG, LAIRD OF. A name applied to Sir Robert Grierson (q.v.).

LAG. A phenomenon attending the magnetization of iron. See MAGNETISM, *Magnetic Properties of Iron*; HYSTERESIS.

LA GALLISSONNIÈRE, là gä'l'sō'nyär', MARQUIS and COMTE DE. See GALLISSONNIÈRE

LAGAN, lä'gan. A small river in the Province of Ulster, Ireland. It rises in the middle of County Down about 13 miles west of Downpatrick and, flowing first northwest and finally northeast, empties into Belfast Lough at Belfast, after a course of about 35 miles. Its lower half forms the boundary between counties Down and Antrim. The Lagan Canal, which is 27 miles long and admits vessels of 5½ feet draft, starts from the river about 1 mile from Belfast and enters Lough Neagh about 2 miles from Lurgan.

LAGARDE, la'gärd' (properly Bötticher, in honor of his mother's name), PAUL ANTON (1827-1891). One of the greatest Orientalists of the nineteenth century. He was born at Berlin, Nov. 2, 1827. He studied theology, philosophy, and Eastern languages at Berlin and Halle and began his academic career in the latter place in 1851. From 1854 to 1866 he was teacher at a Gymnasium in Berlin. In 1869 he became Ewald's successor at Göttingen and remained there till his death (Dec. 22, 1891). Lagarde's writings were very numerous and represent a wide field of activity. His earlier studies were on Iranian subjects and were published as *Gesammelte Abhandlungen* (1866). As the result of investigations in London and Paris in 1852-53, he published several Syriac and Greek texts and critical studies, among them: *Didascalia Apostolorum* (1854); *Analecta Syriaca* (1858); the books of Titus Bostrenus against the Manichæans, Greek and Syriac (1859); *Geoponica* (1860); *Reliquiæ Juris Ecclesiastici Antiquissimæ Græcæ* (1856); *Constitutiones Apostolorum* (1862); *Clementina* (1865). Other studies of a like character are the *Prætermissorum Libri Duo* (1879); *Petri Hispani de Lingua Arabica*

Libri Duo (1883); *Judæ Harizii Macamæ Hebraice* (1883). He edited the *Opere italiane* of Giordano Bruno (1888-89). In his *Armenische Studien* (1877) and *Persische Studien* (1884) he continued his Iranian studies. *Semitica* (1878-79), *Orientalia* (1879-80), *Ægyptiaca* (1883), and the *Uebersicht über die im aramaischen, arabischen und hebraischen ubliche Bildung der Nomina* (1889) were important works. Lagarde's most valuable work, perhaps, was his contributions to the textual criticism of the Bible and upon the Old Testament Apocrypha and the Septuagint. *Symmiata* (1877-80) and the *Mitteilungen* (1884-91) contain some of the best of his later work. Consult the "Bibliography of the Works of Paul Anton de Lagarde," by Gottheil, in the *Proceedings of the American Oriental Society* for 1892. A volume of poems written by him appeared after his death (1897). His library is now owned by the New York University. Consult the memoirs by Anna de Lagarde (Göttingen, 1894) and by Albrecht (Berlin, 1901).

LAGAR/TO. One or another of the lizard fishes (q.v.), especially *Synodus fætens*.

LAGASH (lä'gäsh or lä'gäsh) **DYNASTY**. See BABYLONIA, *History*.

LAGENARIA, lä'jé-nä'ri-ä See BOTTLE GOURD.

LAGERLÖF, lä'gér-léf, (OTILIA LOVISA) SELMA (1858-). A distinguished Swedish story-writer. She was born at the old family manor of Mårbacka, Vermland; her father was a Swedish army officer; her mother came of a family of artists and clergymen. While working upon her first book, *Gosta Berlings Saga* (2 vols., 1891; Eng. trans., Boston, 1898), she was a teacher in a high school for girls in Landskrona. Coming at a time when Sweden was weary of the pessimistic realism which had been the vogue, *Gosta Berling* was a refreshing breath of romance and brought the author prompt and large success. A year's travel in Egypt, Palestine, and Greece provided her with material for the second volume of her *Jerusalem* (2 vols., 1901-02; Eng. trans., New York, 1903), and also for portions of her *Christ Legends* (1904; Eng. trans., New York, 1908). Out of travel and a study of conditions in Italy and especially in Sicily came the *Miracles of Anti-Christ* (1897; Eng. trans., Boston, 1899). Commissioned (1902) by the National Teachers' Association of Sweden to write a school textbook which should present in story form the folklore, geographical peculiarities, and flora and fauna of the various provinces of the country, Miss Lagerlöf accomplished her task with a success that added a children's classic to Swedish literature—*Nils Holgersson's Wonderful Journey through Sweden* (2 vols., 1906-07), the English translation of which is entitled *The Wonderful Adventures of Nils* (New York, 1907). Honors followed Miss Lagerlöf's successes: in 1904 the Swedish Academy awarded her its great gold medal; in 1907 she received the degree of doctor of letters from Upsala University; in 1909 she was awarded the Nobel prize for literature; and in 1914 the Academy (Swedish) elected her to membership—the first woman to have received this honor. Her vogue in America is in part due to Mrs. Velma Swanton Howard, who early believed in her appeal to Americans and carefully translated many of her books. Miss Lagerlöf's work includes also: *From a Swedish Homestead* (1899; Eng. trans.,

New York, 1901); *Invisible Links* (1894; Eng. trans., Boston, 1899); *The Girl from the Marsh Croft* (1908; Eng. trans., Boston, 1910); *Further Adventures of Nils* (1911); *Liljebrona's Home* (1911; Eng. trans., New York, 1914); *The Legend of the Sacred Image* (1913; Eng. trans., New York, 1914); *Matilda Wrede* (1913; Eng. trans., New York, 1914). In 1914 a folk comedy, *Dunungen*, based on her book *Invisible Links*, was produced in Stockholm. Consult J. Mortensen, *Selma Lagerlof* (2d ed., Stockholm, 1913).

LAGERSTRÆMIA, lā'gēr-strē'mi-ā or lā'gēr (Neo-Lat., named in honor of Magnus von Lagerström, a director of the East Indian Company at Götterburg). A genus of plants of the family Lythraceæ, distinguished by winged seeds and with about 20 species including some of the noblest trees of tropical forests. *Lagerstræmia flos-reginæ* is the jarool of India, a magnificent tree, which attains a height of 50 feet, with red wood, which, although soft, is durable under water and is therefore much used for boat building. It has been successfully introduced into southern California as an ornamental plant. *Lagerstræmia indica*, the crape myrtle, with showy pink, red, or white flowers, is a common shrub cultivated from the vicinity of Washington, D. C., southward. If grown much farther north, it requires winter protection. It is a native of India or China. Cf. MYRTLE.

LAGOA DOS PATOS, lā-gō'ā dush pā'tush. The largest lake of Brazil, 145 miles long by 20 to 40 wide, situated in the State of Rio Grande do Sul and separated from the Atlantic Ocean by a small strip of swampy land (Map: Argentina, J 4). It receives from the west the Jacuhy River and is connected by a short channel with the Lagoa Mirim on the south. Lagoa dos Patos communicates by an inlet with the Atlantic at the city of Rio Grande do Sul. At its north extremity is Porto Alegre. It is very shallow, but has a navigable channel.

LAGOA MIRI, lā-gō'ā mē'rē. See MIRIM.

LAGO D'AVERNO, lā-gō dā-vēr'nō. See AVERNUS.

LAGO DEI PALICI, dā'ē pā-lē'chē. See NAFFIA.

LAGO DI PERUGIA, dē pā-rōō'jā. See TRASIMENO, LAGO.

LAGO MAGGIORE. See MAGGIORE, LAKE.

LAGOON' ISLANDS. See ELLICE ISLANDS.

LA GORCE, lā gōrs', PIERRE (FRANÇOIS GUSTAVE) DE (1846-). A French historian, born in Vannes. He studied law and held an official position in Arras until 1880, when he devoted himself to historical study. He received the Gobert prize of the Academy of Moral and Political Sciences, and in 1914 was elected to the French Academy. His important works are: *Histoire de la seconde république française* (2 vols., 1887), covering the years 1848-51; *Histoire du second empire* (7 vols., 1894-1905), carrying the story from December, 1851, to September, 1870; *Histoire religieuse de la révolution française* (1909).

LAGOS, lā'gōs or lā'gōs. Formerly a British colony and protectorate of West Africa; later a province, called also the Western Province, of Southern Nigeria (Map: Africa, E 4). By an order in council which came into operation Jan. 1, 1914, Northern Nigeria and Southern Nigeria were amalgamated into the Colony and Protectorate of Nigeria, and the division of Southern

Nigeria into three provinces (Lagos, Central Province, and Eastern Province) was abolished. Lagos Province extended from the French Colony of Dahomey eastward to the Central Province, and from the Bight of Benin northward to Northern Nigeria (the boundary being about lat. 90° N.; including all the Yoruba country with the exception of Ilorin). Its area was approximately 29,000 square miles and included the coastal region of Southern Nigeria, known as the "colony" (about 1300 square miles). The total population in 1914 was estimated at 2,250,000. The interior of Lagos is hilly. The rivers are unimportant. The climate, like that of the Guinea country in general, is unhealthy for Europeans, though medical and sanitary science has done much towards lessening the prevalence of fever. At the town of Lagos the mean temperature in 1912 was 81.2°, the highest shade temperature being 98°, in November, and the lowest 69°, in June. The rainfall in the province was 40.50 inches in 1912 and varied from 27.86 to 178.41 inches in different parts of the country. Numerous tropical crops are cultivated to some extent. Cotton culture has been introduced. Manufactures include little besides native cloths and mats, brick, pottery, boats and canoes, carved ivory, beadwork, and certain ironwares. The chief exports include palm oil, palm kernels, rubber, and mahogany. There is cable communication with England and with Bonny in the (former) Eastern Province. In 1901 a government railway was opened, extending from Iddo Island (which lies between Lagos Island and the mainland) to Ibadan, 123½ miles distant; Iddo Island is connected with the mainland by a railway and road bridge, 900 feet long. This line was subsequently extended 182¾ miles to Jebba in Northern Nigeria and finally to a point 145 miles northeast of Jebba, forming a junction with the Baro-Kano line. Telegraph lines connect with the Dahomey system. In various districts there are many good roads. There are several government and assisted schools and also Mohammedan schools.

The natives may be comprehended in three groups: the Jejis, or Effons, the Benins, or Binis, including the Mahins and Jekris; and the most important, the Yorubas, including the Oyos (the Yorubas proper), the Egbas, the Ifes, the Ijebus, the Ijeshas, the Aworis, the Ekos or Igaras, the Ekitis, and the Egbados.

The chief towns include Lagos (see below), Ibadan (pop., about 175,000), Abeokuta (51,000), Oyo (45,000), Ijebu Ode (22,000), Ondo (24,000), Ilesha (16,000), Ikorodu (12,000), and Epe (8000).

From 1851 to 1861 the British made unsuccessful efforts to induce the kings of Lagos to put down the slave trade. In the latter year King Docemo ceded his possessions to Great Britain in consideration of an annual pension of £1000 (which he received until his death in 1885). Lagos was formed into a separate government in 1863; in 1866 it was attached to the government of the West African Settlements; in 1874 it was incorporated with the Gold Coast Colony; in 1886 it was erected into a separate colony; in 1906 it was amalgamated with Southern Nigeria as the Lagos, or Western, Province. To the original cession other cessions of territory by native chiefs were added at various times from 1862 to 1899.

LAGOS. The temporary capital of Nigeria, from Jan. 1, 1914 (pending the selection of a

site for a capital on the river Kaduna). It is situated on an island of the same name (Map: Africa, E 4), and is the most important seaport of Upper Guinea and one of the largest and most progressive towns of West Africa. It is 4279 miles from Liverpool, 1203 miles from Freetown (Sierra Leone), 132 miles from Forcados, and 395 miles from Calabar. The town is connected with Iddo Island by a bridge 2500 feet long, carried on steel screw piles, some of which are 100 feet long. The population, which is very mixed, is about 60,000; Europeans number about 500. Extensive harbor works were in progress in 1914; towards the end of the preceding year 7000 feet of the Eastern Training Mole and 1800 feet of the Western Mole had been completed. Formerly the town of Lagos was a centre of the slave trade.

LAGOS, lá'gós. A city of Mexico, in the northeastern part of the State of Jalisco, on the Mexico Central Railroad, 6000 feet above sea level (Map: Mexico, H 7). It was founded in 1563, by Francisco Martel, and after the War of Independence was named Lagos de Moreno after its defender, Pedro Moreno, who died here in battle against the Spaniards in 1817. Pop., 1900, 15,999; 1910, 12,243.

LAGOS, lá'gush. A seaport of Portugal, in the Province of Algarve, on a wide bay on the south coast, 40 miles west of Faro (Map: Portugal, A 4). It is fortified by an ancient wall with two batteries. A large viaduct leads over the narrow part of the bay. The harbor affords protection from north and west winds only, but is deep and capacious. The surrounding region is fertile, and the vine is much cultivated. A productive tunny fishery is carried on in the vicinity. Lagos is supposed to be on the site of the Roman *Lacobriga*. Pop., 1900, 8268. In the bay of Lagos, Admiral Boscawen obtained a signal victory over the French Mediterranean fleet, Aug. 18, 1759, and in 1797 Admiral Jervis defeated a Spanish squadron.

LAGOSTA, lá-gó'stá. An island in the Adriatic, off the coast of Dalmatia, Austria, to which it belongs (Map: Austria, E 5). It is 65 miles west of Ragusa, and has an area of 16 square miles. Its coasts are precipitous. On the north side is the small village of Lagosta, whose inhabitants are engaged chiefly in fishing and the production of oil and wine.

LAGOTHRIX (Neo-Lat., from Gk. *λαγός*, *lagós*, hare + *θηρίον*, *thirion*, hair). A genus of South American monkeys, closely allied to *Cebus*, and containing six species of woolly howlers, or "barrigudos." Among these are *Lagothrix lagotricha*, or *humboldtii*, and *Lagothrix infumata*. The former is the larger and better known. It inhabits the upper Amazon valley, but the latter is abundant about the headwaters of that river, and upon the slopes of the Andes, where it forms an important article of the food of both whites and Indians. One small tribe of 200 Indians killed and ate about 1200 woolly monkeys every year. These animals live almost exclusively upon fruits. In captivity they are quiet and grave, and have mild tempers, but they are very delicate and short-lived.

LAGO TRASIMENO. See TRASIMENO, LAGO.

LA GRANDE, lá gránd'. A city and county seat of Union Co., Oreg., about 305 miles by rail east by south of Portland, on the Grande Ronde River, and on the line of the Oregon Washington Railroad and Navigation Company

(Map: Oregon, G 2). It is the most important commercial centre of a productive lumber, wheat, fruit, and live-stock region, and has lumber mills, railroad shops, a flour mill, brickyard, etc. The city has adopted the commission form of government. Pop., 1900, 2991; 1910, 4843.

LA GRANGE, lá gránj. A city and the county seat of Troup Co., Ga., 71 miles southwest of Atlanta, on the Atlanta and West Point, the Atlanta, Birmingham, and Atlantic, and the Macon and Birmingham railroads (Map: Georgia, A 2). It has large cotton and cottonseed-oil mills and a creamery, and is of considerable importance as a commercial centre, having several jobbing houses. There are two female colleges, which are controlled by the Methodist and Baptist denominations. Settled in 1826, La Grange was incorporated in 1828. The city owns the water works, electric-light and sewage plants. Pop., 1900, 4274; 1910, 5587.

LA GRANGE. A village in Cook Co., Ill., 14 miles west of Chicago, on the Chicago, Burlington, and Quincy and the Indiana Harbor Belt railroads (Map: Illinois, J 2). Chiefly residential, the town contains a State Masonic orphans home, Nazareth Academy, St. Joseph's Institute, and Broadview Seminary. There is also an aluminium factory. Pop., 1900, 3969; 1910, 5282.

LA GRANGE. A town and the county seat of La Grange Co., Ind., 47 miles north by west of Fort Wayne, on the Grand Rapids and Indiana and the St. Joseph Valley Traction railroads (Map: Indiana, G 1). It has agricultural, stock-raising, and creamery interests, and manufactures of flour, lumber, pickles, ice, ice cream, and cement-brick machinery. The water works are owned by the town. Pop., 1900, 1703; 1910, 1772.

LA GRANGE. A city in Lewis Co., Mo., 10 miles north by west of Quincy, Ill., on the Mississippi River, on several steamship lines, and on the Chicago, Burlington, and Quincy railroad (Map: Missouri, E 1). It has an important river trade, exporting hay, corn, oats, and creamery products, and has a large foundry, a creamery, and a pearl-button factory. La Grange College (Baptist) was established here in 1858. It has artesian wells of medicinal water, and enjoys some popularity as a health and summer resort. La Grange was settled in 1833 and incorporated in 1853. The water works and electric-light plant are owned by the city. Pop., 1910, 1360.

LA GRANGE. A city and the county seat of Fayette Co., Tex., 96 miles by rail west by north of Houston, on the Colorado River, here crossed by two fine bridges, and on the Missouri, Kansas, and Texas and the Galveston, Harrisburg and San Antonio railroads (Map: Texas, D 5). It has a considerable trade in cotton, cottonseed oil, grain, live stock, etc., and several industrial establishments, among which are cotton gins and compresses and cottonseed-oil mills. The water works are owned by the city. Pop., 1900, 2392; 1910, 1850.

LAGRANGE, lá'gránzh', JOSEPH LOUIS (1736-1813). One of the greatest mathematicians of the eighteenth century. He was born at Turin, his father being War Treasurer to the King of Sardinia. Lagrange was educated at the College of Turin. At first he became interested in speculative philosophy, but his extraordinary mathematical ability soon made it clear that the proper domain of his activity

was mathematics. At 19 he communicated to Euler his solution of the famous isoperimetric problem, which had led him to establish the principles of the calculus of variations. The result was that Lagrange at once took a place among the foremost savants of Europe. He was soon made professor of mathematics in the artillery school at Turin, and in 1758 he founded the society which subsequently became the Royal Academy of Turin. In 1764 he received the prize offered by the Academy of Sciences at Paris for an investigation on the libration of the moon; in 1766 he was likewise successful in a question concerning the theory of the satellites of Jupiter, and in the same year was called to take Euler's place as director of the Academy of Berlin, which position he held for 20 years. He then went to Paris, and became a member of the Academy. During the Revolution he was at the head of the commission which had in charge the establishment of the metric or decimal system, and was also a member of the bureau for rewarding useful inventions. On the establishment of the Ecole Polytechnique (1797) Lagrange was made professor there. After the Revolution he was made professor in the newly established Ecole Normale. Under Napoleon he was made a member of the Senate and given the rank of Count. In pure mathematics Lagrange is noted for his contributions to the theory of series, the theory of numbers, differential equations, the numerical solution of equations, and the calculus of variations. His astronomical work was, however, quite as remarkable. His most noted work is *Mécanique analytique* (1788; 3d ed., 1853-55, Ger. trans. by Servus, 1887). His other works are: *Théorie des fonctions analytiques, contenant les principes du calcul différentiel* (1797; 3d ed., 1847, Ger. trans. by Grison, 1798-99); *Traité de la résolution des équations numériques* (1798; 3d ed., 1826); *Leçons sur le calcul des fonctions* (1806); *Lectures on Elementary Mathematics* (trans. by McCormack, Chicago, 1898); besides a large number of memoirs. His complete works, in 14 volumes, were published at Paris in 1866-92. His manuscripts were purchased in 1815 and given to the Institute by Carnot. Lagrange's name is connected with numerous mathematical theorems. For his biography, consult J. B. J. Delambre, "Notice sur la vie et les œuvres de Lagrange," in J. L. Lagrange, *Œuvres*, vol. i (Paris, 1866).

LA GRANJA, là grăn'ha. A town of Spain. See SAN ILDEFONSO.

LA GRIPPE. See INFLUENZA.

LA GRITA, là gr'tá. A town in the State of Táchira, Venezuela. It is situated in a beautiful mountain valley nearly 6000 feet above the sea, 75 miles south of Lake Maracaibo, and 60 miles southwest of Mérida, the capital of Los Andes. In the surrounding region wheat, sugar cane, tobacco, coffee, cacao, and rice are produced, and stock raising is carried on. It has a delightful climate, lies on the high road between Mérida and Maracaibo, and is an important trading centre. It was founded in 1576 by Francisco de Cáceres and has been several times visited by destructive earthquakes. Pop. (commune, est.), 26,000.

LA GUAYRA, là gwí'rá. A leading seaport of Venezuela, situated on a narrow strip of land between the mountains and the sea and about 5 miles from Carácas, of which it is the port (Map: Colombia, D 1). Its climate is

very hot and unhealthful, the temperature averaging 84° F., but of late sanitary improvements have lessened the discomforts. The principal square contains a statue of the celebrated physician Vargas, a native of La Guayra, and there are several churches and hospitals. The harbor is protected by a fort and a breakwater. La Guayra imports chiefly manufactured goods and exports coffee, cacao, and skins. In 1912 it held first rank in imports, valued at \$8,544,187, and fourth rank in exports, which amounted to \$4,536,256. It has factories for cigars, cigarettes, hats, and boots, which are made mainly for home consumption. Steamship lines connect it with Europe and America, and it is the terminus of a cable to Curaçao. A railroad 29 miles long, constructed over the high intervening mountains, connects the town with Carácas. It has a floating dry dock and shipbuilding plant. It is the seat of a United States consul. Pop., 12,000. La Guayra was founded in 1588. Its port was blockaded in 1903 by the English-German fleet pending the settlement of claims against the Venezuelan government.

LA GUÉRONNIÈRE, là gá'rónyâr', LOUIS ETIENNE ARTHUR, VICOMTE DE (1816-75). A French politician, born at Limoges in Haute-Vienne. He first attracted notice by the articles which he contributed to the *Avenir National* of Limoges about 1835. Subsequently he made the acquaintance of Lamartine, whom for many years he regarded as both his political and literary master. Ultimately he came to a rupture with Lamartine and became an ardent Bonapartist and the apologist of the coup d'état. He was a member of the Corps Législatif in 1852, State Councilor in 1853, and Senator in 1861. In 1868 he was made Ambassador at Brussels and in 1870 was sent to Constantinople. After the downfall of the Second Empire he edited the paper *La Presse* and founded afterward *Le Salut*. He died in Paris, Dec. 23, 1875. He wrote: *Études et portraits politiques contemporains* (1856); *L'Empereur Napoléon III et l'Angleterre* (1858); *L'Empereur Napoléon III et l'Italie* (1859); *Le pape et le congrès* (1859); *La France, Rome et l'Italie* (1861); *Le droit public et l'Europe moderne* (1875) — His elder brother, DUBREUIL HELION, COMTE DE LA GUÉRONNIÈRE, was an exponent of legitimism and opposed the July monarchy and the Second Empire, but took a more favorable attitude towards the Republic. Among his numerous political writings are *La Prusse et l'Europe* (1867); *La France et l'Europe* (1867); *L'Esprit du temps et de l'avenir* (1868); *La crise* (1869); *La politique nationale* (1869); *La Prusse devant l'Europe* (1870); *La catastrophe de la France* (1871); *L'Internationale et la guerre civile en France* (1871); *L'Homme devant l'histoire* (1872); *M. Thiers* (1876).

LAGUERRE, là gâr', EDMOND NICOLAS (1834-86). A French mathematician, born at Bar-le-duc. In 1853, when he was a candidate for the Ecole Polytechnique, he attracted great attention by an article in the *Nouvelles Annales de Mathématiques* supplementing the work of Poncelet. He was an artillery officer at Metz and Strassburg and in 1864 returned to Paris as a teacher at the Polytechnique. In 1870 he published the first part of an important work on geometry. He became a member of the Institute in 1883 and soon afterward was made professor of mathematical physics at the Col-

lège de France. Most of his writings appeared in mathematical journals, but he published separately *Théorie des équations numériques* (1880) and *Recherches sur la géométrie de direction* (1885). Consult the preface by H. Poincaré to Laguerre's *Ouvres* (2 vols., Paris, 1898-1905), edited for the Academy of Sciences by Hermite, Poincaré, and Rouché.

LAGUERRE, (JEAN HENRI) GEORGES (1858-1912). A French lawyer and Socialist politician, born in Paris. He was educated at the Lycée Condorcet and in 1879 was called to the French bar. Participating in politics, he was elected to the Chamber of Deputies in 1883 as the representative of the Radical-Socialists, was reelected in 1885 and 1889, but failed of election in 1893. He was one of the chief supporters of General Boulanger (q.v.) in 1890. He wrote for Georges Clemenceau's *La Justice* and later became director of *La Presse*. As a lawyer, he first attracted attention by his defense of the anarchists Prince Kropotkin (q.v.) and Louise Michel (q.v.) in 1883, and of the leaders of the Decazeville strike in 1886. Laguerre became one of the greatest French criminal lawyers of his day, but in 1893 he was excluded from the Paris bar by jealous political enemies, who, on account of his connection with *La Presse*, asserted that he was involved in commercial operations incompatible with his profession; and thereafter he practiced in the provinces.

LAGUNA, la-goo'na, or **LA LAGUNA**, also called CRISTÓBAL DE LA LAGUNA. A town of the island of Tenerife in the Canaries. It is situated on the north shore, near Santa Cruz, in a beautiful plain surrounded by wooded mountains. It has wide and straight streets and large plazas and is the seat of a bishop and of a university. There are a town hall, a normal school, a seminary, a public library, and an enormous cathedral with five naves. Laguna was formerly the capital of the island. Pop., 1900, 13,152; 1910, 16,322.

LAGUNA. An important pueblo town in Valencia Co., N. Mex., 67 miles west of Albuquerque, on the Atchison, Topeka, and Santa Fe Railroad (Map: New Mexico, B 4). The inhabitants belong to the Keresan stock (q.v.) and, like all the other Pueblo Indians, are industrious and self-supporting, raising sufficient crops for their own wants, although almost their whole territory is a desert, and the Indian title, acquired under old Spanish laws, is in dispute. There are here an adobe Roman Catholic church, almost 200 years old, and a tuberculosis sanitarium. According to an official report, only 215 out of over 17,000 acres covered by their grant can be used for farming purposes, and their main dependence is an adjoining strip of fertile land along the San José River. Wool raising is carried on. Pop., 1910, 1583. See also PUEBLO.

LAGUNA. See KERESAN STOCK.

LAGUNA. A province of central Luzon, Philippines, southeast of Manila (Map: Philippine Islands, C 3). It has the form of a crescent, encircling the south and east shores of Laguna de Bay, which, together with the Province of Rizal, bounds it on the north. On the east lie the provinces Infanta and Tayabas, on the south the latter and Batangas, and on the west Cavite. Its area is 752 square miles. The surface is broken and mountainous in the central and northern portions, containing the famous Mount Maquiling with its grotto.

In the east and northwest it is more level. Mineral springs abound. The climate is variable in temperature, but moist. The province is watered by numerous streams and lakes, which in the rainy season form fever-breeding swamps. Laguna is known as the garden of the Philippines, and quantities of sugar, palay, corn, coffee, and coconuts, are produced. The production of coconut oil is a flourishing industry, and there are also manufactures of bolos and furniture. There are many good roads, and a railway skirts the south shore of the bay from Santa Cruz, the capital, to Manila. Pop., 1903, 148,606. The inhabitants are exclusively Tagalogs and are all more or less civilized. Capital, Santa Cruz (q.v.).

LAGUNA DE BAY, dà bi. A navigable fresh-water lake in the southern part of Luzon, Philippines, about 45 miles long and 15 miles wide in its broadest part (Map: Philippine Islands, C 3). It has the island of Talim near its centre, and on its shores are a number of important towns, chief of which are Morong and Santa Cruz. It is connected with Manila Bay on the west by the Pasig River, about 10 miles long.

LA HABANA. See HAVANA.

LA HARPE, là hîrp, FRÉDÉRIC CÉSAR DE (1754-1838). A Swiss statesman, born at Rolle in the Canton of Vaud. He studied at Geneva and Tübingen and went in 1782 to St. Petersburg, where he became tutor of the future Alexander I and imbued him with certain democratic principles. He was a passionate republican and a Vaudois patriot, and his writings stirred up revolts against the tyranny of the Bernese, but brought about his dismissal by the Emperor of Russia and caused him to be outlawed by the Swiss authorities. In 1795 he went to France to solicit the intervention of the Directory in Swiss affairs, and in 1798, when French troops had instituted an Helvetic republic, La Harpe became one of its directors. The restoration of the cantonal system sent La Harpe a fugitive to Paris in 1800, where he lived till 1814. When the allies entered Paris, Alexander I greeted his old tutor affectionately, gave him the rank of general, and at his entreaties insisted in the Congress of Vienna on the rights of the Canton of Vaud. In 1816 La Harpe settled at Lausanne, where he died. Among his writings may be mentioned *Essais sur la constitution du pays de Vaud* (Paris, 1796).

LA HARPE, JEAN FRANÇOIS DE (1739-1803). A French critic, born in Paris, Nov. 20, 1739. He began his literary life as a satirist with *Héroïdes* (1759) and followed this with four mediocre classical tragedies *Waruul* (1763, perhaps the best), *Timoléon* (1764), *Pharamond* (1765), and *Gustave Wasa* (1766). He visited Voltaire at Ferney from 1766 to 1768; and then became literary critic of the *Mercure de France*, continuing to write dramas and gaining academic recognition. He was elected to the Academy (1776) and in 1786 became professor of literature at the Lycée. His lectures there, published as *Cours de littérature ancienne et moderne* (1789-1805), though narrow and superficial, were once highly esteemed. His best critical work is found in his analysis of seventeenth-century writers. His *Commentaire sur Racine* (1795-96) shows sound critical judgment. He joined the revolutionary movement, but was imprisoned during the Directorate and

from a Voltairean became an ardent Catholic. In criticism La Harpe stands on the threshold of the Romantic revival as the talented representative of a sterile conservative classicism. His *Œuvres*, in 16 volumes, appeared in 1821. Consult Sainte-Beuve, *Causeries du lundi*, vol. v (Paris, 1856), and Bruno Edlich, *Jean François de La Harpe als Kritiker der französischen Literatur im Zeitalter Ludwigs XIV* (Leipzig, 1910), containing a bibliography.

LAHIJAN, la'hä-jän'. An important trading town of Persia, in the Province of Gilan, 5 miles from the south shore of the Caspian Sea, 25 miles east of Resht (Map: Persia, D 4). It was formerly the capital of the Province of Gilan. Silk is the chief product. Pop. (est.), 5000.

LA HIRE, la' er', ETIENNE DE VIGNOLLES (c.1390-1443) A French general. He was born in Gascony, and the name La Hire, given him by his enemies, was adopted by him. He fought bravely at Coucy in 1418, but had to surrender to the Duke of Burgundy; was at the siege of Alençon in 1421 and in the battle of Verneuil in 1424, and in 1429 was with Jeanne d'Arc at Orléans. In 1431 he was captured by the English in an attempt to release Jeanne from her imprisonment in Rouen, but was ransomed by the French cities and assisted in the capture of Chartres (1432). He died at Montauban, after many honors had been conferred on him by Charles VII. On account of his companionship with Jeanne d'Arc and of the many stories told of his bravery and wit, he is one of the most popular of the French chevaliers, and his name is often used at cards in French for the knave of hearts.

LA HIRE, PHILIPPE. See DE LA HIRE.

LAHME, lā'me, DER. See HERMANN VON REICHENAU.

LAHN, län. An affluent of the Rhine, joining it a few miles above Coblenz. It rises in Westphalia and flows through Hesse-Nassau and Hesse. Its length is 135 miles and it is navigable by means of numerous locks up to Giessen, about 90 miles from its mouth. On its banks is Ems, and its valley is followed by a railroad line.

LA HOGUE, or LA HOUGUE. See HOGUE, LA.

LA HONTAN, la on'tän', ARMAND LOUIS, BARON DE (1666-1715). A French soldier and traveler. He was born at Mont-de-Marsan in Gascony and went to Canada as a common soldier in 1683. He was stationed at various military posts, made several expeditions against the Indians, visited Michilimackinac and Sault Ste. Marie in 1688 and Green Bay in 1689, and claimed to have been on the upper Mississippi. While on his way to France in 1692, as bearer of dispatches from Count Frontenac, he stopped at Placentia Bay, Newfoundland, and defended the place bravely against an English force. He was made King's lieutenant in Newfoundland and Acadia, but quarreled with the Governor and was dismissed from the service. He traveled through Portugal, Spain, Holland, Denmark, and England, settled in Hanover, and died there. In 1703 La Hontan published at The Hague an account of his adventures in America, under the title *Nouveau voyage dans l'Amérique septentrionale*, and followed it up the next year with a *Suite des voyages de l'Amérique*, treating chiefly of the lake region of North America and the upper waters of the Mississippi. Consult V. H. Paltsits, *Bibli-*

ography of Writings of Baron Lahontan (New York, 1905).

LAHONTAN, LAKE A former extensive lake of the Great Basin region in western Nevada. See LAKE LAHONTAN.

LAHORE, là-hör'. A division of the Punjab (q.v.), British India, comprising the districts of Lahore, Amritsar, Montgomery, Gurdaspur, Sialkot, and Gujranwala (Map: India, B 2). Area, 12,387 square miles. Pop., 1901, 5,101,882; 1911, 4,656,629. It extends from the Himalaya to Multan, along the right bank of the Sutlej. The surface, save near Dalhousie hill station in Gurdaspur, is an alluvial plain, irrigated by the Bari Doab Canal and the Sutlej with ramifying channels. Wheat is the principal crop, and barley, maize, rice, cotton, sugar, tobacco, oil seeds, and the opium poppy are cultivated. Capital, Lahore.

LAHORE. The capital of the Punjab, British India, and of the division and district which take their names from it, in lat. 31° 35' N. and long. 74° 20' E, on the left bank of the Ravi River and at the junction of the railways from Calcutta, Peshawar, and Karachi (Map: India, B 2). It is distant by rail 32 miles from Amritsar, 298 from Delhi, 784 from Karachi, 1280 from Bombay, and 1252 from Calcutta. The city is the residence of the Lieutenant Governor of the Punjab and the seat of an Anglican and of a Roman Catholic bishopric. Lahore consists of the native town, about 1 square mile in area, and, to the south and east, the European quarter, or civil station. Three miles east of the latter is the Lahore Cantonment, which until 1906 was called Mian Mir. The native city, to which access is had by 13 gates, was formerly surrounded by a brick wall, 30 feet in height, and a moat. During the years subsequent to 1849, when the government was given over to the British by the Maharajah Dhulip Singh, the city underwent considerable improvement; the walls were reduced in height and finally razed, and the moat filled in, and their site is occupied by a garden encircling the city on all sides but the north. The citadel or fort stands upon an eminence at the northeast. The city is mean and gloomy in appearance, with narrow, winding streets and blind alleys; but this is offset by splendid buildings of the Mogul period. These are especially to be noted on the northeast side, where "the mosque of Aurungzebe, with its plain white marble domes and simple minarets, the mausoleum of Ranjit Singh, with its rounded roof and projecting balconies, and the desecrated façade of the Mogul palace, stand side by side in an open grassy plain, exhibiting a grand *coup d'œil*." In 1849 the environs were an expanse of crumbling ruins, and the European residences were grouped around the old cantonment south of the city; the European quarter spread gradually eastward and now covers a considerable area that was formerly jungle and ruins. The older part of the European quarter, south of the native city, is known as Anarkali; here are a public garden, the Secretariat buildings, town hall, museum, Punjab University, Punjab Public Library, Government College, Senate Hall, the new University Hall, the Mayo and Lady Aitchison hospitals, and other public buildings. The Old Mall, an excellent road, connects Anarkali with the native city. East of Anarkali is the European quarter known as the Naulakha. It is known also as the railway colony, for situ-

ated here are the station, the extensive workshops of the Northwestern Railway (with some 5000 employees), and a railway school building. The Upper Mall extends southeast to Lawrence and Montgomery halls (surrounded by a large public garden) and Government House. On or near this road, which is the main thoroughfare of the newer residential quarter, are various government offices, the chief court, most of the European shops, and the Anglican cathedral, a fine building in the later Early English style, consecrated in 1887. The Aitchison Chiefs' College is beyond Government House towards the Lahore Cantonment.

Formerly Lahore was famous for the manufacture of superior silk cloths of Bokhara thread and the production of gold and silver embroidery, glass, enamel, and arms. The decorative arts have practically disappeared, being superseded by the manufacture of coarse and inferior silks, cotton prints, vegetable oils, candles, soap, etc. A good quality of woolen stuffs is produced. Lahore is an important trading centre. The municipality was created in 1867. A system of water works was opened in 1881 and a drainage system in 1883. The city contains the principal educational institutions of the Punjab. These include the Punjab University (with five colleges), the medical and law colleges, a training college, the Aitchison Chiefs' College, the Mayo School of Art, and various technical and special schools, high schools, etc.

Lahore is the largest city of the Punjab. The population, excluding the cantonment, was 138,876 in 1881, 159,597 in 1891, and 186,884 in 1901 (including 113,253 Mohammedans, 62,922 Hindus, 5964 Sikhs, and 4199 Christians); including the cantonment, the population in 1901 was 202,964, and, in 1911, 228,687.

The traditional founder of Lahore is Lava, son of Rama, but it is probable that the city was not founded before the first century A.D. In 1036 it became the capital of the Ghaznavid dominions east of the Indus, but for about 60 years subsequent to 1042 was governed by viceroys. During the reign of Masud III (1099-1114) it was made the Imperial capital. The city was taken by the Mongols in 1241 and put to ransom in 1246. It was rebuilt by Balban in 1270, but 15 years later the Mongols returned and for a long period made numerous raids. From 1398, when it was taken by a detachment of Timur's army, it seems to have been desolate until rebuilt by Mubarak Shah in 1422. About 100 years later it fell to Babar. Lahore reached its greatest splendor under Mongol rule and particularly during the reign (1556-1605) of Akbar, who held his court there from 1584 to 1598. Under Akbar the city rapidly developed, exceeding its present area and population. The architectural importance of Lahore increased under Jahangir (died 1627), and during the reign of his son, the great Shah Jahan, the city probably had a circuit of some 16 or 17 miles. Under Aurungzebe, Shah Jahan's son, the population began to decline, and the architectural history of Lahore virtually came to an end. From the accession of Bahadur Shah until in 1798 the authority of Ranjit Singh confirmed the Sikh power in the Punjab, Lahore was subjected to successive invasions and conquests, and it gradually sank into a crumbling ruin. Ranjit Singh made the city once more the centre of a flourishing kingdom, but anarchy followed his death in 1839, and an invasion of British

territory resulted in war and the British occupation in 1846, when the British resident became the real authority at Lahore. The government was resigned to the British by Dalip Singh in 1849.

LAHORE, VISCOUNT HARDINGE OF. See **HARDINGE**, SIR HENRY.

LAHR, lār. A manufacturing town of the Grand Duchy of Baden, Germany, situated in the valley of Schutter, 53 miles south-southwest of Karlsruhe (Map: Germany, B 4). The municipal park and the museum of antiquities are noteworthy. Lahr has manufactures of linen and woolen cloth, hats, horsehair cloth, artificial flowers, leather, snuff, cartons, umbrellas, and toys. There are also lithographic and printing establishments. It has a good trade in wine. Pop., 1900, 13,576; 1910, 15,191.

LAIBACH, lî'bâg, or **LAYBACH**. The capital of the Austrian Crownland of Carniola, situated on the Laibach River, 45 miles northeast of Trieste (Map: Austria, D 3). It contains a number of fine promenades and squares, adorned with monuments, among which the most notable is the bronze bust of Radetzky by Fernkorn. The best of the ecclesiastical edifices is the Italian cathedral of St Nicholas, with a high dome. Other noteworthy buildings are the town hall, the government headquarters, the palace of justice, the agricultural building, the old castle on the Schlossberg dominating the town, and the palaces of the Bishop and the counts of Auersperg. The educational institutions include Gymnasias, a seminary for teachers, a theological seminary, a school of commerce, two schools of music, a library of 61,000 volumes, a theatre, and a museum. Slovene is the official language, and Laibach is the focus of the movement to promote its use. Laibach manufactures cotton goods and other textiles, church bells, tobacco, and machinery, wire, paper, lace, pottery, leather, fire hose, and iron products. It has large railway repair shops and some commerce. It is the seat of a prince-bishop. In the neighboring Laibach Fen have been found interesting lake dwellings. Pop., 1900, 36,547, 1910, 47,127, mostly Slavic. Laibach is believed to occupy the site of the Roman Emona or Hemona. It flourished under the rule of the Franks, and in 1277 passed under the rule of the house of Hapsburg. It was the seat of the French dominion of the Illyrian provinces from 1809 to 1813. In 1821 Laibach was the scene of the famous congress of monarchs, convened for the purpose of putting an end to Carbonarism in Italy and of restoring Naples and Sicily to their former political status. The results of the congress were the passing of resolutions establishing among European nations the right of armed intervention in the affairs of any neighboring states in case of internal political disturbances, and the occupation of Naples by Austria. Most of the larger European countries were represented at the congress, against whose action England protested.

LAIDLAW, WILLIAM (1780-1845). Friend and amanuensis of Sir Walter Scott. He was born at Blackhouse, Selkirkshire, and after farming with little success became (1817) steward to Scott, who placed a high value on his counsel and friendship. Laidlaw wrote several lyrics, but the simple ballad "Lucy's Flittin'" alone is remembered. With Sir Walter's assistance he compiled part of the *Edinburgh Annual Register* after 1817.

L AIDLER, HARRY WELLINGTON (1884-). An American Socialist author and lecturer. He was born in Brooklyn, N. Y., and was educated at Wesleyan (A.B., 1907), at the Brooklyn Law School of St. Lawrence University (LL.B., 1910), and at Columbia (Ph.D., 1914). He served as a reporter on the Brooklyn *Daily Eagle* in 1907-10, was admitted to the New York bar, and studied social conditions in Europe in 1914. In 1910 he became organizing secretary of the Intercollegiate Socialist Society, an organization similar in many respects to the Fabian Society of England, and in 1912 he became editor of the quarterly, *The Intercollegiate Socialist*. His treatise, *Boycotts and the Labor Struggle* (1914), is an authoritative and comprehensive work on that subject.

L'AIGLON (THE EAGLE). A drama by Edmond Rostand, produced in Paris March 15, 1900, with Sarah Bernhardt in the title rôle. The subject is the young Duke of Reichstadt, the unfortunate son of Napoleon Bonaparte.

L AINEZ, L'ññth, DIEGO. See LAYNEZ

L AING, lāng, ALEXANDER GORDON (1793-1826). A British explorer, born in Edinburgh. He was educated at the university of his native city and in 1810 became an ensign in the Edinburgh Volunteers. The next year he went to the West Indies, where he served until 1822, when he took command of a company in the Royal African Corps and was ordered to Sierra Leone. During the next two years he made extensive explorations in the neighboring countries and in 1824, during a visit to England, was ordered by the Colonial Secretary to undertake a journey by way of Tripoli and Timbuctoo to the source of the Niger. He was the first European to reach the latter city, which he entered on Aug. 18, 1826. He left it about September 24 and two days later was murdered by Arabs who were probably acting under instructions from the Bashaw of Tripoli. An account of his earlier explorations was published in 1825 under the title *Travels in Timmannee, Kooranko, and Soolima, Countries of Western Africa*. Consult Robert Chambers (ed.), *Biographical Dictionary of Eminent Scotsmen*, vol. ii (Glasgow, 1830), and Thomas Nelson, *Memoirs of Oudney, Clapperton, and Laing* (Edinburgh, 1830).

L AING, DAVID (1793-1878). A Scottish antiquary, born and educated at Edinburgh. He became an apprentice in his father's bookstore, traveled abroad to buy books, met Lockhart, and became a friend of Scott. He was secretary of Scott's Bannatyne Club and editor of many of its publications. He was made honorary professor of antiquities for the Royal Scottish Academy in 1854. His many works include the following: *The Select Remains of the Ancient Popular Poetry of Scotland* (1821), *Fugitive Scottish Poetry* (1823-25), *The Poems of William Dunbar* (1834), the first collected edition; *Lauder's Memorable Occurrences* (1840), *Letters and Journals of Robert Baillie, 1637-62* (1841), *The Collected Works of John Knox* (1846-64), *Notes of Ben Jonson's Conversations with Drummond of Hawthornden* (1842), *Garden's Theatre of Scottish Worthies* (1878), besides several important works on etchings and engravings.

L AING, GORDON JENNINGS (1869-). An American classical scholar, born at London, Ontario, Canada. After graduating from the University of Toronto (1891), he taught Latin and Greek at Whetham College, Vancouver, Brit-

ish Columbia (1892-93), and at the University of Toronto (1893-95), and then was fellow in classics at Johns Hopkins, where he took the degree of Ph.D. in 1896. After a year at the American School of Classical Studies in Rome (1896-97) and service as lecturer in Latin at Bryn Mawr College (1897-99), he became a member of the Latin department of the University of Chicago in 1899. He was managing editor of the *Classical Journal* in 1905-08, associate editor of *Classical Philology* after 1905, and general editor of the University of Chicago Press after 1908. He served also as annual professor at the American School of Classical Studies in Rome (1911-12) and was vice president of the American Institute of America (1913-14). His publications include *Masterpieces in Latin Literature* (Boston, 1903), an edition of *Selections from Ovid* (New York, 1905), and an edition of the *Phormio* of Terence (Chicago, 1908), besides articles and reviews in various learned periodicals, especially in relation to Roman topography and Roman religion.

L AING, MALCOLM (1762-1818). A Scottish historian. He was born in Mainland, Orkney, near Kirkwall, where he received his earlier education; attended Edinburgh University, and was admitted to the bar in 1785. His ability attracted some attention, but he gave up law as a profession to devote himself to historical research. His writings, although somewhat awkward in style, are thorough and accurate. He continued Henry's *History of Great Britain* (1793), and wrote a *History of Scotland from the Union of the Crowns, on the Accession of James VI to the Throne of England, to the Union of the Kingdoms* (1802).

L AING, SAMUEL (1810-97). A British author and politician, born at Edinburgh and educated at Cambridge, where he taught mathematics for a time. He studied law and entered political life as secretary to Labouchère of the Bureau of Commerce, who gave him special charge of the Department of Railway Construction. He was a disciple of Gladstone, became member of Parliament for Wick (1852), held several positions under the Liberal government, was president of the society which instituted the Sydenham Crystal Palace Exhibition (1854), and a director of railways in France, Belgium, and Canada. During 1860-65 he was Minister of Finance in India, and he wrote about that country and China. His chief publications include *Modern Science and Modern Thought* (1885), *Problems of the Future* (1889), *Human Origins* (1892).

L AIRD, lārd, DAVID (1833-1914). A Canadian statesman. He was born in New Glasgow, Prince Edward Island, and was educated at the Presbyterian Theological Seminary, Truro, Nova Scotia. He founded and became editor of the *Patriot* of Charlottetown. He sat in the Assembly of his native province and as a member of the Executive Council was a delegate to Ottawa to negotiate for the union of Prince Edward Island with the Dominion government. After the union he was a Liberal member of the Dominion Parliament, served as Minister of the Interior (1873-76), and was in 1876-81 Lieutenant Governor of the Northwest Territories. In 1874, as Commissioner, he concluded a treaty with the Indians of the northwest by which they gave up to the government about 75,000 square miles of territory. In 1881 he returned to

Prince Edward Island and failed in 1882 and in 1887 to be reelected to the Dominion House of Commons. From 1898 to 1900 he was Indian Commissioner for Manitoba and the Northwest Territories, and in the latter years removed to Ottawa to serve in an advisory capacity on Indian affairs. While in office, he concluded several treaties whereby Indian titles to land became extinguished and reverted to the crown. He published *Our Indian Treaties* (1905).

LAIRD, JOHN (1805-74). An English shipbuilder, born in Greenock, Scotland. He is said to have been the first builder of iron steamships and for a long time was the head of the firm of John Laird and Sons, iron shipbuilders and engineers at Birkenhead, near Liverpool. Among the vessels built by his firm were the *John Randolph*, said to have been the first iron vessel used in American waters, the *Nemesis*, the first iron vessel equipped with guns, and the famous Confederate vessel *Alabama*. He retired from the active management of the business in 1861, after which time the firm became known as Laird Brothers. From 1861 until his death he was a member of Parliament.

LAIRD-MAIR. See LAWRENCE, LORD.

LAIRESE, lā'rēs, GÉRARD DE (1641-1711)

A Flemish historical painter and etcher. He was born at Liège and under the direction of his father received a liberal education in literature and art. He was also a pupil of Bertholet Flemal at Liège. At the age of 15 he painted good portraits and historical subjects. From the traditional account it seems that he lived in great poverty at Utrecht and in the neighborhood, painting signs for a living, until summoned by a picture dealer to Amsterdam, where he speedily became celebrated. He is said to have gained inspiration for painting by playing the violin. He painted with great facility, leaving above 250 works. His style was influenced by Poussin and the antique, his art being essentially Flemish, and not realistic, like the Dutch. It was sumptuous and mannered in character. In 1690 his sight became impaired, but he continued his usefulness by dictating his ideas on painting to his pupils and associates. They were collected by his son and published at Amsterdam, under the title *Het groot schilderboek* (1707-12), which, translated into English, German, and French, became a manual for the art academies of the eighteenth century.

His largest works were decorations for houses in Amsterdam and for Dutch castles. He was especially fond of mythological subjects, his religious pictures being less impressive. Among his paintings at Amsterdam (Rijks-Museum) are a "Bacchanal," "Legitimate Power," "Revolution," "Venus, Mars, and Cupid," in the Louvre are the "Institution of the Eucharist," "Cleopatra at Tarsus," and a "Dance of Children." The gallery at Cassel is also rich in his works. For the cathedral of Liège he painted a "Penitence of St. Augustine" and "Baptism of St. Augustine"; for the church of St. Ursula, at Aix-la-Chapelle, the "Martyrdom" of St. Ursula.

LAIIS (Lat., from Gk. *Aais*) The name of two Greek courtesans, celebrated for their beauty. 1. The elder Laïs was born probably at Corinth about 475 B.C. Her beauty was said to surpass that of any other woman of her time, but her greed and capriciousness were also notorious, and, when old, she grew overfond of the wine bottle. Her lovers included many

famous men, among them the philosopher Aristippus of Cyrene. 2. The younger Laïs was born probably in Sicily and is said to have been brought to Athens when still a child. She sat as a model to the painter Apelles. Falling in love with a certain Thessalian, she accompanied him to Thessaly, where, it is said, she was stoned to death by some jealous women.

LAISSEZ-FAIRE, lā'sā' fār (Fr., let do), **LAISSEZ-PASSER, lā'sā' pāsā'** (Fr., let go on). As originally used, the first of these phrases represents a demand for freedom from onerous restrictions in production, the second for freedom of exchange. Under the mercantile system industry and commerce were subject to a mass of regulations which hampered the individual even in matters of trifling importance. A reaction in thought set in against this excessive regulation, culminating in the laissez-faire teachings of the physiocrats (q.v.). The expression "laissez-faire" is said to have been employed before 1680 by Legendre, a merchant, in a reply to a question of Colbert concerning the needs of industry. The idea appears more definitely worked out in the writings of Boisguillebert (1712), and as early as 1735 the Marquis d'Argenson had declared that laissez-faire should be the watchword of every public power. "To govern better, it is necessary to govern less," he writes. The view did not become common until the latter half of the eighteenth century. The maxim *laissez-faire et laissez-passer* appears to have been popularized by Gournay, to whom it was attributed until within recent years.

The doctrine secured a wide following both in France and in other European countries. In England Adam Smith and the whole English classical school of political economy manifest its influence. The French classical economists were likewise champions of laissez-faire, and numerous followers appeared in Germany. In the latter half of the nineteenth century the doctrine of laissez-faire lost ground, however. The German school of economics, which emphasized the importance of the economic functions of government, seemed for a time to have completely overthrown the older doctrine. A reaction has, however, set in which promises to restore to favor a modified form of the principle of laissez-faire.

Adherents of the theory have never stood for the view that the individual should be left free to do as he pleases in other matters than trade and industry. The doctrine is not one of anarchy, as it has been made out to be by its opponents. Nor does it deny that government has certain economic functions to perform; although, indeed, an obscure follower of Bentham, Sir J. Bowring attempted to show that political economy looks for nothing from the state except security for industry. The adherents of the theory would, as a rule, agree that the state should perform those functions which cannot be adequately performed by individuals; they would also leave to the state functions which primarily redound to the public good. See FREE TRADE; PHYSIOCRATS; POLITICAL ECONOMY; INDIVIDUALISM.

Consult, for brief summaries of the history of the doctrine, J. J. Lalor, *Cyclopedia of Political Science*, vol. ii (New York, 1893); Palgrave, *Dictionary of Political Economy* (London, 1894-99); McLaughlin and Hart, *Cyclopedia of American Government*, vol. ii (New York, 1914).

The most satisfactory history of the origin of the phrases is August Oncken, *Die Maxime Laissez-Faire et Laissez-Passer* (Bern, 1886). A brief account is given by Higgs, *The Physiocrats* (London, 1897); William Cunningham, *Industrial Revolution, Being the Parts Entitled Parliamentary Colbertism and Laissez-Faire* (Cambridge, 1908); also J. W. Garner, *Introduction to Political Science* (New York, 1910).

LAISTNER, list'nēr, LUDWIG (1845-96). A German author, born at Esslingen, Württemberg. He studied theology at Tübingen, had charge of a pastorate for two years, and was a private tutor in Munich, where he devoted himself exclusively to literary pursuits after 1880, and whence he removed to Stuttgart in 1889, as literary adviser of the publisher Cotta. Besides *Barbarossa's Brautwerber* (1875), an epic poem, and *Novellen aus alter Zeit* (1882), he wrote: *Nebelsagen* (1879), contributions to German mythology; *Der Archetypus der Nibelungen* (1887); *Das Rätsel der Sphinx, Grundzüge einer Mythengeschichte* (1889); *Germanische Volkernamen* (1892); and with Paul Heyse he edited *Neuer deutscher Novellenschatz* (24 vols., 1884-88).

LAITY, lā'y-tī (from *lay*, from OF., Fr. *lai*, from Lat. *laicus*, from Gk. *laikos*, *laikos*, relating to the people, from *laos*, *laos*, people). In Church relations, the name given to all persons who do not belong to the clergy (q.v.). Among Catholics the term has a stricter meaning than among Protestants, for the latter do not make the same profound distinction between those especially dedicated to the service of the Church and the general body of worshippers. The Roman Catholic church claims for its priesthood a direct and special mission supernaturally bestowed to teach and govern the faithful laity in all matters concerning religion. Most Protestant bodies deny this sharp distinction and regard all members as of the same spiritual grade. In modern usage the term is applied in a similar sense to distinguish those who are not in a learned profession from its members; thus, those who are not lawyers are "laymen" to the legal profession.

LAIUS. See **EDIPUS**.

LAJARD, lā'zhār', JEAN BAPTISTE FÉLIX (1783-1858). A French archaeologist, born in Lyons. He was attached as secretary (1807) to the French Ambassador to Persia and spent several years in that country exploring and studying Oriental religions, particularly in their effect upon Greek culture. He also made a collection of Babylonian cylinders which are now in the National Library in Paris. The value of his researches was recognized, and after his return to France he held several important offices. Much of his writing was contributed to the *Académie des Inscriptions et Belles Lettres*, to which he was elected in 1830. His works include *Recherches sur le culte, les symboles, les attributs et les monuments figurés de Vénus en Orient et en Occident* (1837-47) and *Recherches sur le culte publique et les mystères de Mithra en Orient et en Occident* (1847-48).

LAJEUNESSE, lā'zhē'nēs', MARIE LOUISE CECILIA EMMA. See **ALBANI**, EMMA.

LAJOIE, ANTOINE GERIN. See **GERIN-LAJOIE**, ANTOINE.

LA JONQUIÈRE, lā zhōn'kyār', JACQUES PHÉLIX TAFFANEL, MARQUIS DE (1680-1753). A French naval officer, who went to Canada as Governor in 1749. He had previously been en-

gaged in military service—had fought the Protestants in the Cévennes (1703), was especially known for his services with Duguay-Trouin at the siege of Rio de Janeiro (1711), had been present at the battle of Toulon (1744), and had won a notable victory at Finisterre with six ships over 18 of the British. He was appointed Governor-General of Canada in 1746, but the fleet in which he had embarked was scattered by storms and never reached Quebec. In 1747 his ship was captured and himself taken prisoner to England. After his release, again appointed Governor-General of Canada, he was suspected of being a silent partner of Western fur traders, and he undoubtedly backed the zealous Abbé le Loutre in his design of securing Acadia for France against the English among the Acadians.

LA JUNTA, lā hōōn'tā. A city and the county seat of Otero Co., Colo., 64 miles south-east of Pueblo, on the Arkansas River, and on the Atchison, Topeka, and Santa Fe Railroad (Map: Colorado, F 4). It is a division point on the Santa Fe system and contains railroad yards and shops, employing 1200 men. Other industrial establishments include flour mills, an elevator, and a canning factory. The surrounding region produces cattle and sheep, cantaloupes, and alfalfa. La Junta owns its water works. Pop., 1900, 2513; 1910, 4154.

LAKANAL, lā'kā'nāl', JOSEPH (1762-1845). A French statesman and educator, born at Serres in the Department of Ariège and educated for the priesthood. When the Revolution broke out, Lakanal, who was then professor of philosophy in the college at Moulins, was sent by the Department of Ariège as a deputy to Paris. In the National Convention he gave an unqualified vote for the death of the King. Shortly afterward he was made a member of the Committee of Public Instruction and quickly rose to the head of that body. He initiated most of the important reforms tending to make education universal in France. To his efforts was also due the founding of the Ecole Normale and the Institut de France. In 1798, as commissary general of the Department of the Rhine, he reformed abuses in the army and built up the frontier against foreign invasion. During Napoleon's tenure of power Lakanal filled various subordinate positions in educational institutions in France. On the accession of Louis XVIII he was proscribed as a regicide and came to the United States. Congress voted him 500 acres of land, and a little later he accepted the presidency of the State University of Louisiana. In 1825 he resigned and retired to his plantation on Mobile Bay. Shortly after the revolution of 1830 he returned to France and became a member of the Académie des Sciences Morales et Politiques. Consult E. Guillon, *Lakanal et l'instruction publique* (Paris, 1881). See also Lakanal, *Projet d'éducation nationale* (ib., 1793), for his own account of his educational ideas.

LAKE (AS. *lacu*, from Lat. *lacus*, lake; connected with OHG. *lahha*, Ger. *Lache*, pool, OIr. *loch*, lake, Gk. *lakkos*, *lakkos*, hole). A body of standing water surrounded by land. In common usage the term "pond" is applied to very small lakes, but there is no uniformity in agreement as to where the line is to be drawn. In Scotland the word "loch" is applied to lakes and also to lakelike arms of the sea almost completely shut in by the land. In the case of the Caspian, Dead, and Aral seas the term "sea" is applied to what are true lakes.

General Characteristics. Lakes vary greatly in form, depth, and source of their water supply. They are usually elongated in the direction of the inlet and outlet, owing to the fact that they commonly arise from some interference with the free drainage along a preëxisting river valley. Often the outline is irregular because the dam at the outlet causes the water to rise up into tributary valleys. In some cases the water rises over low divides, forming many islands and a very irregular coast, as in Champlain, Winnetoesaukee, and other lakes. Others may have straight shore lines following the valley walls or may occupy small circular basins. In depth lakes vary greatly; thus, Great Salt Lake has a depth of less than 25 feet, and Crater Lake, in Oregon, of 2000 feet. They may occur at any elevation above the sea, and some, like the Dead Sea, are even below sea level. Excepting in very severe climates deep lakes do not freeze in winter, because it is necessary to reduce the entire lake to 39° F. before the surface can freeze. Some lakes have no surface tributaries, but receive their waters from the rains and from underground sources, others have many tributaries. Usually the largest feeder or inlet is at the upper end of the lake. The outlet in most cases is limited to a single channel.

Great floods raise the level of all but the larger lakes, and wet seasons cause the surface to rise by the increased amount of water supplied from the rain. This rising may come so long after the wet period that the connection is not readily discovered. There is also a slight tide on the larger lakes, though ordinarily unnoticeable, but in V-shaped bays its height may be so increased as to be easily detected. Steadily blowing wind, drifting the water before it, causes well-defined currents of water. On smaller lakes, when heavy rains and melting snows coincide with strong wind, floods occur on the deltas. The lake level is then raised in some parts and lowered in others by the wind, and the water of the streams cannot flow off, consequently flooding the delta. Still another change of level of lakes is due to a difference in the air pressure on the two ends of the lake. A low pressure on one end and a high on the other disturbs the equilibrium of the water; it is pushed down under the heavier air and rises under the low pressure. This starts an undulation of the lake water, which is analogous to the rocking of a basin, and a wave passes up and down the lake, slowly dying out with each succeeding undulation. To such changes in lake level the name "seiches" is applied.

Lakes without Outlets. In all countries there is evaporation from the surface of lakes, so that less water flows out than enters, there may also be loss through seepage into the earth. On account of this, even in moist climates, lakes with a small drainage area may not rise to the point of outflow. This is true of small basins in sand-dune regions or in sandy glacial deposits, where the water speedily soaks into the loose soil. Slowly, however, the washing in of clay and the growth of vegetation form a more impervious bottom, so that first swamps, then ponds, are caused. Little kettle-shaped basins in terminal moraines often have such a small drainage area that they do not rise to overflow, or possibly overflow only in periods of heavy rains or melting snows. Deep lakes in volcanic craters, like Crater Lake in Oregon, also fail to reach the point of overflow, because the rainfall

and drainage are not sufficient to fill the basins. Where the climate is very arid, the lack of abundant rain, the rapid evaporation, and the seepage commonly keep the lake waters below the rim of the basin; and in deserts these conditions may completely dry up the basins, or permit them to have lakes or swampy bottoms only during rains. These effects of aridity are illustrated in the Great Salt Lake, the Dead Sea, and the Caspian Sea. As the streams entering lakes bring a load of mineral matter in solution, and as this is not carried off in the vapor, lakes without outlet have a steadily increasing load of mineral matter. Among the mineral substances thus dissolved, salt, gypsum, and carbonate of lime are usually the most abundant. In time, therefore, these substances may be present in such quantity that no more can be held by the water, and then some of the mineral load must be deposited. Thus, carbonate of lime is being precipitated on the bottom and shores of the Great Salt Lake, and salt and gypsum have been precipitated in many lakes in recent times and in past ages.

Origin of Lakes. The causes of lakes are as various as their forms. In general they may be considered as consequences of natural interference with drainage. They may exist on a new land surface, when they may be called *original consequent lakes*, since they are formed in consequence of original irregularities in the land; they may result from the normal development of rivers and may then be called *lakes of normal development*; and they may be due to some accidental interference with preëxisting drainage, when they may be called *lakes of accidental origin*. All lakes fall into one of these three great classes.

Original consequent lakes are illustrated by some of the shallow lakes of Florida, which exist in depressions on a raised sea bottom; the same condition exists in the Siberian plains and in the Argentine plains. Consequent lakes are also found in shallow basins on the beds of extinct lakes. Thus, the Great Salt Lake is in a depression in the deposits of a much larger lake that once existed there. Any other new land surface, as a lava flow, or a thick sheet of glacial drift which obscures the old land, may have depressions in which ponds or lakes develop. There are many small lakes of this origin in the glaciated belt of America and Europe.

Of lakes of normal development there are also numerous illustrations. Abandoned meanders of rivers, forming oxbow lakes, and abandoned river channels on deltas, shut off from the river by the deposit of river silt, are instances. Still another kind is found where stream development is taking place in a region of limestone or other soluble rock. Under these conditions some of the drainage is underground, the surface settles here and there by undermining, and little basins or sink holes are formed towards which the water drains. If the hole in the centre becomes filled, ponds are caused. The growth of alluvial fans by streams coming from a mountain into a more level valley sometimes dams the river in the main valley. Thus, Tulare Lake in California is made by a broad, low, alluvial fan made by King River, which comes down from the Sierra Nevada.

By far the most common cause for lakes is some accident to a stream, so interfering with its normal development as locally to transform its valley to a basin. An avalanche across a river

dams back a lake, and the growth of a mountain barrier makes a still greater dam. The warping of valleys during mountain growth also makes basins. Lake Geneva in the Alps has been ascribed to this origin. There are basins where the rocks across a valley have been faulted—e.g., in southern Oregon, in Ireland, and in the case of the Dead Sea. When the land has subsided and the sea entered the mouths of river valleys, the building of bars across the drowned valleys often shuts in the water, forming lakes. These may be made salt by the occasional overflows of the sea, or they may be completely disconnected from the sea. Such lakes are illustrated by the shut-in bays on the south shore of the Great Lakes. Sinking of parts of the land during earthquake shocks forms basins, as in the "sunk" country of Arkansas, in the Mississippi valley, that was shaken by the earthquake of 1811. Lava dams hold back river water, as is illustrated in the Auvergne region of central France; by Snag Lake, near Mount Shasta; by the Lake of Tiberias, in the Jordan valley; and by many other lakes in volcanic regions. After the volcanic energy has subsided volcanic craters are occupied by lakes, as in the Eifel region of Germany; Lake Nemi, near Rome, Averno, near Naples; and many other places. Such lakes are especially large and deep when the crater bottom has subsided, as in Crater Lake, Oregon. But perhaps the most important single cause for lakes is glaciation. By moraine dams and by dams of other classes of glacial deposits a vast number of lakes in northeastern America and northwestern Europe have been formed. Without doubt the number of glacial lakes and ponds in northeastern America and northwestern Europe is several hundred thousand. There are estimated to be 10,000 lakes in Minnesota alone, due in one way or another to the Pleistocene ice sheet.

It is found that glaciated regions are characterized by an abundance of lakes, while unglaciated regions have relatively few. In addition to the deposit of materials forming a dam across stream valleys, glaciers have scoured out many basins, known as rock basins. Seneca and Cayuga Lake valleys in central New York are regarded by some geologists as formed in this manner; the Great Lakes owe at least a part of their depth to this cause, and the same is true of some of the Alpine lakes, notably the Italian lakes Como, Lugano, and Maggiore. Many lakes are the result of a combination of causes. For example, the Great Lakes are evidently in old river valleys, deepened to some extent by glacial erosion, further deepened by a warping of the earth's crust, and with their depth still further increased by dams of drift in the preexisting valleys. The Alpine lakes also seem to combine valley warping, glacier erosion, and glacial-drift dams among their causes.

Destruction of Lakes. Lakes are normally of brief duration, from the standpoint of geological time. Consequently lakes are mostly of recent origin and are especially abundant in regions where some recent accident has happened to drainage; as, e.g., where glaciers have been, or where lava flows have recently overspread areas of country. Since lakes act as catchment basins for sediment, they are soon filled by the contributions brought by the incoming streams, by rain wash, by winds, and by waves. Much of the finer sediment settles in the lake at a distance from the shore, but most of the coarser

material accumulates near the shore and especially in the river deltas. These grow out into the lake, forming flats at the head of the lakes and protruding deltas on the margin. In some cases, where the sediment supply is abundant, as in the Swiss lakes, which receive glacier-fed streams, the growth of deltas from opposite sides of the lake has cut a single lake in two parts. This is clearly illustrated in the case of Lakes Thun and Brienz, which are divided by the delta deposit on which Interlaken is situated.

As lakes are shallowed by sediment deposit, organic contributions help finally to fill them. Various forms of vegetation, including lilies, reeds, rushes, cane, and sphagnum, are very effective in this last stage of lake destruction. When finally filled, the lake becomes a swampy plain, the rivers then build the plain up into dry land in their establishment of a slope or grade across the plain.

Lakes are not always destroyed solely by filling. The outlet stream is always eroding at the barrier, though this work is usually slow, because the lake water has filtered out the sediment, so that the outlet is robbed of its cutting tools. Thus, the Niagara, in flowing from Lake Erie, has cut away but little more of the barrier than the loose soil and consequently flows practically on the surface of the plain. Where the outlet passes through unconsolidated material it may rapidly lower the lake level. If a condition like that at Niagara could exist near a lake, the eating back of the falls would in time reach the lake and rapidly drain it. This will not happen in the case of Niagara, because the layer which causes the cataract dips towards the south, and the fall will disappear before Lake Erie is reached.

A lake may also be destroyed by a change of climate. Thus, a series of lakes existed in the great basin of western United States during the Glacial period, when the climate was cooler and damper. (See LAKE BONNEVILLE; LAKE LAHONTAN.) During the Glacial period large lakes also existed along the margin of the ice wherever the glacier formed a dam across north-flowing stream valleys. An enormous lake of this origin existed in the valley of the Red River of the North, to which the name Lake Agassiz (q.v.) has been given. Similar lakes appeared in the basin of the Great Lakes, while the St. Lawrence valley was ice-filled. (See LAKE IROQUOIS.) The shore lines of these glacial lakes are plainly seen along the margin of the Great Lakes and record a very complex history, with various outflows which were made available as the ice front melted farther and farther back. The deposits made in these extinct lakes form much of the soil of the land along the southern margin of the Great Lakes. Such methods of lake destruction are abnormal; the natural and usual method is filling, combined with a partial removal of the barrier over which the outlet flows.

Distribution, Area, and Depth of Lakes. Lakes of one kind or another occur in nearly all lands, but they are very unequally distributed. Since the most common cause of their formation is the disturbance of drainage by glacial action, they are normally more abundant in mountain regions or within those areas of the continents that were subjected to the Pleistocene ice invasion. Countless numbers of lakes are found in the glaciated sections of the United States, Canada, and northern Europe, including some of

the largest examples. Within the lower latitudes they are mainly confined to mountain regions, where they may be the result of local glaciers, volcanic action, crustal displacements, or of other causes. The amount of water stored in lakes is small compared with that held in the ocean. Sir John Murray estimates the volume of the lakes of the world at 2000 cubic miles; the same authority reckons the water of the ocean at 324,000,000 cubic miles. The largest fresh-water lake is Superior, but the Caspian Sea (which is really a lake, although its water is saline) has an area nearly six times as great. The following table gives particulars of area and depth for the more important lakes of the world:

	Area, sq. miles	Maximum depth, ft.
Caspian	170,000	3,000
Superior	31,200	1,008
Victoria Nyanza	26,000	240
Aral	25,000	222
Michigan	22,500	870

LAKE. A dye. See COCCIDÆ.

LAKE, GERARD, first VISCOUNT OF DELHI AND LEWISARREE (1744-1808). An English general. He was born July 27, 1744; entered the army when only 14 years of age, and fought in the Seven Years' War. He served in America in 1781 under Lord Cornwallis; with the Duke of York in Flanders (1793-94), acquitting himself brilliantly at Lincelles; and as commander in chief in Ireland, defeated the rebels at Vinegar Hill, near Wexford, June 21, 1798, and the French invading troops at Bellinamuck, near Cloone, Sept. 8, 1798. From 1790 to 1802 he was member of Parliament for Aylesbury. In 1800 he went to India as commander in chief and captured Delhi in 1803 by an adroit strategic movement. He also took Agra and continued his successful campaign by the decisive battles of Aligarh and Lewisarree, defeating Sindia, the

Gwallor ruler, and gaining possession of all his dominions north of the Jumhal River. For his services General Lake was raised to the peerage, and after the campaign of 1804-05 against Holkar, Maharajah of Indore, he was created Viscount. He died in London, Feb. 20, 1808. Consult Wilkinson (ed.), *From Cromwell to Wellington* (London, 1899), and Pearse, *Memoir of the Life and Military Services of Viscount Lake* (ib., 1908).

LAKE, KIRSOPP (1872-). An English biblical scholar, born in Southampton. He was educated at St. Paul's School and at Lincoln College, Oxford. He was curate of Lumley, Durham, in 1895 and of St. Mary the Virgin, Oxford, in 1897-1904, and then became professor of New Testament exegesis and early Christian literature at Leyden. In search of Greek ecclesiastical manuscripts, he visited Mount Athos and other monasteries. Besides articles in the *Encyclopædia Britannica*, he published: *The Text of the New Testament* (1900), *Texts from Mt. Athos* (1902), *The Historical Evidence for the Resurrection of Jesus Christ* (1907); *The Early Days of Monasticism on Mt. Athos* (1909); *The Codex Sinaiticus* (1911); *The Earlier Epistles of St. Paul; Their Motive and Origin* (1911), *The Apostolic Fathers*, in the "Loeb Classics" (text and translation, 1912); *The Stewardship of Faith: Our Heritage from Early Christianity*, Lowell Lectures for 1913-14 (1914).

LAKE, SIMON (1866-). An American naval architect, born at Pleasantville, N. J. He was educated at the Clinton Liberal Institute, Fort Plain, N. Y., and at Franklin Institute, Philadelphia. He invented the even-keel type of submarine torpedo boat, built his first successful experimental boat in 1894, and in 1897 built the *Argonaut*, the first submarine to operate successfully in the open sea. Subsequently he built many submarine torpedo boats for the United States and for foreign countries. He invented also an apparatus for locating and raising sunken vessels, a submarine contrivance for pearl and sponge fishing, and a heavy-oil internal-combustion engine for marine use.

LAKE AGASSIZ, ág'á-sē. The name given to an extinct lake that during the late Glacial period covered a large area in the Red River valley of Minnesota, North Dakota, and Canada. Its former existence is made known by deltas at the entrance of the inflowing rivers, and by well-marked shore lines which can be traced for long distances with but slight variation in level. The investigations of Upham and other geologists indicate that the natural drainage towards the north was held back by the great ice sheet, and that the lake discharged at the southern end through a channel 50 miles long into the Minnesota River and thence into the Mississippi. The lake, which in the period of its greatest expansion was larger than all the Great Lakes combined, disappeared when the ice melted sufficiently to permit the Red River to resume its course. The lake bed is now a plain covered with glacial till and silt and yielding a fertile soil to the growth of wheat. Consult Warren Upham, "The Upper Beaches and Deltas of the Glacial Lake Agassiz," in *United States Geological Survey, Bulletin No. 39* (Washington, 1887); "The Glacial Lake Agassiz," in *United States Geological Survey, Monograph No. 25* (Washington, 1895); new ed., with supplementary notes, in G. F. Wright, *Ice Age in North*

America (5th ed., Oberlin, 1911). See GLACIAL PERIOD.

LAKE ALBERT, or **ALBERT NYANZA**, called by the natives MWUTAN-NZIGE. A large lake of British East Africa, one of the reservoirs of the Nile, situated in a deep rock basin, 80 miles northwest of the Victoria Nyanza (Map: Africa, H 4). This lake is the northernmost of a series of five that occupy the lower basins of a great rift valley that extends for 1000 miles in a general southerly direction almost to the mouth of the Zambezi River. Tanganyika and Nyassa occupy other portions of the same rift valley. The Albert Nyanza is of an oblong shape and is, approximately, 100 miles long from northeast to southwest, 25 miles broad, with an area of 1800 square miles. It is intersected by lat. 2° N. and long 31° E. The Nile issues from the northern end of the Albert Nyanza, where the outlet of the Victoria Nyanza, the Victoria Nile, discharges into the lake. At its south end the lake receives the Semliki, the outlet of the Albert Edward Nyanza. On the east it is fringed by precipitous cliffs, having a mean altitude of 1500 feet, with isolated peaks rising from 5000 to 10,000 feet. The surface of the lake is about 2100 feet above the sea; its water is fresh and sweet and comparatively shallow, the deepest soundings being less than 60 feet. The northern and western shores of the lake are bordered by a massive range of hills, called the Blue Mountains, which have an elevation of about 7000 feet. The existence of this vast lake first became known to Europeans through Speke and Grant, who in 1862 heard of it under the name of the Luta-Nzige. It was described by the natives as only a narrow reservoir forming a shallow back-water of the Nile. When Speke and Grant, after the discovery of the Victoria Nyanza, were, in 1863, descending the Nile on their return to Europe, they met, at Gondokoro, Sir Samuel White Baker (q.v.), who was ascending the river. After a toilsome march and many adventures his party came, early in 1864, in sight of the lake, which Baker named in honor of Prince Albert, who was but recently dead. The extent and general outlines of the lake were not accurately determined until 1876, when it was circumnavigated by Signor Romolo Gessi, an Italian explorer attached to General Gordon's Egyptian expedition. A year later, in 1877, Colonel Mason, an American officer in the service of the Egyptian government, made a more careful survey of the lake, fully confirming Gessi's report. See GREAT RIFT VALLEY.

LAKE BONNEVILLE, bôn'vil. A glacial lake which once occupied the basin of northwestern Utah. The shore lines still discernible along the inclosing mountain ranges show that it attained an area of nearly 20,000 square miles and a depth of 1000 feet. During its second period of expansion the lake waters overflowed to the north, draining into the Shoshone River and thus reaching the Pacific. Evaporation lowered the lake until only shallow bodies of salt water remain, of which Great Salt Lake (q.v.) is the largest. Consult Gilbert, "Lake Bonneville," in *United States Geological Survey, Monograph No. 1* (Washington, 1890). See GLACIAL PERIOD.

LAKE CARP. A carp sucker (*Carpiodes hompensi*), abundant in the Great Lakes. See CARP SUCKER.

LAKE CHAMPLAIN, BATTLE OF. See CHAMPLAIN.

LAKE CHARLES. A city and the parish seat of Calcasieu Parish, La., 217 miles by rail west of New Orleans, on the Calcasieu River, and on the Kansas City Southern, the Louisiana Western, the Lake Charles and Northern, the Louisiana and Pacific, and the St. Louis, Iron Mountain, and Southern rail roads (Map: Louisiana, C 6). It is finely situated on Lake Charles and has a fine Federal building, a Carnegie library, handsome court house, city hall, post office, and public school buildings, a large hotel, St. Patrick's sanitarium, and a park. The commercial interests are important. There are extensive lumber and rice mills, cold storage and ice plants, machine shops and other industrial establishments. The surrounding district produces long-leaf pine timber in immense quantities, and also petroleum, sulphur, salt, sugar, rice, truck, and live stock. Settled about 1850, Lake Charles was first incorporated in 1860 and adopted the commissioner form of government in 1913. Pop., 1900, 6680; 1910, 11,449; 1914 (U. S. est.), 13,481.

LAKE CHETIMACHES, shét'i-mash'. See GRAND LAKE.

LAKE CITY. A city and the county seat of Columbia Co., Fla., 60 miles (direct) west by south of Jacksonville, on the Atlantic Coast Line, the Georgia Southern and Florida, and the Seaboard Air Line systems (Map: Florida, D 1). It is the seat of Columbia College (Baptist) and was, until 1905, the home of the State Agricultural College, removed in that year to Gainesville. The city is in a productive cotton region, has important trucking and cattle-raising interests, and carries on a considerable trade in lumber, turpentine, and phosphates. By a new charter, granted in 1901, Lake City's limits were extended, and a form of government by mayor and municipal council provided. The water works and electric plant are owned by the city. Pop., 1900, 5032; 1910, 5032.

LAKE CITY. A city in Wabasha Co., Minn., 58 miles by rail southeast of St. Paul, on the expansion of the Mississippi River known as Lake Pepin, and on the Chicago, Milwaukee, and St. Paul Railroad (Map: Minnesota, E 6). It is a popular summer resort and has a public library and fine school buildings. There are grain elevators, flour mills, wagon works, a foundry, cut-glass works, a pearl-button factory, boat factory, and a nursery of 1800 acres. The water works and electric-light plant are controlled by the city. Lake City adopted the commissioner form of government in 1911. Pop., 1900, 2744; 1910, 3142.

LAKE CUSK. A fish, the burbot (q.v.).

LAKE DISTRICT. A picturesque region of mountain, lake, wood, and valley, in the counties of Cumberland and Westmoreland, England. It has been immortalized by the Lake school (q.v.) of poets and is visited annually by thousands of tourists. See CUMBRIAN MOUNTAINS.

LAKE DWELLINGS. The name applied to human habitations built usually on foundations of piles or posts, but also constructed of trunks of trees, brush, earth, or stone, and erected on the shallow borders of lakes, rivers, and other inland waters. In Switzerland they are technically called *palafittes*, in Italy *terramare*, in Ireland and Scotland *crannogs*, and the German term is *Pfahlbauten*, or pile structures. These structures abounded in Switzerland and adjacent parts of Germany, France, and Italy; but accounts and remains of such edifices occur else-

where in both hemispheres, among all types of mankind, in modern as well as in ancient times and in every grade of culture.

Celtic peoples lived on crannogs, both in Ireland and southwestern Scotland, during the wars that followed the Roman Conquest. Herodotus describes the lake dwellings erected by the Pæonians over the waters of Lake Prasias in Thrace; Hippocrates mentions them on the shores of the river Phasis in Colchis, east of the Black Sea; in Sindh, northwestern India, the habitations of pastoral tribes are elevated on piles to avoid dampness and insects; they are found in the lakes of Central Africa, throughout the Malay Archipelago and the Philippine Islands, and even in the Melanesian groups; they were constructed on the Amazon, and in Guiana; and on Lake Maracaibo they were so abundant that the first discoverers named the country Venezuela, or Little Venice.

The account of the discovery of the lake dwellings forms one of the most interesting chapters in the history of archaeology. Fishermen on the Swiss lakes had long complained that their nets

living in this form of habitation, and the Bronze age 42,500. From the station of Wangen on Lake Constance 4450 stone axes and other relics were recovered; from Moosseedorf, near Bern, 2702, covering a great variety of Stone-age implements; and from Nidau, on Lake Bienné, over 2000 artifacts in bronze of great beauty mixed with Neolithic implements. The palafittes discovered and reported are only a handful as compared with those that actually existed, and in some of those mentioned as a single station there were 20 or more separate structures. Rotting of piles, conflagrations, war, and natural catastrophes were among the causes necessitating rebuilding. That many structures were destroyed and rebuilt on their own débris is evidenced by the existence of three or more superimposed layers in the lake's bottom. Robenhausen shows three layers of piles, 100,000 in all, and at Morges, on Lake Geneva, three contiguous stations cover Swiss ancient history—one of them containing only stone, a second stone and bronze, and the third bronze alone.

The designers of the lake dwellings followed

LAKE DWELLING.

Pile village. Lake Sina Maria below Maracaibo, Venezuela. After E. M. Plumacher, United States Consul.

became entangled in obstructions on the bottom. Then came the exceptionally dry and cold winter of 1853-54, when the lakes, not receiving their usual supply of water, sank a foot lower than was ever known before, leaving broad strands and islands along the margins. In a small bay, on Lake Zurich, between Ober Meilen and Dollikon, the inhabitants, in order to enlarge the size of their gardens, built a wall down to the water line and filled the depression by dredging mud from the lake. Not only stumps of ancient piles, but hundreds of implements of handicraft made from stone, bone, and especially of antler, came up in the dredge. No metal objects were found; the only relics found were those of a very rude and primitive race.

Most of the greater lakes, including Bienné, Constance, Geneva, Morat, Neuchâtel, and Sempach, disclosed not one, but many settlements, Neuchâtel as many as 50, while many smaller lakes yielded valuable archaeological material.

Troyon attempted to reconstruct from data thus obtained the settlement of Morges, one of the largest on Lake Geneva, which was 1200 feet long by 150 broad, covering 180,000 square feet, and estimated its population at more than 1200; while the villages on Lake Neuchâtel seem to have had about 5000 inhabitants, the entire Stone age in Switzerland numbered about 31,875

two plans of construction—the crannog style, closely related to terraced mounds, and the pile building, resting above the water on posts. In the former, stones, brush, and mud were heaped up in shallow places in small sheets of water not far from shore. Short piles were driven around the edge of the tumulus, and retaining walls were rudely constructed, not to support the mass, but to protect it. On the top of these islands lived the family or clan.

In the smaller Swiss lakes, where the surf was not too strong for the sea wall, crannog foundations were erected. But on the larger lakes, where the winds often made the waters turbulent, was adopted the second method, or pile structures. After bronze axes found their way into the region, it was not difficult to fell a tree 6 inches in diameter, but before the Bronze age, in the building of Wangen on Lake Constance, Moosseedorf, Nussdorf, and Wauwyl, only stone axes were used. The lower ends of the piles look as though they had been gnawed by beavers. The amount of labor involved may be judged from the fact that at Wangen alone 50,000 piles were used.

In case the bottom was hard, stones were heaped about the bases of the piles. A dugout boat laden with stone was found at the station of Concise on Lake Neuchâtel. On the contrary,

when the soil was too soft, rough planks or frameworks of logs were fitted to the lower ends of the piles to prevent their sinking too low. The framework for the platform is a matter of conjecture, but deductions from the practices of historic and modern savages give an approximate idea of their construction. Among the Pæonians on Lake Prasias in Thrace, planks or slabs were fitted on the tops of piles out in the lake away from the shore, and a narrow causeway or bridge was the only entrance. When a new pile dwelling was projected, all the members of the tribe worked together. Afterward when the men, who were polygamists, married, they sank three piles for each wife, bringing the timber from Mount Orbelus. Each man had his own wooden hut on the platform with a trapdoor opening to the water.

The archæologist finds that with the aid of the historian and the ethnographer he has no difficulty in reconstructing the ancient Swiss lake dwellings. In the Stone age piles were not planted with absolute regularity, and at Wauwyl the crannog or Packwerkbauten style was followed. The ground was laid off in four quadrangles, the interiors of which revealed several platforms, one above another, the spaces between being filled with branches of trees, leaves, and peat. This succession of levels proves that the site was long occupied. Communication with the land was by means of boats and narrow pile bridges. The dwellings in the earliest lake villages were perhaps circular tents or huts made wholly or in part of skin, the builders transferring their land habitations to platforms. Later on there were walls consisting of wooden uprights, wattled with brush, chinked with moss, and plastered on the inside.

Troyon was convinced that the dwellings were circular like those of the historic Gauls and 10 to 15 feet in diameter, but the more sober view, from evidence and analogies, is that they were rectangular and varied greatly in dimensions. The floors were of poles or of roughly hewn planks and often in two layers, one above the other. The fireplace was either of clay or later of dressed stone. The roofs were of grass, or earlier of skins held down by poles, as may be seen among the South American tribes. There were out-structures for the domestic animals and for defense. The storage was in the nature of granaries. Cooking was by roasting or boiling. The water of the lakes was sufficient for domestic purposes. The industrial activities of the lake dwellers are shown by the abundant and diversified relics. Checker, twilled, and twined weaving and wickerwork abound. They made coiled basketry with locked and split stitches like that of the Salish tribes, chipped and hafted scrapers, saws, adzes, and other tools like the Eskimo, and excavated canoes from logs. Bears'-teeth necklaces are abundant. The pottery is somewhat like that of eastern America. Lances, spears, and barbed harpoons are plentiful, but the toggle harpoon is missing.

The animals of the lake dwellers in their remains tell an interesting story of progress in culture here. In the Stone-age lake dwellings the bones of wild animals abound (bear, badger, martin, skunk, wolf, fox, wild cat, beaver, elk, urus, bison, stag, deer, wild boar, and marsh boar); but in the Bronze-age stations the bones of wild animals are very rarely found. Domestic animals (horses, ox, goat, sheep, and dog) were all known to the Neolithic lake dwellers. The

Bronze-age people retained these and added or tamed the hog.

The flora is equally instructive. Barley, wheat in several varieties, spelt, beans, acorns, apples, and flax, in a charred state, come from the most ancient as from the most recent stations. Hemp, oats, and rye are absent from all. Heer makes the important suggestion that while the charred remains of wild species agree in the minutest particulars with those still living in Switzerland, the cultivated plants differ from all existing varieties, having smaller seed.

The history of the lake dwellings is as long as that of industrial Europe down to the complete dominion of iron. They were in Switzerland and Italy in the Neolithic age, when the people of England, France, and Spain were erecting their megalithic monuments and building dolmens. They existed during the entire Bronze age, however long that may have been, since polished stone and bronze are here and there mingled with that metal. In a few of them iron axes and knives are mixed with sword and lance blades. The Stone-age remains outnumber the others, and some of them are of vast extent.

The builders of the Neolithic lake dwellings in Switzerland and thereabout were almost certainly the thickset, brown-eyed, brachycephalic race of middle Highland Europe, with chestnut-brown hair, called Celtic by older writers, Alpine by Lapouge, Lappanoid by Pruner Bey, and Celto-Slavic by French writers generally. They bear other names, but they all refer to the same short-headed stock wedged into middle Europe between blond longheads on the north and brunet longheads on the south. The lake dwellers are supposed to have been of Asiatic origin and to have marched at their leisure entirely across Europe, between the forty-fifth and fiftieth parallels, thousands of years ago, reaching Switzerland, Belgium, and even Ireland, through Hungary and the valley of the Danube.

A variety of industrial occupations insured their material and intellectual progress, and their residence in a country abounding in game and fish and fertile land encouraged hunting, fishing, boat building, skin working, agriculture, textile arts, pottery, and gave them surplus for trade. At the same time their wealth invited the attacks of hungry and jealous neighbors and made them warlike and aggressive. All of these combined gave them solidarity in purpose and action. Many of the most artistic of the relics found are weapons and shields. There is little to show their social life, but it cannot have been greatly different from that revealed by the early historians of Germany.

Consult: Keller, *The Lake Dwellings of Switzerland and Other Parts of Europe* (London, 1878); Robert Munro, *Ancient Scottish Lake Dwellings or Crannogs* (Edinburgh, 1882); id., *The Lake Dwellings of Europe* (London, 1890); id., *Palæolithic Man and Terramara Settlements in Europe* (New York, 1912). See CRANNOGS.

LAKE EDWARD, or **EDWARD NYAN'ZA** (formerly known as Albert Edward Nyanza; name changed to avoid confusion with Lake Albert (q.v.); native name, MUTA-NZIGE). A lake in Central Africa, a little south of the equator, on the boundary line between the Belgian Congo and the British Protectorate of Uganda (Map: Africa, G 5). It lies in the same branch of the Great Rift Valley (q.v.), or structural trough, of eastern Africa which contains lakes Albert, Kivu, and Tanganyika, at an altitude of more

than 3000 feet. It is bordered on the west and east by the scarp front of the Archean plateau and is overtopped on the north by the volcanic cone of Mount Ruwenzori (q.v.), 16,000 feet high. To the south of the lake lies the wide plain of Ruchuru. The lake is elliptical in shape, with a major axis 55 miles long extending northeast-southwest and a minor axis 27 miles long; area, about 1500 square miles. To the northeast Lake Edward is connected with the smaller Lake Kafuru. The whole basin is one of the sources of the Nile, discharging through the Semliki River into Lake Albert to the northeast. The lake was discovered in 1876 by Stanley, who regarded it as the southern part of Albert Nyanza. On his subsequent visit (1889) he explored it thoroughly and named it in honor of the then Prince of Wales, subsequently King Edward VII.

LAKE ERIE. See ERIE, LAKE.

LAKE ERIE, BATTLE OF. See ERIE, BATTLE OF LAKE.

LAKE FOREST. A city in Lake Co., Ill., 28 miles north-northwest of Chicago, on Lake Michigan, and on the Chicago and Northwestern Railroad (Map Illinois, J 1). It is entirely a residential town and a place of unusual beauty, is the seat of Lake Forest College (q.v.), and has a public library, an academy, and a seminary for girls. Lake Forest was settled and incorporated in 1859. Pop., 1900, 2215; 1910, 3349.

LAKE FOREST COLLEGE. A coeducational institution of higher learning at Lake Forest, Ill. It was chartered in 1857 as Lind University, the name being changed to Lake Forest University in 1865. Under this charter a preparatory school for boys, known as Lake Forest Academy, was opened in 1858; a similar school for girls (Ferry Hall) was opened in 1869, and this was followed by the establishment of Lake Forest College in 1876. In 1902 the trustees abandoned the university idea, severed the connection between the college and the Chicago-Kent College of Law and the Northwestern College of Dental Surgery, and for the future confined their attention to the college and the two preparatory schools. The name Lake Forest University was retained for legal reasons. The total enrollment for 1913-14 was as follows: college—faculty, 21, students, 193; academy—teachers, 13; students, 117, Ferry Hall—teachers, 23; students, 120. The college campus, 50 acres, with 15 buildings, is valued at \$685,000; income-bearing endowment, \$771,000; academy, 15 acres, with 5 buildings, valued at \$235,000; Ferry Hall, 13 acres, with 3 buildings, valued at \$210,000. The libraries of the three departments contain 35,000 volumes. The president in 1914 was John S. Nollen, Ph.D.

LAKE FOREST UNIVERSITY. See LAKE FOREST COLLEGE.

LAKE GENEVA. See GENEVA, LAKE.

LAKE GENEVA. A city in Walworth Co., Wis., 71 miles northwest of Chicago, Ill., on the Chicago and Northwestern Railroad (Map: Wisconsin, E 6). It is a popular summer resort, having an attractive situation on Lake Geneva, a fine body of water, 9 miles long, ranging from $1\frac{1}{2}$ to 3 in width, and fed entirely by springs. Among the features of the city are the Oakwood and Lakeside sanitariums and the public library, and near by is the Yerkes Observatory of the University of Chicago. (For illustration, see OBSERVATORY.) There are cement-stone and

brick works, a condensed-milk factory, and a creamery. Lake Geneva, incorporated in 1883, is governed by a mayor, elected annually, and a council of which the executive is a member. The water works are owned by the city. Pop., 1900, 2585; 1910, 3079.

LAKE GEORGE. A village and the county seat of Warren Co., N. Y., 62 miles north of Albany, on the Delaware and Hudson Railroad (Map: New York, G 4). It has a picturesque location at the south end of Lake George, popular as a summer resort, and contains a public library and a fine park. Forts George and William Henry were located here. Pop., 1900, 1465; 1910, 632. The village was formerly called Caldwell, this name being changed to Lake George in 1904. See GEORGE, LAKE.

LAKE HERRING, MOONEYE, or WHITING. Names applied to the cisco and other whitefish (q.v.) See PLATE OF WHITEFISH, SMELTS, ETC.

LAKE HURON. See GREAT LAKES; HURON, LAKE.

LAKE INDIANS, or SENJEXTEE. A name sometimes applied to the Colville Indians (q.v.).

LAKE IROQUOIS, ir'ò-kwoi'. The name given to the glacial waters that occupied the site of Lake Ontario during late Pleistocene time. When the Labrador ice sheet was retreating from the area now comprised in the basin of the Great Lakes, it formed a dam across the St. Lawrence outlet and forced the waters to seek a more southerly channel. The discharge of the eastern part of the basin then was over the low divide at Rome, N. Y., into the Mohawk and thus into the Hudson River. Lake Iroquois extended considerably south of the present shore line of Lake Ontario, and its various stages of level are marked by a succession of terraced beaches which reach across central and western New York. The melting of the ice opened the lower outlet through the St. Lawrence, the waters subsiding into the basin they now occupy.

LAKE LAHONTAN, là-hònt'an. An extinct lake which with Lake Bonneville (q.v.) occupied in the Glacial period a part of the Great Basin region. Lake Lahontan was situated in western Nevada, and its depressions are now filled by small salt lakes. The shore lines indicate an extreme irregularity of outline, which conformed to the mountainous topography of the region. Consult Russell, "Geological History of Lake Lahontan, a Quaternary Lake of Northwestern Nevada," in *United States Geological Survey, Monograph No. 11* (Washington, 1885).

LAKE LAWYER. A fish, the burbot (q.v.).

LAKE LEOPOLD. See RIKWA.

LAKE LEOPOLD II. See LEOPOLD II, LAKE

LAKE LOAM. See LOESS.

LAKE MARACAIBO. See MARACAIBO, LAKE.

LAKE MEGANTIC. A town and the capital of Compton Co., Quebec, Canada, on the Chaudière River and on the Canadian Pacific Railway, 69 miles east-northeast of Sherbrooke by rail (Map: Quebec, H 5). The industrial establishments include saw mills, sash and door factories, furniture factory, broom factory, and pulp mill. It is a popular summer and health resort. Pop., 1901, 1883; 1911, 2399.

LAKE MENZALEH. See MENZALEH, LAKE.

LAKE MICHIGAN. See GREAT LAKES; MICHIGAN, LAKE.

LAKE MINNEWAUKON. See MINNEWAUKON, LAKE.

LAKE MÉRIS. See MÉRIS, LAKE.

LAKE MOERO, or **MWERO**. See **MOERO**, LAKE.

LAKE MOHONK (mô-hôpk') **CONFERENCE**. A series of annual conferences held at Mohonk Lake, N. Y. The movement was originated by Albert K. Smiley in 1883. Mr. Smiley, who was at that time a member of the Board of Indian Affairs, invited a number of those interested in the affairs of Indians to a meeting at Mohonk Lake to confer in regard to measures affecting the interest of the Indian tribes. These conferences were continued annually, meeting in October. In 1904 the scope of the conference was enlarged to include peoples of the Philippines, Porto Rico, and other dependencies of the United States. In 1895 was held the first of an annual series of conferences on international arbitration, known as the Lake Mohonk Conference on International Arbitration. The purpose of this conference was specifically to create and direct public sentiment in favor of international arbitration and an international court and generally to encourage the substitution for war of pacific methods in settling disputes between nations. This conference has become one of the most useful agents in the promotion of peace. It is attended annually by persons of national and international reputation, who deliver addresses on subjects relating to peace. At the Nineteenth Annual Conference on Arbitration held in 1913, it was recommended that the Secretary of State of the United States urge the nations which participated in the Second Hague Conference to form immediately the international preparatory committee recommended by it to prepare and submit to the nations a programme for the Third Hague Conference. Mr. Albert K. Smiley, who originated the conferences and defrayed the expenses of the meetings, died in 1912. The work was then taken up by his brother, Daniel Smiley. The Conference on International Arbitration maintains a permanent office. The secretary in 1914 was H. C. Phillips, Mohonk Lake, N. Y.

LAKE NICARAGUA. See **NICARAGUA**, LAKE.

LAKE OF BRIENZ. See **BRIENZ**, LAKE OF.

LAKE OF THE WOODS. A body of water famous in the history of the international boundary between the United States and the Hudson's Bay Company's territories. It is so named from the fact of its being studded with wooded islands and surrounded by hill forests. It lies in the west of Ontario, Canada, and on the north border of Minnesota, United States, 190 miles west-northwest of Lake Superior (Map: Ontario, F 8). According to the treaty which closed the War of Independence, it was divided between Great Britain and the United States by a central line running north-northwest from the mouth of the Rainy River. At its south end it receives the Rainy River from the Rainy Lake, and at its north extremity it sends forth the Winnipeg on its course to Hudson Bay. It is 65 miles long, from 10 to 50 miles wide, and measures about 300 miles round. Mining for free-milling gold is extensively carried on in its neighborhood, while the lumber industry is of great importance and centres about Kenora. Summer excursion steamers ply on its waters, and there is a steam-ferry service between the towns of Rat Portage, Norman, and Keewatin on its shores.

LAKES (Fr. *laque*, from Pers. *lāk*, *lak*, lac, from Skt. *lāksā*, lac insect, from *laksā*, hundred thousand, so called in reference to the numbers of the insects). Insoluble colored compounds of metallic salts with organic dyestuffs. In dyeing, these metallic salts are called *mordants* (q.v.). Salts of metals which easily dissociate to metallic hydroxides in boiling water are valuable as mordants. The color lake which forms is a chemical combination between the acid or phenolic nature of the dyestuff and the metallic hydroxide. With the fibre, the compound becomes threefold fibre—metallic hydroxide—dyestuff. In the dyeing of wool and silk the lakes formed are generally from the salts of barium, iron, tin, chromium, aluminium, magnesium, copper, or zinc.

Another class of lakes is that formed in mordanting and dyeing cotton with basic colors. Cotton does not have the power of combining with metallic hydroxides to any degree, but will unite with tannic acid, etc. In this case lakes are formed from basic colors by the aid of tannic acid, soap or sulphonated oil, sodium phosphate or arsenate, resin soap, casein or albumin, and tartar emetic or antimony salts.

According to Pliny and other early writers, pigments were frequently collected from the waste dye liquors of brazilwood, kermes, etc., which were designated as *laccæ*. The color of lakes often depends both upon the nature of the hydroxide and that of the dyestuff employed. *Carmine lake*, which is prepared by precipitating the coloring matter of cochineal, as by adding sodium carbonate to a cochineal decoction containing alum or stannous chloride, is of a beautiful scarlet color. According to the place where it has been manufactured, carmine lake is named Chinese, Florentine, Hamburg, Roman, or Venetian. *Madder lake*, which is also of a bright-red color, is made by dissolving the extract of madder or garancine in ammonia and then precipitating with alum or stannous chloride. It is also known as liquid madder lake, maroon lake, or rubric lake. Brazilwood yields a coloring matter which, when treated similarly to the foregoing, produces a purplish-red lake. *Vienna lake* is a species of brazilwood lake. Logwood yields a lake which is of a violet color. Addition of gypsum or kaolin to the brazilwood lake yields the so-called rose-pink lake. Persian berries and quercitron yield yellow lakes, that from quercitron being sometimes called *Dutch pink*. Madder lake has been largely superseded by the alizarine-red lake, which may be prepared by dissolving commercial alizarine in an aqueous solution of caustic soda, adding in succession sodium phosphate and Turkey-red oil. The solution is then treated with aluminium sulphate and calcium chloride. Variations in color may be produced by adding the purpurines. The eosin dyes give brilliant scarlet and crimson lakes. The usual precipitants are lead salts. The various lakes yielded by the coal-tar colors find extensive application in the arts, for paper staining, in printing, in lithography, in general

decorative painting, in calico printing and silk dyeing, and in preparing colored varnishes for ornamental metal surfaces, wood, leather, glass, etc. For detailed information, see the authorities referred to under **DYEING**; **COAL-TAR COLORS**; **TEXTILE PRINTING**. Consult also Jennison, *The Manufacture of Lake Pigments from Artificial Colors* (London, 1900), and Thorpe, *Dictionary of Applied Chemistry* (ib., 1912).

LAKES, LAW OF. The courts of England have rarely been called upon to expound the rules of the common law upon this topic, and systematic writers upon law in that country have not essayed the task of stating them. In 1878, however, the House of Lords was forced to consider the subject in two cases which went to that tribunal from Ireland and Scotland respectively. The Irish case involved the right of fishery in Lough Neagh, an inland lake covering nearly 100,000 acres. It was held that the crown has not, of common right, title to the soil underneath such a lake nor to the rights of fishery therein. It appears to have been assumed by all the law lords who delivered opinions in the case that when a lake is wholly surrounded by the land of a single owner the entire lake is included in his estate. They left undecided, however, the question whether, in the case of several riparian owners upon such a lake, each was entitled to the soil *usquam ad filum aquæ*. The Scottish case brought out the fact that the law of Scotland gave just that right to the several riparian owners upon Scottish lakes, and this right was recognized by the House of Lords, although it was decided (also in accordance with Scots law) that the rights of boating, fishing, and fowling were held by the various riparian owners in common.

In the United States the legal principles applicable to inland lakes have received frequent and exhaustive consideration from the courts. With respect to the Great Lakes, such as Ontario, Erie, and Michigan, the decisions of the courts have been uniformly based upon the theory that they are public waters. The land beneath them is owned by the State in trust for the public purposes of navigation and fishing, a trust which it cannot abdicate in favor of individuals or corporations.

The rules laid down by the State courts relative to other lakes are far from uniform. They are fairly divisible into three classes. In a few States, having only small lakes, which are not within the common-law definition of navigable waters, the courts have declared that these bodies of water are subject to the rules governing non-navigable streams. The soil is private property, as are the rights of fishing, fowling, and boating upon the waters. In Massachusetts and Maine the law upon this subject has been determined largely by early Colonial ordinances, which retained the ownership of lakes and ponds containing more than 10 acres in the State. Accordingly the common-law rules governing public waters apply to them. The soil beneath them, the use of the water, and the rights of fishing, fowling, and boating thereon are subject to State ownership and control. The third class of rules were first enunciated by the courts of New York, but have been adopted with some modifications by most of the States. According to these rules, lakes wholly within the territory of a single State are divided into two classes—those which are not navigable in fact and those which are. The first class are subject to private

ownership, and, in case of several riparian owners, each owns to the middle of the lake; i.e., the boundary lines of his adjoining tract extend from the shore or meander line on lines converging to a point in the centre of the lake. Lakes of the second class follow the same rule so far as the lake bed is concerned, but the State is entitled to control all rights of navigation, fishing, and fowling thereon. This power of control is in the nature of a trust for all its citizens. In some States the soil, as well as the control of the surface, of lakes navigable in fact, belongs to the State. Such, too, is the rule applied in New York and Vermont to Lake Champlain. Consult Gould, *Treatise on the Law of Waters, Including Riparian Rights* (Chicago, 1900).

LAKE SAINT CLAIR. See **SAINT CLAIR, LAKE**; **GREAT LAKES**

LAKE SAINT JOHN. See **SAINT JOHN, LAKE**.

LAKE SALMON. The namaycush, or lake trout.

LAKE SCHOOL. The name which the *Edinburgh Review* gave to a group of poets—Wordsworth, Coleridge, and Southey—who, at the beginning of the nineteenth century, lived by the English lakes in Cumberland and Westmoreland.

LAKE SHEEPSHEAD. The river drumfish. See **DRUM**.

LAKE SIMCOE. See **SIMCOE, LAKE**.

LAKEWOOD. A famous health and pleasure resort in Ocean Co., N. J., 59 miles by rail south by west of New York, on the Central Railroad of New Jersey (Map: New Jersey, D 3). It is surrounded by an extensive forest of pines, in which are several fine lakes, is wholly free from malaria, and its bracing air and comparatively mild climate attract thousands of persons during the spring and winter. There are several fine hotels, beautiful country estates, and many cottages owned by annual visitors. Situated here are the Gould and Rockefeller estates, which are visited by thousands of tourists annually. In the vicinity is the Laurelton Farm, one of the largest poultry farms in the world. Pop. (township), 1900, 3094; 1910, 5149.

LAKEWOOD. A city in Cuyahoga Co., Ohio, on Lake Erie, 4 miles from the centre of Cleveland (Map: Ohio, G 2), of which it is a residential suburb. It contains a Carnegie library and the Lakewood Hospital, and has a large carbon factory. A high-level bridge, costing \$3,000,000, crosses the Cuyahoga River at this point. Pop., 1900, 3355; 1910, 15,181; 1914 (U. S. est.), 20,219.

LAKH. See **LAC**.

LAKMÉ. An opera by Delibes (q.v.), first produced in Paris, April 14, 1883; in the United States, March 1, 1886 (New York).

LAKMIUT, lûk'mût. See **KALAPUYA**.

LAKSHMI, lûksh'mé (Skt. *Lakṣmī*, wealth,

beauty, from *lakṣa*, sign, token, fortune). The Hindu goddess of wealth, prosperity, and beauty, and wife of Vishnu (q.v.), whose consort she is in his various reincarnations. She is said to have sprung, Aphrodite-like, from the foam of the sea when the gods and demons churned the ocean. According to other accounts she sprang from a lotus, which flower she is always represented as holding; hence she is sometimes called Padma, the goddess of the lotus (Skt. *padma*, lotus). More often she is termed *Sri*, as an embodiment of fortune and loveliness. Consult Dowson, *Hindu Mythology* (London, 1879), and Wilkins, *Hindu Mythology* (ib., 1900). For illustration, see Plate of HINDU DEITIES in the article INDIA.

LALAGE, lâl'a-jê (Gk. *λαλαγή*, prattling). A term of endearment commonly used of a lady-love. It is given by Horace to two different persons.

LA LAGUNA. See LAGUNA.

LALANDE, là'lând', JOSEPH JÉRÔME LE-FRANÇOIS DE (1732-1807). A French astronomer, born at Bourg-en-Bresse. He was intended for the law, but devoted himself with such success to mathematics and astronomy that the French Academy sent him to Berlin in 1751, to determine the moon's parallax, at the same time that Lacaille was sent to the Cape of Good Hope. In 1752 he returned, was subsequently appointed one of the astronomers of the Observatory of Paris, and in 1761 succeeded Delisle in the professorship of astronomy in the Collège de France. In 1795 he became director of the Paris Observatory. The Prix Lalande, established by him in 1802, is an annual prize of 540 francs, awarded to the person who, in France or elsewhere, makes the most interesting research or contributes the most useful memoir or work in the field of astronomy. His lectures had a rare attractiveness, and he published several astronomical works of a popular kind as well as works of profound scientific value. His principal work is his *Traité d'astronomie* (Paris, 2 vols., 1764; 3d ed., 3 vols., 1792). His *Histoire céleste française*, containing his great catalogue of 47,000 stars, which were afterward reduced by Francis Baily, appeared in 1802. He also wrote: *Voyage d'Italie* (Paris, 1769; 2d ed., 9 vols., with atlas, 1786), giving an account of his travels in Italy during 1765 and 1766; *Bibliographie astronomique* (ib., 1803); and a number of minor works on astronomy, navigation, etc.

LA LANDELLE, là län'dél', GUILLAUME JOSEPH GABRIEL DE (1812-86). A French author, born at Montpellier. He served in the navy for 12 years and was stationed in South America for most of this time. The scenes of many of his romances are laid in that country, and several of them have been translated into Spanish. Among these are: *La couronne navale* (1848); *Une haine à bord* (1851); *Les princes d'ébène* (1852); *Le dernier des filibustiers* (1857); *Sans Peur le corsaire* (1859). He also wrote: *Le langage des marins, recherches historiques et critiques sur le vocabulaire maritime* (1859); *Les géants de la mer* (1871); *Légendes de la mer* (1880).

LALANDES (là'ländz') FOX DOG. A fenec-like animal (*Octocyon megalotis*) of South and East Africa, having remarkably large ears and a very bushy tail. It is a native of open country and is very shy and not well known. It is usually nocturnal and found singly or in pairs. Its food consists of mice, birds, and fruit, while in some places termites seem to form the bulk

of its diet. It is especially interesting as one of the most aberrant of the Canidae and because of its unusual dentition. In the lower jaw it invariably has four molar teeth, or one more than any other member of the family, and in the upper jaw either three or four molars, whereas all other living canines possess only two. Anatomists look upon this as an indication of a marsupial ancestry. It is known to South African hunters as the long-eared Cape fox. See Plate of FOXES AND JACKALS.

LALANNE, là'lân', LÉON LOUIS CHRÉTIEN (1811-92). A French engineer, born in Paris. He was educated there at the Polytechnic School, and his first professional engagement was in the construction of the railway from Paris to Sceaux (1846). Two years afterward, during the revolution, he was appointed guardian of the national studios, but, on account of the revolution, found it safer to live out of France (1849-62), during which time he was charged with important public works in Wallachia, western Switzerland, northern Spain, and elsewhere. After his return to his native land he was made an inspector general (1867) and was director of the School of Bridges and Roads from 1877 until he retired in 1881. His works include: *Mémoire sur l'arithmo-planimètre* (1840); *Tables nouvelles pour abréger divers calculs relatifs aux projets des routes* (1840); *Description et usage de l'abaque ou compteur universel* (1845); *Instruction sur les règles à calcul* (1851); *Assainissement des halles centrales* (1875); *Rectification historique sur les ateliers nationaux* (1887).

LALEMANT, lâl'män', GABRIEL (1610-49). A French Jesuit missionary, born in Paris, where his family were hereditary practitioners of the law. He was a nephew of Jérôme Lalemant (q.v.). He became a member of the Society of Jesus in 1630 and in 1646 went to Canada, where he was sent to the Huron mission. During a great invasion of the Iroquois he was captured and, after being fearfully tortured, was put to death. Consult Francis Parkman, "The Jesuits in North America," in *France and England in North America*, part ii (Boston, 1902).

LALEMANT, JÉRÔME (1593-1673). A French Jesuit missionary to New France. He joined the Society of Jesus in 1609 or 1610 and served in various educational positions at Clermont, Blois, and other places. In 1638 he was sent to New France as superior of the missions to the Hurons, which position he held until 1645. From 1645 to 1650 he was superior of all the missions in New France, with headquarters at Quebec. He returned to France in 1650 to secure aid in the work and remained until 1659, when he went back to New France. For six years he was again superior of missions. Many of his reports, letters, and appeals are to be found in various volumes of the *Jesuit Relations* (Cleveland, 1896-1901).

LA LIBERTAD, là lë'bër-täd'. A seaport of the Republic of Salvador, situated on the Pacific Ocean, 20 miles south of Nueva San Salvador (Map: Central America, C 4). Its harbor is protected by a breakwater and is commercially the most important in the country. It exports coffee, sugar, rice, and indigo. Pop., 2708.

LALIN, là-lën'. A town of northwest Spain, in the Province of Pontevedra, situated among the mountains, 26 miles northeast of Pontevedra (Map: Spain, A 1). It contains the ruins of the monastery of Carboiro, a beautiful Roman

temple, and has manufactures of leather and paper. Pop., 1900, 17,882; 1910, 16,311.

LA LÍNEA, lá'le-ná-á. A town of Spain in the Province of Cadiz, situated just within the Spanish line at Gibraltar, whence the name. The town is chiefly of modern construction and has few interesting features, though there are a theatre, a bull ring, and several casinos. It is inhabited chiefly by laborers, and its gardens supply Gibraltar with vegetables. It has a Spanish garrison, but is not fortified, its forts having been razed by the English in 1810 to prevent their being used by the French invading army. Pop., 1900, 27,743; 1910, 33,296.

LALIQUE, lá'lek', RENÉ (1860-). A French jeweler and decorative artist, born at Ay, Marne, and educated at the Collège de Fontenay. In 1885 he established a workshop, where he originated and executed artistic designs in precious stones and metals. His work came to be in great demand. In 1905 he decorated the French room at the exposition of Liège, Belgium. He became an Officer of the Legion of Honor.

LALITA-VISTARA, lá-le'tá-vís-tá-rá (Skt., delightful expanse). The name of one of the most celebrated works of Buddhistic literature. It contains a narrative, written in Sanskrit, of the life and doctrine of the Buddha and is considered by the Buddhists as one of their nine chief works, treating of dharma, or religious law. It is one of the developed sutras of the Mahayana system of northern Buddhism, and it is based on older accounts of the Buddha's life. Its older portions are in verse, the prose parts are regarded as later in origin. There is a complete French translation by Foucaux, *Lalita-Vistara, ou développement des jeux* (Paris, 1884-92), an incomplete English rendering by Rajendralala Mitra, *Lalita-Vistara, or Memoirs of the Early Life of Sakya Sinha* (London, 1886); a partial German version by Lefmann, *Lalita-Vistara* (Berlin, 1874); and an edition of the Sanskrit text, with indexes, by Lefman, *Lalita-Vistara, Leben und Lehre des Sakya Buddha* (Halle, 1902-08).

LALLA ROOKH, lá'lá' rōōk' An Oriental romance by Thomas Moore (1817). It consists of four metrical tales told to Lalla Rookh, a young Indian princess, on a journey, by her betrothed disguised as a minstrel.

L'ALLEGRO, lá-lá'grō A lyric poem in the short-rhyme couplet by John Milton. It was written between 1632 and 1638.

LALLEMAND, lál'mán', CHARLES FRANÇOIS ANTOINE, BARON (1774-1839). A French general, born in Metz. He volunteered in 1792 and gave such proofs of valor that after the battle of Jena he was made colonel and in 1811 became general of a brigade, taking part in the defense of Hamburg. While in command of the Department of the Aisne in 1815, he made an effort to assist Napoleon, after the latter's return from Elba; and he was made general of a division. After the battle of Waterloo, where he fought with distinction, he wished to accompany his former Emperor to St. Helena, but his request was denied by the English, and he was imprisoned in Malta. Condemned by the Bourbons, he could not return to France, when released, and came to the United States (1816). Here he met his brother, and the two determined to found a colony of refugees in Texas, but were unsuccessful because of Spanish opposition. Lallemand still hoped to free Napoleon, with

whom he was in constant communication, and the latter, on his death (1821), bequeathed to him 100,000 francs. As he had been condemned to death, the French government was averse to his receiving the money. After opposing the course of the Liberals once more, in the Spanish War (1823), he spent some time in New York City as head of a school, but at the end of the revolution of 1830 returned to France, where he was restored to his military and political honors, serving in the Chamber of Peers (1832) and, for a while, as military commander in Corsica.

LALLEMANT. See AVÉ-LALLEMANT.

LALLY, lá'lá', THOMAS ARTHUR, BARON DE TOLLENDAL, COUNT DE (1702-66). A French general and Governor in the Indies, born at Romans in Dauphiné. His father, Sir Gerard Lally, was an Irish Jacobite refugee and commander of an Irish regiment. In his youth Lally distinguished himself as a soldier in Flanders. Later he took part in the battle of Fontenoy and was made a brigadier general on the field. In the same year (1745) he accompanied Prince Charles Edward to Scotland and in 1756 was made a lieutenant and appointed commander in chief in the East Indian settlements. He commenced hostilities against the British in India in 1758, took many places, and besieged Madras itself, but sustained a severe defeat near Vindarachi and was compelled to retreat to Pondicherry, which was attacked in 1760 by a greatly superior British force. Lally held out for 10 months, but Pondicherry fell on Jan. 16, 1761. He was brought to England as a prisoner of war, but upon hearing that he was under accusation in France, he secured his liberty and went to Paris to defend himself. The Parlement of Paris, however, on May 6, 1766, condemned him to death for betraying the interests of the King and the East India Company, and he was beheaded three days after. His son procured a royal decree in 1778, declaring the condemnation unjust and restoring all the forfeited honors. Consult: G. B. Malleson, *The Career of Count Lally* (London, 1865); the *Biographie Michaud*, article "Lally"; Voltaire, *Œuvres complètes*, vol. ii (Paris, 1885).

His son, TROPHIME GÉRARD, Marquis de Lally-Tollendal, was born in Paris, March 5, 1751. He was a member of the States-General and National Assembly in 1789 and acted with the Third Estate. He was in Switzerland during 1790 and 1791 and, returning in the following year, became alarmed at the democratic tendencies of the National Assembly and allied himself with the court. He sought to protect the King, but was himself obliged to flee to England. After the establishment of the Consulate he returned to France and lived at Bordeaux. Louis XVIII made him a peer in 1815, but he remained true to his political principles and defended constitutional liberty. He died March 11, 1830. He was the author of some *Mémoires*, designed to aid in the rehabilitation of his father; also of the *Défense des émigrés* (1794), which made a great sensation in France at the time of its appearance. Consult Gauthier de Brézy, *M. le Marquis Lally-Tollendal* (Paris, n. d.), and Henri Carré, "La Révision du Procès Lally, 1778-1786," in *Revue Historique*, vol. lxxxiii (Paris, 1903).

LALO, lá'lá', EDOUARD VICTOR ANTOINE (1823-92). A French composer, born in Lille. He was a pupil of Baumann at the Lille Con-

servatory, after which he went to Paris and played the viola at chamber concerts in the string quartets of Arningaud and Jacquard. About this time he wrote the opera *Fiesque*, which was not performed. He then turned to instrumental composition and wrote the *Symphonie espagnole*, a *Concerto de violon* for Sarasate, and a *Concerto russe*. He also wrote a ballet, *Namouna*, whose music became popular, and composed *Le roi d'Ys* (1888), a comic opera in four acts. Its beauties were at once recognized, and it has ever since been regarded as his masterpiece. An unfinished opera, *La Jacquerie*, was completed by Coquard and played at Monte Carlo in 1895. Lalo ranks high among modern French composers. His orchestration is dainty and scholarly, while all his music is marked by warmth and color. Other works include: *L'Allegro symphonique*; *Concerto for the Cello*; *Rhapsodie norvégienne*; *Concerto for the Piano*. He died in Paris. Consult Hugues Imbert, *Nouveaux profils d'artistes* (Paris, 1892).

LA LUZ, lá lōōth. The harbor of Las Palmas (q.v.), Canary Islands.

LAMA. A genus, formerly known as *Auchenma*, of the Camelidae (q.v.), composed of the guanaco, llama, alpaca, and vicuña (qq.v.). It has been specially studied by O. Thomas (*Proceedings of the Zoological Society of London* for 1891), who concludes that the llama and alpaca are forms of the guanaco (*Lama huanacos*) and that the vicuña (*Lama vicugna*) is distinct. See Plate of CAMELS.

LAMACHUS, lám'a-kūs (Lat., from Gk. *Λαμάχος*, *Lamachos*) (c.465-414 B.C.). An Athenian commander. He took part in the earlier campaigns of the Peloponnesian War, in 433 B.C. drove Timesilaus from Sinope, was in command of a fleet in the Euxine (424), and signed the Peace of Nicias (421). But he is better known for his bravery in the Sicilian expedition, where he was in command with Alcibiades and Nicias. He was killed in the summer of 414, in a skirmish with the Syracusans. He was ridiculed by Aristophanes as a member of the war party.

LAMAISM, lá'má-iz'm (from Tib. *blama*, superior, lama). The name given to that form of Buddhism which prevails in Tibet and Mongolia. It is Buddhism (q.v.) corrupted by Sivaism (see SIVA) and by a mixture of Shamanism (q.v.) and sorcery, which goes back, in part at least, to Bon, or the primitive Tibetan religion. The religion was not known in Tibet until the seventh century A.D., when King Sroñ Tsan Gampo (638-641 A.D.) married two princesses, one from India and one from western China, both of whom were devoted Buddhists. Through their influence this monarch became converted to the faith of the Enlightened One. But Sroñ Tsan appears to have been a Buddhist more in name than in fact, it was left to a later king, Thi-Sroñ Detsan, to become the true promoter and ardent upholder of the faith. This ruler invited a Buddhist monk named Padma-Sambhava, or Lotus-Born, to come from northern India to Tibet, which he did in the year 747 A.D., and became the real founder, organizer, and patron saint of Lamaism as the religion of Tibet. He at once gave battle to the sorcerers and exorcisers, fighting them with their own weapons, and, aided by the King, he established the order of "red" Lama priests. The emphasis which his pupils laid on magic has brought his name some disrepute among the more intelligent dignitaries of the Lamaist church,

who belong to the "yellow" order of monks. The character of this new Tibetan faith, as Waddell points out, was largely "a priestly mixture of Sivaite mysticism, magic, and Indo-Tibetan demonolatry, overlaid by a thin varnish of Mahayana [northern] Buddhism. And to the present day Lamaism still retains this character." From the date of its founding the religion continued to develop and spread until about 900 A.D., when it received a check and underwent a brief period of persecution or reaction; but it soon recovered, growing stronger than ever as the Kings grew weaker. A great religious organizer, *Atiśa* (Tib. ཀུན་གྲུབ་ཀྱི་ཆེན་པོ་, who came from India (1042), reformed the priesthood into a unitary body.

The Mongol dynasty founded by Genghis Khan was favorable to the Lamas, Kublai Khan being converted to Lamaism by Rags-pa, abbot of the Sa-skya monastery. These abbots came to be recognized as regents of Tibet (1270-1340), but under the later Mongol emperors and the Ming dynasty which followed them (1368), their power decreased, owing to the creation of new abbots by the emperors; it was the great saint and monastic reformer bTsoñ-K'a-pa who lent his influence to the grand Lamas, thus enabling them to become both temporal and spiritual rulers. By playing off the Mongols, who, after a relapse, had been converted against Lamaism, against their Tibetan opponents, and the Chinese against the Mongols, the crafty Lamas managed to maintain their independence until the Manchu Emperor Kang-hi (reigned 1662-1722 A.D.) put an end to their political independence of China and established a Chinese administration. It is interesting to note in this connection that the Emperor of China was given by the Lamaists a religious status, inasmuch as he is considered an incarnation of Manjusri, while the Russian Czar is supposed to be an incarnation of the soul of the goddess Tara. It was Nag-wan Lözang, the fifth Grand Lama, who in 1640 A.D., by a stroke of statecraft, got himself confirmed as the Dalai Lama, or "Lama vast as the ocean," and the modern period of Lamaism may be said to have begun with him. To-day Lamaism extends beyond the borders of Tibet to the Kalmuk Tatars on the banks of the Volga, through Siberia, Manchuria, Mongolia, and scattering in China, so that it is estimated that its followers number no fewer than 10,000,000.

With regard to doctrine and religious belief the Buddhist theory of the universe, with its Hindu heaven and hell and its general system of morality, was adopted, but the presence of abundant extraneous matter of foreign accretions has already been mentioned. As ancient Buddhism knows of no worship of God, but merely of an adoration of saints, the latter is also the main feature of Lamaism. (See MAHAYANA.) The essence of all that is sacred is comprised by this religion under the name of dKon mChhog gSsum (pronounced *kon-ch'og-sum*), which consists of the three most precious jewels—the Buddha jewel, the doctrine jewel, and the priesthood jewel—which represent a kind of trinity, with essential unity. The first person of this trinity is the Buddha, but he is not the creator or the origin of the universe; as in Buddhism, he is merely the founder of the doctrine, the highest saint, though endowed with all the qualities of supreme wisdom, power, virtue, and beauty, which raise him beyond the pale of ordinary existence. The second jewel, or the doctrine (dharma), is the law or religion—that which

is, as it were, the incarnation of the Buddha, his actual existence after he had disappeared in Nirvana. The third jewel, or the priesthood (*sangha*), is the congregation of the saints, comprising the whole clergy, the incarnate as well as the nonincarnate representatives of the various Buddhistic saints. The latter comprise the five Dhyani Buddhas (see *DHYANI BUDDHA*), or the Buddhas of Contemplation (*Amitābha*, of whom the Lama of Ta-shi-lunpo is an incarnation, being the most revered), and, besides, all those myriads of Bodhisattvas, Pratyeka Buddhas, or solitary saints who have attained perfection by themselves without the Supreme Buddha's help, and pious men, who became canonized after their death. It is obvious that among their number a portion only can enjoy practical worship; but the clergy, as the visible representative of these saints, claim and receive due homage at all the religious ceremonies. Of the Bodhisattvas, Padmapāni, an emanation of Amitābha, and Manjusri are the most popular. Inferior in rank to the saints are the gods and spirits, the former chiefly taken from the pantheon of the Sivaïtes. The highest position among these is occupied by the four spirit kings—Indra (*q v*), the god of the firmament, Yama, the god of death and the infernal regions; Yamantaka, or Siva, as revenger in his most formidable shape, and Vaisravana, or the god of wealth. The goddess Tārā has an earthly representative in the abbess of the 'S i' 'D' monastery, who is deeply revered. Besides these, there are a number of genii, tutelary demons, and spirits, which receive recognition or worship. The worship of these saints, gods, and spirits consists chiefly in the reciting of prayers and sacred texts and in the intonation of hymns, accompanied with a kind of music, which is a chaos of deafening sounds of horns, trumpets, and drums. During this worship, which takes place three times a day, the clergy, summoned by the tolling of a little bell, are seated in two or more rows, according to their rank; and on special holidays, the shrines, temples, and altars are decorated with symbolic figures, while offerings of tea, flour, milk, butter, and others of a similar nature are made by the worshippers, animal sacrifices or offerings entailing injury to life being forbidden, as in the Buddhistic faith. In the ritual which the priests conduct, rosaries, prayer wheels, and prayer flags form also a part, and symbols, holy relics, charms, and amulets are employed in acts of worship or superstitious rites, while charms, spells (as such may be considered the formula *Om, mani padme hum*, 'O, Lotus jewel, amen,' which the Lamas incessantly repeat), incantation, divination, astrology, and necromancy are also resorted to.

• The religious festivals and holidays of Lamaism are numerous. The three great festivals are New Year's, the Flower Feast, and the Water Feast, to which might be added a lantern festival and the chase of the scapegoat of bad luck. The Log-gSaar, or the festival of the new year, in February, marks the commencement of the season of spring, or the victory of light and warmth over darkness and cold. The Lamai-ti, like the Buddhists, celebrate it in commemoration of the victory obtained by Buddha over six heretic teachers. The second festival, probably the oldest festival of the Buddhistic church, is held in commemoration of the conception or incarnation of the Buddha and marks the commencement of summer. The third is the Water

Feast, in August and September, marking the commencement of autumn.

The two principal sacraments of Lamaism are baptism and confirmation. The former is administered on the third or tenth day after birth; the latter, generally when the child can walk and speak. The marriage ceremony is to the Tibetans not a religious, but a civil act, though it is from the Lamas that the bridegroom and bride learn the auspicious day; nor do they fail to complete the act with prayers and rites, which must be responded to with handsome presents. A similar observation applies to the funeral ceremonies of the Tibetans. The method of disposing of the dead is by burning, by interment, and likewise by exposing the body in the open air, to be devoured by birds and beasts of prey. When a man dies, a Lama must be present to superintend the proper separation of the body and the soul and to direct the spirit on its journey to the Western paradise; also to cast the horoscope and to enable the departed to be reborn in a happy existence or to enter the regions beyond rebirth, for Lamaism, like Buddhism, has the doctrine of metempsychosis and reincarnation. The most lucrative part of the Lama's business, however, is the masses which he has to perform until the soul is released from Yama, the infernal judge, and ready to enter upon its new existence.

One of the most interesting features of Lamaism is the organization of its hierarchy. Its summit is occupied by two Lama popes, the one called *Dalai Lama*, who resides at Potala, a hill near Lhasa; the other bearing the titles of *Tashi Lama* (Old, Krashi), *Teush Lama*, *Bogodo Lama*, etc., and officially called *Pan-ch'en rin po ch'e*, literally 'the right reverend great teacher jewel' (i.e., precious teacher)—he resides in the convent at bKra-Shiss-Lhun-po, or Ta-shi-lun-po, near gShiss-Ka-rTse and is an incarnation of Amitabha. In theory both popes have the same rank and authority in spiritual as well as in temporal matters, but as the Dalai Lama possesses a much larger territory than the other, he is in reality much more powerful. Next in rank are the *Khutuktus*. The third degree is that of the *Khubilghans* or *Hobilghans*—which Mongol name is more frequently given to them than the Tibetan title *byang chub*—a translation of the Sanskrit *bodhisattva*. Their number is very great. These three degrees represent the clergy, which claims to be the incarnation of the Buddhistic saints. The theory of the reincarnate succession of the Lamas is strongly marked. The Dalai Lama and the Pan-ch'en were in their former lives the two chief disciples of the great Lamaist reformer bTson-K'a-pa (born in 1378) who was an incarnation of the Bodhisattva Amitabha or, as some will have it, of Manjusri, and who is reputed to have founded, in the first half of the fifteenth century of the Christian era, the present system of the Lama hierarchy. He was the founder of the "yellow" order of monks, who do not marry and who carry an alms bowl, like their Hindu colleagues. The Khutuktus were, in their prior existences, other Buddhistic saints of very great renown; and the Khubilghans are those reborn hosts of saintly patrons whom the temples and convents of Lamaism possess in boundless numbers. On the death of a Grand Lama his soul is supposed to take up its abode in some infant born shortly after the pontiff's decease. Up to the end of the eighteenth century the clergy of these various classes determined

the choice of the children into whose bodies the souls of their departed members had migrated. At present, however, it seems that the Emperor of China exercises a paramount influence on the discovery of those transmigrations. In order to ascertain the rebirth of a departed Lama, various means are relied upon. Sometimes the deceased had, before his death, confidentially mentioned to his friends where and in which family he would reappear, or his will contained intimations to this effect. In most instances, however, the sacred books and the official astrologers are consulted on the subject; and if the Dalai Lama dies, it is the duty of the Pan-ch'en to interpret the traditions and oracles; whereas, if the latter dies, the Dalai Lama renders him the same service. The proclamation of so great an event, however, as the metempsychosis of a Dalai Lama or a Pan-ch'en is preceded by a close examination of the child who claims to be in possession of the soul of either of these personages. The child thus selected is subjected to a strict course of educational discipline destined to enable him to perform his important duties.

Besides the three classes of the higher clergy alluded to above, Lamaism possesses a lower clergy, which, having no claim to incarnate holiness, recruits its ranks on the principle of merit and theological proficiency. It has four orders: the pupil or novice, who enters the order generally in his seventh or ninth year; the assistant priest; the religious mendicant; and the teacher or abbot. To these may be added two academical or theological degrees and also two dignities, conferred by the sovereign Lamas on those doctors who have distinguished themselves by extraordinary sanctity or learning. All the members of these orders must make the vow of celibacy, and by far the greatest number of them live in convents. A Lamaist convent or monastery, *dGonpa*, consists of a temple, which forms its centre, and of a number of buildings connected with the temple and used as the meeting rooms, the library, refectory, dwellings, and other spiritual and worldly wants of the monks. At the head of the convent is a *Klu'i* or an abbot, the latter being elected by the chapter and appointed by the Dalai Lama or the provincial Khubilghan. In addition to these orders of monks and convents, Lamaism has likewise its nuns and nunneries.

The scriptures of Lamaism are divided into two great collections: (1) the canon or sacred books, called *bKang-gyur* or *Kang-gyur*, the translated commands or words of the Buddha, rendered from the Indian texts or, in a few instances, from the Chinese; (2) the commentary *bs-Tan-gyur* or *Tan-gyur*, which is encyclopædic in its character. The canon, or *Kang-gyur*, contains no fewer than 1083 works, which in some editions fill 100 or 108 volumes of about 1000 pages each. It comprises the following sections: (a.) *Dul-wa* (Skt. *Vinaya*), discipline; (b.) *Dō* (Skt. *Sūtra*), sermons of the Buddhas; (c.) *Ch'os-non-pa* (Skt. *Abhidharma*), philosophy, including *S'er-p'yi* (Skt. *Prajñā Paramitā*), or metaphysics. There are also minor subdivisions containing details as to doctrine, including Nirvana (*Mya-nan-las-'das-pa*), ethics, ritual, magic, and the like. The commentary literature, *Tan-gyur*, is very voluminous and comprehensive, some 225 volumes in folio, but it has not the canonical authority of the other collection. The "red" monks, too, have a literature which is con-

sidered heterodox; the works and legends of Padma-Sambhava belong to this category. Much religious lore and superstition are also embodied in the enormous popular literature of Tibet.

Bibliography. There are also important works in Russian by Pozdniecev, Ukhtomskii, Vasiliev, and other scholars. See also **BUDDHISM** and its bibliography.

LAMAMIAO, lá-má-mé-ou' (Mong. *Dolon-nor*), also called CHAO NAIMAN SUME. An important commercial town in the southeast of Mongolia, situated at an altitude of about 4000 feet, about 150 miles north of Peking. It is one of the centres of the Chinese-Mongolian trade and is especially noted for its statues of bronze, copper, and iron, gongs, vases, and other religious objects, which are exported in large quantities to Buddhist countries. Manufactures and agricultural products from China are exchanged here for animals. Russian goods come to the town from Kiachta, and the Tatars exchange herds of oxen, camels, and horses for tea, cloth, and tobacco. There are two extensive monasteries in the Mongolian part of the town. Pop. (est.), 30,000.

LA MANCHA. See MANCHA, LA.

LA MANCHE. See MANCHE, LA.

LAMANSKY, lá-mán'ski, VLADIMIR IVANOVITCH (1833-). A Russian philologist and historian, born and educated in St. Petersburg. He was professor of Slavic literature in the university of that city in 1865-90 and founded the ethnographical periodical *Zivaia Starina* in 1890. His publications include: *The Slavs in Asia Minor, Africa, and Spain* (1859); *Servia and the Slavs of Southern Austria* (1864);

Historical Study of the Græco-Slav World (1871); *The Songs of Southern Russia* (1875); *Studies of the Czech* (1878) and Bulgarian literatures; *Secrets d'Etat de Venise* (1884); *The Three Worlds of Europe and Asia* (1892). An intense "Slavophile," Lamansky in the historical view looks upon the Greek-Slavic civilization as the opposite of the Germano-Roman.

LAMAR, la-mär'. A city and the county seat of Prowers Co., Colo., 116 miles east of Pueblo, on the Atchison, Topeka, and Santa Fe Railroad (Map: Colorado, G 3). It is in the fertile Arkansas valley, producing alfalfa, hogs, sheep, and fruits. Among the industrial establishments are a large condensed-milk plant, flour and feed mills, lumber yards, and manufactories of beet sugar, sashes and doors, brooms, and bricks and tile. The city contains a Carnegie library and two hospitals and owns its water works. Pop., 1900, 987; 1910, 2977.

LAMAR. A city and the county seat of Barton Co., Mo., 39 miles north by east of Joplin, on the north fork of the Spring River, and on the Missouri Pacific and the Frisco Lines systems (Map: Missouri, B 4). It has a public-school library, a courthouse, and Lamar College. The city is in a region largely agricultural, with coal-mining interests. There is a trade in flour. The water works and electric-light plant are owned by the city. Pop., 1900, 2737; 1910, 2316

LAMAR, José (1778-1830). A South American general, born at Cuenca in what is now Ecuador. His early life was spent in Spain, where he fought against France; in 1815 he was sent to Peru in command of the Spanish army, from which he resigned after the surrender of Callao Castle (1821), to enter the Republican army. He commanded the Peruvian troops at Ayacucho (1824) and in 1827 was elected to the Presidency of Peru. In 1828 he provoked a war with Colombia and in 1829 was defeated by Sucre, the late President of Bolivia, who commanded the Colombian forces at Cuenca. He was deposed a few months afterward and died in exile.

LAMAR, JOSEPH RUCKER (1857-1916). An American jurist, born at Ruckersville, Ga. He attended the University of Georgia, graduated from Bethany (W. Va.) College in 1877, and studied law at Washington and Lee University. Admitted to the bar in 1878, he practiced law at Augusta, Ga., from 1880 to 1903, was a member of the Georgia House of Representatives in 1886-89, and served as commissioner to codify the laws of Georgia in 1895. He was appointed associate justice of the Supreme Court of Georgia in 1901 to fill an unexpired term and was regularly elected to that office in 1903; but two years later he resigned and resumed the practice of law at Augusta, where he met and became the friend of President Taft. In 1910 he was appointed associate justice of the Supreme Court of the United States, and in 1914 he served as one of the delegates of the United States to the Niagara Falls Peace Conference, which attempted to settle the dispute with Mexico concerning insults to the American flag by the government of General Huerta.

LAMAR, LUCIUS QUINTUS CININNATUS (1797-1834). An American jurist, born at Eatonton, Ga., of French-Huguenot descent. He was educated at Milledgeville, Ga., and studied law at Litchfield, Conn. Returning to his native State, he was admitted to the bar in

1819 and rapidly won distinction in his profession. In 1819 he revised *Georgia Justices*, and in 1821 he was commissioned by the State Legislature to make a compilation of *The Laws of Georgia from 1811 to 1819* (1821). In 1830 he was elected to succeed Thomas W. Cobb as a judge of the Georgia Supreme Court and remained upon the bench until his death.

LAMAR, LUCIUS QUINTUS CININNATUS (1825-93). An American lawyer and legislator, son of the preceding. He was born in Putnam Co., Ga., graduated at Emory College (Oxford, Ga.) in 1834, studied law at Macon in the office of A. H. Chappell, and was admitted to the bar in 1847. In 1849 he removed to Oxford, Miss., where, besides practicing law, he was adjunct professor of mathematics in the University of Mississippi from 1850 to 1852, when he removed to Covington, Ga. He was elected to the Georgia Legislature in 1853 and returned to Mississippi in 1855. In 1856 he was elected to Congress and in 1858 he was re-elected. In December, 1860, he resigned to take part in the Secessionist movement in his State. He was a member of the Charleston Convention of 1860, before which he made a stirring speech, and of the Mississippi Convention which, on Jan. 9, 1861, passed the ordinance of secession, which he himself had drafted and presented. In the summer of 1860 he had accepted an appointment to the chair of ethics and metaphysics in the University of Mississippi, but resigned his professorship to heed the call to arms. In May he was chosen lieutenant colonel of the first regiment raised in Mississippi for service "during the war." He led his regiment at Yorktown and Williamsburg, but resigned from active service in October, 1862, and early in the following year was sent to Europe as special commissioner of the Confederate States to the Russian Empire. He did not proceed to his post, however, and, his commission not being confirmed by the Confederate Senate, he returned to America early in 1864, after having spent some months in London and Paris. From December, 1864, until the close of the war, he served as judge advocate of the military court of the Third Army Corps, with the rank of colonel. He was professor of ethics and metaphysics at the University of Mississippi in 1866 and 1867 and of law from 1867 to 1870. In this year he resigned in consequence of Republicans having become trustees of the university upon the readmission of the State into the Union. He was a member of Congress from 1873 to 1877 and of the United States Senate from 1877 to 1885, was Secretary of the Interior in President Cleveland's cabinet from 1885 to 1888, and was an associate justice of the United States Supreme Court from 1888 until his death. His efforts were directed chiefly to bringing about a reconciliation and a better understanding between the North and the South, and a remarkable eulogy of Senator Sumner, delivered by him before the House in 1874, did more than perhaps any other one thing up to that time towards accomplishing this result. He opposed with great energy and eloquence all schemes involving the debasement or undue inflation of the currency and in 1878 showed his strength of conviction and independence of mind by refusing to resign or change his views on this question at the command of the Mississippi Legislature and by appealing to the people, who enthusiastically sustained him.

Among his many notable orations and addresses perhaps the ablest was that delivered at the unveiling of the Calhoun monument at Charleston, S. C., in 1887. Consult Mayes, *Lucius Q. C. Lamar: His Life, Times, and Speeches* (Nashville, Tenn., 1896).

LAMAR, MIRABEAU BUONAPARTE (1798-1859). An American politician, President of Texas, the brother of the elder L. Q. C. Lamar. He was born at Louisville, Ga., and engaged in agricultural and mercantile pursuits until 1828, when he founded a States'-rights newspaper, the *Columbus Independent*. In 1835 he went to Texas and became prominently identified with the revolutionary party. He served at the battle of San Jacinto, was commissioned major general, and was appointed to the command of the army in the summer of 1836, but insubordination in the ranks forced his retirement. He then became Attorney-General, Secretary of War, Vice President, and President of Texas. During his term of office as President (1838-41) the independence of Texas was recognized by the chief powers of Europe. He is credited with having originated the educational system of Texas. He recommended in his message to the Third Congress of the Republic the Act (passed in 1839) granting three leagues of land to each county for the support of an academy and 50 leagues for the "establishment and endowment" of two universities. From these provisions have developed the public-school system of the State and the University of Texas. He served with distinction in the Mexican War and against the Comanche Indians. In 1857 he was appointed United States Minister to the Argentine Republic, but did not serve; in 1858 Minister to Nicaragua and Costa Rica. He published *Verse Memorials*.

LA MARA. See LIPSUS, IDA MARIE.

LA MARCK', COUNT. A name of the Belgian soldier and author Arenberg (q.v.), or Arenberg.

LAMARCK, JEAN BAPTISTE PIERRE ANTOINE DE MONET DE (1744-1829). A French zoölogist, regarded as the greatest of the period between Linnaeus and Cuvier. He was born Aug. 1, 1744, at Bazentin-le-Petit, a village in Picardy, the eleventh child of parents belonging to the minor nobility. Destined by his parents for the Church, though preferring a military life, he entered the college of the Jesuits at Amiens. But, his father dying in 1760, he enlisted at the age of 16 in the French army during the Seven Years' War, distinguished himself, and was promoted to a lieutenancy. His military career was, however, checked by a serious accident, whereupon he went to Paris, studied medicine, and, meeting Rousseau, was led to study botany under Bernard de Jussieu. For 10 years he studied native and exotic plants. His *Flora française*, published in 1778 in three volumes and augmented to six volumes in the third edition of 1805-15, brought young Lamarck immediate fame and led to his election to the French Academy of Sciences in 1779. In 1781 Buffon obtained for him a commission as royal botanist, charged with visiting the foreign botanical gardens and museums as well as mines. His travels (1781-82) led him to visit Holland, Germany, and Hungary. On his return he was appointed keeper of the herbarium of the Royal Garden, to which he afterward gave the present name, *Jardin des Plantes*. His career as a botanist, in which he achieved such success that

he was called the French Linnaeus, covered a period of about 25 years. Meanwhile he took an active part in the reorganization of the Museum of Natural History, with the result that his ideas were carried out and extended by Lakanal, and the *Jardin des Plantes* was transformed into an institution of higher instruction, with a staff of 12 professors.

In the summer of 1793, the Museum of Natural History having been reorganized, the chair of zoölogy was divided, the professorship of vertebrate zoölogy being filled by Geoffroy Saint-Hilaire, while to Lamarck, now 49 years of age, was assigned the chair of invertebrate zoölogy. In 1801 appeared his *Système des animaux sans vertèbres*, in the introduction to which his views on the origin of species were first published. Lamarck introduced great reform in the classification of animals, founding the classes Infusoria, Annelida, Crustacea, Arachnida, and Tunicata, the order of Cirripedia, and the molluscan group of Heteropoda. He specialized in the Mollusca, breaking up the Linnæan genera into more modern generic groups, and all later work in this branch has been in the line of expansion and elaboration of his labors. The *Philosophie zoologique* was published in 1809 (trans. by Hugh Elliot, 1914) and in 1815-22 appeared his monumental work, in seven volumes, *Histoire naturelle des animaux sans vertèbres*, augmented to 11 volumes in the second edition of 1835-45.

Lamarck was greatly interested early in life in meteorology, and from 1799 to 1810 he published an annual " . . . " and was the first to foretell " . . . " of the weather. His speculations in physics and chemistry were, however, worthless, in fact, he lacked the qualities of an experimenter, in this respect differing from Darwin. A little book, published in 1802, entitled *Hydrogéologie*, preserves his reflections on geology, in antagonism to the "catastrophic" ideas of Cuvier; and Huxley characterized it as containing "sober and philosophic hypotheses," compared with those of Cuvier.

× Lamarck was the founder of invertebrate paleontology, as Cuvier was of vertebrate paleontology. He utterly opposed Cuvier's views of the sudden general extinction and creation of species, believing that the fossil forms were the ancestors of the animals now living; species to his mind being variable and undergoing a slow modification. He insisted on the following foundation principles of paleontology: (1) the great length of geological time, (2) the continuous existence of organic life through the geological periods, (3) the physical environment remaining of the same general nature throughout, but with (4) continued gradual, not catastrophic, changes in the relative distribution of land and sea—changes which (5) caused corresponding modifications in the habits, and (6) consequently in the habits, of living beings, so that there has been all through geological history a slow modification of life forms. Although Lamarck was a uniformitarian and thus anticipated Lyell, his idea of creation was evolutionary rather than simply uniformitarian. His evolutionary theories brought him into sharp controversy with Cuvier, whose influence led to their neglect by his contemporaries. It was only in the present century that their real worth has been appreciated. See LAMARCKISM. . . .

Lamarck was a man of exceedingly fine character, generous, free from jealousy and self-assertion. He was patriotic, imperturbable under the assaults of fortune, and patient under affliction. His mind was essentially philosophic, broad, and synthetic, he was a bold thinker and in every respect an epoch-making man. Besides the larger works mentioned above, he was the author of many articles, some of which have been translated into English and have become the bases of standard works on the subjects treated. He died Dec. 18, 1829, at the age of 85 years.

LAMARCKISM. The doctrine of J. B. P. A. Lamarck (q.v.), which considers the fundamental or primary factors of evolution in the transformation of species. Lamarck claimed that all living beings arose from germs, through spontaneous generation and that the most primitive was monad-like. In his opinion the first germs of plants and animals were formed in favorable places and under favorable circumstances. The functions of life beginning and an organic movement established, these germs "necessarily gradually developed the organs, so that after a time and under suitable circumstances they have been differentiated" into parts or organs, development proceeding from the simple to the complex. He postulated great length of time, so great "that it is absolutely beyond the power of man to appreciate it in an adequate way." He adds that "with the aid of sufficient time, of circumstances which have been necessarily favorable, of changes of condition that every part of the earth's surface has successively undergone—in a word, by the power which new situations and new habits have of modifying the organs of living beings—all those which now exist have been gradually formed such as we now see them." Vestigial organs are explained as remains of parts which had been actively used by the ancestors of existing forms, but which have become atrophied by disuse. The fact of variation is fully appreciated, as also adaptation to needs. In his opinion specific characters vary most. He points out that the peripheral parts, as the legs, mouth parts, antennæ, etc., are first affected by the causes which produce variations, while it requires a longer time for variation in the internal organs to take place. He also insisted that, when the conditions of existence remain constant, species do not vary.

Lamarck's factors of organic evolution were

seven, as follows. 1. Effects of favorable circumstances due to changes of environment, of climate, soil, food, temperature, etc. Such changes are direct in the case of plants and the lowest animals, but indirect in the case of the higher animals and man.

2. Needs, new physical wants or necessities induced by change of the conditions of life, result in the production of new propensities, new habits and functions. Lamarck showed that change of habits may lead to the origination or modification of organs, that changes of functions also modify or create new organs. He said: "It is easy to demonstrate by observation that uses or habits have given rise to forms," which is another expression for Geoffroy Saint-Hilaire's "C'est la fonction qui crée l'organ," and an anticipation of Dohrn's principle of change of function as a means of modification of organs. (See FUNCTION CHANGE.) Lamarck's use of the word "need" or "necessity" (*besoin*) has been greatly misunderstood and caricatured. He shows, however, that by change of environment animals are subjected to new surroundings, involving new ways and means of living. Thus, certain land birds driven by necessity (*besoin*) to obtain their food in the water, gradually assumed characters, or structures, adapting them for swimming, wading, or for searching for food in the shallow water, as in the case of the *Podiceps* kinds.

3. Use and disuse. The continual use or exercise of organs develops them, as in the wings of birds, etc. The second of these principles he illustrates by the cases of the mole, the whalebone whales, whose rudimentary teeth exist in the embryo, the anteater, the blind Proteus of caves, the eyeless bivalves, and the snakes, whose ancestors lost their limbs in the process of becoming adapted for gliding through brush or grass or similar obstacles.

4. The doctrine of the struggle for existence and of competition was stated by Lamarck. He frequently refers to the precautions that nature has taken to place limits to the too great increase in individuals and the consequent overcrowding of the earth. The stronger and better armed, he says, devour the weak, the large animals devour the smaller. The multiplication of the smaller species is so rapid that these smaller species render the earth inhabitable for others, but their length of life is very short, and nature always preserves them in just proportions, not only for their own preservation, but also for that of other species. The larger species, however, multiply slowly, and thus is preserved the kind of equilibrium which should exist.

5. Lamarck's characteristic doctrine is the inheritance of characters acquired during the life-time of the individual. (See USE INHERITANCE.) This by some writers is regarded as the only feature of Lamarckism, but in reality he discusses the subject very briefly, yet it appears to be a necessary result of the action of use and disuse, and of change of any of the conditions of life.

6. The effects of crossing were considered by Lamarck, and—what has been overlooked by commentators and critics—he clearly insists on the leveling or swamping effects of free intercrossing. He anticipated much modern discussion in his statement: "If, when any peculiarities of form or any defects whatsoever are acquired, the individuals in this case always pair-

ing, they will reproduce the same peculiarities, and, if for successive generations confined to such unions, a special and distinct race will then be formed. But perpetual crosses between individuals which have not the same peculiarities of form result in the disappearance of all the peculiarities acquired by particular circumstances."

7. The principle of geographical isolation (see ISOLATION) was anticipated by Lamarck, who, at the close of the paragraph above quoted, goes on to say: "Were not men separated by distances of habitation, the mixtures resulting from crossing would obliterate the general characters which distinguish different nations" (*Philosophie zoologique*, p. 262). This idea of segregation is also involved in his account of the origin of man from apes. He does not, however, specifically apply this principle to other animals than man.

Lamarck (*Philosophie zoologique*, 1809) summed up his conclusions in the following laws:

"*First Law.*—In every animal which has not exceeded the term of its development, the more frequent and sustained use of any organ gradually strengthens this organ, develops and enlarges it, and gives it a strength proportioned to the length of time of such use; while the constant lack of use of such an organ imperceptibly weakens it, causes it to become reduced, progressively diminishes its faculties, and ends in its disappearance.

"*Second Law.*—Everything which nature has caused individuals to acquire or lose by the influence of the circumstances to which their race may be for a long time exposed, and consequently by the influence of the predominant use of such an organ, or by that of the constant lack of use of such part, it preserves by heredity (*génération*) and passes on to the new individuals which descend from it, provided that the changes thus acquired are common to both sexes or to those which have given origin to these new individuals."

Afterward, in the introduction to the *Animaux sans vertèbres* (1815), he enunciates these principles under four laws, as follows:

"*First Law.*—Life, by its proper forces, continually tends to increase the volume of every body which possesses it, and to increase the size of its parts, up to a limit which it brings about.

"*Second Law.*—The production of a new organ in an animal body results from the supervention of a new want (*besoin*) which continues to make itself felt and of a new movement which this want gives rise to and maintains.

"*Third Law.*—The development of organs and their power of action are constantly in ratio to the employment of these organs.

"*Fourth Law.*—Everything which has been acquired, impressed upon, or changed in the organization of individuals, during the course of their life is preserved by generation and transmitted to the new individuals, which have descended from those which have undergone those changes."

Lamarck failed to catch the idea of natural selection—the essence of Darwinism—though his views on overpopulation were fundamentally like those of Malthus (1798), whose essay on population gave the hint both to Darwin and to Wallace, which became the germ of the theory of natural selection (q.v.). Consult: F. W. Hutton, *Darwinism and Lamarckism, Old and New*

(London, 1899); Samuel Butler, *Evolution Old and New; or The Theories of Buffon, Dr. Erasmus Darwin and Lamarck as Compared with that of Charles Darwin* (New York, 1911); and especially the admirable translation of Lamarck's principal work, by Hugh Elliot, *Zoological Philosophy* (New York, 1914). See EVOLUTION; HEREDITY

LA MARMORA, là măr'mô-rà, ALBERT, COUNT OF (1789-1863). An Italian general and scientist, elder brother of Alfonso. He was born in Turin, was educated for the army at Fontainebleau, and served with distinction, being decorated by Napoleon I after the battle of Bautzen. On account of his participation in the revolutionary movement in Piedmont in 1821, he was disgraced and exiled to the island of Sardinia and remained there for nearly 10 years, during which time he was occupied in the study and investigation of the natural characteristics of the island. The result of his labor appeared in an elaborate report, which is highly esteemed for its accuracy. In 1831, recalled from his exile by the government, he was restored to favor, became a member of the Accademia delle Scienze of Turin, and was made a lieutenant general. On the outbreak of the great movement of 1848 he joined Daniel Manin and became prominent during the unsuccessful revolt of Venice. Later, however, he assumed the character of peacemaker, and by his wise counsels succeeded in allaying much of the irritation which existed among the leaders of the contending parties. Besides several scientific memoirs La Marmora published in French his great work, *Voyage en Sardaigne, ou description statistique, physique et politique de cette île* (5 vols., 1839-57), comprising an atlas and complete description of Sardinia.

LA MARMORA, là măr'mô-rà, ALFONSO FERREIRO, MARQUIS OF (1804-78). An Italian general and statesman, born in Turin. In 1816 he entered the military academy in his native city, becoming a lieutenant in the artillery in 1823. In 1843 he became major and, for his distinguished conduct in the War of 1848 against Austria, was decorated with the medal of valor. The services he then rendered the Sardinian army removed from the mind of Charles Albert a prejudice which his warm advocacy of military reform had aroused in the King. La Marmora was made a brigadier general and in 1849 repressed a rebellion in Genoa. In the same year he entered the cabinet as Minister of War and initiated a series of reforms which amounted almost to the reorganization of the army. In 1855 he was placed in command of the Sardinian troops sent to the Crimea, distinguished himself in the battle of the Tchernaya, and at the close of the war was invested with the Order of the Bath and the Grand Cross of the Legion of Honor and reentered the ministry in his former capacity. He was next to the King in command of the Italian forces in the War of 1859, by which Lombardy was acquired, and upon Cavour's resignation in July presided over the cabinet till January, 1860. In 1861 he was sent to Prussia as Envoy Extraordinary. In November of that year he became Governor of Naples. From 1864 to 1866 he was Prime Minister and concluded the alliance with Prussia. In the campaign against Austria in 1866 he lost the battle of Custoza and resigned his position as chief of staff as well as his portfolio. His last official position was that of Governor of

Rome, which he held from October, 1870, to January, 1871. His account of the secret negotiations between Prussia and Italy (*Un po più di luce sugli avvenimenti del 1866*, Florence, 1873) incurred the denunciation of Prince Bismarck and the censure of the Italian government, in consequence of which La Marmora did not publish the second volume of this work, but defended himself in a work entitled *I segreti di stato nel governo costituzionale* (Florence, 1877). He died in Florence, Jan. 5, 1878. Consult Chiala, *Le général La Marmora et l'alliance prussienne* (Paris, 1878), and Massari, *Il generale Alfonso La Marmora, ricordi Biografici* (Florence, 1880).

LAMARQUE, là'märk', JEAN MAXIMIN, COUNT (1770-1832). A French general and statesman, born at Saint-Sever in the Department of Landes. In 1791 he joined the army as a private soldier and rose to be a captain of grenadiers in the famous corps commanded by Latour d'Auvergne (see TURENNE). He was made a brigadier general in 1801, and distinguished himself in the battle of Austerlitz and in the campaigns of Tirol and Naples. Having taken the island and fortress of Capri from the English in 1808, he was made a general of division and rendered brilliant service in the ... Wagram, in Calabria, and in Spair ... parte's return from the island of Elba he made Lamarque commander in chief of the Army of La Vendée, where the insurrection was quelled and the country pacified. In 1815 he was proscribed by the restored Bourbons and retired to Belgium, where he remained until 1818, when he was permitted to return to Paris. In 1828 he was elected to the Chamber of Deputies from Mont-de-Marsar and became an important member of the opposition, being especially noted for his eloquence and disinterestedness. In 1830 he was active in the July revolution and continued to be prominent until his death, which took place June 1, 1832. The presence of armed guards at his funeral incensed the Republicans and led to the insurrection of June 5-6, 1832. Besides many political pamphlets, such as *De l'esprit militaire de la France* (Paris, 1826) and *La vérité toute entière sur le procès d'un maréchal de France* (ib., 1831), Lamarque left some personal memoirs, which were published by his family, *Souvenirs, mémoires et lettres* (3 vols., ib., 1835-36).

LAMARTINE, là'mär'tèn', ALPHONSE DE (1790-1869). A French lyric poet and statesman, born Oct. 21, 1790, at his father's estate at Milly, near Mâcon, in Burgundy. The poet was reared in an atmosphere of Catholic piety and of ardent devotion to royalty. He seems to have felt very early the beauty of external nature. Lamartine's education was at first intrusted to a priest. Later he attended several not very good schools, and he gathered knowledge by desultory reading and by his own observation, either in France, in Italy, or in the Orient. On the fall of Napoleon he joined the Garde Royale, which he soon quitted. In 1820 he published his *Méditations poétiques*, which struck a note new to French poetry. With *Le lac*, *L'Automne*, *La prière*, *L'Immortalité* we catch the first harmonies of the romantic lyric. A great deal of interest has been manifested recently in the relations of Lamartine to Madame Charles, who inspired *Le lac* and whom Lamartine sang under the name of Elvire. In form the *Méditations* were as lacking in precision as

was the character of Lamartine. Technical flaws are still more numerous in the *Nouvelles méditations* (1823) and in the *Harmonies* (1829). In *Jocelyn* (1836), an epic idyl in Alexandrines, we have the story of a youth who by sacrificing everything that most men desire attains peace of soul. In *La chute d'un ange* (1838) the angel Adar leaves heaven that he may live on earth with Daïdha, a daughter of the Giants. With the *Recueils* (1839) Lamartine returns to the manner of 1820, adding nothing to the theme. In 1820 he had married at Chambéry an English girl, Miss Birch. Soon afterward he went to Italy on diplomacy, and there he had experiences embodied in *Graziella* (1852), an elegy in prose, ending in a poem. In 1829 Lamartine was elected to the Academy. With the year 1830, in which appeared the *Harmonies poétiques et religieuses*, the diplomatic career of the poet, who had been employed in various legations in Italy, came to an end. He tried to get a seat in the Chamber, but failing, he with his wife and daughter set sail in 1832 at Marseilles for the Orient, a pilgrimage of 18 months, which resulted in the *Souvenirs, impressions, pensées et paysages pendant un voyage en Orient* (4 vols., 1839). Lamartine, who during his absence had been elected to the Chamber as deputy from Bergues, Le Nord, took his seat soon after his return from the East. He at once commanded attention by his eloquence and gradually drifted towards Republicanism. In 1847 he came out with his *Histoire des Girondins*, a work of slight historical value, but whose brilliant rhetoric helped to bring about the revolution of 1848. After the February upheaval Lamartine was a member of the provisional government and Minister of Foreign Affairs and represented 10 departments in the Constituent Assembly, enjoying for a few months an immense popularity, which, however, he lost through the insurrection in June. His lame apology was made in *Trois mois au pouvoir* (1848) and in *the Histoire de la révolution de 1848* (1849). Lamartine told about his youthful emotions in the *Confidences* (1849) and in the *Nouvelles confidences* (1851), but the same notes had been struck 30 years before; taste had changed, and he failed to awaken any sympathy. About this time Lamartine's extravagant habits brought him to financial ruin. To better his fortune he wrote history voluminously—*Histoire de la restauration* (8 vols., 1852), *Histoire de la Turquie* (8 vols., 1854-55), *Histoire de la Russie* (2 vols., 1855)—all works of little worth. Lamartine had no fitness for such work; he was preëminently a poet. Napoleon III, in 1867, gave him the income of 500,000 francs. His body was buried at Saint-Point, near Mâcon.

Lamartine's Works appeared in 40 volumes (1800-66). Among the more recent of many Lives and critical studies of Lamartine are: Faguet, *XIXème siècle* (Paris, 1885); Pomairols, *Lamartine, étude de morale et d'esthétique* (ib., 1889); Chamborant de Périssat, *Lamartine inconnu* (ib., 1891); Reyssie, *La jeunesse de Lamartine* (ib., 1892); Deechanel, *Lamartine* (ib., 1893); Rod, *Lamartine* (ib., 1893); Brunetière, *Evolution de la poésie lyrique*, vol. i (ib., 1894); Lemaître, *Contemporains*, vol. vi (ib., 1895). On Lamartine as a statesman, consult: Ronchaud, *La politique de Lamartine* (Paris, 1878); Voglié, *Heures d'histoire* (ib., 1893). There is an English Life by Lady Maynet Domville (London, 1888). For Madame Charles

or the *Elvire* of the *Méditations*, see France, *L'Elvire de Lamartine* (ib., 1893); important and more precise documents have been recently incorporated: R. Doumic, *Lettres d'Elvire à Lamartine* (Paris, 1905), and L. Séché, *Lamartine de 1816-1830, Elvire et les Méditations* (ib., 1905); E. Sugie, *Lamartine* (ib., 1910); P. de Lacretelle, *Les origines et la jeunesse de Lamartine* (ib., 1911).

LAMAS, lá'más, ANDRÉS (1817-91). A Uruguayan statesman and historian. One of the most versatile men that the Americas have thus far produced, he served his country well as soldier, statesman, diplomat, statistician, author, jurisconsult, bibliophile, numismatist, antiquarian, and thinker. From 1839 to 1849 he was Prefect of Montevideo. Later he was Minister of Finance and at various times subsequently acted as Minister to Brazil and to the Argentine Republic. He devoted himself also to the study of South American history, was one of the founders of the Historical Institute of Montevideo, and gradually gathered together a large and valuable collection of manuscripts illustrative of the subject. The latter have been published in part as *Colección de obras, documentos y noticias para servir á la historia del Río de la Plata*.

LAMB, LADY CAROLINE. See MELBOURNE, WILLIAM LAMB.

LAMB, CHARLES (1775-1834). An English essayist and critic. He was born in London, Feb. 10, 1775, and received his education at Christ's Hospital School. An impediment in his speech debarred him from a university appointment, and he left school in 1789 to take a small clerkship under his elder brother in the South Sea House. In 1792 a friend procured him an appointment in the accountant's office of the East India House, a post which he held for 33 years. Insanity, inherited from the mother, cast a gloom over the family life, showing itself once in Charles, who in his twenty-first year was confined in an asylum for a few weeks, and frequently in his sister Mary Ann (born 1764), who in 1796 was suddenly seized with acute mania and stabbed her mother to the heart. This tragedy prevented Charles from marrying Ann Simmons, the "gentle maid" who is alluded to in several sonnets and under the name of Bartram in *Dream Children*. The rest of his life was devoted to his unfortunate sister, whom he refused to place permanently in confinement. In her periods of health she was of great assistance to him in his literary work. Lamb's first published efforts were four sonnets contributed in 1796 to the volume *Poems on Various Subjects* by Coleridge, his old schoolfellow and devoted friend. In 1797 Coleridge published a second edition of his *Poems*, to which Lamb and his friend Charles Lloyd contributed; and in 1798 Lamb and Lloyd issued *Blank Verse*, in which first appeared the exquisite lines entitled "Old Familiar Faces." Lamb did not acquire fame by these poems nor by the tale *Rosamund Gray* (1798), the drama *John Woodvil* (1802), or the farce *Mr. H.* (performed Dec. 10, 1805). In 1807 he received a commission from William Godwin to contribute to his "Juvenile Library." For this series he and his sister wrote their *Tales from Shakespeare* (1807), Mary doing the comedies and Charles the tragedies. This was his first real success and led the next year to the *Adventures of Ulysses*, which Charles wrote single-handed out of Chapman's *Homer*. In 1808

he published *Specimens of English Dramatic Poets Contemporary with Shakespeare*, which was a revelation to his generation, almost totally ignorant of these great writers, and which established his reputation as a critic of rare taste. A collection of his miscellaneous writings in prose and verse appeared in 1818. In 1820 he was invited to join the staff of the *London Magazine* and contributed, as the first of a series of light prose essays, a description of the old South Sea House, signing himself Elia, the name of an old fellow clerk. This and the papers following it, the finest of their kind in the English language, appeared in collected form as *Essays of Elia* (1823) and *Last Essays of Elia* (1833). In 1825 Lamb was retired from his clerkship on account of failing health, and he received a pension of £441 a year, upon which he and his sister removed first to Enfield and finally to Edmonton; but Mary's increasing insanity, separation from literary friends, and the death of Coleridge in 1834 combined to surround the last years of the genial author's life with melancholy. He yet continued to write considerably. To this time belong "Popular Fallacies" (1826) and the beautiful lines on the death of Hood's first child, entitled "On an Infant Dying as Soon as Born" (1828). Lamb died at Edmonton, Dec. 27, 1834. Mary Lamb outlived him nearly 13 years, dying in May, 1847. Lamb belongs to a group of essayists and critics of which the other chief members are Hazlitt and Leigh Hunt. Though he was not so productive as either of his contemporaries, his work is of a finer quality. Time has taken nothing from the charm of the *Essays of Elia*, and in appreciative criticism Lamb is still one of the masters. One of the delights of all his works is the revelation of himself, his pathos, and his humor.

Bibliography. *Letters of C. Lamb, with a Sketch of his Life*, edited by T. N. Talfourd (London, 1837; new ed., ib., 1849), to which he added *Final Memorials* (ib., 1850); the critical biography by Alfred Ainger, in "English Men of Letters Series" (ib., 1882), *Complete Works and Correspondence*, edited by Alfred Ainger (6 vols., ib., 1883-88); *The Lambs, their Lives, their Friends, and their Correspondence*, edited by W. C. Hazlitt (ib., 1897), *Lamb and Hazlitt: Further Letters and Records*, edited by W. C. Hazlitt (ib., 1900); *Works of Charles Lamb and of Mary Lamb*, edited by William Macdonald (12 vols., New York, 1903), Bertram Dobell, *Sidelights on Charles Lamb* (ib., 1903); *Letters: Newly Arranged, with Additions by Alfred Ainger* (2 vols., London, 1904), E. V. Lucas, *Life of Charles Lamb* (2 vols., New York, 1905); id. (ed.), *The Works of Charles and Mary Lamb* (7 vols., ib., 1905, 6 vols., ib., 1913); *Bibliography of the Writings of Charles and Mary Lamb*, compiled by J. C. Thomson (Hull, 1908).

LAMB, CHARLES ROLLINSON (?-). An American artist, born in New York. His brother Frederick and he became known for their work in ecclesiastical art in the Lamb Corporation, which they controlled, for their work in behalf of civic improvement and other artistic movements. Trained as an architect and at the Art Students' League, New York, Charles Rollinson Lamb designed the impressive Dewey Arch, erected in Madison Square, New York, in honor of Admiral Dewey's return (1899), and the Court of Honor at the Hudson Fulton Celebration in 1909. As specialties he devoted most time to religious architecture and to memorial

and historical art. He became vice president of the American Fine Arts Society and was at one time president of the Art Students' League and of the Municipal Art Society of New York.

FREDERICK STYMETZ LAMB (1863-). An American mural painter and designer of stained glasses. He studied at the Art Students' League under Sartain and Beckwith, at the Beaux-Arts, Paris, under Lefèvre and Boulanger, and modeling under M. Millet. He became a member of the National Sculpture Society and of the National Society of Mural Painters and was chosen secretary of the National Arts Club. Gold medals were awarded him at the Atlanta Exposition in 1895 and at the Paris Exposition in 1900. Good examples of his work are a series of historic windows in Plymouth Church, Brooklyn, and a mural decoration, "Conference of General Washington before the Battle of Long Island," Public School No. 5, Brooklyn. In addition he lectured and wrote on civic art.

ELLA CONDIE LAMB (?-). The wife of Charles R. Lamb. She became chiefly known as a mural painter and designer of stained glasses and mosaics. Born in New York, she studied under William Chase, Walter Shirlaw, and C. Y. Turner, in England under Sir Hubert Herkomer, and in Paris under Collin and Courtois. She became a member of the National Society of Mural Painters and received a gold medal at the Atlanta Exposition in 1895. Good examples of her mural decorations are: "The Open Book," Governor Flower Memorial Library, Watertown, N. Y.; the Governor Baldwin Memorial, St. John's Chapel, Detroit, the Sage Memorial figures of Arts and Sciences, Cornell University; and the Russell Memorial, Wells College.

LAMB, DANIEL SMITH (1843-). An American physician, born in Philadelphia. He studied medicine at Georgetown University, served in the Civil War as a private and then in the military hospitals at Alexandria, Va., became assistant surgeon at the Army Medical Museum in 1868, and in 1892 was appointed pathologist in the latter institution. After 1873 he was professor at Howard University, first of materia medica and then of anatomy, and from 1894 to 1900 he held the chair of general pathology in the United States College of Veterinary Surgeons. He conducted post-mortem examinations of President Garfield, Henry Wilson, Senator Preston Smith Brooks, and Garfield's assassin, Guiteau. A member and officer of various medical and other scientific societies, Lamb edited the *Washington Medical Annals* and published a *History of the Medical Department of Howard University* (1900), besides monographs on medical, sanitary, and anthropological subjects.

LAMB, HORACE (1849-). An English mathematician and physicist, born in Stockport. He was educated at Owens College, Manchester, and at Trinity College, Cambridge, of which he was fellow and assistant tutor in 1872-75. After being professor of mathematics for 10 years at the University of Adelaide, Australia, he returned to England in 1885 and became professor of mathematics at Owens College. He became a fellow of the Royal Society in 1884 and was Royal medalist in 1902 and vice president of the society in 1909-10. Lamb wrote, besides papers for scientific periodicals, *The Mathematical Theory of the Motion of Fluids* (1878); *Hydrodynamics* (1895; 3d ed., 1906); *Infinitesimal Calculus* (1897; 3d ed., 1907); *Dynamical*

Theory of Sound (1910); *Statics, Including Hydrostatics and the Elements of the Theory of Elasticity* (1912).

LAMB, JOHN (1735?-1800). A Revolutionary soldier, born in New York. In his early years he worked with his father, a skillful optician, and in 1760 he became a wine merchant. He was a prominent member of the Sons of Liberty and conducted much of the correspondence with similar bodies in other cities. He was conspicuous in resistance to the Stamp Act and went to Philadelphia to urge a firm stand against that measure. In July, 1775, he was commissioned a captain of artillery, and on August 23, acting under orders from Congress, removed the cannon from the Battery in New York. He took part in the expedition under General Montgomery against Montreal and Quebec and at the latter place led the van of the storming party and was seriously wounded and taken prisoner. Before his exchange he was promoted to be major and afterward became a colonel. He was in command of West Point at the time of Arnold's treason. After the close of the war he was a member of the Assembly and was appointed collector of customs at New York. He opposed violently the adoption by New York of the Federal Constitution, but nevertheless was continued in his office by Washington. He was ruined by a defaulting clerk and died in poverty. Consult Leake, *Memoir of the Life and Times of General John Lamb* (Albany, 1850).

LAMB, MARTHA JOANNA READE NASH (1829-93). An American historian, born at Plainfield, Mass. Though born and brought up in Massachusetts and for some years a resident of Chicago, she spent most of her active life in New York City (1866-93). From 1883 till her death she edited the *Magazine of American History*, in which she published many of her own essays. Her chief book, the *History of the City of New York* (2 vols., 1877-81), was the valuable result of about 15 years of patient labor and research. Other volumes worthy of citation are *The Homes of America* (1879) and *Wall Street in History* (1883).

LAMB, MARY (ANN). See LAMB, CHARLES.

LAMB, WILLIAM, LORD MELBOURNE. See MELBOURNE, WILLIAM LAMB.

LAMBESA. See LAMBESSA.

LAMBALLE, lān'bāl', MARIE THÉRÈSE LOUISE DE SAVOIE-CARIGNAN, PRINCESS OF (1749-92). A friend of Queen Marie Antoinette. She was born at Turin, the daughter of Prince Louis Victor Amadeus of Carignan. She married in 1767 the Prince de Lamballe, who soon after died a victim of debauchery. Timid, tender, and self-sacrificing, the young widow became the devoted friend and chosen companion of Marie Antoinette, who appointed her superintendent of the royal household, and as an innocent agent in the Queen's intrigues incurred the bitter hatred of the populace. After a short estrangement, when the Countess de Polignac supplanted her in the favor of the Queen, Marie Antoinette turned again to her former friend, whose salon became the meeting place of the Queen and those members of the assembly of notables whom the Queen sought to win over. The Princess of Lamballe fled to England after the attempted flight of the royal family in June, 1791, but rejoined the Queen in November. After Aug. 10, 1792, she received permission to share the captivity of the Queen, but was soon separately immured in the prison of La Force. On

September 3 she was brought before the Tribunal and commanded to swear that she loved liberty and equality and hated the King, the Queen, and royalty. "The first oath," she replied, "I will swear, but the rest I cannot; my heart rebels against it." "Let madame go!" said the president, and at this two men conducted her to the door, where she was torn to pieces by the mob, who paraded her head on a pike under Marie Antoinette's windows at the Temple. A royalist legend praised her behavior in her last hours, but more reliable sources depict her in a state of complete collapse at her trial. Some of her letters are published in volume xxxix of *La révolution française* (Paris, 1900). Consult: Comte de Lescare, *La princesse de Lamballe* (Paris, 1864); G. Bertin, *Mme. de Lamballe* (ib., 1888); Austin Dobson, *Four French Women* (London, 1890); B. C. Hardy, *Princesse de Lamballe* (ib., 1908).

LAMBAYEQUE, lām'bā-yā'kā. A maritime department in northwest Peru, bounded by the Department of Piura on the north, Cajamarca on the east, Libertad on the south, and the Pacific Ocean on the west (Map: Bolivia, B 5). Its area is estimated at 4615 square miles. The greater part consists of a coastal plain with a number of low ridges running down from the cordillera, which also traverses the northeastern part of the department. The soil, except along the river courses, is mostly arid. The chief agricultural products are sugar, tobacco, cotton, and rice. Some good grazing land is found on the mountain slopes. Pop. (est.), 127,000. Capital, Chiclayo.

LAMBAYEQUE. A city of the Peruvian department of the same name, situated on the river Lambayeque, about 6 miles from the sea (Map: Bolivia, A 5). It has manufactures of cotton and woolen goods, is connected by rail with the seaport of Pimentel and is of considerable commercial importance. Pop. (est.), 8000, including many negroes and Chinese coolies.

LAMBEAUX, lām'bō', JEF (JOSEPH MARIE THOMAS) (1852-1908). An eminent Belgian sculptor. He was born at Antwerp, studied at the academy under Geefs, and was early apprenticed to a wood carver. Owing to his great poverty, his early works were executed to please popular taste and were chiefly humorous. He later studied at Paris, whence he sent home "The Kiss" (1881, Antwerp Museum), his first important group. It established his reputation and won him a stipend for a journey to Italy, where he studied the great Florentine sculptors, particularly Jean Boulogne. His chief inspiration, however, was drawn from the great Flemish masters. His style is pictorial rather than plastic, his combinations of line are often startling, and his compositions, often too crowded, throb with exuberant life and impassioned movement. Among important works by him are: "The Wild Song" (1884); "The Brabo Fountain," in front of the Hôtel de Ville, Antwerp; "Drunkenness"; "The Bitten Faun"; "The Robber of the Eagle's Nest"; and the busts of the poet Conscience and Burgomaster Buls of Brussels. His last work, one of the most striking productions of modern sculpture, is the colossal bas-relief, "The Passions of Man" (Parc du Cinquantenaire, Brussels)—an assemblage of surging figures, typifying the struggle between good and evil.

LAMBECK, lām'bēk, or **LAMBECCIUS**,

lām'bēk'tai-us, PETER (1628-80). A German scholar, born at Hamburg. He was educated at Hamburg, Amsterdam, Paris, and Rome. In 1651 he was made teacher of history in the Gymnasium at Hamburg and in 1660 its rector. After joining the Catholic church in 1662 he went to Vienna, where he was appointed librarian of the Imperial Library (1665). His works include: *Commentarii de Bibliotheca Cæsarea Vindobonensi* (1655-79); *Rerum Hamburgensium Libri* (1653-61); *Syntagma Antiquitatum Constantinopolitanarum* (1655); *Platina Historia Urbis Mantuæ* (1675); and the really valuable *Prodromus* of the uncompleted *Historia Literaria* (1710), the opening part of a literary history of the world.

LAMBERT, ALEXANDER (1862-) An American pianist, born in Warsaw, Poland. His musical instruction was begun in 1872 by his father, who was an accomplished musician. In 1876 he was sent by the advice of Rubinstein to the conservatory at Vienna, where he studied for four years under Epstein, graduating in 1880. After another period of study, part of which was spent with Urban at Berlin, he went in 1881 to New York, where he gave a series of concerts. Returning to Europe, he made a concert tour through Germany and Russia and then resumed his studies under Liszt at Weimar. In 1884 he returned to America, where for several seasons he played in concert. From 1888 to 1906 he was director of the New York College of Music. He composed considerable music, but is best known as a remarkably successful teacher and for his arrangement of a valuable *Systematic Course of Studies* (6 vols., 1892).

LAMBERT, lām'bār', EUGÈNE LOUIS (1825-1900). A French animal painter, born in Paris and often called "Lambert des chats" on account of his fondness for painting cats. He was a pupil of Delacroix and Delaroche. His first Salon picture was hung in 1847, and his early work was with birds and still life; but he struck his keynote in "Cat and Parrot" (1857). His paintings abound in the United States. Typical examples of his work are "Cat and Kittens," in the Metropolitan Museum, New York, and "Family of Cats," in the Luxembourg. He designed fascinating illustrations for Cherville's *Chiens et chats* (Paris, 1889).

LAMBERT, lām'bärt, FRANZ, or LAMBERT OF AVIGNON (c.1486-1530). A German Protestant reformer. He was born in Avignon, became a Franciscan friar at an early age, was ordained a priest, and preached with success. In 1522, having been refused permission to join the Carthusians, he embraced the doctrines of the Reformers. He threw aside the garb of his order and began to preach the Reformed faith in Germany and Switzerland. He joined Luther in 1523 at Wittenberg and thence proceeded to Metz and Strassburg. A Protestant academy having been established at Marburg, he became its first professor of theology. He propounded a scheme for the government of the churches by a synod, which was too democratic for the approval of the Lutheran authorities. In 1529 he took part in a general conference of theologians held at that place from the different German provinces. On the whole, his theology was rather Zwinglian than Lutheran. Consult his *Life* by Baum (Strassburg, 1840), Hassenkamp (Elberfeld, 1860), Ruffet (Paris, 1873).

LAMBERT, JOHANN HEINRICH (1728-77). A German philosopher, astronomer, and mathe-

matician, born at Mülhausen in Alsace. He was the son of a poor tailor and obtained his education by his own exertions. At 16 years of age he discovered, in computations for the comet of 1744, the so-called "Lambert's theorem." In 1746 he was made secretary to the philosopher Iselin in Basel, and two years later he became tutor in the family of Count Salis at Chur. In 1756 he began extended travels with his pupils and thus made the acquaintance of many learned men. Three years later he was made professor in the Munich Academy, and in 1765 he became a member of the Academy of Berlin. He wrote extensively on various subjects. His philosophical studies at first claimed the interest of Kant, with whom he corresponded. His *Neues Organon* (1764), in particular, sought the establishment of a philosophical system which, by its investigation of the theory of knowledge, or the power of the understanding to recognize truth, was in opposition to the current method of Wolff. The expectation thus aroused were disappointed by his *Anlage zur Architektonik* (1771), which, though it postdated Kant's dissertation *De Mundi Sensibilibus et Intelligibilibus Forma et Principiis* (1770), adhered to the old scheme of ontology. In physics he did notable work in photometry, pyrometry, and hygrometry, devising original apparatus and methods. In astronomy he was the author of views held to-day concerning the nature of the fixed stars, especially the Milky Way. His contributions to mathematics were the series which bears his name, the conception of the hyperbolic function, and the demonstration of the incommensurability of π . Parts of his works served as starting points for Lagrange and Gauss. His principal works are the following: *Die freie Perspective* (German and French, 1759; 2d ed., 1774); *Beschreibung und Gebrauch der logarithmischen Rechenstäbe* (1761, 1772); *Beiträge zum Gebrauche der Mathematik und deren Anwendung* (4 vols., 1765, 1770, 1772); *Kurzgefasste Regeln zu perspectivischen Zeichnungen* (1768, 1770); *Zusätze zu den logarithmischen und trigonometrischen Tabellen* (1770). Consult: Huber, *Johann Heinrich Lambert nach seinem Leben und Wirken* (Basel, 1829), which contains a list of his writings; Lepsius, *Johann Heinrich Lambert, eine Darstellung seiner kosmologischen und philosophischen Leistungen* (Munich, 1881); Rudio, *Archimedes, Huygens, Lambert und Legendre* (Leipzig, 1892); Otto Baensch, *Lamberts Philosophie und seine Stellung zu Kant* (Tübingen, 1902); Friedrich Schur, *Johann Heinrich Lambert als Geometer* (Karlsruhe, 1905).

LAMBERT, JOHN (1619-83). An English Parliamentary general. He was born at Kirkby Malham in Yorkshire, Sept. 7, 1619; was educated for the law, but on the outbreak of the Civil War became a captain under Fairfax. He fought with conspicuous bravery at Marston Moor, at Naseby, in Scotland, and at Worcester, and in the years of the Commonwealth was, perhaps, second to Cromwell in political influence. He was one of the principal authors of the *Instrument of Government* and favored a representative democracy or a limited monarchy as against an oligarchy. After the death of the great Protector he became the head of the cabal of malcontent officers who overthrew the feeble administration of Richard Cromwell. Lambert, as the leader of the Fifth Monarchy, or extreme Republican party, suppressed with considerable vigor the Royalist insurrection in Cheshire, Au-

gust, 1659; and two months afterward, dismissing the remnant of the Rump Parliament, virtually governed the country along with his officers, under the title of the Committee of Safety. For a brief period his position was considered so important that Charles II was advised to make terms with him by marrying his daughter. The counterplot of Monk, however, frustrated his designs and on April 22, 1660, he was taken prisoner by Colonel Ingoldsby, tried in 1662, and banished to the Isle of Guernsey. On the discovery of a plot for his escape in 1667, he was sent to Drake's Island, Plymouth Sound, where he died in 1683. He was a capable general, distinguished by personal bravery and clemency to his opponents, and was familiarly called Honest John Lambert by his associates.

LAMBERT, JOHN (c.1775-?). An English traveler, who sojourned in North America (1806-09). His scheme of introducing hemp culture into the British colonies was not a success, but his explorations of "those parts rendered interesting by the glories of a Wolfe and a Washington" were more fortunate, and his book, *Travels through Lower Canada and the United States of North America in the Years 1806, 1807, and 1808* (3 vols., 1810), is particularly broad-minded in tone. Lambert also edited Washington Irving's *Essays* (2 vols., 1811), with a lengthy preface. His later years were lived in obscurity.

LAMBERT, LOUIS A. (1835-1910). An American Roman Catholic clergyman, born at Allenport, Pa. He was educated at St. Vincent's College and at the Diocesan Seminary at St. Louis. Ordained a priest in 1859, he was chaplain of the Eighteenth Illinois Infantry during the Civil War. Afterward he served as professor of normal theology and philosophy at the Paulist Novitiate. His side of the controversy in which he and Robert G. Ingersoll were involved in the early eighties was published as a book, and his reply to one of Ingersoll's disciples appeared as the pamphlet *Tactics of Infidels*. Bishop McQuaid of Rochester, who had refused to assign Dr. Lambert to a parish in his diocese, was overruled by a decision of the Pope. Lambert then received the rectorship of the church of the Ascension at Scottsville, N. Y., where he remained until his death. For many years he edited the *Freeman's Journal*.

LAMBERTI, lām-bĕr'té, NICCOLÒ. See NICCOLÒ OF AREZZO.

LAMBERTON, BENJAMIN PEFFER (1844-1912). An American naval officer, born in Cumberland Co., Pa. In 1864 he graduated from the United States Naval Academy. He served in the closing operations of the Civil War, was a member of the Bureau of Equipment in 1879-82, and was lighthouse inspector of the sixth district in 1885-88 and of the fifth district in 1894-98. For his services as chief of staff under Commodore Dewey in the battle of Manila Bay he was advanced seven numbers in rank, becoming captain of Dewey's flagship *Olympia*. He was a member of the Naval Examining and Retiring Board in 1900 and of the Lighthouse Board in 1900-03, became rear admiral in 1903, commanded the South Atlantic squadron in 1903-04, was a member of the Naval War College in 1904, was chairman of the Lighthouse Board in 1905-08, and retired in 1906.

LAMBERTVILLE. A city in Hunterdon Co., N. J., 16 miles northwest of Trenton, on the Delaware River, the Delaware and Raritan

Canal, and the Pennsylvania Railroad (Map: New Jersey, C 3). It has good water power and among its industrial establishments are a tomato cannery, rubber mills, paper mills, stone quarries, foundry and machine shops, flouring mills, and manufactories of pottery, hairpins, wire novelties, etc. There is a public library. First incorporated in 1849, Lambertville is now governed under a revised charter of 1904, which provides for a mayor, elected every two years, and a common council. The city is situated on the site of the ferry on the old York Road from Philadelphia to New York and was known formerly as Coryell's Ferry and later as Georgetown. Pop., 1900, 4637; 1910, 4657.

LAMBERT VON HERSFELD, lām'bért fŏn hĕrs'fĕlt (died c.1088). A German historian of the eleventh century, born probably in Thuringia. Having received a superior education, he entered the Benedictine monastery at Hersfeld in 1058, in the same year was ordained priest, and made a pilgrimage to the Holy Land. His reputation as one of the best mediæval writers is based upon his principal work, the *Annals*, first printed in 1525 (new ed., Hanover, 1874, trans. into Ger. by Hesse, Leipzig, 2d ed., 1893), a history of the world from the earliest times to 1077, only the period from 1039 on, however, showing an independent treatment in giving a comprehensive and well-arranged account of contemporaneous events, told with great clearness and grace of style. An admirer and staunch adherent of Pope Gregory VII, he did not spare Henry IV. He was also the author of *Carmen de Bello Saxonico*, edited by Pannenberg (Göttingen, 1892). Consult *Lambert von Hersfeld und die deutsche Geschichtsschreibung* (Cassel, 1896), and the article in the *Allgemeine deutsche Biographie*, vol. xvii (Leipzig, 1883).

LAMBERVILLE, lām'bār'vĕl', JEAN DE (?-1699). A French Jesuit missionary to the Iroquois Indians of North America. He settled at Onondaga, their chief village, in 1671, having by that time been about three years in Canada, and he became a powerful agent for keeping his savage flock friendly to the French. By extending his influence to the mighty Senecas, he was enabled to frustrate the designs of Governor Dongan, of New York, who strove to hold the Iroquois League an ally of the English. Père Lambertville had good backing while Frontenac was Governor at Quebec, but when the latter was replaced by weaker men, the life of the missionary was endangered by the treacherous seizure of Iroquois who had crossed to Cataract (now Kingston), Ontario, for a peaceable conference, and he had to make his escape (1687). He died in France, and his younger brother, Jacques, succeeded him among the Onondagas, but he, too, was forced to fly (1709), and the mission was abandoned. Consult *The Jesuit Relations*, edited by R. G. Thwaites (Cleveland, 1896-1901).

LAMBÆSA (ancient *Lambæsa*). A town in Algeria, 7 miles southeast of Batna and 17 west of Timgad. The town has a great convict establishment, which dates from about 1850. It is, however, chiefly interesting because of its Roman remains. These include a triumphal arch to Septimius Severus, another to Commodus, temples (to Jupiter, Juno, and Minerva, another to Æsculapius), aqueducts, an amphitheatre, baths, and remains of private houses. Remains have been found, too, of a great Roman

camp 1640 feet by 1476; within this are ruins of a fine building dating from 286 A.D. In volume vii of the *Corpus Inscriptionum Latinarum* appear 4185 inscriptions from the ruins of Lambæsa; 2500 of these relate to the camp. The camp dates from the time of Hadrian, 123-129 A.D. Till 392 a legion was quartered there; on its withdrawal the decline of the town began. Consult: Boissier, *Roman Africa* (New York, 1899; see Index, s.v. *Lambèse*); Gsell, *Les monuments antiques de l'Algérie* (Paris, 1901); Graham, *Roman Africa* (London, 1902); Gsell, *L'Algérie dans l'antiquité* (Paris, 1903); Bouchier, *Life and Letters in Roman Africa* (Oxford, 1913).

LAMBETH. A metropolitan borough of London, in Surrey, on the south bank of the Thames, 1¾ miles southwest of St. Paul's Cathedral and opposite Westminster, with which it is connected by four bridges. Area, 6¼ square miles. Pop., 1901, 301,895; 1911, 298,058. It includes the four districts of Vauxhall, Kennington, Norwood, and Brixton. Its most interesting building, Lambeth Palace, with the parish church, has been the metropolitan residence of the Archbishop of Canterbury since 1197 and contains a fine portrait gallery and a library with 30,000 volumes and valuable manuscripts. Other noteworthy features are St. Thomas's Hospital, several benevolent institutions and fine public buildings: the Surrey Zoological Gardens, and Brockwell, Wandsworth, and Vauxhall parks, the latter the site of the famous Vauxhall Gardens. The numerous industrial establishments include potteries, glassworks, machine works, and breweries.

LAMBETH ARTICLES. The name given to a statement concerning the doctrines of predestination, justification, and free will drawn up at Lambeth Palace in 1595 by William Whitaker, master of St. John's College, Cambridge, and others who agreed with him in holding Calvinistic views. They were approved by Archbishop Whitgift and sent to Cambridge with direction that the scholars should conform to them, but were recalled by order of Queen Elizabeth. The articles are nine in number and strongly Calvinistic in tone. Consult Schaff, *Creeds of Christendom* (New York, 1881), and Curtis, *History of Creeds and Confessions* (Edinburgh, 1911).

LAMBETH CONFERENCE. A gathering of all the bishops of the Anglican communion, held at Lambeth Palace, the official residence of the Archbishop of Canterbury, and under his presidency. The idea of such an assembly was suggested as early as 1851 by Bishop Hopkins, of Vermont; but the first formal request to call it was made by the Canadian bishops in their provincial synod of 1865, the desire growing out of the disquiet caused by the complications of Bishop Colenso's case. Archbishop Longley issued the first invitation in 1867, and it was accepted by 76 bishops. The second conference was held in 1878, in response to the demand of those who realized the usefulness of the first; this time 100 bishops met, under Archbishop Tait. In 1888, under Archbishop Benson, 145 were present; and in 1897 Archbishop Temple presided over 194. In 1908, under Archbishop Davidson, 241 met. The conference does not pretend to legislate or to formulate doctrine; but its value as a means for the interchange of counsel on problems of the day has been so generally felt that it is likely to continue at intervals of approximately 10 years. Its most important single act has

been the promulgation of a basis for the establishment of Christian unity in 1888, known as the Lambeth Quadrilateral—the Holy Scriptures, the Apostles' and Nicene creeds, the two sacraments, and the historic episcopate. A full official report of the origin and the proceedings of the first three meetings has been published by Dr. Davidson, who became Archbishop of Canterbury in 1903, *The Lambeth Conferences of 1867, 1878, and 1888* (London and New York, 1889); *Conference of Bishops of the Anglican Communion* (London, 1897, 1908).

LAMBETH DEGREES. See DEGREES, LAMBETH.

LAMBIN, lām'bān', DENYS. See LAMBINUS, DIONYSIUS.

LAMBINUS, DIONYSIUS (DENYS LAMBIN) (1520-72). A French classical scholar. He was born at Montreuil-sur-Mer in Picardy and studied at Amiens and for several years in Italy. From 1561 he was professor of Latin and Greek at the Collège Royal in Paris and won fame by his editions of classical authors, especially of Horace (1561), Lucretius (1563), Cicero (1566), Nepos (1569), Demosthenes (1570), and Plautus (published after his death, in 1576). These profound works have formed the basis of unnumbered modern editions. Consult the preface to Munro's edition of Lucretius (4th ed., London, 1898), and Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

LAMB'KILL. A North American evergreen shrub. See KAIAIA.

LAMBREQUIN, lām'brē-kīn. See MANTLING.

LAMBROS, lām'brōs, SPYRIDION (1851-). A Greek historian, born in Corfu, son of an eminent numismatist. He was educated at Athens, Berlin, and Leipzig. In 1878 he became an instructor in the University of Athens, in 1882-85 was in the Hellenic Ministry of Education in charge of the section on public schools, and in 1887 became professor of ancient history in the University of Athens, of which he was rector in 1904-05. In 1903 he became general secretary of the committee for the Olympic games. Lambros translated into Greek Curtius' *Griechische Geschichte* (1898-1900), Gregorovius' *Geschichte der Stadt Athen im Mittelalter* (1903-04), Maunde Thompson's *Handbook of Palaeography* (1903), etc. He edited *Néos Ἑλληνορνήμων*, a periodical containing material on Greek literature and history from libraries, archives, and monasteries of the Orient. Among Lambros' published books are a history of Athens (1878, in Greek); *Collection de romans grecs en langue vulgaire et en vers* (1880), a six-volume history of Greece (1886-1908, in Greek); *Catalogue of the Greek Manuscripts on Mount Athos* (1895-1901); *Ἀργυροπούλεια* (1909).

LAMBRUSCHINI, lām'brōō-skē'nā, LUIGI (1776-1854). An Italian cardinal, Secretary of State under Gregory XVI. He was born at Genoa, entered the Order of Barnabites while he was very young, and was secretary of Cardinal Consalvi at the Congress of Vienna. In 1819 he was made Archbishop of Genoa and in 1827 was Nuncio to Paris, where he stayed until the revolution of July, 1830. In 1831 he was made Cardinal, and in 1836 succeeded Bernetti as Secretary of State, at a particularly trying time. He was opposed to innovation and did his best to carry out the papal policy of temporal control. He was author of the famous

allocutions in connection with the quarrel between the Bishop of Cologne and Prussia. In 1842 he became Bishop of Sabina and in 1847 of Porto. On the outbreak of the Roman revolution of 1848 he had to flee to Civitavecchia and later to Naples and finally joined Pius IX at Gaeta. He returned to Rome with the Pope in 1850. In the meantime all his real and personal property had been plundered. Among his writings are *Opere spirituali* (1838) and *Sull' immacolato concepimento di Maria* (1843).

LAMBRUSCHINI, RAFFAELLO, ABBÉ (1788-1873). An Italian writer and teacher, born at Genoa. He studied for the priesthood in Rome, where his uncle, Luigi Lambruschini (1776-1854), was Cardinal and Secretary of State. Upon his return to Tuscany he devoted himself to the natural sciences, especially agriculture, and founded the *Giornale Agrario Toscano* (1827). Afterward he opened a school at his villa of San Carboni and put into practice his theories of education. In connection with his work he published *La guida dell' educatore* (1836-44). In 1848 he was a member of Parliament, and after the annexation of Tuscany Victor Emmanuel made him senator (1860). Among his writings are *Libri dell' educazione* (1849) and *Dell' istruzione* (1871).

LAMBS' CLUB, THE. A social club in New York City, composed chiefly of actors, dramatists, and artists. It had its origin in a group of actors, newspaper men, and other Bohemians, who were in the habit of dining together periodically at the United States Hotel in 1873 and 1874. They organized the club in 1874, modeling it after the Lambs' Club of London, founded by John Hare, George Du Maurier, Sir Douglas Straight, and others. The Lambs has escaped the fate of many similar organizations and preserved its distinctively theatrical character through a wise provision of the constitution. Although nonprofessional members are admitted, the constitution limits their number to one-third of the membership. The clubhouse, at 128 West Forty-fourth Street, is a handsome building, one of the chief features of which is its theatre, where the Lambs hold their annual "gambol." The chief executive officer of the club is the Shepherd, the vice president is the Boy, while the officer who manages and directs the club is known as the Collie. Each year at the close of the theatrical season, the club makes a tour of the principal cities with an entertainment made up of the parts of various plays in which its principals have appeared. This tour is a notable event in the theatrical world, closing the year. The net receipts of these trips have been large and have enabled the club to provide itself with its present clubhouse.

LAMBS' LETTUCE. A salad plant. See C'ORN SAIAD.

LAMBTON, JOHN GEORGE, first EARL OF DURHAM. See DURHAM.

LAMEGO, lá-mā'gō. An old town of Portugal, in the Province of Beira, situated amid rocky mountains 3 miles south of the Douro and 43 miles east of Oporto (Map: Portugal, B 2). It has a Gothic cathedral and a bishop's palace, a Moorish citadel, and some Roman baths. It exports wine and hams. Pop., 1900, 9179. It figured conspicuously in the wars between the Moors and the early kings of León and was captured by Ferdinand I of Castile and León in 1057.

LAMELLIBRANCHIA, là-měl-li-brân'ki-â, or **LAMELLIBRANCHIATA**, -brân'ki-â'tâ. See PELECYPODA.

LAMEL/LICORN (from Lat. *lamella*, thin metal plate + *cornu*, horn). A beetle of the family Scarabæidæ, so named because the club of the antenna is composed of three or more joints which are broad, leaflike, and closely appressed so as to have the appearance of one piece. See SCARABÆIDÆ; BEETLE.

LAMENNAIS, làm'nâ', HUGUES FÉLICITÉ ROBERT DE (1782-1854). A French religious and political writer, of great influence in the second quarter of the nineteenth century. He was born at Saint-Malo and educated largely by his uncle, a fervent opponent of the Encyclopædists. The boy, however, was a passionate admirer of Rousseau. His first published work, *Réflexions sur l'état de l'église en France pendant le XVIIIème siècle* (1808), was a vigorous attack on materialistic philosophy. In conjunction with his brother, after the fall of Napoleon, who had suppressed the former work, he produced *La tradition de l'église sur l'institution des évêques* (1814). On Napoleon's return he was obliged to take refuge in England, where he was befriended by Abbé Caron. In 1815 he entered the Seminary of St Sulpice and was ordained priest the following year. His next work—the first volume of his *Essai sur l'indifférence en matière de religion* (1817; Eng. trans., London, 1898)—made his name famous throughout Europe. The second volume (1820) was occupied with the difficult problems of the theory of certitude—that truth can be certified, not by the individual reason, but only a universal consensus of belief—and he sought to find the essence of Christianity in all the religions of history. He expanded his system at greater length in two succeeding volumes (1821-23) and put forward a *Défense de l'essai sur l'indifférence* (1822) against an opposition of increasing violence, in which his old Seminary of St. Sulpice and most of the French bishops joined. He turned from these controversies to equally convinced and eager public action. With Chateaubriand he defended absolute monarchy in the *Conservateur* of 1818-20; in the *Défenseur*, the *Drapeau Blanc*, and the *Quotidienne* he stood with the extreme Royalists. He attacked the remains of the Gallican spirit in the clergy and criticized the University of Paris, the religious orders, and the bishops with a bitterness that did no good. On his visit to Rome in 1824 his friendly reception by Pope Leo XII gave rise to the rumor that he was to be made a cardinal; but, as his ultramontanist had alienated the Gallican bishops, so his democracy soon alienated the Pope.

Upon the accession of Louis Philippe, Lamennais, with Lacordaire (q.v.) and Montalembert (q.v.), established a journal called *L'Avenir*, which boldly demanded liberty of conscience, of education, of the press, free intercourse with Rome, abstinence from government interference in episcopal elections. The paper grew powerful, and the government, which had laughed at it, now threatened it. Lamennais and Lacordaire were prosecuted, and the former threw himself more ardently into opposition. In 1832, after some of his writings had been censured by a synod of southern French bishops at Toulouse, he went to Rome to lay his case before the Pope, but only to find defeat, in the encyclical *Munari Vos*. In obedience to the Pope, he

suspended the publication of *L'Avenir* and professed submission, which, however, he showed in his letters and anonymous articles was far from being thorough, and on Nov. 5, 1833, he spoke out unmistakably in a letter, addressed to the Pope but published at the same time, which made an unequivocal claim to the right of perfect freedom of thought and expression in matters purely political and secular. However, when an answer came from Rome requiring an unconditional submission to the teaching of the encyclical, he finally yielded to the entreaties of his brother and the Archbishop of Paris, and on December 11 signed the required formula. None the less he took occasion to make it known that he had submitted merely for the sake of peace.

It became abundantly clear, in fact, that Lamennais was drifting further away from his old faith, when in May, 1834, he published *Paroles d'un croyant*—in Guizot's phrase, "the words of a believer who has lost his faith." It was nothing less than a formal declaration of war against monarchy and papacy at once, preaching revolution as a sacred duty and looking to the emergence of a new civil society and a new Christianity. Various governments suppressed the book as fast as it was translated, and the Pope condemned it in the encyclical *Singulari Nos* of July 15, 1834. Lamennais' defense appeared under the title *Affaires de Rome* (2 vols, 1836), preaching a combination of deism and democracy as the religion of the future. For *Le pays et le gouvernement* (1840) he was condemned as seditious and punished by a year's imprisonment and a fine of 2000 francs. On his release he pursued his crusade with unrelenting bitterness. Though one of the fundamental dogmas of his religion he endeavored to retain it as a religion of brotherhood, and in his *Esquisse d'une philosophie* (4 vols, 1841-46) threw his ideas into philosophical form. He hailed the revolution of 1848 as the dawn of the new day, and, as a deputy to the Constituent Assembly, drew up a complete plan for a social organization which was to be the salvation of France and of Europe. When it was rejected, he took no further part in public affairs and sunk into deep despondency. The coup d'état of December, 1851, put the "new" stroke to his hopes. He died Feb. 27, 1854, refusing all religious ministrations, and was buried, by his own request, without ceremony in an unmarked grave in Père-Lachaise.

Bibliography. *Œuvres complètes* (2d ed., 10 vols, Paris, 1844-47); *Œuvres posthumes*, edited by Forgues (5 vols, ib., 1855-58); *Œuvres inédites*, edited by Blaize (ib., 1866); *Correspondance* (2d ed., by Forgues, ib., 1864); *Confidences de Lamennais*, edited by Bois de la Villerabel (ib., 1880); *Lettres inédites à Montalembert*, edited by Forgues (ib., 1898); *Essai d'un système de philosophie catholiques* (ib., 1906); *Lamennais et David Richard* (ib., 1909); Renan, *Essais de morale et de critique* (ib., 1854); Scherer, *Études sur la littérature contemporaine* (ib., 1876-83); Sainte-Beuve, *Portraits contemporains* (ib., 1881-82); Kaufmann, *Christian Socialism* (ib., 1888); Dowden, *Studies in Literature* (2d ed., London, 1889); Janet, *La philosophie de Lamennais* (Paris, 1890); Spuller, *Lamennais* (ib., 1892); Gibson, *The Abbé de Lamennais and the Liberal Catholic Movement in France* (London, 1896);

LAMENTATIONS, BOOK OF. See JEREMIAH, LAMENTATIONS OF.

LA MESA, là mã'sa. A town in the Department of Cundinamarca, Colombia, situated on an affluent of the Magdalena, 30 miles west of Bogotá. It lies in a beautiful plain over 4000 feet above the sea, surrounded by coffee and sugar plantations, has a handsome town hall, and an active commerce in cacao, salt, grain, and hats. Pop., 1908, 5237.

LAMETH, là'mét', ALEXANDRE, COUNT DE (1760-1829). A French soldier and politician, brother of Charles Malo François Lameth. He was born in Paris. After serving as aid under Rochambeau during the American Revolution, he returned to France and in 1789 was deputy from Péronne to the States-General. He soon joined the Third Estate, however; aided in the overthrow of the noble and ecclesiastical privileges; and in 1790, as member of the National Assembly, advocated reforms and the abolition of privileges. He was a bitter personal and political enemy of Mirabeau. After the declaration of war with Austria (1792) he was made *maréchal de camp*, but his efforts to moderate the fury of the people were misunderstood, and, accused of treason by the Assembly, he was forced to flee with Lafayette. With the latter he was imprisoned by the Austrians from 1792 to 1795 and was not allowed to return to France until 1800. In 1810 he was made Baron by Napoleon. He held various prefectships under the Empire and later under the Restoration, and from 1819 to 1825 served as leader of the opposition in the Chamber of Deputies. In addition to numerous political and military articles, Lameth published a *Histoire de l'assemblée constituante* (2 vols., 1828-29).

LAMETH, CHARLES MALO FRANÇOIS, COUNT DE (1757-1832). A French general and politician, brother of the preceding. He assisted the American Colonies in their war for independence and while aid under Rochambeau at the battle of Yorktown was seriously wounded. In 1789 he was a member of the States-General. Elected to the National Assembly by the nobility (1791), he declared himself in favor of reforms, but his opposition to Mirabeau brought about his arrest in 1792. He escaped to Hamburg, where, joined by his brother Alexandre, he engaged in commerce (1795-97). Returning to France (1800), he lived in retirement until 1809, when he fought under Napoleon and served as Governor of Würzburg. He later joined the Bourbons, attained the rank of lieutenant general (1815), and was elected deputy in 1827.

LA METTRIE, là me-trè', JULIEN OFFRAY DE (1709-51). A French physician and materialist. He was born at Saint-Malo and, after

studying theology at several Jansenist schools, was educated in medicine at Paris, Rheims, and under Boerhave in Leyden, and in 1742 became physician to the Gardes Françaises. He fought at Dettingen and Fontenoy, but in 1746 was driven from France and then from Leyden on account of his materialistic *Histoire naturelle de l'âme*. He taught that psychical phenomena are due to organic changes in the brain, that the soul perishes with the body, and that true happiness is only gained through the senses. He was well received by Frederick the Great, by whom he was appointed court reader. He wrote *L'Homme machine* (1748), *L'Homme plante* (1748), and *Réflexions sur l'origine des animaux* (1750). His *Ouvrage de Pénélope ou le Machiavel en médecine* (1748) was a general attack on all the great scientists and physicians of his time.

LAMI, là'mé', LOUIS EUGÈNE (1800-90). A French historical and water-color painter, born in Paris. He studied with Gros and Horace Vernet. He was one of the artists selected by Louis Philippe to paint historical scenes for Versailles, which was then being transformed into a national museum, and many of his rather uninteresting works are still there. He taught painting in water colors to the princes and princesses of the Orléans family, was one of the founders of the French Society of Water Color Artists, and became an Officer of the Legion of Honor in 1863. Very attractive are his water-color illustrations for *Manon Lescaut*, *Gil Blas*, *Merimée's Charles IX*, and the *Works of Alfred de Musset*. He left interesting sketches of his extensive European travels. His "Interior of a Museum" is in the Metropolitan Museum, New York.

LA'MIA (Lat., from Gk. *Λαμια*). 1. In Greek mythology, the daughter of Poseidon and mother, by Zeus, of Herophile, the Delphic sibyl. 2. A beautiful Libyan queen whom Zeus loved. Hera in jealousy robbed her of her children. Lamia, in revenge, killed children whenever possible. Hence she was transformed into a hideous monster, who strangled and devoured young children. In the later development the Lamiae were vampires with the power of assuming attractive forms to allure victims, whose flesh they devoured. The Lamiae were used as nursery hobgoblins to terrify children and corresponded to the mediæval witches. This Lamia has been regarded as the feminine counterpart of Lamus, King of the Læstrygones (q.v.). Consult the article "Lamia," in Roscher, *Lexikon der griechischen und römischen Mythologie*, vol. ii (Leipzig, 1890-97). Keats wrote a poem, *Lamia* (1820), in which the bride is made to revert to her original serpent form. 3. A courtesan of Athens, originally a flute player. She acquired great influence over Demetrius Poliorcetes, into whose hands she fell at the battle of Salamis, and long maintained her power through her talents. She was noted for her great extravagance. Temples were dedicated to her under the name of Aphrodite at Athens and Thebes. 4. A town in ancient Thessaly, on the sea, near Othrys. See the next LAMIA; LAMIAN WAR.

LAMIA, or ZITUNI. The capital of the Nomarchy of Phthiotis, Greece, situated near the head of the Gulf of Lamia, 28 miles south of Phersala (Map: Balkan Peninsula, D 5). It is dominated by a mediæval fortress on the site of a more remote structure. Its chief

features are the mosque, bazars, and gardens. The rearing of camels is a distinctive industry. Pop., about 8000. Here, in 323 B.C., Antipater and his army were unsuccessfully besieged by the Athenians under Leosthenes, who was killed during an assault. To the south are the strategic Pass of Thermopylæ (q.v.) and the Bridge of Alamanna, where in 1821 young Diakos and the Bishop of Salona, commanding 700 Greeks, heroically opposed the advance of a Turkish army. The ancient name of Lamia has replaced the name of Zituni, by which it was known during the Turkish domination.

LAMIAN WAR. A war waged in 323 B.C. by the allied states of Greece against Antipater (q.v.). At first Antipater met with reverses and took refuge in the Thessalian town of Lamia, which gave its name to the war. There he was besieged by the Greeks for some months, but finally managed to escape, through the aid of Craterus (q.v.), thus ending the war and bringing the allies into subjection. Leosthenes, the Athenian commander of the Greeks, was killed during the siege.

LAMINA (Lat., thin plate). A thin layer or coat which may be laid over another; or a plate or scale, as a thin layer of minerals, bone, etc. In anatomy, a bone or part of a bone said to resemble a thin plate, as the cribriform plate of the ethmoid bone. In botany the broad thin petal of a flower, or what is called the blade of a leaf, is technically known as a lamina.

LAMINARIA (Neo-Lat., from Lat. *lamina*, thin plate). A genus of brown seaweeds of the family Laminariaceæ, or kelps. The species are widely distributed in the cooler waters of the globe, are common on rocky coasts, and attain a marked development upon the Pacific coast of America. They are marked by a cylindrical stalk of varying length, which expands above into a leaflike structure without a midrib. *Laminaria digitata* is the common tangle of the seacoasts. *Laminaria potatutum* is common in Australia; its hard stalk furnishes material for implements of various kinds. Other species, as *Laminaria bulbosa*, were formerly extensively used by glass and soap makers. *Laminaria saccharina* is a source of mannite. In Japan *Laminaria japonica* and *Laminaria angusta* are important articles of food. A number of species are important sources of iodine. They are also collected for the potash they contain, which make them and other kelps valuable for fertilizers. See PLATE OF HYDROPHYTES.

LAMINATION (from ML. *laminare*, to plate, from Lat. *lamina*, thin plate). The arrangement of sedimentary rocks, such as shales and sandstones, in thin layers or laminae. Lamination indicates interruption in the process of deposition, which may have been occasioned by successive tides, by periodical floods, or by change in the supply of material. Clay deposits frequently show a fine sprinkling of sand on the surface of the layers, which may be further distinguished by their varied colors. It seems probable also that laminated structure is sometimes produced in argillaceous rocks by the pressure of the overlying strata. See GEOLOGY.

LAMISTA, lâ-mě'stâ. A South American tribe. See YAMBO.

LAMIUM. A genus of plants of the mint family. See DEAD NETTLE.

LAMMASCH, lâm'ash, HEINRICH (1853-). An Austrian jurist, born in Seitenstetten, Lower Austria. He was educated at

the University of Vienna, became law lecturer there in 1878, and after teaching at Innsbruck (1885-89) returned to Vienna as professor of international and criminal law. In 1899 he became a member and Conservative leader of the Austrian Upper House and represented Austria in the first Hague Peace Conference. He became a member, and in 1911 president, of The Hague Tribunal and was one of the Venezuela arbitrators in 1903 and president of the boards that decided the Muscat case in 1905 and the Newfoundland fisheries case in 1910. Much of the Austrian penal code is due to him, as a young man he traveled in England and was impressed with English reformatory methods. He wrote: *Moment objektiver Gefährlichkeit im Begriffe des Verbrechensversuche* (1879); *Auslieferungspflicht und Asylrecht* (1884; trans. into French); *Duchstuhl und Beleidigung* (1893); *Grundriss des österreichischen Strafrechts* (1899; 4th ed., 1911); *Rechtskraft internationaler Schiedssprüche* (1913, published by the Nobel Institute); *Schiedsgerichtsbarkeit* (1914).

LAM'MAS DAY (AS. *hlammæsse*, *hläfmæsse*, loaf mass, bread feast, from *hläf*, Goth. *gahlaiba*, OHG. *hlaiba*, Ger. *Laib*, loaf + *mæsse*, OHG. *missa*, *messe*, Ger. *Messe*, mass, from ML. *missa*, mass, from Lat. *missa*, p.p. fem of *mittere*, to send). August 1. It is one of the cross-quarter days, or half-quarter days, in England. On this day, which is the feast of St. Peter ad Vincula, it was customary in early times to make offerings of the first fruits of the harvest.

LAMMENS, lâ'mîns', HENRI (1862-). A Belgian Orientalist. He was born in Ghent, entered the Society of Jesus, and became professor of Arabic literature in the Instituto Biblico at Rome and a great authority on Oriental history, on the geography of Syria, and on Mohammedanism. Among his works possibly the most important is *Fatima et les filles de Mahomet* (1912).

LAMMERGEIER, lâm'mër-gî'ër (Ger. *Lammergeier*, lambs' vulture, from *Lammer*, pl. of *Lamm*, OHG., Goth., AS, Eng. *lamb* + *Geier*, OHG. *gir*, vulture; connected with OHG. *ger-giri*, *grig*, Ger. *gierig*, greedy, Goth. *gairns*, desirous). The largest of European birds of prey (*Gypæctus barbatus*), measuring 40 inches or more in length and from 8 to 10 feet in extent of wing. Really an eagle and therefore one of the Falconidæ, it has won its name of "bearded" or "griffon" vulture from its frequent use of carrion as food, and it often resorts to the remains of vultures' feasts to gather up and devour the scattered bones. Its food ordinarily consists of small mammals and young lambs and chamois, in addition to carrion, but when driven by hunger, it has been known to attack sheep, goats, and even children. In north Africa, land tortoises form an important article of its diet, and it is reported to break open their shells by carrying the turtles high in the air and letting them fall upon rocks. Marrow bones are broken open in the same way. The stories of lammergeiers forcing chamois over precipices, and similar tales indicative of great sagacity and courage, appear to be exaggerated, but there seems little doubt that the birds do at times frighten living animals and force them to jump to their death. The fully plumaged bird is handsomely clothed, the back, wings, and tail being brownish black, the lower parts tawny, and the head white, with black marks on the

sides and tufts of black feathers at the mouth angles. The lammergeier ranges from the mountains of Spain and north Africa eastward through the Alps and mountains of Greece into Asia, as far as northern China. It is now rare in most parts of Europe and is destroyed whenever an opportunity offers. It is a bird of majestic flight, but has not the royal dignity of some of the eagles. The nest is made of sticks, in a crevice or on a shelf of a cliff, and usually only one egg is laid. This is dull yellow, clouded with rusty brown. See Plate of VULTURES.

LAMMERMUIR (lām'mēr-mōōr') **HILLS**. A range of low hills in Scotland, on the boundary between Haddington and Berwick shires, terminating in a precipitous coast on the North Sea (Map Scotland, F 4).

LAMMIE, ALFRED. In Dickens's *Our Mutual Friend*, a scheming character, flashy in appearance and manners, and fertile in plans for making money.

LAMNIDÆ (Neo-Lat. nom. pl., from Lat. *lamna*, *lamna*, thin plate). A family of sharks, represented by two well-defined groups, viz., Lamnæ or porbeagles, having lanceolate teeth, sigmoidally curved and not serrated, and Carcharodontes, having triangular serrated teeth. See PORBEAGLE, MAN-EATER SHARK.

LAMOIGNON DES MALESHERBES. See MALESHERBES, CHRÉTIEN GUILLAUME DE LAMOIGNON DE.

LAMÓN, la-mōn'. A landlocked bay of the Pacific Ocean on the east coast of the island of Luzon, Philippines (Map: Philippine Islands, D 3). It reduces Luzon to the narrow isthmus which here separates the southeastern peninsula from the main part of the island. Its width between Point Saley and Point Dapdap is 26 miles. Between these points lie the large island of Alabat and the smaller Calbalet, forming two channels which lead into a large and well-protected harbor, called Lopez Bay, hitherto little used. On the northwest shore are the two anchoring grounds of Port Lampón and Maubán, which are ports of call for steamers.

LAMOND, lām'ond, FREDERICK (1868-). An English pianist and composer, born at Glasgow. He received his first instruction on the piano and organ from his brother. In 1882 he entered the Raff Conservatory in Frankfort, where his teachers were Heermann (violin), Schwarz (piano), Urspruch (composition). The winter of 1884-85 he spent with Bülow and the following winter with Liszt. When he made his début in Berlin, in 1885, he was received with such marked favor that the German capital before long became his permanent residence. His subsequent tours of Austria, England, and Russia firmly established his reputation as one of the greatest interpreters of Beethoven and Brahms. His compositions include a symphony in A; an overture, *Aus dem schottischen Hochlande*; a piano trio; a sonata for cello and piano; piano pieces.

LAMONT, là-mōnt', DANIEL SCOTT (1851-1905). An American politician, journalist, and cabinet officer, born at Cortlandville, N. Y. He was educated at the State normal school at Cortland and at Union College, but left before graduation to engage in newspaper work on the *Argus* in Albany, where he became the friend of Grover Cleveland. He became well known as a political correspondent and held several legislative clerkships. From 1883 to 1889 he was private secretary to Mr. Cleveland during the

latter's two years as Governor of New York and during his first term as President, in which capacity he was remarkably popular. Thereafter for four years Lamont was engaged in various business enterprises in New York City, and when Cleveland was again elected to the presidency he was appointed Secretary of War. In 1897 he became vice president of the Northern Pacific Railway.

LAMONT, là-mōnt', JOHANN VON (1805-79). A German astronomer and physicist. He was born at Braemar in Aberdeenshire, of an old Scottish family, studied at Ratisbon and in 1828 became assistant in the observatory at Bogenhausen, near Munich. In 1835 he was made director of the same observatory, and in 1852 he became professor of astronomy in the University of Munich. His greatest work in astronomy was his minute observations of 34,674 lesser stars, published in the *Annalen der Sternwarte in München*. But he did more effective service in the study of terrestrial magnetism: he discovered the decennial period (1850) and the earth current (1862), made Bogenhausen a centre of meteorological research, and wrote *Handbuch des Erdmagnetismus* (1849), *Astronomie und Erdmagnetismus* (1851), and "Magnetismus," in Karsten's *Allgemeine Encyclopädie der Physik* (1863-64). He made magnetic surveys of Bavaria (1852), of France and Spain (1856), and of north Germany and Denmark (1858).

LA MONTE, ROBERT RIVES (1867-). An American Socialist, born in Brooklyn, N. Y. He studied at Rutgers College and at the University of Virginia and was admitted to the bar in Kansas and later in New Jersey. He took up journalism at Haverhill, Mass., in 1900, and became associate editor of the *International Socialist Review* and editor of the *Sunday Call*, New York, in 1909. He was a delegate to the Socialist National Convention at Rochester, N. Y., in 1900, and to the International Socialist Congress at Copenhagen, Denmark, in 1910, and served as a national organizer of the Socialist party in 1900 and 1911. He translated *The People's Marx* (1899) and Enrico Ferri's *Socialism and Modern Science* (1900) and is author of *Socialism, Positive and Negative* (1907) and *Men versus the Man* (1910).

LAMORICIÈRE, là-mô'rê-syâr', CHRISTOPHE LÉON LOUIS JUCHAULT DE (1806-65). A French general, born at Nantes. He studied at the Ecole Polytechnique and went to Algeria as a lieutenant of engineers in 1830. In 1833 he became chief of a battalion of Zouaves and in 1837 colonel. He particularly distinguished himself at the siege of Constantine. From 1841 to 1843 he was engaged in active warfare against the native tribes, defeating Abd-el-Kader in a sanguinary battle near Mascara (1842). In 1844 he took part in the battle of Isly and was made in 1845 interim Governor of Algeria. To him belongs the glory of concluding the war in Africa by forcing Abd-el-Kader to surrender in 1847. He had been elected to the Chamber of Deputies from the Department of the Sarthe the previous year and was reelected after his return from Algeria. In the Thiers ministry, which Louis Philippe called to office on Feb. 24, 1848, in a vain endeavor to avert his impending downfall, Lamoricière was made Minister of War. Upon the abdication of the King he sought to proclaim the Duchess of Orléans as Regent, but was caught in the fire of the bar-

ricades and narrowly escaped with his life when the Revolution broke out. He commanded the attack on the barricades during the June insurrection and suppressed the uprisings of the Socialists. He was Minister of War during the government of General Cavaignac and in 1849 was sent by Odilon Barrot on an important diplomatic mission to Russia. He attached himself to the Republican party in the Legislative Chamber after his return, being a very decided opponent of the schemes of Louis Napoleon. He was arrested on the occasion of the coup d'état of Dec. 2, 1851, and was at first imprisoned in Ham and afterward exiled, not being allowed to return until 1857. During his exile, which he spent in Germany, Belgium, and England, he became a devout Catholic and in 1860 was appointed by Pius IX commander of the papal troops. He organized an army of young Catholic devotees for the purpose of defending the holy see from the hateful progress of "revolution," and indirectly to restore the temporal power to the Pope. He was, however, compelled to surrender his whole force to the Sardinian general Cialdini at Ancona, after having been defeated at Castelfidardo, Sept. 18, 1860. He returned to France and died near Amiens, Sept. 11, 1865. Consult: E. Keller, *Le général Lamoricière* (Paris, 1891); Rastoul, *Le général Lamoricière* (ib., 1894); Flornon, *Lamoricière* (ib., 1903).

LAMORMAINI, lă'môr-mî'nê, WILHELM GERMAIN (1570-1648). An Austrian Jesuit, born at La Moire Mennie, a village near Luxemburg. He joined the Jesuits in 1590 at Brünn. In 1596 he was ordained priest, in 1623 he became rector of the Vienna College, and next year he was made confessor to the Emperor Ferdinand II. He published *Ferdinandi II Virtutes* (1637), which appeared in the following year under the title of *Idea Principis Christiani*. His correspondence with Emperor Ferdinand and his family was published by Dudik (1876).

LA MORRA. A game played by the ancient Romans and the modern Italians. It calls for two players. These stand opposite each other, holding their closed right hands before them. Each then flings out his right hand, with one or more fingers open (the other fingers are shut up in the palm); at the same time he calls out a number, hoping that this number will give correctly the total of fingers displayed by his adversary and himself combined. If both players strike the right total, or if neither strikes it, no point is scored; if only one player cries out the total correctly, he scores a point. Five points, or less often 10 points, constitute a game. Each player marks his score on his left hand, which he keeps rigidly upright, level with his shoulder, with one finger extended for each point of his score. The modern Italians are passionately devoted to the game and play it for stakes of wine, money, etc. At first the arm is raised above the head and brought sharply down, the fingers opening as the arm descends; as the players warm to their work, however, they keep their right hands opposite their breasts and open and close their fingers with speed that only the expert eye can follow. The Romans called the game, from the sudden opening of the fingers, *micare digitis* (to flash with the fingers). Since one can cheat easily at the game, by holding a finger, especially the thumb, only half extended, to open or close it later as will suit his purpose, or by lying about the position of the

finger, the Romans, in seeking to describe a man as exceptionally honest, declared that one could "flash fingers with him in the dark." Consult W. W. Story, *Roba di Roma* (8th ed., Boston, 1887).

LA MOTTE, là môt, ANTOINE HOUDAR DE (1672-1731). A French author and critic, born in Paris. His first work, a comedy, *Les originaux* (1693), was a failure; but he continued to produce operas, ballets, and tragedies, one of which, *Inès de Castro* (1723), was successful for many years. He was admitted to the Academy in 1710 and two years afterward became blind. His *Réflexions sur la critique* (1715) has some value. One edition of his works appeared in 1754, *Œuvres choisies* in 1811, *Œuvres de théâtre* in 1730, and *Lettres* in 1754. He was a champion of the moderns in the controversy of the ancients and the moderns.

LA MOTTE FOUQUÉ, là môt' fōō'kâ', FRIEDRICH HEINRICH KARL, BARON DE (1777-1843). A German Romantic novelist and poet, best known as the author of *Undine*, a classic of romanticism. He was born in Brandenburg, served in the Prussian army from 1794 to 1803 and in 1813, and spent the rest of his life chiefly on his estate in Nennhausen and at Halle, where from 1831 to 1842 he lectured on modern history and poetry, attacking modern tendencies. He died in Berlin. At first he imitated Spanish poets, and then Norse legend and Old German poetry attracted him. In 1808 he published *Sigurd der Schlagentoter*, the first of three poetic dramas based on the *Nibelungen*sage. In 1811 came the beautiful fairy tale *Undine*, followed by the very popular romance of chivalry *Der Zauberring* (1813), *Sintram und seine Gefährten* (1814), *Die Fahrten Thiodolfs des Isländers* (1815), which Fouqué regarded as his best work, the historical epic *Bertrand du Guesclin* (1821), and several volumes of poems. In 1840 he published an autobiography. His numerous later writings added nothing to his reputation. His selected works (12 vols., 1841) contain little of import save what has been translated into English—*The Enchanted Ring*, *Sintram*, *Aslauga's Knight*, and the exquisite *Undine*. A passionate medievalist, he fought bitterly and vainly against the new ideals in life and literature. Consult "Biographical Notice of La Motte Fouqué," in Thomas Carlyle, *German Romance*, vol. i (London, 1841), and K. Wenger, *Historische Romane deutsche Romantiker* (Bern, 1905).

LA MOTTE-GUYON. See GUYON, JEANNE MARIE BOUVIER DE LA MOTTE.

LA MOTTE-VALOIS, vâ'lwâ', JEANNE DE LUZ DE SAINT-RÉMY, COMTESSE DE (1756-91). A French adventuress. See DIAMOND NECKLACE, THE AFFAIR OF THE

LAMOUREUX, lâ'mōō'rê', CHARLES (1834-99). A French violinist and conductor, born in Bordeaux. He studied at the Paris Conservatory and won the first prize for violin in 1854. He afterward played first violin at the Opéra and founded a society for chamber music. In 1873 he organized the Société de l'Harmonie Sacrée, which in 1875 gave the first performance of the *Messiah* in Paris. In 1876 he became assistant conductor and in 1878 first conductor at the Opéra. In 1880 he was made a Knight of the Legion of Honor. His inauguration of the *Nouveaux Concerts* in 1881 (later better known as the *Concerts Lamoureux*) was a continuation of the work begun by Colonne. Many new com-

posers, particularly Wagner, had their first hearing in France at these concerts. He produced the operas *Lohengrin* and *Tristan und Isolde* for the first time in Paris and proved himself a good interpreter of German music. He died in Paris. After his death his son-in-law Chevillard (q.v.) continued the *Concerts Lamoureux*, which still are among the most important musical events of Paris.

LAMP (from Fr. *lampe*, Lat. *lampas*, Gk. *λαμπάς*, *lampas*, torch, from *λάμπειν*, *lambain*, to shine). Any artificial light source, but especially a single movable unit. The earliest and most primitive lamps were burning brands plucked from the camp fire, and coals nursed into flame in a brazier. Then came torches of resinous wood, often consisting of several twigs or splinters bound fast together and saturated with fat or oil. A little later was discovered the art of making candles. When the top of the candlewick is lighted, the flame melts the wax or tallow nearest and, heating it until it bursts into flame, develops a much more powerful light than the wick alone could give. About the same time came flat open vessels of stone, clay, bone, or shell (sometimes the skulls of animals) burning fat; and later shallow lamps of stone or clay or metal containing oil in a covered reservoir, from which it is drawn by capillary attraction through a small hole to the tip of an ignited wick. Such lamps were called *lychna* by the Greeks and *lucernæ* by the Romans and have been found in great numbers in the ruins of Greek and Roman cities, especially from the excavations of Tarsus, Pompeii, and Herculaneum. The principle in all is the same. At first the *lucernæ* were made of unglazed pottery and with only one wick hole, but better material and more elaborate forms succeeded, and the light-giving power was increased by increasing the number of outlets and wicks. The wicks were generally made of flax tow; less often of rushes and other vegetable fibres.

Among the northern tribes, especially those living in the region of perpetual snow, the lack of olive and other vegetable oils made the use of fat compulsory, except on the sea, where seal and whale oil were plentiful. Small open stone pots, afterward superseded by metal, were partly filled with grease, and a wick was thrust down through the middle, which, being lighted, consumed the fat as it melted. Stone cups of this kind are occasionally dug up in Scotland and other parts of Europe; in principle they are the same as the *padelle*, used in Italian illuminations, and the old grease pots which once formed the footlights of theatres. The Eskimo shape square boxes of soapstone and use them in the same way.

No great improvement in the efficiency of lamps took place until near the end of the eighteenth century, when the ancient small round wicks were replaced by large flat woven ones that were inclosed between the flame and the oil in a metal casing and were adjusted by a spur wheel that forced them up or down, thus regulating the flame easily and quickly and promoting better combustion. The Swiss chemist Argand (q.v.) substituted for the flat wick a tubular one between two metal cylinders, the inner of which extended down through the base of the oil reservoir and thus provided internal draft. But the epoch-making discovery that transformed the whole method of oil lighting and, as regards the art of illumination, pushed

the world forward thousands of years was accidental. One of Argand's workmen, in heating a bottle over the open flame, cracked off the bottom and held the remainder over the flame so that it acted like a chimney. He had sense enough to notice that the flame at once burned more brilliantly and more steadily. This accidental discovery of the *glass lamp chimney* remained unparalleled in importance in the field of artificial illumination until the recent discovery and development of the electric lamp.

Soon after the middle of the nineteenth century, as a result of the development of oil wells in the United States (see *PETROLEUM*), kerosene began to take the place of whale, lard, olive, and other oils, until now the improved kerosene lamp is used throughout the world by semi-civilized as well as civilized nations. The lamps that came over with the Pilgrims on the *Mayflower* were Dutch and went by the name of "Betty lamps." They are of iron, some forged and some cast, and also of brass. They are shaped like a pear, but flat on top and bottom. The earliest form was known as the "open Betty," or slot lamp. This was succeeded by the Betty with a hinged lid. The wick support was a small half-round metal bar fastened at the lower end to the inside bottom of the lamp. There was a handle at the back, attached by a link to a pointed hook that held the lamp suspended from the high back of a chair, or from a crevice between the great stones framing the fireplace. All lamps used in New England were imported until 1680, when a tin-mith of Newburyport, Mass., began the manufacture of "Newburyport Bettys." An early maker of pewter lamps and candlesticks was Richard Graves, of Salem, Mass. Another was Henry Shrimpton, of Boston, whose work is distinguished for

LAMP

Section of Rochester lamp, showing central-draft burner.

beauty and artistic perfection. Americans who helped to improve the lamp were Benjamin Franklin and Benjamin Thompson, better known as Count Rumford. A modification of the central-draft burner is the *student lamp*, in which the oil reservoir is above the burner, 5 or 6 inches away, and connected with it by a tube, through which the flow of oil under gravity

pressure is automatically so regulated that only as much reaches the wick as is needed for consumption. These lamps give out less heat than the ordinary central-draft burner. For electric and gas lamps and the art and science of illumination, see **ELECTRIC LIGHTING**, **LIGHTHOUSE**; **SAFETY LAMP**; **GAS**, **ILLUMINATING**, **ETC.**, **BURNERS**

LAMPADOPHORIA (Lat., from Gk λαμπαδόφορῖα, a bearing of torches, from λάμπα, *lampas*, a torch, and φέρειν, *pherein*, to carry). A torch race, such as was held in many places in the Greek world in honor of various divinities. At Athens we know of important torch races in honor of Prometheus, Hephaestus, Athena, Pan, and Artemis Bendis, a Thracian goddess. The latter was held in the Piræus, and the contestants were mounted. The race seems to have originated in honor of Prometheus (q.v.) and his gift of fire to mankind. At the festival of Prometheus the course was from his altar at the Academy (q.v.) to the Dipylon Gate (q.v.). At other festivals the start was at the altar of Eros, in the same neighborhood, but the goal is not certain. Two kinds of torch race on foot seem to be described. One was a sort of relay race, where the torches were passed from one runner to another, and the band whose lighted torch first reached the goal was the victor. The other was a race between individuals, each of whom strove to bring his lighted torch to the goal. If the torch was extinguished, the runner was disqualified. The torches seem to have been of wax and were provided with a handle and shield to protect the hand. The torch races were held at night. In some races the runners carried also shields on the left arm, as in the race in armor. The race was regarded as a severe test requiring careful training. In addition to the handbooks and dictionaries of classical antiquities, consult the careful study by Sterrett, in *American Journal of Philology*, vol. xxii (Baltimore, 1901), and Gardiner, *Greek Athletic Sports and Festivals*, especially pp. 292-293 (London, 1910).

LAMPAS. The name commonly given to a swelling of the mucous membrane covering the hard palate and projecting in a more or less prominent ridge immediately behind the horse's upper incisor teeth. This swelling is entirely natural and occurs in every healthy horse. It is usually seen in young horses during the period of shedding the teeth. As a direct treatment slight

scarification is the most that will be required. The remedy in common use is to apply an astringent wash of alum water. The practice of burning the lampas is very severely condemned.

LAMPASAS, lām-pās'as. A town and the county seat of Lampasas Co., Tex., 60 miles (direct) north by west of Austin, on a branch of the Lampasas River and on the Gulf, Colorado, and Santa Fe Railroad and the terminus of a branch of the Houston and Texas Central (Map: Texas, C 4). It has a considerable trade in cotton, grain, wool, hides, agricultural produce, live stock, pecans, poultry, and eggs, and its industries are represented by cotton gins, flour mills, wagon shops, etc. Sulphur springs have given the locality considerable popularity as a health resort, and the town contains a public library and two large parks. The water works are owned by the municipality. Pop., 1900, 2107; 1910, 2119.

LAMPBLACK. Soot, produced on a commercial scale by the imperfect combustion of various materials, such as coal tar or wood tar, pitch, petroleum, rosin, etc. These substances are burned in a fireplace, the dense smoke passing through a long brickwork flue into the chambers where the soot collects. The finest quality of lampblack is deposited in the last of these chambers. This portion of the soot may be used directly for making printers' ink and for similar purposes, but to render it fit for making water colors the lampblack must be subjected to a process of purification. This may be effected by digesting the soot with hot sulphuric acid, then washing with water. According to the German method, the cooled soot is deposited on woolen cloths hung in the condensing chambers. By shaking or beating the fabric the pigment is easily detached.

LAMP'ER EEL, or **LAMP'ERN**. See **LAMPREY**.

LAMPERTI, lām-për'tà, FRANCESCO (1813-92). A famous Italian singing master, born at Savona. He studied piano and harmony at the conservatory in Milan. While director of the theatre at Lodi, he made a practice of cultivating any fine natural voices that he chanced to find and engaging them for his theatre. In this way he trained an astonishing number of singers who rose to great prominence and carried their teacher's name far beyond the limits of Italy. In 1850 he was appointed professor of singing at the Milan Conservatory, where he remained for 25 years. He resigned in 1875 and until his death devoted all his time to private pupils, who flocked to him from all parts of the world. The essentials of his method he embodied in a treatise, which was published in an English translation by J. C. Griffith under the title *A Treatise on the Art of Singing* (1876). Among his most famous pupils were Campanini, Mariani, Galli, Angeleri, Cruvelli, Albani, Sembrich, Artôt.

LAMPETER (lām'pè-tēr) **BRETHREN.** See **AGAPEMONE**.

LAMPLIGHTER, THE. A novel by Maria Susanna Cummins (1854).

LAMP'MAN, ARCHIBALD (1861-99). A Canadian poet, born at Morpeth, Ontario, Nov. 17, 1861. He was descended from a German family of Loyalists who emigrated from Pennsylvania at the outbreak of the Revolution. After graduating from Trinity College, Toronto 1882, he taught school for a few months and then entered the government post office at Ot-

LAMPREYS AND DOGFISH

1. HAGFISH or SLIME EEL (*Myxine glutinosa*).
2. RIVER LAMPREY (*Entosphenus tridentatus*).
3. COMMON DOGFISH (*Squalus acanthias*).
4. SAWFISH (*Pristis pectinatus*).

5. SAWFISH (under side).
6. CALIFORNIA SWELL SHARK (*Catullus uter*).
7. OIL SHARK or TOPE (*Galeorhinus zyopterus*).
8. GREAT COW SHARK (*Hexarchus griseus*).

tawa. His published volumes comprise *Among the Millet, and Other Poems* (1888) and *Lyrics of Earth* (1895). Lampman died at Ottawa, Feb. 10, 1899. Consult the *Poems*, edited with a memoir by D. C. Scott (Toronto, 1900).

LAMPONG, lām-pōng'. A Malay people of somewhat mixed blood, inhabiting southern Sumatra. The Lampong have developed in a high form the Malayan village system and are otherwise noteworthy from a sociological point of view. They are said to be very faithful in marriage.

LAMPOON' (Fr. *lampon*, from *lampons*, first person pl. of *lamper*, to drink, from OF. *lapper*, *laper*, from AS. *lapan*, Eng. *lap*; connected with Icel. *lepja*, OHG. *laffan*, Lat. *lambere*, to lick, connected with Lat. *labium*, Pers. *lab*, lip). A term applied to any stinging satire written with a direct purpose to vex, reproach, or abuse particular individuals, as distinguished from satire directed against vice and folly. Its use probably arose from a tendency of drinking songs to give a free rein to personal abuse or satire.

LAMPRECHT, lām'prekt, KARL (1856-1915). A German historian, born at Jessen and educated at Göttingen, Leipzig, and Munich. In 1885 he was appointed professor at Bonn, in 1890 at Marburg, and in 1891 at Leipzig. During 1910-11 he was rector of the University of Leipzig. He received honorary degrees from Columbia, the University of Christiania, and St. Andrews. His works include: *Beiträge zur Geschichte des französischen Wirtschaftslebens im elften Jahrhundert* (1878); *Deutsches Wirtschaftsleben im Mittelalter* (1886); *Die römische Frage von König Pipin bis auf Kaiser Ludwig den Frommen* (1889); *Die kulturhistorische Methode* (1900); and, after a visit to the United States, *What is History?* (1905) and *Americana* (1906). He founded in 1882 *Die westdeutsche Zeitschrift für Geschichte und Kunst* and after 1904 was in charge of Heeren and Ukert's *Allgemeine Staatengeschichte*. By all means his most famous work is his *Deutsche Geschichte* (13 vols., 1891-1908), which made him the chief exponent of the so-called *Kulturgeschichte*. In opposition to the orthodox political historians, of the type of Ranke, Lamprecht believes that the historian's chief task is to trace the unfolding of what he calls the "social soul," and that the modern science of history is primarily social-psychological and not exclusively political. Although his *History of Germany* is epoch-making, it has excited great opposition among other historians, and the extent of the Lamprecht literature is immense. His chief exponent has been Dietrich Schäfer. Although his work is deficient on the personal, ecclesiastical, and political sides, he is probably the most famous German historian of his time. The University of Leipzig established for him an Historical Institute, with facilities unrivaled in Europe. Consult Gooch, *History and Historians of the Nineteenth Century* (London, 1913).

LAMPRECHT THE PRIEST. A Frankish poet. Little is known of his life. He is the author of a Middle Frankish epic known as the *Alexanderlied*, a life of Alexander the Great, made up of every incident, legendary or historical, that he could collect. In it Alexander relates many strange adventures. It was written about 1130 and is based on a French original by Aubry de Besançon and a Latin prose version. The *Alexanderlied* was published by Diemer, Massmann, and by Weismann (with a

translation, in 1850, Frankfort-on-the-Main). There is also a modern High German version by Ottmann in Hendl's *Bibliothek der Gesamtlitteratur* (Halle, 1898).

LAMPREY (OF., Fr. *lamproie*, It. *lampreda*, from ML. *lampreda*, *lampetra*, lamprey, from Lat. *lambere*, to lick + *petra*, rock; in allusion to the fish's habit of attaching itself to rocks by its suckorial mouth). An eellike animal of the family Petromyzontidæ, of the class Cyclostomata or round-mouth eels. Lampreys, or lamperns, are characterized by the possession of a circular mouth formed for sucking instead of true jaws. They are eel-shaped and have no scales. There are seven roundish gill orifices on each side, through which the water is expelled, thus effecting respiration. They attach themselves to stones and other objects by their sucker mouths, and also to fishes, from which they scrape the flesh by their rasping teeth. They will also eat other small animals or even dead matter. There are 7 genera and about 15 species. Lampreys generally ascend rivers or brooks at the spawning season, and afterward many of the individuals die. The lampreys undergo a metamorphosis, the young differing from the adult in the rudimentary eyes, absence of teeth, larger brain, and other structural characters. These larval forms have been described as different genera. No undoubted fossil remains of lampreys are known; they have no hard structures except the "teeth" to be preserved. The common marine or "great-sea" lamprey (*Petromyzon marinus*) occurs in both Europe and America and attains a length

THE GREAT SEA LAMPREY.

1. Outline of the animal. 2. Sucking mouth; s, suckorial buccal teeth; mx, maxillary tooth; l, lingual tooth; md, mandibular tooth. 3. Longitudinal section of mouth and throat.

of 3 feet. The small lamprey common in the lakes and streams of the Mississippi valley is *Ichthyomyzon concolor*. Another species, common in Europe, is *Lampetra fluviatilis*. The lampreys are highly regarded as food by some people. For an extended description of their structure and habits, consult Goode, *Fishery Industries*, sec. i (Washington, 1884). See Plate of LAMPREYS AND DOGFISH.

LAMPRIDIIUS, ÆLIUS. A Latin historian and biographer, who lived in the reigns of Dio-

cletian and Constantine the Great. He was one of the writers of the *Scriptores Historia Augustæ* (see AUGUSTAN HISTORY), in which his name is prefixed to the lives of Commodus, Antoninus, Diadumenianus, Elagabalus, and Alexander Severus. According to some authorities, he also contributed the biographies of Marcus Aurelius, Lucius Verus, Pertinax, Albinus, and Macrinus. Consult Peter's text of the *Scriptores Historia Augustæ* (Leipzig, 1884) and the English translation by Bernard (London, 1740); also Schanz, *Geschichte der römischen Litteratur*, vol. iv (2d ed., Munich, 1914).

LAMP'SACUS (Lat., from Gk Λάψακος, *Lampsakos*) (the modern Lapsaki). An ancient city of Mysia, situated on the Hellespont, where it begins to widen into the Propontis. It was settled by colonists from Phocæa and Miletus and passed from the Persian domination to Athens after the battle of Mycale (479 B.C.). It was a flourishing city in later Greek times and under the Romans and was celebrated as the centre of the worship of Priapus (q.v.).

— **LAMP SHELL**. A brachiopod. See BRACHIOPODA.

LAMPYRIDÆ. See FIREFLY.

LAMSDORF, läms'dorf (or LAMBSDORF), VLADIMIR NIKOLAEVITCH, COUNT (1837-1907). A Russian statesman, of an old noble family. Educated at the Alexander Lyceum in St Petersburg (Petrograd), upon graduation he entered the Ministry of Foreign Affairs. While Count Muraviev was head of this department, Lamsdorf was Assistant Minister, and he was appointed Minister upon Muraviev's death in 1900. In this office he took an active part in drawing up the Peking Treaty of 1900, by which China had to pay the expenses incurred in the suppression of the Boxer Rebellion, and which regulated the commercial relations of the two countries. Later he endeavored to prevent war between Russia and Japan—all through 1903 he was carrying on diplomatic negotiations with Japan in an effort to settle the Manchurian question, but with no success. When, Oct. 25, 1904, the Russian fleet fired by mistake on the British fishing fleet off the Dogger Bank, Lamsdorf was instrumental in securing a peaceful settlement of the affair. He resigned in 1906.

LAMSON-SCRIBNER, FRANK. See SCRIBNER, FRANK LAMSON.

LA'MUS. See LÆSTRYGONES; LAMIA. 2.

LAMUTS, lä'muts. A people of Tungus stock, who dwell on the shores of the Sea of Okhotsk, in part of northern Kamchatka and the country to the west. They are the maritime division of the Tungus. The Lamuts came into contact with the Russians in the seventeenth century, and their village life has been much affected. Consult Hieckisch, *Die Tungusen* (St. Petersburg, 1872); Müller, *Unter Tungusen und Jakuten* (Leipzig, 1882); Olsufjev, "Der Anadyr-Bezirk," in *Petermanns Mitteilungen* for 1899 (Gotha); Bogoras, "The Chukchi of Northeastern Asia," in the *American Anthropologist* (New York, 1901).

LAMY, lä'mé', BERNARD (1640-1715). A French oratorian. He was born in Le Mans, entered the Oratory in Paris (1658), became professor of philosophy in Saumur (1671), was deposed for advocating the Cartesian philosophy (1675), and removed to Grenoble, where he taught in the seminary till 1686. Later he taught in Paris. Having fallen into difficulties because

he had ventured to publish a book without proper permission, he removed to Rouen (1690) and there died Jan. 29, 1715. His fame rests upon several valuable publications: *L'Art de parler* (1675); *Apparatus ad Biblia Sacra* (1686; Fr. trans., 1697, 1709. Eng. trans., London, 1723); a Gospel harmony (1689), *Traité historique de l'ancienne Pâque des Juifs* and its sequel (1693), a very elaborate 30 years' study, *De Tabernaculo Fœderis, de Sancta Civitate Jerusalem et de Templo* (1720, with life by Deswold).

LAMY, ETIENNE MARIE VICTOR (1845-). A French author, born in Cize, Jura. He was educated at the Collège Stanislas and became a doctor of law in 1870. From 1871 to 1881 he was a deputy from his native department, Jura, and his earlier writings were political and historical. In the House of Deputies he was a member of the Left, but he broke with his party and became a clerical reactionary, writing for the *Gaulois* and the *Correspondant*. In 1905 he became a member of the Academy, and in 1913 he succeeded Thureau-Dangin as its perpetual secretary. Among Lamy's works are *Le tiers parti* (1868), *L'Irinée et la démocratie* (1889), *La France du Levant* (1898), *Etudes sur le second empire* (1895), *La femme de demain* (1899), an edition of the memoirs of Aimée de Coigny (1900), *Témoins de jours passés* (1909, 1913), *Au service des idées et des lettres* (1909), *Quelques œuvres et quelques ouvriers* (1910, 1913).

LANAI. See HAWAIIAN ISLANDS.

LAN'ARK. The county town of Lanarkshire, Scotland, a royal, municipal, and police burgh on the Clyde, 32 miles southeast of Glasgow (Map Scotland, E 4). It manufactures nails, oil, cotton goods, textiles, and shoes. It has Roman and feudal remains. Here, in 978, Kenneth II assembled a parliament, and in a niche of the church is a colossal statue of Wallace, of whose early exploits Lanark was the scene. Pop., 1901, 6440, 1911, 5900. The Falls of the Clyde are near the town, and a mile to the south lies the manufacturing village of New Lanark (pop., 973), celebrated as the scene of Robert Owen's experiment (1815-27) for the improvement of the working classes.

LAN'ARKSHIRE. An inland county of the southwest division of Scotland and the most populous in the country. Area, 897 square miles (Map Scotland, E 4). Pop., 1801, 147,700, 1901, 1,339,327, 1911, 1,447,034. The surface is exceedingly varied, being low in the northwest and rising to the southeast and south. The principal hills are the Lowthers, which attain a maximum altitude of 2403 feet in Green Hill. Though the county is watered by the Clyde (q.v.) and its affluents, much of the soil is marshy and barren. The northern part is the chief mining region of the county, producing iron, coal, and lead. Iron ore is smelted at Glasgow and many other towns, and the cotton, flax, and woolen manufactures, carried on in and around Glasgow, are the most important sources of wealth in the county. There are large shipbuilding and engineering works along the Clyde. Agricultural pursuits include stock raising for dairy purposes, fruit raising, and market gardening. Capital, Lanark. Lanarkshire at an early period was inhabited by the Damnonii, a Celtic tribe. In the seventh century a large district, including Lanarkshire, was subdued by the Saxons of Northumbria.

LANAUTTE, ALEXANDRE MAUBICE BLANC DE. See HAUTERIVE, COUNT D'.

LANCASHIRE, lāp'kà-shēr. A maritime county of northwest England, bounded north by Cumberland and Westmoreland, east by Yorkshire, south by Cheshire, and west by the Irish Sea (Map: England, D 3). Area, 1869.1 square miles. Pop., 1901, 4,378,293, 1911, 4,825,739. The north and east portions are hilly, and the west, towards the coast, level. The chief rivers are the Mersey, Ribble, Wyre, Hodder, Calder, and Leven. Wheat, oats, and potatoes are generally cultivated, but Lancashire is chiefly a mining and manufacturing county. Coal and iron abound, and lead and copper are also mined. South Lancashire is noted for the manufacture of cotton, the production of worsteds, woolens, silk, machinery, glass, and soap, and shipbuilding, are extensively carried on in Liverpool, Manchester, Preston, and Blackburn. Capital, Lancaster. In early British days the region now known as Lancashire was peopled by the Brigantes and Voluntii. After the Conquest part of it became first the Earldom and then the Duchy of Lancaster. Since the reign of Edward IV it has been a crown duchy and palatinate.

LANCASTER, lāp'kàs-tēr. The capital of Lancashire, England, on the Lune, near its mouth, 45 miles northeast of Liverpool (Map: England, D 2). The most interesting building is the fifteenth-century church of St. Mary. It manufactures cotton and silk goods, cabinetwork, coco matting, machinery, pottery, and leather. The harbor has 1700 feet of quays and a depth of 12 feet at spring tides. There is some trade in coal and limestone. The port includes Glasson Dock, 5 miles southwest. The town is neat and well built. It has an ancient castle of Roman and Saxon origin and a fine aqueduct, which carries the Lancaster Canal across the river. It owns its gas, water, and electric lighting plants, baths, slaughterhouses, markets, public parks, art gallery, free library, grammar schools, and schools of technical education. The first of its many charters was granted by King John in 1193. Pop., 1901, 40,329, 1911, 41,410.

LANCASTER. A town, including several villages, in Worcester Co., Mass., 20 miles by rail north by east of Worcester, on the Nashua River, and on the Boston and Maine Railroad (Map: Massachusetts, D 3). It has the State Industrial School for Girls, the Thayer Museum of North American Birds, and a large public library. Though Lancaster is primarily a place of residence and small farming interests, it contains a yarn factory. There are municipally owned water works. Pop., 1900, 2478; 1910, 2464. Lancaster, settled about 1643, by John Prescott, an ancestor of the historian, was incorporated as a town two years later. In 1676 Indians massacred 40 of its citizens and laid the place in ruins. Consult: A. P. Marvin, *History of the Town of Lancaster* (Lancaster, 1879); H. S. Nourse (ed.), *The Early Records of Lancaster* (ib., 1884); id., *Military Annals of Lancaster* (ib., 1889); Emerson, *Lancaster on the Nashua* (Leominster, Mass., 1904).

LANCASTER. A town and the county seat of Coos Co., N. H., 137 miles north of Concord, on the Israel River, and on the Boston and Maine and the Maine Central railroads (Map: New Hampshire, G 3). It is a popular residential place and summer resort, attractively situated among the White Mountains, and has the

Helen Fowler Weeks Home and a public library. It is also the commercial centre for the neighboring White Mountain resorts and manufactures lumber, woodwork, machinery, belt hooks, drugs, etc. Lancaster was settled in 1764. Pop., 1900, 3190; 1910, 3054.

LANCASTER. A village in Erie Co., N. Y., 10 miles east of Buffalo, on the Lackawanna, the Erie, the New York Central, and the Lehigh Valley railroads (Map: New York, B 5). It is of considerable importance as a manufacturing centre, having iron and brass foundries and machine shops, malleable-iron works, knife factory, glassworks, flouring mills, steel plants, railway shops of the New York Central, brick-yards, and other industries. There are two fine high-school buildings and a public library. The town was settled in 1813. Lancaster owns its water works. Pop., 1900, 3750, 1910, 4364.

LANCASTER. A city and the county seat of Fairfield Co., Ohio, 32 miles by rail southeast of Columbus, on the Hocking River, and on the Hocking Valley and the Pennsylvania Company railroads (Map: Ohio, E 6). It has the State industrial school for boys and a fine courthouse and city hall. The city is in a rich agricultural region and in the natural-gas belt; its manufactures include agricultural implements, foundry products, stoves, paper, automobile tires, wood-pulp machines, lenses, carbon pyrometers, gloves, flour, shoes, and glass. The facilities for shipping by rail have made Lancaster an important trade and produce centre. The government is administered under the municipal code of 1902 by a mayor, council, auditor, and treasurer, elected biennially, and by directors of public service, public safety, and public health, appointed by the mayor and council. There are municipal water works and gas plant. Settled in 1800, Lancaster was first incorporated in 1831. It was the birthplace of Gen. W. T. Sherman and Senator Sherman. Pop., 1900, 8991, 1910, 13,093; 1914 (U. S. est.), 14,840.

LANCASTER. A city and the county seat of Lancaster Co., Pa., on the Conestoga River, 69 miles west of Philadelphia, on the Pennsylvania, the Philadelphia and Reading, and the Lancaster, Oxford, and Southern railroads (Map: Pennsylvania, J 7). It is the seat of Franklin and Marshall College (q.v.), with the Theological Seminary of the Reformed Church in the United States, and has the Lancaster General Hospital, St. Joseph's Hospital, the Children's and Stevens homes, the Long Home for Aged Women, Stevens Industrial Trade School, A. Herr Smith Library, Ann C. Witmer Home, and the Shippen School for Girls. The first Pennsylvania State Normal School is at Millersville, near Lancaster; and the old Moravian Linden Hall Seminary is at Lititz. The city, situated in the most fertile farming and tobacco-growing region in the State, is the centre of a large trade in tobacco and produce and has numerous tobacco warehouses, cigar factories, two large silk mills, rolling mills, cotton mills, cork works, caramel factories, ironworks, and manufactories of brick machines, emery wheels, umbrellas, carriages, and watches. The government is administered by a mayor, elected every two years, and a bicameral council which controls elections to most of the subordinate offices, the executive's power of appointment, which in these cases is subject to the consent of the council, extending only to police officers, police turnkey, and city-hall janitor. The city

spent in 1912-13, in maintenance and operation, \$680,000, the main items of expense being \$157,000 for schools, \$108,000 for the water works, which are owned by the municipality, \$36,000 for the police department, and \$29,000 for the fire department. The income amounted to \$626,000. Pop., 1890, 32,011; 1900, 41,459; 1910, 47,227; 1914 (U. S. est.), 49,685.

Settled about 1718, and at first called Hickory Town, Lancaster received its present name in 1729, was chartered as a borough in 1742, and became a city in 1818. In December, 1763, the Paxton Boys massacred a band of neutral Indians here. While Philadelphia was occupied by the English in 1777, Congress sat in Lancaster for a few days, and in 1784 a band of soldiers marched to Philadelphia from here to force Congress to provide for paying the Continental army, in consequence of which mutiny Congress adjourned to Princeton. Lancaster was the capital of the State from 1799 to 1812. It was the birthplace of Gen. John Fulton Reynolds (q.v.), in whose honor a monument has been erected on the battlefield of Gettysburg. Consult Mombert, *An Authentic History of Lancaster County* (Lancaster, Pa., 1869), and *Pennsylvania Historical Collections*, vol. i (Philadelphia, 1853).

LANCASTER. A town and the county seat of Lancaster Co., S. C., 94 miles by rail north by east of Columbia, on the Southern and the Lancaster and Chester railroads (Map: South Carolina, D 2). It is the centre of a fertile district, growing cotton, tobacco, and grain, and has extensive cotton and cotton-oil mills and a fertilizer factory. The water works are owned by the town. Pop., 1900, 1477; 1910, 2098.

LANCASTER, DUCHY OF. An English duchy and county palatine (see PALATINE), created by royal charter. Edward III., on the death of Henry, Duke of Lancaster, conferred the duchy on John of Gaunt and his heirs forever. During the Wars of the Roses Henry VI and Edward IV both endeavored so to settle the duchy that it should descend to the heirs of their body apart from the crown and continue with them in the event of their losing the latter. The result of these attempts has been the preservation of the duchy as a separate possession in order and government, but united in point of inheritance, the monarch being possessor, not as King of England, but as Duke of Lancaster. The duchy is almost coequivalent with Lancashire. The revenues, which from £29,000 (\$145,000) in 1847 had increased to £108,016 (\$526,038) in 1913, are paid over to the privy purse. They are wholly exempted from parliamentary control, except that the annual account for receipt and expenditure is presented. The county palatine forms only a portion of the duchy, which includes considerable estates not within the county palatine. There is a chancellor of the duchy (i.e., of the part of it which does not lie within the county) and of the county palatine, which two offices are generally united. The Duchy Court of Lancaster, held at Westminster and presided over by the Chancellor, or his deputy, exercises jurisdiction in all matters of equity relating to the lands of the duchy. The administration of justice has been assimilated to that of the rest of England since 1873. The office of Chancellor is a political appointment, which is usually conferred on a statesman of eminence, frequently a member of the cabinet, who is expected to devote his

time to such larger questions occupying the attention of government as do not fall within other departments. The stipend is £2000 (nearly \$10,000) per annum. Consult Fishwick, *A History of Lancashire* (London, 1894), and *John of Gaunt's Register*, edited by Armitage-Smith (ib., 1911).

LANCASTER, HOUSE OF. The name of the dynasty which occupied the throne of England from 1399 to 1461 and again in 1470-71. The title originated during the reign of Henry III., who in 1267 made his second son, Edmund Crouchback, Earl of Lancaster. On the failure of male heirs, John of Gaunt, fourth son of Edward III., married Blanche, the Lancastrian heiress, and in 1362 was created Duke of Lancaster. His older brother Lionel was at the same time created Duke of Clarence and in this manner originated the rival houses of Lancaster and York. John of Gaunt's son, Henry IV., seized the crown, dethroning Richard II (q.v.). Henry's usurpation could be justified on hereditary principles only upon the assumption that the inheritance to the crown could not pass through females, or that his ancestor, Henry Crouchback, was really older than Edward II., having according to the legend been set aside on account of a physical deformity, though in fact he was called Crouchback from having won the Crusader's cross. Henry's rule was really based upon the acceptance by Parliament of his defective title, and he is the first English king who ruled by parliamentary right. Henry IV (1399-1413) and Henry V (1413-22) maintained their position through the support of Parliament and the Church, which they were careful to conciliate, and through the brilliant victories of Henry V in France, but the long minority and inefficient rule of the last Lancastrian, Henry VI, which began in 1422, was a time of violence, ending in the Wars of the Roses. Consult Gairdner, *The Houses of Lancaster and York* (London, 1886); Ramsay, *Lancaster and York* (2 vols., Oxford, 1890); Stubbs, *The Constitutional History of England* (5th ed., vol. iii, ib., 1895). Hartwright, *The Story of the House of Lancaster* (London, 1897); and the bibliographies under the separate kings. See ENGLAND; JOHN OF GAUNT; HENRY IV, V, VI.

LANCASTER, SIR JAMES (c.1550-1618). An English navigator. Of his early life, which was spent among the Portuguese, little is known. He first comes into prominence as commander of one of the English vessels under Drake in the attack on the Spanish Armada in 1588, and in the same vessel, with two convoys, he sailed from Plymouth in 1591 and, after a voyage to India full of exciting adventures, returned in 1594 with rich Portuguese spoil. Another profitable prize-seeking expedition off the African coast, and the damage inflicted on the Spanish-Portuguese trade, resulted in the organization of the East India Company and his appointment as commander of an expedition of four vessels which sailed from Torbay in 1601. Warmly received by the kings of Atchin and of Bantam as an enemy of the Portuguese, he established most favorable commercial relations with them and on his return to England in 1603 was knighted. Having become wealthy, the rest of his life was spent in England as a director of the East India Company. He interested himself in the project for discovering the Northwest Passage, and on his advice the gov-

ernment sent out an expedition. Baffin named a strait, opening into Baffin Bay, Lancaster Sound, in his honor. Consult Markham (ed.), *The Voyages of Sir James Lancaster* (London, 1877), published by the Hakluyt Society.

LANCASTER, JOSEPH (1778-1838). The founder of the Lancastrian system of instruction, one of the rival systems of monitorial instruction (q.v.). Lancaster was born in London and served as a seaman, but, inspired by philanthropy, began the work of teaching without any previous training and before the age of 20 had more than 1000 pupils under his care. This was made possible by his adoption and improvement of the plan of instruction first formulated by Dr Andrew Bell, of Madras, and hence also called the Madras system of instruction. Lancaster soon gained the support of some of the nobility, and the Royal Lancastrian Society was formed, schools were established, and buildings erected. From this grew the British and Foreign School Society, supported by the non-conforming churches, which continues to exist and supports many of the public schools of England, although the Lancastrian ideas have long since been outgrown. Lancaster's ideas had a great vogue in England and for a time in Holland, France, and Germany, but, quarreling with his patrons, he came to the United States, where he lectured with success. His ideas were very popular throughout the Eastern and Northern States. In New York, Baltimore, and Philadelphia, as well as in smaller communities, this system was generally adopted. After the death of Lancaster, which occurred as the result of an accident in New York City, his family removed to Mexico, where this educational system was received with great favor, and legislative aid was granted under the control of a national Lancastrian system. The plan was also received with favor in some South American countries. See article on **MONITORIAL SYSTEM**. Consult: Lancaster, *Improvements in Education* (New York, 1833); the *Educational Record* (ib., 1867-68); Gill, *System of Education* (Boston, 1899); Salmon, *J. Lancaster* (New York, 1904); A. B. Binns, *A Century of Education, 1808-1908, being the Centenary of the British and Foreign School Society* (London, 1908).

LANCASTER SOUND. A channel connecting Baffin Bay with Barrow Strait, between North Devon and Cockburn Island, in lat. 74° N. (Map: America, North, K 2). Discovered in 1616 by Baffin, it was explored by Parry in 1819. It is the only part of the Northwest Passage that is navigable every year. See **POLAR RESEARCH**.

LANCASTER, or LANCASTRIAN, SYSTEM. See LANCASTER, JOSEPH; MONITORIAL SYSTEM.

LANCE (OF., Fr. *lance*, from Lat. *lancea*, from Gk. λόγχη, *lonché*, light spear), THE HOLY. 1. The name applied in the Greek church to the knife with which the priest cuts the bread at communion. This knife is formed like a lance, designed to imitate the spear by which Christ was pierced. 2. A lance which is claimed by tradition to be the one employed by the Roman soldier to thrust into the side of Christ on the cross. It was said to have been discovered by Helena, the mother of Constantine, and was long preserved in the portico of the Church of the Holy Sepulchre. Thence the head was carried to Antioch. There by a vision it was discovered by the Crusaders in 1098, pawned

by Baldwin II to the Venetians, from whom Louis IX of France obtained it in 1239 and carried it to Paris. It was seen there as late as 1796, but now it has disappeared. The shaft of the lance was in Constantinople until 1492, when the Sultan sent it to Innocent VIII, and it is now preserved in St. Peter's at Rome. Another lance, whose tradition can be traced as early as 1273, claiming to be the true holy lance, is at Vienna, and still another is at Cracow. For the Roman relic, consult De Mély, in P. E. D. Riaut, *Exuvie Sacre Constantinopolitane*, vol. iii (Geneva, 1878).

LANCE, GEORGE (1802-64). An English painter of still life, born at Little Easton, Essex. After working in a factory at Leeds he went to London, met Landseer by chance, and became a pupil of Haydon and a student at the Royal Academy. He exhibited in all 135 works at the British Institution, 48 at the British Artists, and 38 at the Royal Academy. He ranked first among contemporaneous English painters of flowers, fruit, and dead game. There are numerous examples of his work in the National Gallery and in the Tate Gallery, London.

LANCELET (so called from its shape). One of the primitive vertebrates, found on sandy beaches, classified as of the class Acrania. See **AMPHIOXUS**.

LANCELOT (län'se-lôt) OF THE LAKE. A character in the Arthurian romances. The oldest extant form of the Lancelot story is contained in the German poem *Lanzelet* (before 1200), by Ulrich von Zatzikhoven. According to this account a fairy called the Lady of the Lake carries him away when only a year old to her castle on an island in the sea. At the age of 15 he sets out on his knightly exploits, in the course of which he is victorious in a tournament held by Arthur, enters the castle of the dead, where he is enchanted, kills a giant, wins the domain of Iweret, and marries his chaste daughter Iblis. It is very probable that the tale, as thus related, is Celtic in the main essentials. It is even possible that it was the subject of some Anglo-Norman poem that found its way into Germany, and it may have been brought by Hugh Morville, King Richard's hostage in Germany (1194). Somewhat earlier than the German poem, the French trouvère Chrestien de Troyes (q.v.) made use of the Lancelot story for a love romance. In his *Chevalier de la charrette* (or *Knight of the Cart*) (about 1170), Lancelot appears as the lover of Guinevere, the wife of Arthur. The Queen is carried away by Meliagraunce to his castle, whence no one ever returns. Lancelot hastens in pursuit; but, losing his horse, he is fain to ride in a cart driven by a dwarf. He defeats the ravisher in single combat and brings back the Queen. Throughout this adventure the passion of Lancelot and Guinevere is kept prominent as the ruling motive. For following in further detail the development of the Lancelot story, there is not sufficient material. No doubt it continued to be the theme of many Anglo-Norman poets. Early in the thirteenth century it was expanded and thoroughly woven into Arthurian legend, in the French prose romances *Lancelot*, consisting of four parts: the *Lancelot proper*, the *Queste del Saint Graal*, the *Grand Saint Graal*, and *La mort du roi Artus*. The manuscripts of this immense prose romance commonly ascribe the authorship to

Walter Map, Chancellor of Henry II (q.v.); but this is probably a fiction. Map may, indeed, have written of Lancelot in Norman-French verse, which served as the source of the German *Lanzelet* and other subsequent romances. If so, his work is merged beyond recognition in that of several other hands. The authorship of the prose *Lancelot*, as it now stands, is unknown. From the French the story passed into the *Morte d'Arthur* of Sir Thomas Malory, printed by Caxton in 1485.

Of the romance thus fully developed, the situation and the main incidents are well known. Lancelot, of royal lineage, is brought to Arthur's court by the Lady of the Lake to be dubbed a knight. He proves his valor in the King's wars and tournaments. The most beautiful and generous as well as the bravest knight in all the world, he is beloved by the Queen, with whom he carries on an intrigue. In course of time Elaine, or the fair maid of Astolat, becomes enamored of him and dies for her love. With Galahad, Perceval, and other knights, he seeks the adventure of the Holy Grail (q.v.), but fails in the quest because of his sin. He is discovered in the chamber of the Queen, with whom he flees to Joyous Gard. On the intervention of the Pope Lancelot surrenders Guinevere to the King and departs over the sea. Arthur, leaving his nephew Modred in charge of his realm, pursues Lancelot. In his absence Modred is crowned King at Canterbury. Arthur returns, slays him in a great battle, but is himself mortally wounded. In a magic barge he is borne by fairies to Avalon, the land of immortality, to be healed of his grievous wound. Lancelot, hearing of Arthur's death, comes to England to seek the Queen, who has retired to the nunnery at Almesbury. Dismissed by her, he also retires to a hermitage, where he passes the rest of his life in penance and prayer. After the death of the Queen he sickens and dies. His body is laid in the chapel at Joyous Gard, but his soul is borne to the gates of heaven by hosts of angels. The story of Lancelot and Guinevere has been treated by poets of the first order. As to the romance of the thirteenth century the passion of these lovers was awakened by a fatal kiss. That incident Dante immortalized in the sinful love of Francesca and Paolo (*Inferno*, v). The love of Lancelot and Guinevere is the centre of interest in Tennyson's *Idylls of the King*; and two motives from it were impressively handled by William Morris in "The Defence of Guenevere" and "King Arthur's Tomb".

M. Gray (ed.), *Lancelot of the Laik, from the Cambridge University Library Manuscript* (Edinburgh, 1912); and for the "Lanzelet" of Ulrich von Zatzikhoven, *Romania*, vol. x (Paris, 1881).

LANCER. A cavalry soldier armed with the lance. Lancer regiments were first brought into the regular army service by Napoleon. They

had previously been confined exclusively to the Cossack arm of the Russian service. The lance is from 8 to 11 feet long, of bamboo or steel tubing having a sharp, spearlike point made of steel, and a metal-encased heel. A little distance below the point of the lance is placed a small pennon. Lancer regiments have proved particularly effective when used against defeated or demoralized infantry and have been increasingly employed in both the German and British establishments. The problem of their future, in view of recent developments in rapid and effective rifle fire, is the problem of cavalry in general. As an accompaniment to expert horsemanship, the dexterous use of the lance is of the greatest value, and the cavalry of all armies using it practice at various feats of skill. In single combat with a swordsman (see FENCING) the lancer strives to keep his opponent on his left flank, thus securing the advantage of his longer weapon and freer play—and considerably handicapping the swordsman. The foot soldier, armed with rifle and bayonet, attacks the lancer on his lance side, manoeuvring to get inside his guard—a form of attack which is specially advantageous because of the unwieldiness at close quarters of the lance as a weapon of defense. There are 15 regiments of lancers in the Bengal cavalry division of the British Indian native army. During the British-Boer War of 1899-1902 the British lancers were successfully employed against the Boers, on the few occasions that contact between the combatants was possible, notably at Elaadslaagte. It was observed, however, that in field operations the lancer cavalry, owing to their lances, were readily seen at great distances by the Boers and to that extent were limited in their usefulness. In the Great European War of 1914 conflicts of German and Belgian lancers were a conspicuous feature of its early stages. Instead of the bamboo staff employed in most services, the Germans used a tubular lance of steel 3.2 meters in length. In the Belgian army previous to the war there were four regiments of lancers armed with a bamboo lance 2.85 meters in length. In the British army there were six regiments of lancers, while in the French army a number of the dragoon regiments were equipped with the lance. Whatever may be the future of cavalry in general, the opening years of the twentieth century and the Great European War witnessed a growing employment of lancer regiments. See CAVALRY.

LANCERS. A square dance for eight or 16 couples. It was probably invented about 1819, either by Joseph Hart, who published, the following year, *Les Lanciers: A Second Set of Quadrilles for the Pianoforte, with Entirely New Figures*; or by Duval, of Dublin, who also at this time published a set. The lancers was first danced in London in 1850, but it had been introduced in Paris by Laborde in 1836. It originally consisted of five figures—La Rose, La Ladoiska, La Dorset, Les Lanciers, and L'Etoile—and was a most intricate dance.

LANCET FISH (so called from the sharp spines, one on each side of the tail), or HANDSAW FISH. One of a family (Alepisauridæ) of ferocious pelagic fishes of the order *Isomi*. (Cf. LANTERN FISH.) They are found in both the Atlantic and Pacific, but are rarely seen except when cast ashore dead or dying by storms, or are caught by deep-sea lines. They are elongated, scaleless, swift-moving fishes, with the

snout prolonged, the mouth deeply cut and armed with long fangs and numerous small teeth (see Plate of LANTERN FISHES): but the lower jaw is unable to drop far, so that the mouth cannot be widely opened. The gill openings are very wide; there is no air bladder. The fins are exceedingly delicate, and the dorsal one may be folded down out of sight in a groove along the back. Every part of the skeleton is extremely fragile. About a dozen species are known, all of the genus *Plagyodus*, and varying from 2 to 4 feet long. The lancet fish proper is *Plagyodus ferax* of the North Atlantic. A Western species (*Plagyodus asculapius*), also called wolf fish, is known by several specimens from California and Alaska. Another Pacific species (*Plagyodus borealis*) is the one called handsaw fish, in allusion to the serrations on the first ray of the ventral fin—a characteristic, however, of the whole group.

LANCET WINDOW. A long and narrow window with acutely pointed-arched head. This form was much used in France and Great Britain during the early period of Gothic architecture and was retained in England and Scotland long after it had been supplanted in France by the wider tracered forms. Several lancet windows are frequently grouped together in early English Gothic, so as to produce an effect of elegant simplicity. The groups of two and three at Salisbury and Ely, and the famous Five Sisters at York, are especially good examples. In some cases the central lancet is higher than the others. The development of tracery drove out the lancet.

LANCEWOOD. The wood of a small West Indian tree, *Ocandra virgata*, or *Bocagea virgata*, of the family Anonaceæ, valued for its strength and elasticity. It is used by coach-builders for shafts and carriage poles, for which it is specially fitted. The tree, which is very straight, seldom attains a diameter of more than 9 inches with the bark on. White lancewood, derived from *Bocagea laurifolia*, or *Ocandra laurifolia*, is little used. Lancewood is also derived from *Duguetia quilarensis* and other species in South America.

LANCHOW, lan'chow', *Chan pron lán'-chō'*. The capital of the Chinese Province of Kansu, situated on the right bank of the Hoang-ho and near the Great Wall, in lat 36° 8' N. and long 103° 55' E. (Map China, H 4). It is one of the most important cities of north China, lying at the converging of trade routes connecting China with Turkestan, and Tibet. The town is . . . of wood and has well-paved streets. There are an ammunition factory and manufactures of cloth and camel's-hair goods, all operated by steam. Lanchow carries on an extensive trade in silk stuffs, fur, metal, and wooden articles, grain, vegetables, fruit, and tea. Pop. (est.), 500,000.

LANCIANI, lán-chá'né, RODOLFO AMEDEO (1847-) An Italian archaeologist, born in Rome. He studied at the Roman College and at the University of Rome and also was a pupil of the famous Christian archaeologist De Rossi. At the age of 20 Lanciani assisted at the excavations at Ostia (q.v.) and after the establishment of the Italian government in Rome engaged in its archaeological service almost continuously. In 1872 he became secretary of the Archaeological Committee, three years later vice director of the Museo Kircheriano, from 1875 to about 1895 he was director of excavations,

and after 1878 he was professor of Roman topography in the university. In the United States he became well known through his books dealing with the excavations and monuments of ancient Rome and through his visit to America and his lectures in 1886-87. The most important of his publications are: *I comentarii di Frontino intorno le acque et gli acquedotti* (Rome, 1880), a comprehensive study of the water supply and distributing systems of ancient Rome; *Ancient Rome in the Light of Recent Discoveries* (Boston, 1888), his American lectures; *Ricerche sulle XIV regioni urbane* (Rome, 1890); *L'itinerario di Eusebio e l'ordine di Benedetto canonico* (ib., 1891); *Pagan and Christian Rome* (Boston, 1893); *The Ruins and Excavations of Ancient Rome* (ib., 1897); *The Destruction of Ancient Rome* (New York, 1899); *Forma Urbis Romæ* (Milan, 1893-1901), a map of Rome in 18 parts, 46 plans, on the scale 1:1000, showing all the ancient monuments and the excavations, *New Tales of Old Rome* (Boston, 1901); *Golden Days of the Renaissance in Rome* (ib., 1906); *Wanderings in the Roman Campagna* (ib., 1909).

LANCIANO, lán-chá'nó (Lat. *Anxanum*). An episcopal city in the Province of Chieti, Italy, 12 miles southeast of the city of Chieti, and 8 miles from the Adriatic and the nearest railway stations (Map: Italy, E 3). It occupies three hills, two of which are connected by an ancient bridge of great square blocks of stone. The central position of this town caused it to be selected for judicial and civil headquarters during the Roman and the Gothic periods. It has a gymnasium, technical schools, a seminary, a public library, a city hospital, an asylum for the aged, one for infants, and a municipal theatre. The country produces grain, fruit, wine, oil, and silk, and there are important hemp and linen factories. Pop. (commune), 1901, 18,528; 1911, 19,917.

LANCRET, lán'krá', NICOLAS (1690-1743). A French genre painter. He was born in Paris, of wealthy parentage, and was first apprenticed to an engraver, whom he left to study painting under D'Ulin, a professor of the Academy. His friendship and admiration for Watteau moved him to study under Gilot, with whom he remained several years. Lancret imitated Watteau, both in manner of painting and in choice of subjects. He was admitted to the Academy in 1719 as painter of "fêtes galantes" and afterward became councilor of the Academy (1735). He is not the equal of Watteau, though he sometimes approaches him; his brush is more conventional, and he had less imagination. Yet his compositions at best, while airy and graceful, are natural and true. Their dominant color note is a silvery gray. Lancret is most in his element when rendering the frolics and revels of the Regency. His art is best represented in the royal palaces of Berlin and Potsdam by no less than 28 examples, purchased by Frederick the Great. Among the most famous are the "Magic Lantern," "The Bird Catcher," New Palace, Berlin; "Le Moulinet" and "Dance" and "The Fountain" at Potsdam. The Louvre possesses his "Four Seasons" and eight others, including the delightful pastel, "The Music Lesson." Among those in French provincial museums "The Hum Lunch" (Chantilly) is especially noteworthy. In the National Gallery, London, are "The Four Ages"; in the Wallace collection, nine examples, and in the Hermitage,

St. Petersburg, six. Lancret excelled also in pastels. Excellent drawings by him are in the British Museum. Consult: Ballot de Sovot, *Eloge de Lancret* (Paris, 1743; new ed., ib., 1874); Dilke, *French Painters of the Eighteenth Century* (London, 1899); Foster, *French Art from Watteau to Prud'hon* (ib., 1905).

LAND (AS. *land*, OHG. *lant*, Ger. *Land*; connected with Ir. *land*, *lann*, Welsh *llan*, Corn., Bret. *lan*, OChurch Slav. *lědina*, land). As a technical term of the law of England and America, the term "land" comprehends not only the surface of the earth, but a vertical area extending indefinitely downward towards the centre of the earth and indefinitely upward towards the sky, together with everything which has become permanently affixed to the soil within the limits of that space. It thus includes all waters collected in wells, cisterns, or ponds, as well as waters percolating through the soil; all improvements of a durable or permanent character, such as houses, fences, monuments, etc., and the vertical column of air which rests upon the surface as its base.

As thus employed, the term describes the subject matter of real property rather than the nature of the property, land as such not being capable of absolute ownership, but being subject to certain rights of user and enjoyment, known as estates. But the term "land" is not coextensive in meaning with real estate, as certain rights over land, as leasehold interests, are in our legal system classified as personal property, and, on the other hand, things which have no connection with land, such as heirlooms, are under certain circumstances regarded as real property. See ESTATE, FIXTURES, HEREDITAMENT; REAL PROPERTY.

LAND, GOVERNMENT. See GOVERNMENT LAND; LANDS, PUBLIC.

LANDAU, län'dou. An old town in the Rhine Palatinate, Germany, situated on the Queich, 11 miles south of Neustadt (Map Germany, C 4). It has an historical museum and a thirteenth-century church. It has manufactures of iron, machinery, umbrellas, gas and water mains, wire, hats, clocks, furniture, leather, and soap. It has a large trade in produce, fruit, and wine of the surrounding country, and a yearly cattle market. Landau became a free Imperial city in 1290, was taken eight times during the Thirty Years' War, and, having passed to France by the Peace of Westphalia, was fortified by Vauban in 1668. It was annexed to Bavaria in 1816; its fortifications were razed in 1871. Pop., 1900, 15,823; 1910, 17,767.

LANDAU, län'dä. See CARRIAGE.

LAND BANKS. Banks of issue organized for the purpose of loaning credit on land. In England a National Land Bank was incorporated by Act of Parliament in 1696. Landed estate, made over to the company by the subscribers, took the place of capital stock and served as security for notes issued. The object of the corporation was to make a large loan to the government and to lend money to individuals on land as security. The interest paid by individuals was not to exceed 4 per cent, and land on which interest was in arrears for two years could be sold. The scheme was found wholly impracticable and, in spite of many tempting offers made by its promoters, failed to obtain the necessary amount of subscriptions. In 1714, 1732, and 1740 attempts were made in

New England to establish similar land banks, but it was believed that the security of land held by the corporation was sufficient to enable the notes to circulate, and therefore it was believed that bank capital and current redemption of notes were unnecessary. Instead of a promise to pay on demand, the notes merely bore the statement that the members of the company would accept them at their face value in all mercantile transactions, and in some cases the promise that the note would be redeemed in 20 years. None of these banks were in existence long enough to affect trade. The issue of notes by the banks established in 1714 and 1732 was promptly suppressed by the colonial governments, and in 1741 the land banks of 1740 were declared illegal by Act of Parliament.

Bibliography. White, *Money and Banking* (Boston, 1892); Rogers, *First Nine Years of the Bank of England* (Oxford, 1887); Davis, *Currency and Banking in the Province of Massachusetts Bay*, vol. ii (Publications of the American Economic Association, May, 1901).

LAND CRAB. Any species of crab (q.v.) which in a mature state is not aquatic, having become adapted to a terrestrial mode of life. Such are now grouped into a family, the Gecarcinidae, and divided into several genera. The species are numerous and all inhabitants of warm countries. They very much resemble the common crabs of our shores and are remarkable as animals breathing by gills, and yet not aquatic, some of them inhabiting very dry places, where they burrow in the sand or earth; but some degree of moisture is absolutely necessary to them to prevent the desiccation of their gills. Many, and probably all of them, carry their eggs to the water, for which purpose some of them annually migrate from considerable distances to the sea; but there is reason to suppose that some deposit their eggs in fresh water. The black crab, or mountain crab (*Gecarcinus ruricola*), of the West Indies, usually resides in woods and on hills often 2 or 3 miles from the sea, which, however, it regularly visits in the months of April and May. Like most of the other species, this land crab is active chiefly during the night, and except in rainy weather it seldom leaves its burrow by day. It feeds chiefly on vegetable food. When in season, it is highly esteemed for the table, as some of the other land crabs also are; and its spawn or roe, which before being deposited forms a bunch as large as a hen's egg, is accounted a delicacy. Another species of *Gecarcinus* abundant in Jamaica is known as the white land crab. It occurs in dry and somewhat sandy fields near or at some distance from the shore. It reaches a large size, the body being 4 or 5 inches across and the legs very long. The color is dull grayish white. During its migration to the ocean this crab is a great nuisance in some localities from its habit of going over, under, or through the houses, but not around them. The negroes eat these crabs, but they are not relished by the whites. A land crab of Ceylon (*Ocypoda*) is so troublesome on account of the burrows which it makes in the dry soil of the equestrian promenade at Colombo, that men are kept in regular employment to fill them up. The grass lands of some parts of India swarm with small land crabs, which feed on the grass or on green stalks of rice. The hermit crab (q.v.) also occasionally adopts a terrestrial life; a common West Indian species (*Cenobita diogenes*) occurs

at Key West, far from water, living under stones in the shells of land snails. Consult Lowe, *A Naturalist on Desert Islands* (London, 1911). See COCONUT CRAB.

LANDEN, JOHN (1719-90). An English mathematician. He was born at Peakirk, Northamptonshire. From 1762 to 1788 he was land agent of Earl Fitzwilliam. He became known as a mathematician through his contributions to the *Ladies' Diary* in 1744 and subsequently through his papers in the *Philosophical Transactions* from 1754 to 1785. He is chiefly remembered for the "Landen theorem" for the expression of the arc of a hyperbola in terms of two elliptic arcs. He published: *Mathematical Lucubrations* (1755); *The Residual Analysis* (1764); *Mathematical Memoirs* (2 vols., 1780-89).

LANDER, FREDERICK WEST (1821-62). An American soldier, born in Salem, Mass. He was educated at the Norwich Military Academy in Vermont and took up the profession of civil engineering. The United States government employed him on transcontinental surveys to select a route for a Pacific railroad. Later he undertook a survey for the same purpose at his own expense and was the only man of the party to survive. He constructed the overland wagon route in the face of great difficulties and constant hostility of the Indians. During the early part of the Civil War he served with distinction on secret missions and on the staff of General McClellan, until his sudden death from congestion of the brain, at which time he had the rank of brigadier general of volunteers. He was engaged in the capture of Philippi, the battle of Rich Mountain, and many minor skirmishes.

LANDER, LOUISA (1826-). An American sculptor, born at Salem, Mass. She studied under Crawford in Rome, where she modeled her "To-Day," a marble figure, symbolical of America, and "Galatea." Among her other works are a life-size figure of Virginia Dare, the first English child born in America; "Undine"; a reclining statue of "Evangeline" Ceres Mourning for Proserpine"; "Captive Pioneers"; and numerous portrait busts.

LANDER, RICHARD LEMON (1804-34). An English African explorer, born at Truro, Cornwall, where his father was an official. After service with London families, during which he visited the West Indies and the Continent, he accompanied Major Colebrooke as servant to Cape Colony in 1823 and traveled with him across the colony. A taste for exploration led him to secure service with Capt. Hugh Clapperton, whom he attended on his second and last expedition to the interior of western Africa in 1825. After Clapperton's death in 1827 at Chungary, Lander with great difficulty reached the coast and returned to England in 1828. *The Journal of Richard Lander from Kano to the Coast* was printed with Clapperton's *Journal* (1829). In the following year Lander published *Records of Captain Clapperton's Last Expedition to Africa, and the Subsequent Adventures of the Author* (2 vols., 1830). These works exhibited qualifications that induced the British Ministry to give him command of an expedition to explore the course and termination of the Niger. He and his younger brother, John Lander, left England in January, 1830, and after exciting adventures, before December of the same year had descended the Niger from Bousa and had determined the confluence of the

Benue, or Chadda, with the Niger and the outlet of the latter river by several deltaic mouths into the Bight of Benin. For this service Lander received the first gold medal bestowed by the Royal Geographical Society of London. The brothers' journals were purchased by Murray, the publisher, and edited by Lieut. Alexander Bridport Beecher and appeared as *Journal of an Expedition to Explore the Course and Termination of the Niger* (3 vols., 1832); the work was translated into several European languages. While in command of an expedition organized by a company of Liverpool merchants to open up commerce in the African interior (1832-34), Lander was shot in an affray with natives at Ingiamma on the Niger and died shortly afterwards, from the effects of his wound, at Fernando Po. Consult Laird and Oldfield, *Narrative of an Expedition into the Interior of Africa in Steamers, 1832-34* (London, 1835).

LANDES, länd (Fr, heaths). Extensive tracts of land in the southwest of France, extending along the Bay of Biscay for a distance of about 130 miles and covering an area of more than 5000 square miles (Map: France, S., D 4). The surface in general is flat and sandy marshland, over which the peasants travel in some parts mainly on stilts. There are, however, numerous dunes along the coast, some of them reaching a height of 250 feet. Attempts to reclaim this vast region began at the end of the eighteenth century, and now a considerable part of it is covered with pine forests. Dune palisades have been built to prevent encroachment of the sand on the vegetation. The climate has also been improved by the digging of canals for the outlet of the stagnant water. The inhabitants are engaged chiefly in forestry and cattle raising.

LANDES. A maritime department of southwest France, one of the largest but most thinly peopled in the country, bounded on the west by the Bay of Biscay (Map: France, S., D 4). Area, 3615 square miles. Pop, 1901, 291,856; 1911, 288,902. North of the Adour River the greater part of the surface is composed of the *landes* (q.v.), which afford a bare pasturage to sheep and cattle, but south of this river, in the hilly La Chalosse region, it is very fertile. Its chief industries are connected with cork, timber and its by-products, charcoal, tar, turpentine, and rosin. There are also salt works and stone quarries. The principal river is the Adour. Capital, Mont-de-Marsan.

LANDESMANN, län'des-mán, HEINRICH (1821-1902). An Austrian lyricist, novelist, and essayist, whose pseudonym was Hieronymus Lorm. He was born at Nikolsburg, Moravia, and studied in several schools in Vienna. For the most part, however, his education had to be private, because of repeated sickness, and because in his fifteenth year he became partly blind and completely deaf. Later in life he lost sight entirely. His literary career began with *Abdul* (1843). Soon after this he went to Berlin and published *Wiens poetische Schwingen und Federn* (1847), a very clever piece of political and literary criticism which roused the anger of Metternich. He became critic for Kühne's periodical *Europa* and wrote *Grafenberger Aquarell* (1848) while in Berlin. His novels include: *Ein Zögling des Jahres 1848* (1855; later eds., under the title *Gabriel Solmar*); *Am Kamin* (1856); *Der ehrliche Name* (1880); *Ein Schatten aus vergangenen Tagen*

(1882); *Ein Kind des Meeres* (1882); *Das Leben kein Traum* (1888); *Geheimrätin* (1891). He also wrote dramas, such as *Die Alten und die Jungen*, *Das Forsthaus*, and *Hieronymus Napoleon*; critical essays; *Gedichte* (1870), *Neue Gedichte* (1877), and *Nachsommer, neue Gedichte* (last ed., 1901). These lyrics are probably the most important of Landesmann's works. He is one of the foremost German poets of pessimism. Consult Wittner, *Oesterreichische Portraits und Charaktere* (Vienna, 1906).

LANDGRAF, länt'gräf, GUSTAV (1857-). A German classical scholar, born in Lichtenfels. He was educated at Erlangen and Würzburg; from 1879 to 1905 he taught in various secondary schools and then became director of the Schweinfurt Gymnasium, in the next year of a Gymnasium in Bayreuth, and in 1913 of the Maximiliansgymnasium of Munich. He edited school textbooks, especially of some of Cicero's writings, contributed to Wölflin's *Archiv für lateinische Lexicographie*; and published studies of Cæsar's historical works and his continuators, a *Latensische Lexicographie* (11th ed., 1911), which has been translated into Italian (1898) and French (2d ed., 1907), and *Beiträge zur historischen Syntax der lateinischen Sprache* (1899). He contributed also to vol. iii of *Historische Grammatik der Lateinischen Sprache*, by various scholars (Leipzig, 1903).

LAND'GRAVE, or **LAND'GRAF**. See **GRAF**.

LANDING FORCE, or **LANDING PARTY**. An organized force detailed from the crew and officers of a ship and designed for operating on shore when no other military forces are available. It usually consists of nearly all the marines serving on board the ship and of one or more companies of bluejackets (i.e., enlisted men who are not marines—men enlisted as landsmen are *bluejackets*, but not strictly *sailors*). The men are armed with rifles, machine guns, and 3-inch field guns when the latter are thought necessary. They are landed in boats, light infantry boats being the first ashore, the men in the other boats following when the first party is in position to prevent a surprise of the main body. When landing in the face of opposition, the force is supported by the fire of armed boats, and the guns of the ship if possible. In any case, care is exercised to avoid being under fire of the enemy, except for a few seconds, while still in the boats.

A naval infantry company consists of 48 men in ranks, six petty officers (two acting as the right and left guides), a captain of company, and two lieutenants of company. A machine-gun detachment consists of 12 men and a petty officer; the crew (called a *section*) of the 3-inch naval field gun consists of 24 men and 3 petty officers in charge of an ensign, or warrant officer. Two sections of artillery make a platoon, two platoons a battery, and two or more batteries a battalion. It will be noticed that two machine-gun detachments are equal to a section of artillery or infantry; two sections of artillery are equal to a platoon of artillery or a company of infantry. These equalities in numbers simplify the organization and drill of the men at infantry and artillery. When the landing force of a ship consists of several companies, it is called a *battalion*. Two to four battalions form a *regiment*. Battalions are commanded by lieutenant commanders or lieutenants, and regiments by commanders or captains. If two or

more regiments are landed, they form a *brigade*, which is commanded by a captain or rear admiral.

LANDIS, KENESAW MOUNTAIN (1866-). An American judge. Born at Millville, Ohio, he attended the public schools of Logansport, Ind., and in 1891 graduated from the Union College of Law, Chicago. Except for two years, when he was private secretary to W. Q. Gresham, then United States Secretary of State, Landis practiced law in Chicago until 1905, when he became United States district judge for the northern district of Illinois by appointment of President Roosevelt. On the bench Judge Landis established a national reputation as an independent and fearless judge when he tried the Standard Oil rebate cases in 1907, found the defendants guilty, and, in each offense finable, sentenced the defendants to pay the amount of \$29,240,000 as the sum total of the several violations. Although later reversed by higher courts, the decision was decidedly popular.

LANDIT, or **LENDIT**, län'dé' (Fr. *Pendit*, from *le*, the + *endit*, from ML. *indictum*, assembly, from Lat. *indicare*, to appoint, from *in*, in + *dicere*, to say). **THE FAIR OF**. A celebrated fair in mediæval France. In 1109 the cathedral of Paris received a reputed portion of the true cross. In order to allow this to be seen, the Bishop chose a large open place between Saint-Ouen, Saint-Denis, and Paris, where, on the second Wednesday in June, it should be exhibited. Because of the great gathering of people for the religious festival, merchants flocked thither and held a fair under the auspices of the monks of Saint-Denis. The fair was much frequented by merchants from Normandy, Flanders, and the north of France. Because of the civil wars, the fair after the middle of the sixteenth century was held in the town of Saint-Denis and soon lost its importance. In the eighteenth century it became a sheep market. Consult Lebeuf, *Histoire de la ville et la diocèse de Paris*, vol. ii (Paris, 1883).

LAND LEAGUE. One of the leagues founded at different times in Ireland to improve the condition of the tenant. In the winter of 1879-80 the agrarian distress caused by partial failure of the crops during the preceding year assumed the proportions of a famine. The peasants were unable to pay rents, and a large number of evictions followed, with consequent resistance and conflicts with the police. At this time Michael Davitt conceived the plan of forming an organization of tenant farmers to further the tenants' interests. Charles Stewart Parnell, the leader of the Irish party, approved of the plan, and on the 21st of October, 1879, the Land League was organized in Dublin, with Parnell as president and Davitt as one of the three secretaries. The object of the league was to raise money for the relief of the distressed Irish peasantry and to furnish them with legal counsel in resisting the landlords. It advocated peasant proprietorship of the soil as a remedy for the existing evils. The league grew in Ireland and was very effective in preventing evictions and reducing rents. Its agitation, however, was incendiary in character, and disturbances became more frequent. To relieve the distress, Gladstone in 1880 secured the passage of a bill providing for the temporary suspension of evictions, but the Lords by an overwhelming majority rejected the measure. This action on the part of the

Lords increased the outrages in Ireland. Although the most radical leaders of the Land League, especially Michael Davitt, deprecated the use of force, they were unable to prevent it. Cattle were frequently mutilated, and murders of landlords occurred in different parts of the country. Rents were often withdrawn altogether. In November, 1880, the government charged Parnell and his associate leaders with conspiracy, but failed to convict them. In order to meet the lawlessness and at the same time to remedy agrarian distress, Forster, the Irish Secretary, introduced coercion bills, which were to be followed by a land act. These bills were passed amid unparalleled scenes of disorder on the part of the Irish members, and the famous Land Act of 1881 became a law. (See IRISH LAND LAWS.) The league was not satisfied with the concessions made, and in the next convention, held at Dublin in the following September, it was decided, on the advice of Parnell, to continue the agitation and resistance until the new law had been tested in the courts. The government thereupon decided to suppress the league. Parnell, Davitt, and the other leaders were arrested and imprisoned. They replied by the famous No Rent Manifesto, exhorting the Irish people to pay no rent while their leaders were in prison. This caused the government to declare the suppression of the league by the decree of Oct. 18, 1881. The reforms which the Land League hoped to institute were taken up and in part effected by the Irish National League under Parnell's leadership, and the principal object of the Land League was realized in 1902, when an Act of Parliament was passed to enable the peasants to acquire title to the lands they occupied. Consult Cashman, *The Life of Michael Davitt* (Boston, 1881); Flatley, *Ireland and the Land League* (ib., 1881); Michael Davitt, *The Fall of Feudalism in Ireland, or the Story of the Land League Revolution* (London, 1904).

LÄNDLER, lënt'lër. A slow waltz in $\frac{3}{4}$ or $\frac{3}{8}$ time, characteristic of Austria, where it originated and received its name from the dialectic *Landel*. It is very popular in Germany. The French Tyrolienne (q.v.) is an imitation of it.

LANDLOCKED SALMON. Any of various salmon—in North America more particularly the winninish (q.v.)—which dwell in large bodies of fresh water and never, or only in exceptional instances, go down to the sea. See SALMON.

LANDLORD AND TENANT. Those who stand in the relationship which subsists when one person holds land of another and in subordination to the latter's title. The relationship arises whenever one having an estate in land grants to another a lesser estate therein. It exists equally, therefore, between a tenant in fee simple and his grantee in fee tail and between a tenant for years and his subtenant. In either case the grantor or lessor, whatever the quality and nature of his own estate, is the landlord of the grantee or lessee, and the latter is the tenant of the former. In all cases the estate or interest remaining in the landlord is technically known as a reversion (q.v.). Excepting in the case of an estate for years, which is capable of indefinite subdivision, a person cannot acquire the relation of a landlord by granting to another an estate of the same kind or quality as that which he himself possesses, even though it be limited so as to come to an end before the probable termination of the grantor's estate. Thus, a tenant in fee simple cannot grant lands in fee

simple to another so long as the grantee and his heirs continue to reside on the premises conveyed, retains no interest which can be called a reversion, nor does such a grant create a tenure between grantor and grantee. At the most the grantor in such a case has left only an indefinite interest, known as a "possibility of reverter."

The relation of landlord and tenant had its origin in the feudal system of land tenure, under which all freehold lands, including fees, were held of a superior lord. Under that system it was possible for a tenant in fee simple to grant the lands in fee simple to be held of himself, in which case he became the immediate feudal superior of his grantee. This practice of subinfeudation, as it was called, was abolished by the famous Statute Quia Emptores, enacted by the English Parliament in 1290, since which time the alienation of a fee divests the grantor of all his right and interest therein. But as this statute applied only to conveyances in fee, it left the way open for the various forms of tenure above described, by which the relation of landlord and tenant is still created. As has been stated, the tenant in fee simple who grants the land in fee tail or for life is the landlord of his grantee in precisely the same way as he is of a tenant for years, but in practice the phrase "landlord and tenant" is more commonly employed to describe the lastnamed relation.

As thus understood, the relation usually arises from an instrument of conveyance, known as a lease (q.v.), and the rights and responsibilities flowing therefrom are partly the result of positive law and partly of the agreements and stipulations embodied in the lease. Of the inherent legal incidents of the relation, perhaps the most important are the obligation of the landlord to protect the tenant's possession against all persons claiming a legal right to the premises, and the correlative obligation of the tenant to recognize his landlord's title. The former is violated by an eviction by the landlord or any one claiming under him or by one asserting a paramount title, the effect of which is to suspend the rent due by the lease and to give the evicted tenant an action for damages against his landlord. But the landlord is not bound to protect the tenant against trespasses or nuisances, his implied covenant for quiet enjoyment, as it is called, not extending to unlawful acts of third parties. Neither is the landlord bound to furnish a habitable tenement. He leases the land, with such improvements as happen to be thereon, and the tenant takes them as they are. It is no eviction of the tenant if, upon taking possession, he finds the premises uninhabitable. See EVICTION.

The tenant, on the other hand, is estopped from denying his landlord's title, or, in general, from setting up a title, either in himself or in another, adverse to that of his landlord, and that irrespective of whether the latter's title be good or bad. Neither can he, at common law, ever acquire a good title as against his landlord by any lapse of time. So long as he continues in possession he is held to the relation of a tenant and cannot get into adverse possession of the premises, so as to take advantage of the Statute of Limitations. This rule has, however, been generally modified by statutes permitting a tenant, after a certain length of time, or even, in a few States, by disavowal of his landlord's title, to acquire the status of an adverse possessor. In no case, however, can this be

done until the expiration of the term of the tenancy.

This duty of the tenant to refrain from denying his landlord's title is the modern survival of the feudal obligation of fealty, pledged by the vassal to his lord. Its most serious breach at common law consisted, not in the tenant's setting up the invalidity of the landlord's title in an action for the rent, nor yet in his assertion of an independent title, by adverse possession, but in the tortious or wrongful conveyance of the premises to a third person in fee. This was effected by one of the ancient modes of conveyance, as feoffment, fine, or common recovery, which had the curious effect of vesting in the grantee the actual estate which it purported to convey, even though this was greater than the estate of the grantor. This grave breach of the tenant's good faith was attended by the complete forfeiture of his own estate to the landlord whom he had thus betrayed. The abolition of tortious conveyances by statute has done away with this violation of the tenant's duty. See **FEOFFMENT**; **FORFEITURE**; **LIFE ESTATE**.

Among the other important incidents of the relation of landlord and tenant are the obligation of the tenant to refrain from committing waste on the premises, his right to cut wood for fire, for fencing and repairs, and other similar privileges, known as "estovers"; the right of a tenant for life or at will to the emblements or growing crops, and the right of a tenant under certain circumstances to remove fixtures which he has annexed to the freehold. The obligation of a tenant for life or years to keep the premises in repair is a direct consequence of his liability for what is known as permissive waste, which consists in permitting the premises to deteriorate with use. At common law this is carried so far as to compel the tenant to rebuild a house destroyed by accidental fire, but this extreme consequence of the doctrine of waste has generally been abrogated by statute in the United States. All of these rights and obligations flow naturally from the relation between the parties and do not depend upon agreement. See **EMBLEMENTS**, **ESTOVER**; **FIXTURES**; **WASTE**.

Other obligations of the parties are the result of agreements which, in the language of the books, "touch and concern the land." These are very numerous, the more usual ones being the obligation of the tenant to pay a stipulated rent, to refrain from assigning the lease without the landlord's permission, to make certain improvements, and the like; and, on the landlord's part, to renew the lease for a further term, to pay for improvements at the expiration of the lease, to permit the removal of fixtures not otherwise removable, etc. Rent is never due in the absence of an agreement, express or implied, but by statute an understanding to pay a reasonable rent for the use and occupation of leased premises may be implied in cases where the lease is silent on the subject. Where agreements of the kind above enumerated are embodied in a covenant, i.e., an instrument under seal, they become a part of the relation of landlord and tenant, and become binding, not only upon the original parties, as is the case with ordinary contracts, but extend to all those who may, during the continuance of the lease, succeed to the position of the original parties respectively. Such covenants are said to "run with the land." It is on this principle that a tenant's obligation to pay a certain rent is passed on to any one to

whom he may assign the lease, and the landlord's right to enforce the obligation passes, upon a sale of the land, to the grantee of the reversion.

Most of the obligations of landlord and tenant, whether inherent in the relation or contractual, are enforceable only by an action for damages. This is especially true of the obligations arising out of the agreements of the parties. In the absence of an express provision to that effect, there is, in general, no right on the part of the landlord to terminate the lease and eject the tenant for failure to pay rent or for any other breach of duty. This result can be attained only by incorporating in the lease a condition forfeiting the estate for a failure to perform the covenants thereof. This, however, is frequently done.

Under most circumstances the relations of landlord and tenant come to an end without notice. This is always true of estates for life and for years, and generally of tenancies at will and at sufferance. Estates from year to year, or from month to month, on the other hand, are a peculiar form of tenancy at will, terminable only at the end of a current period and then only upon due notice. But the estate of a tenant may come to an end in other ways than by effluxion of time. Apart from cases of forfeiture for waste, for felony, for breach of condition, and the like, leasehold estates are regularly terminated by the "release" of the reversion to the tenant, or by the "surrender" of the tenant's estate to his landlord. These are modes of conveyance operating only where there is "privity of estate" between the parties thereto and peculiarly appropriate therefore to the case of landlord and tenant. The result in either case is to produce what is known as a merger, the lesser estate disappearing in the greater and thus coming to an end. See **FORFEITURE**, **RELEASE**; **SURRENDER**; also **LEASE**; **LEASEHOLD**; **TENURE**. Consult the authorities appended to the article on **REAL PROPERTY**, and McAdam, *Rights, Remedies, and Liabilities of Landlord and Tenant* (New York, 1901); Taylor, *The American Law of Landlord and Tenant* (Boston, 1904); Fawcett, *Landlord and Tenant* (3d ed., London, 1905); Tiffany, *The Law of Landlord and Tenant* (St. Paul, 1910).

LAND OF BEUTLAH. A name occurring in Isa. lxii. 4 and given in Bunyan's *Pilgrim's Progress* to the region of peace where the pilgrims rest after their journey until called to cross the river of Death to the Celestial City; it typifies the Christian peace of mind after the trials of this life.

LAND OF NOD. A humorous designation of the state of sleep, from the name of the land mentioned in Genesis iv, where Cain dwelt after the murder of Abel.

LANDOIS, län'dwä', HERMANN (1835-1905). A German naturalist. He was born at Münster and educated there for the priesthood, which he entered in 1859, but afterward left to devote himself to scientific study and the popular presentation of natural history. He was made professor of zoology at the Academy of Münster (1873) and also head of the zoological museum. He wrote: *Tierstimmen* (1875); *Lehrbuch der Zoologie*, with Altum (5th ed., 1883); with Martin Krass, *Der Mensch und die drei Reiche der Natur* (part i, 14th ed., 1911; part ii, 11th ed., 1904; part iii, 8th ed., 1910); an equally successful *Lehrbuch für den Unterricht in der Naturbeschreibung* (part i, Zoologie, 8th ed., 1912;

part ii, *Botanik*, 7th ed., 1907; part iii, *Mineralogie*, 3d ed., 1908).—His brother, **LEONARD** (1837–1902), a German physiologist, was born at Münster and educated at Greifswald, where he took his degree in 1863 and became professor of physiology in 1872. He wrote on the blood, the pulse, and transfusion, on optical phenomena and electromagnetism, and published a valuable and successful *Lehrbuch der Physiologie des Menschen* (12th ed., 1909).

LANDOLT, län'dölt, EDMUND (1846–). An ophthalmologist, who was born in Aarau, Switzerland, and made Paris his permanent residence. He was educated at Heidelberg, Zurich, Vienna, Berlin, and Utrecht, and at Paris became an assistant in the university eye clinic. In the Franco-Prussian War he was at Héricourt with the Zurich ambulance service. In 1874 he returned to Paris, established an optical clinic and, with Javal, the *Laboratoire d'Ophthalmologie* at the Sorbonne. With Panas and Gayet, Landolt edited the important *Archives d'Ophthalmologie*, to which, as to the *Zeitschrift für Augenheilkunde*, he made valuable contributions. Among his many publications are *Leçons sur le diagnostic des maladies des yeux* (1877), *Manual of Examination of the Eyes* (1879); *Traité complet d'ophtalmoscopie*, with Wecker, *The Refraction and Accommodation of the Eye* (1882); *Vademecum of Ophthalmological Therapeutics*, with Gygax (1895), in French, English (1898), German, and Japanese versions.

LANDON, län'dôn', CHARLES PAUL (1760–1826). A French painter and author, born at Nonant. He studied under Regnault and won the Prix de Rome in 1792. He became successively painter to the Duc de Berri, corresponding member of the Institute, and conservator of the Louvre. While his paintings were much admired under the Empire, it is for his books that he will be remembered. Among them are: *Vie et œuvres des peintres les plus célèbres des arts* (25 vols., 1803–24), *Description de Paris* (1809–19); *Annales du musée et de l'école moderne des beaux-arts* (17 vols., 1801–08).

LANDON, LETITIA ELIZABETH (1802–38). An English poet—better known by her initials L. E. L.—born in Chelsea. In 1820 her first poem, "Rome," appeared in the *Literary Gazette*. She published several volumes of verse, the most widely read of which was the *Improvisatrice* (1824). She wrote three novels, of which the best is *Ethel Churchill* (1837). Consult Blanchard, *Life and Remains of Landon* (London, 1841), and *Poetical Works*, edited by W. B. Scott (ib., 1873). Her *Traits and Trials of Early Life* (1836) is supposed to be autobiographical.

LANDOR, län'dör, A. HENRY SAVAGE (1865–). An English traveler, writer, and artist. He was born in Florence, a grandson of Walter Savage Landor. After studying art in Paris he traveled in eastern Asia for several years and thereafter visited numerous countries of the other continents. In 1897 he reached both sources of the Brahmaputra River; later he explored central Mindanao Island, where he discovered the "white tribe" (Mansakas); in 1900 he accompanied the allied troops on the march to Peking, and with them entered Lhasa, the Forbidden City, and in 1902 went overland from Russia to Calcutta. During 1903 he visited some 400 islands in the Philippine and Sulu archipelagoes; in 1906

he crossed Africa in its widest part, a distance of 8500 miles, covered in 364 days; and in 1910–12 he crossed South America from Rio de Janeiro to Lima, traversing unexplored central Brazil and climbing the Andes. In 1914, after the return of Theodore Roosevelt from South America, Landor declared that the River of Doubt, which Roosevelt claimed to have discovered, did not exist. Later in the same year, at the beginning of the European War, Landor served as dispatch bearer for the Belgian government, his route being from Antwerp to Bordeaux, temporarily the French capital. His writings, largely illustrated by his own sketches, include *Along with the Harry Anu* (1893); *Corca* (1895), *In the Forbidden Land* (1898); *China and the Allies* (1901); *Across Coveted Lands* (1902); *The Gems of the East* (1904); *Tibet and Nepal* (1905); *Across Wildest Africa* (1908); *The Americans in Panama* (1910); *An Explorer's Adventures in Tibet* (1910); *Across Unknown South America* (1913).

LANDOR, WALTER SAVAGE (1775–1864). An English poet and prose writer, son of Walter Landor and of Elizabeth Savage, born at Ipsley Court, Warwickshire, Jan. 30, 1775. As a sturdy boy of 12, he was sent to Rugby, where he distinguished himself in Latin verse. Owing to an ungovernable temper, he was difficult to manage and was accordingly removed from Rugby at the advice of the head master. In 1793 he entered Trinity College, Oxford. Unconventional in his bearing, too pronounced in his Republican opinions, he got into difficulties there. For firing a gun at the window of a Tory undergraduate he was rusticated in 1794 and never returned. He quarreled with his father over the incident and was left to look after himself on an allowance of £150 a year. He now spent three years in Wales, where he wrote *Gebir* (1798), which shows the influence that Milton and Pindar were then exercising upon him. The poem was greatly admired by Coleridge, Southey, and the young Shelley, but it found no favor with the general public. Writing with almost equal facility in Latin, he made a Latin version of the poem (1803). On the death of his father, in 1805, he succeeded to the family estates and began squandering them at Bath. For a few months in 1808 he served under Blake in Spain, largely to gratify a dislike to the French which he had conceived on a visit to Paris in 1802. In 1809 he purchased the estate of Llanthony Abbey, in South Wales, where by his extravagance and quarrels he wasted a large part of his patrimony. In 1811 he married Julia Thuillier, the daughter of an unsuccessful banker. The marriage was particularly unfortunate. At this time appeared his *The Tragedy of Count Julian* (1811), which, though ill adapted to the stage, is impressive as a dramatic poem. Leaving his Welsh estate in charge of his mother, he settled first at Tours and then in Italy, where he lived mostly until 1835, occupying the Palazzo Medici in Florence and the Villa Chiusa in Fiesole. To this period and the years following belong the delightful *Imaginary Conversations* (1824–29); the *Citation and Examination of William Shakespeare . . . Touching Deer-Stealing* (1834); *Pericles and Aspasia* (1836); and *The Pentameron* (1837). In 1838 he settled in Bath, where he lived, with some interruptions, till 1858. In the meantime he had published his choicest poems, the *Hellenics* (1846), some of which were translations of Latin poems written

when a young man under the title *Idyllia Heroica* (1814, 1820). Best of them is "The Hamadryad." In 1858 Lander returned to Italy, eventually taking apartments at Florence. Here he was aided by Browning and visited by Swinburne. He died Sept. 17, 1864. Lander's was a powerful personality connecting the earlier and later poets of the nineteenth century. His poetry has never been widely read, but has almost invariably charmed the poets themselves. His prose, though uneven in quality, rises at times to magnificence. He was kind-hearted and chivalrous and made many friends as well as enemies. Consult his *Works*, with life by Forster (8 vols., London, 1876); *Letters and Other Unpublished Writings*, edited by Wheeler (ib., 1897), *Letters, Private and Public*, edited by Wheeler (ib., 1899); Sidney Colvin, *Lander*, in "English Men of Letters Series" (ib., 1881); Edward Dowden, in his *Studies in Literature* (5th ed., ib., 1889); Lillian Whiting, *The Florence of Lander* (Boston, 1905); W. A. Bradley, *Early Poems of Walter Savage Lander: A Study of his Development and Debt to Milton* (London, 1914).

LANDOUZY, lān'dōō'zē', LOUIS JOSEPH THÉOPHILE (1845-). A French physician, born at Rheims. He took part in the Franco-German War, graduated from the medical school in Paris in 1876, became an associate of its faculty in 1880, and professor of therapeutics and materia medica in 1893. He was elected to the French Academy of Medicine in 1913. He published *Sur la tuberculose infantile* (1875-88); *Sur les paralysies dans les maladies aiguës* (1880); *Recherches sur les causes de l'ataxie locomotrice progressive* (1882), the collaboration with Ballet which gained an Academy prize; *Sur la myopathie atrophique progressive* (1886), with Déjerine, and crowned by the Institute, *Les sérothérapies, leçons de thérapeutique et matière médicale* (1898); *Glossaire médical* (1902); *Hygiène sociale* (1908).

LANDOWSKA, lān-dōf'skă, WANDA (1877-). A Polish pianist, born at Warsaw. She received her musical education at the Warsaw Conservatory and from H. Urban in Berlin. Upon her appointment to the staff of piano teachers at the *Schola Cantorum* she settled in Paris in 1900. Her appearance in 1906 in an historical recital, when she performed on a cembalo old compositions written for that instrument, was so successful that she practically abandoned the piano and undertook extended tours of Europe as a cembalist. She wrote *Bach et ses interprètes* (1906) and *La musique ancienne* (1908).

LAND PLASTER. Gypsum (q.v.), when used as a fertilizer, is sometimes so called.

LAND RAIL. See CRAKE; RAIL; and Plate of RAILS, ETC.

LANDRETH, DAVID (1802-80). An American seedsman. He was born in Philadelphia and was the son of David Landreth, an Englishman, who in 1784 established in Philadelphia a nursery and seed house. David the younger became a partner in the firm and until 1828 was manager of the branch store in Charleston, S. C., which was confiscated by the Confederacy during the Civil War. He then succeeded his father as head of the firm in Philadelphia. From that time forward his leisure was devoted to writing and matters of public interest. He was one of the founders of the Philadelphia Horticultural Society, for which organization he

acted as corresponding secretary from 1828 to 1835 and was an active member of numerous other societies, notably the Philadelphia Society for Promotion of Agriculture and the United States Agricultural Society, in which he held the posts of president and vice president respectively. His most notable work, which appeared at Philadelphia in 1847, was the American edition of *A Dictionary of Modern Gardening*, an English work by Johnson.

LANDRY, AUGUSTE CHARLES PHILIPPE ROBERT (1846-). A Canadian legislator and author, born in Quebec. He graduated from Laval University, studied agriculture at St. Anne College, and devoted himself to farming. He was elected a Conservative member of the Dominion Parliament in 1878 and was again elected in 1882; in 1892 he was called to the Senate, of which body he was appointed Speaker in 1911. He served in the volunteer militia, in 1885 was made a lieutenant colonel, and colonel in 1907. He was elected president of the Quebec Exhibition Company in 1894 and president of the Council of Agriculture in 1896. His publications include papers on literary, political, and scientific subjects, and *Traité populaire d'agriculture théorique et pratique* (1878), *L'Italie, ses beautés et ses souvenirs* (1880), *L'Eglise et l'État* (1883); *Les six raisons du Dr. Verge contre le cercle catholique de Québec* (1884).

LANDS, PUBLIC. That part of the national domain, in the ownership of the government, subject to sale or other disposal under general laws. These lands lie within both the States and the Territories. They have been acquired for the United States chiefly by cession from the individual States and by treaties with foreign nations. At the time of the adoption of the Articles of Confederation, in 1781, the entire national domain was either erected into States or claimed by the individual States as unorganized territory. Under the Articles of Confederation the States were induced to cede their claims to Western territory to the United States. New York in 1781, Virginia in 1784, Connecticut in 1785, and Massachusetts in 1786, with some reservations, ceded to the general government their claim to the territory north of the Ohio River; the States south of Virginia soon followed their example. South Carolina in 1787, North Carolina in 1790, and Georgia in 1802 ceded their claims to lands lying to the west of their limits, so that within a short time after the adoption of the Federal Constitution the United States had come into possession of an immense Western domain. Administration of this domain became one of the important functions of the general government. Perhaps the most notable piece of legislation enacted by the Congress of the Confederation related to the government and disposal of the public lands lying north of the Ohio River. (See NORTHWEST TERRITORY.) The Federal Constitution, adopted in 1789, conferred upon Congress the power to make all needful rules and regulations respecting the territory and other property belonging to the United States, thus making the national legislature the sole authority for the control of the public lands. After the North Carolina and Georgia cessions, the first increase of the public domain came as a result of the Louisiana Purchase of 1803, which, if it included Oregon, as the Land Office has always claimed, amounted to 1,003,216 square miles. In 1812 Congress

claimed and asserted jurisdiction over about 9740 square miles of territory in Spanish West Florida. By the cession of Florida in 1819 about 54,000 square miles were added to the public domain. The public lands within the boundaries of Texas were retained by the State. As a result of the Treaty of Guadalupe Hidalgo (1848) the territory now embraced in the State of California and the territory then known as New Mexico were acquired. The Gadsden Purchase of 1853 brought an area of some 47,000 square miles, and finally Alaska, with 577,300 square miles, was acquired by treaty with Russia in 1867. In 1867 the territory thus acquired into States or Territories, the general government has often reserved large areas for special purposes or for such disposal as it may see fit. It is these areas that are popularly and officially known as the public lands of the United States. The legal title to land occupied by Indian tribes is regarded as being vested in the United States. According to the doctrine early laid down by the courts, the Indians have only a right of occupancy, subject to the power of the United States to extinguish the same either by conquest or purchase. The principle is that they are not absolute owners, but mere occupants, to be protected while in the possession of their lands and incapable of transferring the absolute title to any person or sovereign except that of the county in which they are domiciled. An important source of expense in the public-land policy of the United States has been the cost of extinguishing the Indian titles. Up to 1883 this item of expense had reached the amount of \$9,000,000. As the titles of the Indians have been extinguished, they have been settled upon by the government land embracing altogether nearly 40,000,000 acres.

The public lands of the United States have been disposed of in various ways. The principal method has been sale at a nominal price or gift to individual settlers and grants to States or corporations. Prior to 1801 it was the policy of the government to sell its public lands in large quantities by special contract, the result being an average sale of about 100,000 acres annually. Then followed a policy of selling on credit and in small lots, with the result that some 18,000,000 acres were disposed of. In 1820 the policy of selling for cash, but in lots to suit purchasers, was tried. Within 20 years some 76,000,000 acres had been sold as a result of this method. After the panic of 1837 the preemption system, to be described hereafter, was adopted, by which the most desirable lands were reserved for actual settlers at a low price. The homestead policy adopted in 1862 had the effect of reducing the sales to an average of 1,000,000 acres annually. Up to 1883 the total receipts from the sale of the public lands had reached the amount of \$233,000,000, although, according to a reliable authority, the actual cash outlay of the government in the purchase of foreign territory, the cost of extinguishing Indian titles, the expense of surveying, etc., exceeded this amount by \$126,000,000. One of the most common methods of disposing of the public lands was by grant to individuals on account of special services to the Republic, or to corporations for the purpose of aiding in the construction of railroads, or to the States for the encouragement of education or the building of roads and canals. Of the first class of grants may be mentioned the gifts of land to the Rev-

olutionary soldiers and to eminent individuals like Lafayette, who had rendered distinguished service to the nation. Of the 10,000,000 acres given away down to 1840, the greater part was in reward for military services either in the Revolution or the War of 1812. To reward the soldiers of the Mexican War, about 60,000,000 acres were appropriated by Congress. A few grants were made direct to educational and charitable institutions, but they were exceptions rather than part of a general policy. From 1842 to 1854 various Acts were passed granting quarter sections of land to actual settlers who would take up their residences on certain frontiers. About 3,000,000 acres were disposed of in this manner. Under the homestead policy adopted in 1862 and the similar timber-culture policy introduced in 1878, about 150,000,000 acres were taken up by private persons. The policy of making grants of public lands to the States was begun at an early time and has contributed largely to the depletion of the public domain. As early as 1802 a grant was made for public improvements in Ohio. Between 1824 and 1866 more than 4,000,000 acres were granted to five States for canal purposes. By an Act of 1850 all swamp and overflowed lands within the limits of any State were granted for the purpose of aiding in the construction of levees and drains. The policy of aiding in the construction of railroads by means of public-land grants began about 1850. In September of that year Congress made a grant to the State of Illinois to be applied to the construction of the Illinois Central Railroad. The grant consisted of alternate sections for six sections in width on either side of the road. At the same time grants were made to the States of Alabama and Mississippi to aid in the construction of the Mobile and Ohio Railroad to the Gulf. Between 1852 and 1872 similar grants, about 80 in number, were made to the States of Missouri, Arkansas, Minnesota, Wisconsin, Louisiana, and Florida for the purpose of subsidizing their principal railway lines.

As early as 1845 efforts had been made to secure the aid of the government in the construction of a transcontinental line to the Pacific. With the admission of California to the Union and the rapid development of the Far West the construction of a road to the Pacific became a political necessity. Between 1850 and 1862 the proposition to grant government aid in the construction of the line was a subject of frequent debate in Congress and was favored by both political parties in their national conventions. But between Iowa and California there were no States to which the grant could pass. Accordingly Congress voted a subsidy of public land to such corporations as would undertake the task of building the Pacific railroads. During the ensuing decade 20-odd grants, comprising an aggregate area of 155,000,000 acres, were made, some of which, however, reverted to the government on account of the failure of the railroads to fulfill the conditions under which the grants were made. A few grants for canals and wagon roads between 1863 and 1873 withdrew an additional 3,000,000 acres from the public domain, thus swelling the amount promised by the government to the grand total of 262,000,000 acres. A considerable portion of this, however, reverted to the government and was never patented. In addition to grants for internal improvements the States have received large gifts of public land for the encouragement of education. Those

admitted prior to 1850 received one-thirty-sixth of their area for school purposes. Those admitted since 1850 have received one-eighteenth for the same purpose—a total of nearly 70,000,000 acres. Each of the new States has also received a tract of from one to four townships for a university—a total of more than 1,000,000 acres. By the Act of 1862 Congress granted to each State a tract of land, whose area was proportioned according to its representation in Congress, for an agricultural college. As a result of this policy about 10,000,000 acres were lost to the public domain. The six States admitted to the Union in the period 1889–96 received the magnificent gift of 23,000,000 acres for schools, public buildings, and other purposes. As a climax to the munificence of Congress was an Act of 1902, setting aside all moneys received from the sale of public lands in 17 States and Territories as a special fund for the establishment of an irrigation system. This is expected to yield ultimately several hundred million dollars.

The different methods by which titles to public land may be acquired by private individuals are. (1) preemption, (2) homestead; (3) public auction or private sale; (4) bounty law or military land warrants; (5) under the Timber Culture Act. According to the Preemption Law, which was in force until recently, the applicant was required to settle upon the land, improve it, and reside there continuously for a period of six months. At the expiration of this period, upon furnishing proof of such residence and improvement and upon paying \$1.25 per acre, the preëmtor was entitled to a patent conveying him full title to the land. All public land belonging to the United States to which Indian title had been extinguished was subject to preemption under the conditions, restrictions, and exceptions provided by law. The principal exceptions were lands expressly reserved by law or proclamation of the President, lands included within the limits of an incorporated town or already selected as the site of a city or town, lands actually settled and occupied for purposes of trade or other business, and lands containing saline or mineral deposits. Every person who was the head of a family, every widow, and every unmarried person over the age of 21 years, being a citizen of the United States or having filed a declaration of intention to become such, was entitled to take advantage of the preemption laws, except that no person who was already the owner of 320 acres of land in any State or Territory, or who had abandoned his residence on his own land to reside on the public lands in the same State or Territory, was entitled to the right in question. The preemption system is said to have originated from the necessities of settlers and through a series of more than 57 years of experience in attempts to sell or otherwise dispose of the public lands. The early idea of sales for revenue was abandoned, and a plan of disposition for homes was substituted. The preemption system was the result of long experience, executive orders, departmental rulings, and judicial construction.

Under the Homestead Law, enacted in 1862 and since variously amended, the applicant "enters" upon the land (not exceeding 160 acres), improves it, and resides there continuously for a period of five years. After the expiration of this period, and upon making proof of such residence and improvement, he is entitled to a patent without the payment of money, except a

nominal fee. Any person qualified to take advantage of the Preemption Law is eligible to enter land under the homestead acts, while the lands subject to homestead are the same as those subject to preemption. Under the homestead policy more than 85,000,000 acres of land have passed from the public domain to the possession of private individuals. (See HOMESTEAD LAWS.) The homestead policy is now the approved method of disposing of the public lands. It does not offer the same opportunity for fraud that some of the other methods have shown and has produced the most satisfactory results ever obtained from a national system of land distribution. According to the third method of acquiring title to public land, the President, by order or proclamation, announces that certain lands will be open to public auction at a certain time and continue open for a specified period, during which time they will be sold to the highest bidder for cash, the minimum price being fixed at \$1.25 per acre. Such portions as remain unsold at the expiration of the period of sale are held for private entry and sale. According to the fourth method, certain soldiers or members of their families are given military land warrants entitling them to a specified part of the public lands, and upon presentation to the proper officer of such warrants the holder is entitled to enter upon so much of the public domain without payment of money, unless the land is held above the usual price. Finally, by the Timber Culture Act of 1878 it was provided that a person, upon proof that he had planted a certain number of acres of timber, was entitled to receive a patent for land not exceeding 160 acres occupied. This Act, together with the Preemption Law, has been repealed on account of numerous frauds growing out of their administration. At present the public lands of the United States are classified by the Land Office as *mineral* lands, which are chiefly valuable for their mineral wealth, and are usually reserved from preemption or homestead and sold at from \$2.50 to \$5 per acre; *timber and stone* lands, unfit for cultivation, but valuable otherwise, and usually sold at \$2.50 per acre; *saline* lands, salt springs, at first offered at public sale to the highest bidder at not less than \$1.25 per acre; *town-site* lands, sold at \$1.25 per acre; *desert* lands, sold at the same price and in lots not exceeding 320 acres; *coal* lands, sold usually at from \$10 to \$20 per acre, according to their distance from a completed railroad; and *agricultural* lands, sold everywhere at \$1.25 per acre. From 1854 to 1862 there was a class of *graduated* lands, consisting of parcels which had long remained unsold and were offered to adjoining settlers at very low prices.

The management of the public lands is intrusted to a bureau of the Interior Department known as the General Land Office, at the head of which is a commissioner appointed by the President with the advice and consent of the Senate. This office was created in 1812 and took over the various duties relating to the management of the public lands, which had previously been managed by officers in the departments of State, Treasury, and War. The Land Office constituted a bureau in the Treasury Department until 1849, when it was transferred to the new Department of the Interior. The commissioner is charged with a series of duties relative to the surveying and sale of the public lands, such as relate to private claims for lands

and the issuing and recording of patents for all grants of land of whatever character made under the authority of the United States. Local land offices are established in the various States and Territories where the amount of unsold public land exceeds 100,000 acres. For each land office a register and a receiver are appointed, whose duties are to transact the business relating to the public lands in their districts. The registers receive applications for land, file receipts, and on final payment give to the purchaser a certificate which entitles him to a patent or deed from the United States. Formerly the patents were signed by the President of the United States, but that practice was abandoned, and at present they are signed by a secretary and countersigned by the recorder. It is the duty of the receiver to receive money or land scrip from the purchaser and to issue receipts therefor. Registers and receivers are appointed by the President and hold office for four years. All proceedings for the acquirement of public lands are to be made before these officers, and they are empowered to pass upon all claims relating to land within their districts, their decisions, however, being subject to review by the Commissioner of the General Land Office. Besides these officers there are some 17 surveyors-general—one for each of the surveying districts into which the public domain is divided. Under their direction the public lands are surveyed and described and thus made ready for sale. Another important official of the General Land Office is the recorder, likewise appointed by the President, and charged with countersigning and recording patents. The Commissioner

erment reserves and the unappropriated domain. The rectangular system of surveying the public lands was early adopted by the government and was first practiced in southeastern Ohio under the direction of Thomas Hutchins, geographer of the United States. This system provides for the division of the lands into ranges, townships, sections, and quarter sections. The ranges are bounded by meridian lines 6 miles apart and numbered east and west from a principal meridian. These are divided into townships 6 miles square, numbered north and south from a given parallel. The townships are subdivided into 36 sections, each 1 mile square, and these are again subdivided into quarter sections. See ALASKA; GOVERNMENT LAND.

Canada. The crown or public lands signify that portion of the Canadian domain held by the Dominion and provincial governments for sale or other disposal according to law. The words "ownership of the government" cannot properly be applied to such lands in the sense in which they are applied to the public lands of the United States. On the contrary, whenever Canadian public land or its incidents are described as the property of or belonging to the Dominion or a province, it is meant only that the right to its beneficial use, or to its proceeds, has been appropriated to the Dominion or the province, as the case may be, and is under the control of its legislature, the legal title to the land itself being vested in the crown. In the history of the British provinces which were formed into the Dominion in 1867 the disposal of public lands played an important part, causing needed reforms. Lavish grants were often made by government officials to political favorites, or the lands when sold or leased were subjected to vexatious conditions or dues. They were, however, gradually brought within the course of British law and custom as established at the accession of George III, and passed under control of the legislatures in return for the assumption by the latter of a civil list to meet the expenses of government. The public lands administered by the Dominion are situated in Manitoba, Saskatchewan, Alberta, and the railway belt extending 20 miles on each side of the Canadian Pacific Railway in British Columbia. Those administered by the provincial governments are in Ontario, Quebec, Nova Scotia, and New Brunswick. The total area of Dominion lands in Manitoba, Alberta, and Saskatchewan in 1914 was approximately 446,068,798 acres, and up to Jan. 1, 1914, 189,073,928 acres of Dominion lands had been surveyed and 163,373,928 acres had been alienated, leaving about 25,700,000 acres still to be disposed of. Of the unsurveyed area in the three provinces about 86,000,000 acres were fit for agriculture, and about half of this amount was equal in fertility to the settled areas. The lands are in townships of 36 sections, each section consisting of four quarter sections of 160 acres each. Patents for free homesteads for settlers are issued on proof that the settler is a British subject, has resided on his homestead for at least six months in each of three years, has built a habitable house thereon, and broken 30 acres of his holding. Grazing leases of Dominion lands of a maximum area of 100,000 acres are obtainable to a certain extent.

There are no public lands in Prince Edward Island, none free in Nova Scotia, but in New Brunswick the virgin lands are granted practically free. There are over 7,000,000 acres, of

PUBLIC LANDS

Statement prepared by General Land Office, June 30, 1913

AREA UNAPPROPRIATED AND UNRESERVED

STATE OR TERRITORY	Surveyed acres	Unsurveyed acres	Total
Alabama	77,600		77,600
Alaska		367,963,823	367,963,823
Arizona	11,760,267	27,774,928	39,535,195

Wyoming	30,405,454	1,850,225	32,255,679
Grand total	179,204,397	486,686,632	665,891,029

of the General Land Office makes an annual report to Congress of the work of his office, including statistics of land surveys and sales. These volumes contain a vast amount of descriptive and statistical information concerning the public lands of the United States and are often accompanied by valuable maps showing the gov-

which lumber companies have leased large areas. The conditions for free lands to settlers are easier than those of Dominion lands in the Northwest. In Ontario nearly all the free lands, except in the new district of Patricia, have been taken up; but large areas in northern or New Ontario were in 1914 held at 50 cents per acre. In Quebec on June 13, 1913, there were 7,129,062 acres held for sale or free grants. In 1913 the sales of land by the Hudson's Bay Company and by railway companies having government land grants amounted to \$9,867,155 for 707,149 acres. There were, in 1913, 31,499 ordinary homestead entries for Dominion lands, 6483 pre-emptions, and 789 purchased homesteads under the Dominion Lands Act. Information as to Dominion lands is obtainable from the Department of the Interior, Ottawa, and as to provincial lands from the different provincial governments.

LANDSBERG, MAX (1845-). An American rabbi. He was born at Berlin, Germany, was educated at the universities of Göttingen, Breslau, and Halle (Ph.D., 1866), and at the Jewish Theological Seminary, Breslau, and was ordained a rabbi in 1870. From 1871 to his retirement in 1915 he was minister of Berith Kodesh Congregation at Rochester, N. Y. He served as governor of the Hebrew Union College at Cincinnati, Ohio, and in 1911 as president of the New York State Conference of Charities and Correction. He published a *Ritual for Jewish Worship* (1884; 3d ed., 1910).

LANDSBERG-AN-DER-WARTHE, länts-bërk-än-dër-vär'te. A town in the Province of Brandenburg, Prussia, on the Warthe, 40 miles northeast of Frankfurt-on-the-Oder (Map: Prussia, F 2). It contains a theatre, a museum, and a Gymnasium. The chief manufactures are machinery, boilers, cordage, sacking, lumber, furniture, bricks, starch, wire rope, shoes, sugar, cabinetwork, and leather. There is good trade in grain, cattle, lumber, and sparkling wine. It was founded in 1257. Pop., 1900, 39,339.

LANDSCAPE. In painting, a picture representing natural scenery, with or without accessories of men and animals, which must be subsidiary. The modern feeling for landscape was unknown to Greek art, the human figure absorbing all attention. It was not awakened until Alexandrine times, and in the Roman epoch both landscapes and marines were common. The principal examples are the *Odyssey* landscapes (Vatican), found upon the Esquiline Hill, and some of the mural decorations at Pompeii and Herculaneum. In Byzantine art and during the Middle Ages there was little sense of landscape, gold backgrounds being used for the religious pictures. But with the dawn of the love of nature which came with St. Francis of Assisi and culminated in the art of Giotto, the landscape again entered art, although in a purely decorative fashion, as a background for frescoes or panels.

The first effective use of landscapes as backgrounds was made in the Netherlands by the brothers Van Eyck (c.1400), who through the medium of their oil technique rendered admirably the effects of light and atmosphere. This practice was continued by their followers, especially by those artists born in Holland, like Gerard David, who brought the landscape to the greatest perfection attained during the fifteenth century. In Germany the school of Co-

logne used idyllic landscapes as backgrounds. The work of the succeeding painters resembled the Flemish, which they followed, but was cruder. It culminated in the admirable realistic drawings of Dürer and in the more fantastic productions of his pupil and follower Albrecht Altdorfer.

In Italy Fra Angelico was the first to paint what can be proved to be a landscape from nature. Early in the fifteenth century the Florentines discovered linear perspective, of which Filippo Lippi made use in idyllic backgrounds. Baldovinetti and Pollaiuolo attempted to apply absolute naturalism to the landscape. The usual theme of the Florentine school was some vale of the Arno. The effects of atmosphere were not discovered until the time of Verrocchio, after the middle of the century, they were further developed by Leonardo. The central Italians excelled the Florentines in landscape backgrounds, depicting the spacious hills and dales of central Italy. Piero della Francesca, founder of the school, excelled all of his day in painting light and atmosphere, and his principles were further developed by Perugino in the sixteenth century, and by Raphael, in whose paintings the Umbrian landscape culminated. By his treatment of light and shadow, Correggio lent the landscape a subtle charm. The most important contribution, however, was made by the Venetians in depicting the effects of sunlight and atmosphere. This was done especially by the Bellini and by Giorgione, in whose work the landscape assumes equal importance with the figures. Titian treated landscape still more independently, giving it an ideal and heroic character and becoming the father of the so-called classic landscape. The Carracci and other Eclectics developed this phase even further, painting landscapes independent of figures. The classic landscape found its culmination in the seventeenth century at Rome, in the works of Nicolas and Gaspar Poussin, and especially of Claude Gellée (Lorrain). Its cardinal principle was that the subject must be classical—the Roman campagna or similar scenery, usually with ancient ruins or mythological figures. It laid especial emphasis on composition, the landscape being composed from studies after nature, and affected a radiant golden color scheme. Except in the Netherlands, it became the chief type of landscape, with representatives in many countries. Of a somewhat different character, wildly romantic but more naturalistic, was the contemporary work of Salvator Rosa in the south.

Meanwhile landscape art of quite a different character had arisen during the seventeenth century in the Netherlands. The transition from religious backgrounds to the independent landscape, which took place in the later sixteenth century, was a gradual one. At first a biblical theme was used as an excuse for the landscape, such subjects as the "Flight into Egypt" being especially popular. One of the first to paint independent landscapes was the Fleming Peter Bruegel the Elder. Soon a differentiation was apparent in Flanders and Holland, the latter achieving the most important development of the seventeenth century. It substituted beauty of tone for the brightness of color affected by the earlier and later Flemish schools, and depicted chiefly the water and woodland landscape of Holland. There were no classic reminiscences, but much truth to nature and profound poetic sentiment. The most important pioneer was the

little-known Hercules Segers, whose romantic and poetic landscapes have often been confounded with Rembrandt's. The most important of the earlier masters were Van Goyen and Salomon Ruysdael, painters of river and canal scenes, and Aert van der Neer, painter of moonlight and sunrise effects. The art culminated in the poetic and elemental landscapes of Rembrandt, the versatile but gloomy grandeur of Jacob Ruysdael, foremost of Dutch landscape painters, and in the sunny placid woodland and mill scenes of Hobbema. The cattle painter Albert Cuyp was primarily a landscapist of sunny river scenes, and so were Wouvermann and to a less degree Paul Potter. There was also a goodly array of marine painters. Landscape painting during the seventeenth century in Flanders was not so rich nor so varied as in Holland. Rubens painted landscapes of powerful design, bright color, and exuberant light effects. Brouwer's fine impressions of nature, with delicate light and atmospheric effects, were rather Dutch than Flemish in character. In the eighteenth century landscape painting, generally speaking, declined in Europe, although in France the painters of the rococo—Watteau, Boucher, Fragonard, and others—painted delightful decorative landscape settings for their genre pictures. In Great Britain the Welshman Richard Wilson, the so-called "father of British landscape painting," painted in the manner of Claude, while at Venice Guardi and Canaletto depicted, with fine tonal and coloristic effects, the charms of their home; in the Far East the Japanese painted fine decorative representations of nature simplified.

The impetus to the modern development of landscape painting came from England. A great forerunner was Gainsborough in the eighteenth century, but the two chief representatives were Turner and Constable in the early nineteenth. The former, influenced by Claude, represented the classical side and in his treatment of light effects anticipated the Impressionists. The latter's great innovation was the use of fresh natural colors and the selection of English scenes. Influenced partly by his achievements, but more by the study of the Dutch masters, a powerful and influential group, the painters of Barbizon (q.v.) arose in France. Just before this the Romanticists had somewhat improved upon classic tradition in France, making the landscapes glad or sad, according to the figures and action represented. The great contribution of the Barbizon painters (Rousseau, Corot, Dupré, Diaz, Daubigny, Millet, and Troyon) was the union of a sound naturalism with profound poetic sentiment. By his absolute realistic portrayal of nature Courbet prepared the way for Impressionism; a further impulse towards brighter color came from the Orientalists (Decamps, Fromentin, Ziem). The latest manifestation of the landscape, Impressionism (q.v.), is chiefly concerned with the rendition of light, and with its optical effect on the appearance of natural objects. The influence of the great landscapists of that school, such as Monet, Renoir, Pissarro, Sisley, etc., has transformed the art the world over, raising the entire pitch of color. Except in the works of Cézanne, Van Gogh, less so in those of Gauguin, Postimpressionism (q.v.) can hardly as yet be said to have achieved important results in the landscape. In the remaining European countries landscape painting experienced a development similar to that in France. The French influence—first the Barbi-

zon, then the Impressionist—has been everywhere determinative. Mention should be made of the powerful Glasgow school and the Newlyn (Cornwall) school in Great Britain, and of the Neu-Dachau and Worpswede groups in Germany. Chiefly under French influence important schools of landscape have arisen in all the Scandinavian countries, as is also true of Holland, although here there is a closer connection with the past.

The earliest development of landscape painting in the United States was in the second and third quarters of the nineteenth century—the so-called Hudson River school (q.v.). Its subjects were usually grand or romantic scenery of a panoramic character, painted with inordinate detail; but the school culminated in the excellent art of Inness, Wyant, and Homer Martin. These men were affected, though independently, by the painters of Barbizon, who have exercised the greatest of all foreign influences upon the American school. For, like them, American painters are mood painters and cherish beauty of tone rather than brightness of color. Blakelock, Dearth, Bunce, Crane, Birge Harrison, Ranger, Metcalf, Tryon, Ochtman (to mention a few), illustrate the point. Impressionism has been another powerful influence in the works of Theodore Robinson, Twachtman, Childe Hassam, and others. The present tendency is rather towards strength than subtlety of conception and execution. This is especially seen in the snow scenes of Schofield and Redfield, and the landscapes of the younger men, like Bellows. Nor should the group of marine painters be forgotten. Foremost among these stands Winslow Homer, a typical American, independent of all foreign influence; and among its other members are Carlsen and Waugh. But in America as in Europe the former distinction between figure and landscape painting is no longer clearly defined. Typical examples of this tendency are the American Whistler, whose decorative, tonal landscapes exercised a wide influence, Sargent, and Robert Henri.

Bibliography. No satisfactory account of the history of landscape painting has yet been written. The best manual thus far is Michel, *Great Masters of Landscape Painting*, translated from the French (London, 1910). Consult also: Gilbert, *Landscape in Art before Claude and Salvator* (ib., 1885); P. G. Hamerton, *Landscape, with Original Etchings and Illustrations from Pictures and Drawings* (ib., 1885); Ruskin, *Lectures on Landscape* (ib., 1897). For ancient landscape painting, consult Woermann, *Die Landschaft in der Kunst der alten Völker* (Munich, 1876). For the Italian: Zimmermann, *Die Landschaft in der venezianischen Malerei bis zum Tode Tizians* (Leipzig, 1893); Kallab, "Die toscanische Landschaft im 14. und 15. Jahrhundert," in *Jahrbuch der Kunstsammlungen des allerhochsten Kaiserhauses* (Vienna, 1900); Guthmann, *Die Landschaftsmalerei der toskanischen und umbrischen Kunst von Giotto bis Rafael* (Leipzig, 1902); E. G. Salter, *Nature in Italian Art: A Study of Landscape Backgrounds from Giotto to Tintoretto* (London, 1912). For the Netherlands: Kundall, *Landscape and Pastoral Painters of Holland* (London, 1891); Schubert-Soldern, *Von Jan van Eyck bis Hieronymus Bosch* (Strassburg, 1903); De Jongh, *Het hollandsche Landschap* (The Hague, 1903); Bode, *Great Masters of Dutch and Flemish Painting* (London, 1909). For Germany: Höhn, *Studien*

zur Entwicklung der Münchner Landschaftsmalerei (Strassburg, 1909); Brand, *Anfänge der deutschen Landschaftsmalerei im 14. und 15. Jahrhundert* (ib., 1912). For Great Britain: Holme, *Masters of English Landscape Painting* (New York, 1903); Scott, *Our British Landscape Painters* (London, n. d.). For the United States: Samuel Isham, *History of American Painting* (New York, 1907). Good practical manuals on landscape painting from the artist's point of view are by Birge Harrison, *Landscape Painting* (New York, 1909), and Alfred East, *Art of Landscape Painting in Oil Colour* (London, 1911).

LANDSCAPE GARDENING. The art of arranging trees, shrubs, flowers, and grass, drives and walks, and buildings, in such relation to the natural surroundings of a place and to one another as to produce pleasing effects. The ancients practiced it, but very little is known about the styles in vogue among the different peoples. From the early times of the Christian era to the thirteenth century the art was mainly practiced in the adornment of walled gardens of no great size, connected with castle or convent; this because of the insecure state of the open country. Then for several centuries it received special attention from the nobility, especially in Italy; and then by the popes in their great villas; later by Louis XIV at Versailles, and in some most magnificent parks around royal castles. To-day it is chiefly employed in adorning the parks and cemeteries of cities and the quiet surroundings of individual homes. At the present time landscape gardening is represented by two very distinct systems or styles—the one known as the geometric or formal style, in which regular forms and exact balance of part with part prevail, and the other opposed to this, with an entire absence of fixed patterns, known as the English or natural style. The English style, which is comparatively recent, received its name on the continent of Europe from the fact that it is the popular system of landscape gardening in Great Britain, this resulting from the common reservation there of great open parks, with ancient trees and sheep or deer, the whole left in almost complete wildness. The geometric style dates back to the Romans, and evidences of it still exist in Rome in connection with ancient villas. In general, historical data show that in early times the style of landscape gardening was formal, the flower beds and trees, the alleys and avenues forming regular geometrical lines and figures. Thus, when pleasure grounds were first laid out, they exhibited only geometrical forms, with buildings of various kinds, terraces, mounds, artificial hills, lakes, and streams. The hedges, trees, and shrubs were clipped and pruned, and sometimes trimmed into fantastic shapes, such as figures of animals, vases, and the like. This method of trimming, when carried so far as to give definite shape to trees, is now rarely practiced. It was called topiarian art, and the artist was known as the topiarius. From the time of Charlemagne to the seventeenth century many beautiful parks, all on the formal plan, were laid out in France; but at the close of that period the celebrated French landscape gardener Lenôtre began the development of what has been called of late the French style. The plan of this system was still geometric and differed mainly in its application on a larger scale

instead of the minuter detail so common in the older gardens. This style adapts itself admirably to palaces and large public buildings. The park at Versailles, in France, is a model of this system and a standing monument to Lenôtre.

During the second half of the nineteenth century the natural style had almost entirely supplanted the regular or formal in park construction and other phases of landscape architecture. In this system the rigorously straight lines and patterned figures are abandoned. The walks are winding and irregular, and the trees or groups of trees, shrubs, and flowers are scattered in imitation of natural scenes. Here graceful effects are intended to replace the often stiff regularity of the geometric arrangement. This style also is applicable to small as well as to large grounds. Around residences which have but small grounds it is used in hiding buildings, walls, etc., by massing the trees and shrubs, but leaving such breaks in the planting as to enable the passer-by to see the open greensward, which occupies the entire middle portion of the yard. The trees are also arranged with regard to the views from the windows beyond the premises. It is easier, however, to obtain harmony on a large space, and it is under such circumstances that the natural style appears in all its beauty. The vistas, walks, and roadways are all important and require careful consideration. The walks and drives are generally not supposed to be decorative and are made as little apparent as possible. The branching of the roads and walks follows graceful curves, the right angle being always avoided. On small grounds the walk usually surrounds a central open grass plat, with the trees and shrubs on the other side massed into a framework to complete the picture. If walks are laid across the lawn, however, they are laid sometimes below the level of the grass surface in order to hide them as much as possible. The use of flowering plants in connection with this style is confined to natural grouping of different combinations, according to the effects desired. The groups located at a distance from the principal points often form large masses of a single bright color, while those nearer by represent a mixture of harmonious shades. In all instances the plants are selected with reference to the purposes intended. In districts where the general scene exhibits a succession of rectangular fields, and where everything has evidently been reduced to a condition subservient to utility, a greater irregularity gives pleasure, and the eye loves to rest on any portion of the landscape which seems to exhibit the original beauties of nature. The landscape gardener, however, must not attempt an exact imitation of nature, or try to reduce everything to a state of primitive wildness. Like the painter, he must seek to exhibit nature idealized.

The present trend of landscape gardening in the United States is towards the production of effects with the minimum of artificial design or planting. The desirability of garden furniture and equipment, such as fountains, sundials, pergolas, and the like, is recognized, but they are being adapted more strictly to the locality, the surrounding scenery, and the architectural style of near-by buildings. The public parks of the United States furnish some of the best models of landscape gardening on a larger scale. The cemeteries of nearly all of the larger American cities have also been designed to produce natural effects in landscape gardening, and, al-

though numberless monumental tributes to the dead must necessarily be conspicuous features of the scene, they are the most beautiful works of their kind in the world. American trained landscape gardeners and architects have done much towards the utilization of native trees and plants showing distinctive characteristics. They have been ably supported by the pictorial gardening press of the country, so that at the present time foreign shrubs and plants set in stiff conventional design are giving way to native materials, with natural simplicity as the keynote. This is true in public work, as also in the development of the rapidly increasing suburban communities and private estates, large and small. Among important works now in progress may be mentioned the Botanical Garden for Brooklyn, N. Y., the development of South Philadelphia, including League Island Park; public playgrounds in Boston, Mass., and New London, Conn.; a park system and civic centre for Denver, Colo.; parks and playgrounds for Little Rock, Ark., and Schenectady, N. Y.; the Arroyo Seco Parkway, at Los Angeles, Cal., for which the land alone was to cost \$1,100,000; parks in Buffalo, N. Y.; South Shore Park for Milwaukee, Wis.; and a park system for Gary, Ind. Many other small towns have plans of the same kind under consideration. The so-called "garden suburb" is a recent development near the larger cities, and of those which have been undertaken and partly completed in 1915 may be mentioned Forest Hills Gardens, N. Y.; Torrance, an industrial town near Los Angeles, Cal.; and Neponset Garden Village, a copartnership housing plan at Walpole, Mass.

The subject of landscape gardening has been formulated for teaching, and courses in it are offered at the agricultural colleges and many other institutions. The laying out of grounds and plantings has become a calling, distinct from the work of the skilled gardener.

LANDSEER. A family of English painters and engravers, the most important of which was Sir Edwin Landseer (q.v.).—The father of the family, JOHN (1769-1852), engraver and author, was born in Lincoln. He illustrated a number of works, his plates being chiefly landscapes. The most interesting are a few plates after Turner, the best being probably the "Cascade at Terne." In 1806 he was made associate engraver of the Royal Academy, and in the same year he delivered a series of lectures on engraving before the Royal Institution (published in 1808). He endeavored in vain, through memorials to the Academy and a petition to the House of Commons, to have engraving placed upon the same footing in the Academy as in foreign countries. Disappointed in this, he turned his attention to archaeology, publishing several works. He was a fellow of the Society of Antiquaries and engraver to the King. His three sons became famous.—THOMAS LANDSEER (1795-1880), the eldest, was an engraver. He was born in London and was a pupil of his father and of Benjamin Haydon. He spent most of his life engraving on steel from his brother Edwin's animal pictures. His engravings are faithful and sympathetic reproductions, often full-sized copies of the original paintings. Among his other works is the engraving of Rosa Bonheur's "Horse Fair." The Bibliothèque Nationale in Paris contains an album of his designs and sketches, which indicate high talent. He was author of the *Life and Letters of William Bewick* (1871).—CHARLES LANDSEER (1799-1879) was an historical painter. He received his first instructions in art from his father and from Benjamin Haydon and entered the school of the Royal Academy in 1816. Four years later he accompanied Lord Stuart de Rothesay on a mission to Brazil, where he made a large number of drawings and sketches for Dom Pedro I. He first exhibited at the Royal Academy in 1828, was elected an academician in 1845, and was keeper of the Academy (1851-73). Among his paintings the most important are: "Clarissa Harlowe in the Pawnshop" and "Sacking of Basing House," National Gallery, London; "Pillaging of a Jew's House," "Cromwell at Naseby," National Gallery, Berlin, "The Departure of Charles II from Bentley"; "The Eve of the Battle of Edgehill."

LANDSEER, SIR EDWIN HENRY (1802-73). An eminent English animal painter. He was

born in London, March 7, 1802. Under his father's guidance he sketched animals in the fields about London before his fifth year, and before he was 12 he could etch and paint in water colors and oil. Some of these earliest efforts are preserved in South Kensington Museum. He won the silver palette and three medals of the Society of Arts (1813-16) and made his debut at the Royal Academy Exhibition in 1815. Although he seems to have profited from the advice of Haydon in 1815, he was not among the latter's pupils, and in 1816 he entered the Academy schools. During the following years his painting attracted much attention, especially the "Highland Dogs" (1819) and "Alpine Mastiffs Reviving a Traveler in the Snow" (1820). The latter work, engraved by his father and brother, became one of the most popular prints of the day.

In 1825 he went to Scotland, visiting Sir Walter Scott, whom he painted with his dogs at Abbotsford, and traveling in the Highlands. This visit was of decisive influence upon his art. A great lover of sport, he learned to know the deer in their native haunts and was the first to introduce them into art. His imagination was also affected by the grandeur of mountain scenery, which he used as background for many of his pictures. From this time, too, he began to paint animals, especially the dog, in their relation to man, endowing them with human sentiments. This quality is the chief source of his popularity with the public, but it also distinguishes him unfavorably from really great animal painters like Potter, Snyders, and Troyon, who painted animals as they really are in nature. He also increased the popularity of his pictures by carefully chosen names. Among his most celebrated paintings are "High Life and Low Life" (1831), Tate Gallery, a deerhound and a butcher's mongrel; "A Jack in Office" (1833), South Kensington Museum; "Bolton Abbey in the Olden Time" (1834); "Chatsworth," a picture showing dexterous treatment of dead game, "The Old Shepherd's Chief Mourner," South Kensington Museum, "A Distinguished Member of the Humane Society" (1838), Tate Gallery, "Dignity and Impudence" (1839), National Gallery; "A Random Shot" (1848); "Monarch of the Glen" (1851).

Landseer became an associate of the Royal Academy in 1826, at 24 years of age, the earliest allowed by the statutes, and a member in 1831. He frequently drew and painted the Queen and the Prince Consort, both of whom he taught etching. He was of a nervous temperament, and his peculiar sensitiveness to imagined slights filled the latter part of his life with mental depression. In 1850 he was knighted; in 1855 he received gold medals at the Paris Exposition and at Vienna in 1873. In 1865 he declined the presidency of the Academy. He died Oct. 1, 1873, and was buried in St. Paul's Cathedral.

Although not of the same high quality as his animal paintings, Landseer's portraits were frank and natural; among the best are those of himself and of his father. In the "Connoisseurs" he represented himself as sketching, with a dog on each side watching his progress. He also designed for engravings, his best designs being his illustrations to the *Waverley Novels*. As a sculptor, he designed the fine lions at the base of Nelson's Monument in Trafalgar Square, besides a "Stag at Bay," exhibited the year of his death. In painting he was a facile drafts-

man, swift in execution and elegant in line; his color, however, especially in his last works, is liable to be cold and crude. The chief interest of his canvases consists in their illustrative value, and they are best known through the large number of excellent engravings made of them, especially by his brother Thomas.

His paintings can be studied only in England. The National Gallery contains, besides the important works mentioned above, "King Charles Spaniels" and "Sleeping Bloodhound." In South Kensington Museum there are: "Highland Drovers' Departure"; "Dog and Shadow"; "A Fireside Party"; "There is No Place Like Home"; "The Two Dogs"; "Tethered Rams"; "Suspense"; "Eagle's Nest." The Tate Gallery possesses: "Highland Music" (1830), "Hunted Stag" (1838), "Peacock" (1846); "War" (1846), "Highland Dogs", "Alexander and Diogenes." The National Portrait Gallery contains his portrait of Sir Walter Scott. There are also fine examples at Windsor and in other royal palaces. Among well-known works in private possession are: "Cat's Paw" (1824), "Poacher Deer Stalking"; "Otter Speared" (1844); "Swannery Invaded by Eagles"; "Stag at Bay."

Bibliography. The best monograph on Landseer is by J. A. Manson, in *Makers of British Art* (London, 1902). Consult also Stephens, *Memoirs of Landseer* (London, 1873); Dafforne, *Pictures by Landseer* (ib., 1873); Algernon Graves, *Catalogue of the Works of Landseer* (ib., 1875); M. F. Sweetser, "Landseer," in *Artist Biographies*, vol. III (Boston, 1878).

LAND'S END. The westernmost point of England, in Cornwall, on the Atlantic Ocean, at the entrance to the English Channel (Map England, A 6). The promontory consists of granite cliffs from 60 to 100 feet high, carved into fantastic shapes by the waters of the Atlantic. The vicinity is noted for fine cliff scenery and for one of the most celebrated of natural rock-ing or logan stones in the Kingdom. Land's End is the ancient Bolerium Promontorium.

LANDSHUT, lants'hoot. A free city and the capital of Lower Bavaria, situated on the Isar, 42 miles by rail northeast of Munich (Map Germany, E 4). It is an old town with broad streets and picturesque gabled houses and is partly situated on an island in the river. The churches of St. Martin, St. Jodocus, and the Hospital Church are interesting brick edifices, the first surmounted by a tower over 430 feet high. The Rathaus, originally erected in the fifteenth century, has a number of fine frescoes in its splendid late-Gothic council chamber. Another notable building is the magnificent Italian Renaissance palace erected in the sixteenth century. Its court, with columns, and its friezes, are among the best of their kind. In the vicinity of Landshut, at an altitude of 1530 feet, rises the old castle of Trausnitz, former seat of the dukes of Lower Bavaria. There are schools of agriculture, trade, electricity, pottery. The university, transferred hither from Ingolstadt in 1800, was removed to Munich in 1826. The town manufactures mainly machinery, ropes, chemicals, tobacco, straw hats, art goods, vehicles, organs, textiles, and flour, carries on some trade in agricultural products and live stock, and has important markets or fairs. Pop., 1900, 21,736; 1910, 25,137, mostly Roman Catholics. Landshut was founded in 1204 and was from 1255 to 1503 the capital of the Duchy of Bavaria-Landshut.

LANDSEER

FROM THE ORIGINAL IN THE NATIONAL GALLERY, LONDON

LANDSKNECHT, lānts'knēkt. See **FREE LANCE**; **MERCENARIES**.

LANDSKRONA, läns-krō'nā. A fortified seaport town of Sweden, situated on the Sound, 24 miles north of Malmö (Map: Sweden, E 9). It is regularly built, with broad and straight streets and handsome houses. It has a castle, built in the sixteenth century, which is now used as a prison. The subterranean Observatory of Tycho Brahe stands on the island of Hveen, opposite the town. As one of the manufacturing cities of Sweden, it produces tobacco, sugar, leather, woolen goods, smokeless powder, and ironwork. In the vicinity are coal mines. Its harbor is 35 feet deep, and is equipped with shipyards and good docks. It has regular steamship communication with Copenhagen, Lübeck, and the Swedish coast towns. It carries on considerable trade in grain, dairy products, and timber. Pop., 1901, 14,399. 1911, 16,459.

LANDSLIP. A mass of earth and rocks which for some cause becomes detached from its original position and slides down to a lower level. Earthquakes, erosion, and especially the action of percolating water are common agents of landslips or landslides. There are records of great landslips in the Alps that received their initial impetus from earthquakes, but this agency is most prominent in volcanic regions. The base of cliffs along river valleys is subject to removal by erosion, thus undermining the strata above. The base of strata which rest in an inclined position upon beds of clay or other loose materials may be lubricated by the infiltration of water, causing the strata to slide by mere gravitation. Elevated peat bogs have been known to discharge themselves after heavy rains upon neighboring fields. See **AVALANCHE**.

LANDSMAAL, läns'mål'. The popular indigenous dialects of Norway, as distinguished from the literary language, or Dano-Norwegian, also called Rigsmaal; in a narrower sense, some normalized form of these dialects as used by certain modern writers.

After the union between Denmark and Norway in 1397, Danish became the literary and official language of Norway, though in time this Danish came to differ somewhat in vocabulary and pronunciation from that spoken in Denmark. The old Norwegian language gradually disappeared, except in the country districts. To re-instate this into its former position of a national medium of expression was the purpose of the Landsmaal movement. This was only one phase of that interest in Norse antiquities which characterized the Romantic movement in Scandinavia; it was also a phase of the new national feeling which permeated Norway after its separation from Denmark in 1814.

The chief exponent of the Landsmaal movement is Aasen (q.v.), who in 1848 wrote *Det Norske folkesprogs grammatik*, and in 1850 his *Ordbog over det norske folkesprog*. From that time he and others have labored unceasingly for the recognition of a national Norwegian language. In spite of its bitter enemies, including such men as Björnson and Ibsen, the Landsmaal movement has made steady progress. In 1892 the Legislature passed an ordinance investing the local school board with the right to decide whether the language of the textbooks and of the written work of the pupils shall be Landsmaal or Rigsmaal. The students must learn to read both languages. According to a later ordinance (1896), the students in the sec-

ondary schools must learn to read the Landsmaal as well as the Rigsmaal and to explain passages of literature in both. In 1899 a chair in "Landsmaal and its dialects" was created in Christiania University. In 1912 an ordinance went into effect, according to which the candidates for the maturity examination (artium) may write the two essays constituting the language test in either tongue, but such candidates as write both essays in the same language must take a supplementary examination in the other.

The salient characteristics which distinguish the Landsmaal from Danish are (1) the preservation in several endings of the Old Scandinavian *a*, weakened in Danish to *e*; (2) the consonant sounds *p*, *t*, *k* in certain positions for the Danish *b*, *d*, *g*; (3) the diphthongs *au*, *oy*, *ei*, in several cases where Danish has *ø*, *ö*, *e*; (4) distinctive forms for the masculine and feminine genders, which in Danish are alike; (5) a vocabulary almost exclusively Scandinavian, as against the largely Germanized vocabulary of Danish.

The Landsmaal has a literature not insignificant. Among its best-known authors are Aasen, Vinje, Janson, Garborg, Braaten, Uppdal, etc. There are periodicals printed in the language and also a number of good translations.

Bibliography. Aasen, *Ordbog over det norske folkesprog* (Christiania, 1850), id., *Norsk grammatik* (ib., 1864); Hægstad, *Norsk maalsaga for skule og heim* (Oslo, 1907); Calvin Thomas, "Recent Progress of the Landsmaal Movement in Norway," in *Modern Language Association, Publication*, vol. xxv (Baltimore, 1910); Seip, *Norsk grammatik* (Christiania, 1911). Lillehei, "On the Forms of the Landsmaal in Norway," in *Society for the Advancement of Scandinavian Study, Publication*, vol. i (Urbana, Ill., 1913), containing a good bibliography.

LANDSMAN. Formerly the lowest rating in all branches of the enlisted force of the navy. Landsmen then composed nearly one-third the crew of an ordinary man-of-war. Any young man of sound physique, good moral character, and not less than 18 nor more than 25 years of age was eligible for enlistment, as no nautical or naval knowledge or training was required. In the seaman branch the name of the rating is now *apprentice seaman*, and men so enlisted are accorded the same instruction as that formerly given to landsmen. Men are still enlisted as landsmen for service in the other branches, but they are very few in number on board ship. The pay of a landsman is \$17.60 per month.

LANDSTAD, länd'stād, MAGNUS BROSTRUP (1802-80) A Norwegian bishop, poet, and folklorist. He was born near the North Cape, on the island of Maaø, was educated for the ministry, and succeeded his father as minister at Seljord. He retired in 1876 and removed to Christiania. His greatest literary work was his *Norske Folkeviser* (1851-53), a collection of about 130 popular poems, with music by Lindemann. In this field Landstad and Faye were practically pioneers. In hymnody also he made himself a name by many hymns of his own, by translations from Luther (1855), and by the *Kirkesalmebog*, a hymnary which he compiled, about 60 selections being his own work. It was authorized in 1869 for use by the Norwegian church in Norway and America, and is still its hymnary. His work, *Digte og Sange* (1879), is largely rural and popular in character. *Gamle Sagn om Hjartdolerne* appeared in 1880.

LANDSTURM, *lânt'shturm* (Ger., land storm, land uprising). A part of the military reserve forces of the German and other armies. Service in the German Landsturm is as follows: the men are those who are liable to military service, but do not belong to the army or navy, from the completed seventeenth to the completed forty-fifth year of age. It is divided into two levies, or bans: first ban, those liable to service but who have had no training, from the seventeenth to the thirty-ninth year; second ban, all men, trained and untrained, from the thirty-ninth to the forty-fifth year. See *ARMIES AND ARMY ORGANIZATION; CONSCRIPTION; GERMANY, Army; LANDWEHR*.

LAND TAX. The earliest direct taxes were levied upon land, as the principal source of income. The Athenian tax of 596 B.C. was a land tax levied upon the basis of yield in kind (estimated, not actual yield), and the earliest direct taxes in the Roman Republic were of a similar character. With the development of movable wealth in both Greece and Rome the basis of direct taxation became broader. Other income sources were levied upon roughly in proportion to their productiveness.

After the breakdown of the Roman Empire and the consequent decay of commerce and industry, land became once more the principal source of disposable income, and hence the chief object of direct taxation. In Germany, down to the twelfth century, taxes were levied upon land alone, and the same thing was true of practically the whole of northern Europe. The English imposts known as *shipgeld*, *Danegeld*, the *scutage*, *carucage*, and *tallage* were land taxes. In this period taxes were collected, for the most part, in kind and were levied in proportion either to actual yield, thus varying from season to season, or to estimated yield. The special tax on estimated yield, commuted into a money payment, survived in certain instances to the end of the nineteenth century. Such a survival was the corn tax in Denmark, which remained precisely at the same level for almost a century and a half. It was originally apportioned according to estimated yield in grain, and with the lapse of time came to bear very unevenly upon the several holdings, in consequence of changes in agricultural technique or in means of transportation affecting the value of lands.

With the great development of commercial and industrial wealth of modern times other sources of direct taxation were added to the land tax, until by the opening of the nineteenth century a tendency was clearly manifest to assimilate land to other forms of property under a uniform rate of taxation. This tendency attained full realization in the United States, where, indeed, the provision was frequently inserted in the State constitutions that all property should be assessed for taxation at a uniform rate.

In the last half century the evolution towards assimilation of all forms of property and taxation at a uniform rate has been checked. In the public finance of European countries land is frequently given special treatment and special taxation for local purposes. The most significant developments in this direction are the land taxes of the British states of Australasia, the western provinces of Canada, and of certain States and cities of the United States. Underlying this new tendency in taxation is the principle that the social and political consequences of land

tenure present peculiarities different from those of the exploitation of other forms of wealth. Hence, it is held, social and political considerations, rather than purely financial, should dominate in the taxation of land.

As the most extreme instance of this tendency we may review the land taxation policy of New Zealand. In the third quarter of the nineteenth century land holdings were highly concentrated in that colony. Vast tracts were held for grazing or for speculative purposes, frequently by persons who were not resident in the colony. This situation was felt to be prejudicial to the interests of the colony, and the plan of forcing the subdivision of such tracts through differential taxation early gained popular support. In 1878 a law was passed levying a tax of half a penny in the pound on the capital value of land, unimproved. This tax was abolished in the year following. But in 1893 a far more drastic law was passed. A flat rate of one penny in the pound of unimproved value of land was levied, but on holdings worth less than £1500 (bare land value) £500 were exempt from the tax. In addition to the flat rate a graduated tax was levied on large estates, ranging from one-eighth of a penny in the pound on estates from £5000 to £10,000 up to two pence in the pound on estates above £210,000. On the holdings of absentees from the colony the land tax was increased by 20 per cent.

In 1903 the graduated tax on large estates was increased. By this Act the rate on estates of a value of £7000 (excluding improvements) was increased by one-sixteenth of a penny in the pound; the rate on estates of £210,000 was increased to three pence in the pound. In 1908 the scale of graduation was again raised on estates of £40,000 and upward. Under this law an estate of £200,000 pays a tax of two per cent of the capital value.

The taxes referred to above are provincial taxes. Local authorities are given the option of raising their revenues from land or from other sources. About one-half of the boroughs levy direct taxes upon the unimproved value of land. Two of the chief cities, Wellington and Christchurch, follow this system of taxation.

In South Australia taxes on the unimproved value of the land have been levied for provincial purposes since 1885. Municipalities were empowered in 1893 to levy taxes upon the same basis. In the Canadian Province of Alberta the system is employed for both provincial and local purposes; in British Columbia local authorities are permitted to confine real taxes to the unimproved value of the land alone. In the United States the most conspicuous instance of the tendency is in Oregon, where counties, under a constitutional amendment of 1911, are permitted to confine taxation to land if they choose. The cities of Houston, Tex., and Pueblo, Colo., have levied discriminating taxes upon the unimproved value of the land. In the State of New York a powerful movement in the same direction has resulted in the separate assessment of land and improvements in New York City and in the introduction of several measures in the Legislature for increasing the relative burden upon the land.

The accepted theory of the incidence of land taxation is that it rests where it is placed and cannot be shifted to the consumer of the products of land. A land tax which remains unchanged, like the Danish corn tax mentioned

above, the old Dutch land tax, and the British land tax, becomes practically a rent charge upon the land. In so far as it exceeds the prevailing rates upon other forms of property it sinks the price of the land by an amount equal to its capitalized value. Land taxes that are not fixed in amount, but that exceed the prevailing rate, have a similar tendency to depress the value of land. Hence, it may be said that they represent no real burden to later purchasers of the land; if they reduce the net income value of the land, they have reduced the capital value proportionately. This theory of the incidence of land taxation and its corollary, that no matter how heavy the tax upon land the progress of improvement will not be checked, together with democratic hostility to the large estate and to absenteeism, explains the strength of the current political tendency towards special taxes upon land. See SINGLE TAX, UNEARNED INCREMENT; TAXATION.

LAND TORTOISE. A tortoise (or turtle) of terrestrial habits. All these belong to the extensive family Testudinidae, but do not include all of that family, a large section of which—the terrapins (q.v.) and their allies—are thoroughly aquatic in their adaptations. The land tortoises proper form a section of the family easily recognized by their feet, in which the toes are short, without webs, and the hinder ones "clubbed," while the front of the fore limbs is protected by strong horny scales or frequently by dermal ossifications. The carapace of the shell is usually heavy and highly arched, and the plastron is firmly united to it at the sides of the body. The top of the strong shell is covered with shields, the tail is short, and the entire structure is calculated for compact and secure defense within the fortress of the shell, since these creatures can neither run away from an enemy nor fight him effectually. Land tortoises flourished in past ages, and a few genera, chiefly *Testudo* and its recent modifications, have survived in a limited way to modern times. The term is applied in Europe mainly to the "common" or Greek tortoise, and in the United States to the similar gopher (q.v.) or to the somewhat different box turtles (genus *Cistudo*). Most commonly, however, it refers to the gigantic terrestrial tortoises of the Mascarene and Galapagos groups of islands, now nearly extinct. See TORTOISE.

LAND TRANSFER, REFORM IN. The ancient methods of conveyancing by feoffment and livery of seisin, etc., have been superseded by simple deeds, granting and conveying the property by an accurate description by metes and bounds and signed and sealed by the grantor. In the United States the States are divided into counties, the latter into townships, and the latter into sections; and before a conveyance of real estate it is the practice to have it surveyed and insert in the description in the deed the metes and bounds established by the survey, instead of a general description, as "My estate of Blackacre," as was formerly customary. Recording or registry acts have been passed in most States, and the record of deeds supersedes the dramatic notoriety of livery of seisin. In some cities the record of conveyances must be ordered under sections and blocks into which the area included in the corporate limits is divided. The Torrens system (q.v.) of land registration has greatly simplified the transfer of land in Australia. This system has been

partially adopted in England, Massachusetts, Illinois, Minnesota, and several other States, and is in force in the Philippines and Hawaii. Consult Niblack, *The Torrens System* (Chicago, 1903), and Hogg, *The Australian Torrens System* (London, 1905). See CONVEYANCE.

LANDWEHR, lant'vâr (Ger., land defense). A military term originating in Prussia and since applied to a branch of the national reserve forces of Austria-Hungary, Germany, Japan, and Switzerland. The Prussian Landwehr was first proposed in 1806 by Major Knesebeck of the Prussian army; but it was not until the commencement of the campaign of 1813 that the Prussian system of national defense, for which it was originally solely devised, came into actual being. It was then organized on Scharnhorst's plan by a royal edict dated March 17, 1813. By the constitution of April, 1871, the Prussian regulations were extended to the German Empire. In Austria-Hungary the Landwehr of Austria and Honvédség of Hungary were organized in 1889—citizens who have been transferred from the common army serving two years, and others 12 years. After quitting the reserve of the regular army the German conscript serves 12 years in the Landwehr, five years in the first class, or ban, and seven years in the second ban, completing his service in the Landwehr at the age of 39, when he is transferred to the Landsturm (second ban) for service until the forty-fifth year. In Japan those who have served their period in the active army perform 10 years' landwehr (called "kobi") service. All able-bodied citizens of the Swiss Republic are compelled to serve eight years in the national Landwehr from the thirty-second to the completed fortieth year of their age. They then pass to the Landsturm for the remaining eight years of their service.

The general evolution of the Landwehr has been from a force organized entirely for home defense to an important part of the trained defensive or offensive forces of the nation. See ARMIES; GERMANY, Army; CONSCRIPTION.

LANE, ALFRED CHURCH (1863-) An American geologist, born in Boston. He graduated from Harvard in 1883, taught mathematics there for two years, and studied at Heidelberg. From 1889 to 1892 he was petrographer of the Michigan Geological Survey and instructor in the Michigan College of Mines; thereafter until 1909 he was assistant State geologist (seven years) and State geologist (10 years). In 1909 he was appointed Pearson professor of geology and mineralogy in Tufts College. At the University of Michigan he lectured on economic geology in 1904. He became a member and officer of numerous scientific societies. Various reports on the geology of Michigan, Canada, and the United States were edited, and in part prepared, by him, and he is author also of many short articles of general scientific interest.

LANE, EDWARD WILLIAM (1801-76). An English Arabic scholar. He was born in Hereford, the son of Prebendary Theophilus Lane. After education at Bath and Hereford he abandoned an intention to enter holy orders, also abandoned, owing to ill health, the engraver's profession, which he had learned, and, with a strong predilection for Oriental studies, went to Egypt in 1825. He soon learned Arabic, and, adopting the native garb and habits, commenced his travels, observations, and sketches, which, with the exception of an interval in England,

extended from 1824 to 1835 and resulted in the publication of *Manners and Customs of the Modern Egyptians* (2 vols., 1836), still a standard authority. This was followed by a new translation of the *Thousand and One Nights, or Arabian Nights' Entertainment* (3 vols., 1838-40). From 1842 to 1849 he was in Egypt, collecting materials for an *Arabic-English Lexicon and Thesaurus*, and after his return to England the rest of his life was devoted to the preparation of this gigantic work for publication. In 1863 he received a civil-list pension. Seven volumes of his *Lexicon* (1863-74) appeared during his lifetime; the posthumous publication was completed by his grandnephew, S. Lane-Poole, with the issue of three further volumes (1877-92), the funds being provided by Lane's early friend, the Duke of Northumberland. Consult S. Lane-Poole, *Life of Edward William Lane* (London, 1877).

LANE, FRANKLIN KNIGHT (1864-). An American cabinet officer, born on Prince Edward Island, Canada. Early in life he moved to California, where he attended the State university. He was a reporter, New York correspondent for Western papers, and later part owner and editor of the Tacoma *Daily News*. After his admission to the California bar in 1889, he practiced law in San Francisco, where, as corporation or city counsel from 1897 to 1902, he made a reputation for efficiency and honesty. He was the unsuccessful Democratic candidate for Governor of California in 1902 and for United States Senator in 1903. In 1905 he was appointed by President Roosevelt to the Interstate Commerce Commission and served until 1913 with much success. This nonpartisan appointment was received with satisfaction throughout the country, and Lane's elevation to the chairmanship of the commission in 1913 was also widely endorsed. In 1913 he accepted the invitation to enter the cabinet of President Wilson, as Secretary of the Interior. In this office he urged conservation of coal lands and was instrumental in securing the passage of the Alaska Railway Bill of 1914, providing for a government-built road.

LANE, GEORGE MARTIN (1823-97). An American Latinist and educator, born at Charlestown, Mass. He studied under Beck at Harvard, graduating in 1846; was a Latin tutor there for a year, then studied at Berlin, Bonn, and Heidelberg, and at Göttingen, where in 1851 he took his doctor's degree with a thesis, *Smyrnaeorum Res Gestæ et Antiquitates*, which is still authoritative. He returned at once to Harvard to become professor of Latin. In 1869 he was appointed Pope professor. After his resignation, in 1894, he still continued, as professor emeritus, to give graduate courses. A brilliant and original teacher, he was the author of *Latin Pronunciation* (1871), which turned the tide against the "English method" in the United States, and of a *Latin Grammar* (completed by Morgan, 1898), which is remarkable for its felicitous translations. He was a valued contributor to Harper's Latin lexicons. The well-known ballad of the "Lone Fishball" was from Lane's pen. Consult M. H. Morgan, "Memoir of Professor Lane," in *Harvard Studies*, ix (Cambridge, 1898).

LANE, HARRY (1855-). An American legislator. He was born at Corvallis, Benton Co., Oreg., graduated in medicine in 1876, and served as superintendent of the Oregon State Insane Asylum from 1887 to 1891. He was mayor of

Portland, Oreg., for two terms (1905-09) and in 1913 was elected United States Senator. Early in his term he advocated government ownership of telegraphs and telephones and attacked the firm of J. P. Morgan & Co., for the support it gave to certain financial operations of the New Haven Railroad.

LANE, HENRY SMITH (1811-81). An American political leader, born in Montgomery Co., Ky., where he received an academic education. He studied law, was admitted to the bar, and in 1832 removed to Crawfordsville, Ind., where he practiced and became identified prominently with Whig politics. In 1837 he was elected to the Indiana State Senate; in 1840 he was elected to Congress to fill a vacancy, and he remained in that body until 1843. He served in the Mexican War as lieutenant colonel of a regiment of Indiana volunteers. With the break-up of the Whig party in Indiana, he and some of his former party associates entered into an organization that became the nucleus of the Republican party in the State. Lane took a prominent part in the movement that led to the calling of the first national convention of the party in 1856 at Philadelphia, of which he was chosen permanent chairman. In 1859 he was elected by a coalition of Republicans and "American" members of the Legislature to the United States Senate, in opposition to Jesse D. Bright, who was chosen by the Democrats and seated after a contest. In 1860 he was elected Governor of Indiana and served for a few days in January, 1861, resigning in anticipation of his election to the Senate, where he served from the following March until 1867. In 1866 he was a member of the Loyalists' convention.

LANE, JAMES HENRY (1814-66). An American soldier and politician. He was born at Lawrenceburg, Ind., studied law, and in 1840 was admitted to the bar. In May, 1846, he volunteered for service in the Mexican War. He was chosen colonel of an Indiana regiment and commanded a brigade at the battle of Buena Vista. Immediately after the close of the war he was elected Lieutenant Governor of Indiana, serving in this capacity from 1849 to 1853, and from 1853 to 1855 he was a Democratic member of Congress. In 1855 he removed to Kansas and there became conspicuous as a leader of the Free-State party. He was president of the Topeka Constitutional Convention in the fall of this year, was second in command on the Free-State side during the so-called Wakarusa War, and in 1856 was chosen United States Senator by the Legislature which had met under the Topeka constitution. This election, however, was not recognized by Congress, and Lane remained in Kansas, where in 1859 he acted as president of the Leavenworth Constitutional Convention. In 1861, Kansas having at last been admitted to the Union, Lane was elected to the United States Senate, but, the Civil War having broken out, he soon volunteered for active service in the field, and, after commanding for a time the frontier guards about Washington, was appointed brigadier general of volunteers in December, 1861, though his commission was canceled in the following March. He projected several visionary military expeditions, such as the Great Southern Expedition from Kansas in 1861-62; he became "commander for recruiting in the Department of Kansas" in July, 1862, and in this capacity endeavored to usurp the functions of Governor Robinson and

later of Governor Carney. In 1864, during General Price's raid, he was an aid to General Curtis. He was reelected to the United States Senate in 1865, but in 1866 was attacked with paralysis and during a temporary aberration of mind committed suicide.

LANE, JONATHAN HOMER (1819-80). An American physicist, born at Geneseo, Livingston Co., N. Y., and educated at Phillips Exeter and at Yale College, where he graduated in 1846. In 1848 he was appointed assistant examiner in the United States Patent Office and in 1851 was made chief examiner, but in 1857 was removed for political reasons. In 1869 he was appointed verifier of standards in the office of weights and measures at Washington. In 1870 he published a valuable paper entitled *The Theoretical Temperature of the Sun*. Lane patented an optical telegraph or semaphore and an improved mercury horizon and attempted experiments to secure low temperatures and to determine the absolute zero.

LANE, JOSEPH (1801-81). An American pioneer and soldier, born in Buncombe Co., N. C. He removed to Kentucky in 1814 and two years later crossed the Ohio into Warrick Co., Ind. He was elected to the Legislature in 1822 while still under age and was consequently obliged to wait some time before he could take his seat. From that time until the outbreak of the Mexican War he was a member of one branch or the other of the Indiana Legislature, but in 1846 he resigned from the State Senate to enlist as a private. Soon afterward he was elected colonel of the Second Indiana Volunteers and in 1846 was commissioned brigadier general. He was wounded at the battle of Buena Vista and at Huamantla defeated General Santa Anna, for which service he received the brevet rank of major general in the regular army. He was very successful against the guerrilla bands which infested the country and became known as the Marion of the Mexican War. At the close of the war President Polk appointed him Governor of Oregon Territory, and, when President Taylor removed him two years later (1850), the people elected him delegate to Congress—an office which he held until Oregon's admission to the Union in 1859, when he was chosen to the United States Senate, where he served from February, 1859, to March, 1861. (He also acted as Governor of Oregon from May 16 to 19, 1853.) During President Pierce's administration he commanded the troops sent to suppress an uprising of the Indians. In 1852 the Indiana Democratic State Convention advocated his nomination for the presidency, and in 1860 he ran for Vice President on the ticket with John C. Breckenridge. Upon his defeat he retired from public life to his ranch in Oregon, where he lived in comparative poverty until his death.

LANE, SIR RALPH (c.1530-1603). The first Governor of Virginia. He was born in Northamptonshire, England, and is said to have taken part at an early age in the buccaneering expeditions in which English ships were employed at that time. In 1583-85 he was employed in the government's service in Ireland. He joined Sir Richard Grenville's expedition to America in 1585 and after its arrival established a colony on Roanoke Island and became Governor. The colony was not successful, owing to disadvantageous location, the hostility of the Indians, and the lack of food. When Sir Francis Drake arrived with his fleet in June, 1586, the colo-

nists were glad to return to England. Upon his return Lane was appointed to carry out certain plans for defending the coast, took part in Drake's expedition in 1589 against Portugal, and in 1591 helped to put down an Irish rebellion, for which he was knighted two years later. He remained in Ireland until his death. Consult Sir Ralph Lane, "Account of the Particularities of the Employments of the Englishmen Left in Virginia," in H. S. Burrage (ed.), *Early English and French Voyages* (New York, 1906), and the same in *Old South Leaflets*, vol. v, no. 119 (Boston, 1902).

LANE, RALPH NORMAN ANGELL (better known as NORMAN ANGELL) (1874-). A journalist and peace advocate, of English birth, who lived for some time in the United States and afterward in Paris. He was educated in England, at the Lycée of Saint-Omer, France, and at Geneva, Switzerland. Coming to America in 1890, he went West and engaged in ranching and prospecting, and from 1896 to 1898 he worked on newspapers. For two years he was Paris correspondent of American papers; he edited the *Paris Daily Messenger* in 1900-04, and from its founding in 1905 to 1912 he was general manager of the *Paris Daily Mail*. The book for which Norman Angell is best known, *The Great Illusion* (1910, 5th ed., rev., 1914), has appeared in England, the United States, France, Germany, Holland, Denmark, Sweden, Spain, Italy, Russia, Japan, and China, as well as in these languages: Arabic, Hindi, Bengali, Urdu, Marathi, and Tamil. A study of the relation of military power to national welfare, *The Great Illusion* holds that new economic and social factors in modern times have destroyed the utility of force in international relations and made coöperation instead of competition most advantageous for each state. In 1913 the Garton Foundation, London, was established to propagate Angell's ideas. Other of his writings include: *Patriotism under Three Flags* (1903); *Europe's Optical Illusion* (1909); *Peace Theories and the Balkan War* (1912); *The Foundations of International Policy*, or, in the American edition, *Arms and Industry* (1914); *The Problems of the War and the Peace* (1914); *Prussianism and its Destruction* (1914); *America and the New World State* (1915).

LANE, RICHARD JAMES (1800-72). An English engraver and lithographer, born in Hereford. In 1837 he was appointed lithographer to Queen Victoria. In 1864 he became teacher of etching at South Kensington. His works, which number more than 1000, include the lithograph "Sketches from Gainsborough" (who was his great-uncle), and a series after Lawrence. Among his excellent sketches in chalk or pencil are several portraits of the Queen. He helped to obtain the admission of engravers to the honor of full Academician in 1865. His lithographic portraits have a distinction of manner that raises them above the ordinary.

LANE, WILLIAM COOLIDGE (1859-). An American librarian. Born at Newton, Mass., he graduated in 1881 from Harvard University, where he was assistant librarian in 1887-93 and chief librarian after 1898. He served also as librarian of the Boston Athenæum in 1893-98. In 1898-99 he was president of the American Library Association, of whose publishing board he was secretary and treasurer and later chairman from 1886 to 1907. From 1904 to

1909 he was president of the American Bibliographical Society.

LANE-POOLE, STANLEY (1854-). An English author and archaeologist. He was born in London, Dec. 18, 1854, and was educated at Oxford. He studied numismatics and from 1874 to 1892 was connected with the coin department of the British Museum. During this time he prepared a *Catalogue of the Oriental and Indian Coins* in the museum (14 vols., 1875-92). He was also sent on several important archaeological missions to Egypt, Russia, and Australia. In 1895-97 he was employed by the Egyptian government in research at Cairo. From 1898 to 1904 he was professor of Arabic at Trinity College, Dublin. Among his many works are biographies of his great-uncle, *Edward William Lane* (q.v.) (1877), *Sir G. F. Bowen* (1889), *Aurangzeb* (1892), *Saladin* (1898), and *Babar* (1899); and numerous histories, as *The Moors in Spain* (1897; 7th ed., 1904), *Speeches and Table-Talk of Mohammed* (1882), *The Mohammedan Dynasties* (1893), *Saracenic Egypt* (1900), *The Story of Cairo* (1902), *Medieval India under Mohammedan Rule* (1903), *Egypt in the Middle Ages* (1905). He completed Lane's *Arabic Lexicon* (1877-92) and edited the *Koran* (1879). For his brother, see POOLE, R. L.

LANESSAN, lā'n'sān', JEAN MARIE ANTOINE DE (1843-). A French politician and naturalist, born at Saint-André-de-Cubzac, Gironde. He left his medical studies at Bordeaux to enter the health corps of the marine service and was engaged on the coast of Africa and Cochin-China until the Franco-German War, in which he served as surgeon, though he did not graduate in medicine till 1872. He was deputy in the National Assembly from 1881 to 1891 and from 1898 to 1906. He edited for a short time *Le Reveil* (1881-82) and *La Marseillaise* and interested himself especially in colonial matters. He was sent on missions to Tunis and Cochin-China to determine how far these countries could participate in the exhibition of 1889 and was Governor-General of Indo-China (1891-94). In 1899-1902 he was Minister of Marine in the Waldeck-Rousseau cabinet. He became political director of the *Siècle* and was chosen president of the Union of National Industries, the French Colonization Society, and the International Association of Colonial Agronomy. His writings include: *Du protoplasme végétal* (1876); *Manuel d'histoire naturelle médicale* (1879-81); *Etudes sur la doctrine de Darwin* (1881); *Traité de zoologie et Protozoaires* (1882); *La botanique* (1882); *Le transformisme* (1883); *Flore de Paris* (1884); *Introduction à la botanique* and *Le sapin* (1885); *La Tunisie* (1887); *L'Expansion coloniale de la France* (1888); *L'Indo-Chine française* (1889); *La colonisation française en Indo-Chine* (1895); *Principes de colonisation* (1897); *La lutte pour l'existence et l'évolution des sociétés* (1903); *La morale des religions* (1905); *L'Etat et les églises en France depuis les origines jusqu'à la séparation* (1906); *Les missions et leur protectorat* (1907); *La morale naturelle* (1908; new ed., 1912); *Le bilan de notre marine* (1909); *La lutte contre le crime* (1910); *Nos forces navales* (1911); *Nos forces militaires* (1913).

LANE THEOLOGICAL SEMINARY. A divinity school at Cincinnati, Ohio, founded in 1829 and opened in 1832. It is under the control of the Presbyterian church, but students from other evangelical churches are received.

No tuition fee is charged, and board is provided at a low cost. There are 40 scholarships, each yielding annually the interest on \$2000. The school maintains two clubs, the General Society of Alumni, and the Lane Club, composed of alumni of the vicinity and professors of the seminary. The school owns 60 acres of ground, given by Elnathan Kemper in 1829, a part of which is occupied by the campus. The seminary owns in addition a library building with over 23,000 volumes, five professors' residences, and a number of houses for rent. Its endowment in 1915 was about \$500,000, its income about \$20,000, and its enrollment 57, with a faculty of eight instructors.

LANETT, lā-nēt'. A city in Chambers Co., Ala., 2 miles southwest of West Point, Ga., on the Chattahoochee River and on the Chattahoochee Valley Railroad (Map: Alabama, D 3). It is in a fertile cotton district, and there are cotton mills and bleaching and dyeing works. Ample water power is afforded by falls near by. Pop., 1900, 2909; 1910, 3820.

LANFRANC, lān'frāŋk (c.1005-89). The most eminent of the foreign churchmen who rose to distinction in the mediæval Church of England. He was born of a noble family at Pavia, about 1005, and educated, partly in Pavia, partly at Bologna, for the profession of the law. In the hope of greater distinction he removed to France and taught at Avranches, in Normandy, in a school of law (c.1039), where he became famous. In 1042 he entered the monastery of Bec, not far from Rouen, and in 1045 was appointed prior and opened a school in the monastery which was soon thronged. In 1066 he left Bec and became abbot of a new monastery at Caen founded by William, Duke of Normandy. The latter selected him, after the conquest of England, to fill the primatial see of Canterbury, and he was induced with much reluctance to accept it in 1070. Under his spiritual rule the Church of England received as strong an infusion of the Norman element as was forced upon the political system of England by the iron hand of the Conqueror. He acted as Regent in the absence of William and sustained the feudal relation of King to Bishop in the vexed question of investitures. Lanfranc outlived William, and to his influence the historians mainly ascribed the peaceful submission with which that monarch's successor, William Rufus, was accepted by the Kingdom, as well as the comparative moderation of the earlier years of his reign. Lanfranc died at Canterbury on May 24, 1089. His chief writings are commentaries on the Epistles of St. Paul, the treatise against Berengar, *De Corpore et Sanguine Domini*, and sermons. His letters also are interesting. The first complete edition of his works is that of D'Achéry (Paris, 1648). They are also found in Migne, *Patrologia Latina*, vol. cl, and are edited by Giles (Oxford, 1844). Consult his *Life* by Crozals (Paris, 1877); Freeman, *Norman Conquest* (Oxford, 1887); Böhmer, *Die Falschungen Erzbischof Lanfranks* (Leipzig, 1902).

LANFRANCO, lān-frāŋ'kō, GIOVANNI (1580-1647). An Italian historical painter, of the Eclectic school. He was born at Parma and as a lad was page to the Marquis of Montalto. He showed such talent for design that his lord placed him with Agostino Carracci, who was then painting at Parma. After Agostino's death Lanfranco went to Rome to study under Annibale Carracci and assisted him in the frescoes of the

Farnese Palace. He painted in different cities of northern Italy, decorating the cupola of Santa Maria in Piazza at Piacenza with frescoes of "Angels in Glory" for the Marquis of Montalto. Paul V employed him in the Quirinal Palace and Santa Maria Maggiore. Through intrigue he obtained the commission for the cupola frescoes of San Andrea della Valle, which Domenichino had begun. The subject represented is the "Ascension of the Virgin," surrounded by a multitude of angels, and the decoration is one of the most remarkable of the kind ever executed, both in keenness of foreshortening and treatment of light. At Naples he decorated the cupola of the church of Gesù Nuovo (1631) and painted in other churches, besides finishing the frescoes in the cupola of the chapel of the Treasury in the cathedral, left incomplete at his death by Domenichino. On his return to Rome in 1646 Lanfranco painted "St. Peter Walking upon the Sea" for St. Peter's Church and a Passion series for the chapel of the Crucifix there. As a reward Pope Urban VIII raised him to knighthood. He died in his villa, near Rome.

Lanfranco's chief importance consists in his frescoes, his oil paintings being less pleasing. Of the latter there are numerous examples in all the Italian collections, at Madrid, and in the Louvre. His coloring is brilliant, and his style is vigorous, but all his work is superficial in character. He also studied engraving under Agostino Carracci, his most important plates being biblical subjects of Raphael's "Loggie" in the Vatican, engraved in conjunction with Listo Badalocchio.

LANFREY, LĀN'frā', PIERRE (1828-77). A French historian and politician, born at Chambéry, Savoy. He was educated at the Jesuit college at Chambéry, from which, however, he was expelled, and at the Lycée Bourbon, Paris, where he completed his studies in 1847. He then took up law at the universities of Grenoble and Turin. His bent, however, was towards philosophical and historical studies, and in 1853 he returned to Paris to enter the world of politics and journalism. He first attracted public attention by the publication in 1855 of *L'Eglise et les philosophes du 18ème siècle*, in which he enunciated liberal and anticlerical principles. This was followed in 1857 by his *Essai sur la révolution française* and in 1860 by his *Histoire politique des papes* and the Socialistic novel *Lettres d'Everard*. The same year he became editor of the *Revue Nationale*. In 1863 he published his work *Le rétablissement de la Pologne*. Resigning his editorship in 1864, he devoted himself to his great work, a political and social study of the First Empire, covering the period to 1812, published under the title *Histoire de Napoléon Ier* (1867-74). This is an able and scholarly arraignment of the first Napoleon and counteracted Thiers's laudation of the Emperor. Lanfrey fought with the Garde Mobile in the Franco-German War. In 1871 he was elected a member of the Assembly from Marseilles and shortly afterward was appointed Ambassador to Switzerland. In 1873, on the election of MacMahon to the presidency, he resigned his position and in 1875 was elected a life senator. In politics he acted with the Moderate Left. He died at Pau, Nov. 15, 1877. His *Œuvres complètes* and his *Correspondance* were published in Paris in 1879. Consult Comte d'Haussonville, in the *Revue des Deux Mondes* (Paris, 1880).

LANG, ANDREW (1844-1912). A Scottish

writer, born at Selkirk, March 31, 1844. He was educated at St. Andrews University and at Balliol College, Oxford. At the university he was distinguished for his knowledge of the classics. His *Ballads and Lyrics of Old France* appeared in 1872. His classical knowledge was turned to good use in the English versions of Theocritus, Bion, and Moschus (1880), the *Odyssey* (1879), the *Iliad* (1882), and the *Homeric Hymns* (1899). In the second and third of these translations he was aided by Butcher, Leaf, and Myers. From the French he translated with equal skill *Aucassin and Nicolette* (1867); edited Perrault's *Popular Tales*; and made selections for several books of fairy stories. He made substantial contributions to learning in *Custom and Myth* (1884), *Myth, Ritual, and Religion* (1887; new ed., 1899), and *The Making of Religion* (1898). As a poet he is favorably known by: *Ballads in Blue China* (1880); *Rhymes à la Mode* (1884); *Grass of Parnassus* (1888); *Ballads of Books* (1888). Others of his many publications are: *The Mark of Cain* (1886); *The Monk of Fife* (1895); *Pickle the Spy* (1897); *Magic and Religion* (1901); *The Mystery of Mary Stuart* (1901); *Alfred Tennyson* (1901); a good *Life of J. G. Lockhart* (1896) and of Prince Charles Edward (1900); an edition of Burns (1896) and of Scott (1899). His essays include: *Letters to Dead Authors* (1886); *Letters on Literature* (1889); *Essays in Little* (1891). His most substantial historical works are *A History of Scotland from the Roman Occupation* (1900 ff.) and *James VI and the Gowrie Mystery* (1902). Among later books are *Brown Fairy Book* (1904); *Adventures among Books* (1905); *Historical Mysteries* (1905); *John Knox and the Reformation* (1905); *Secret of the Totem* (1905); *Homer and his Age* (1906); *A Defense of Sir Walter Scott and the Border Minstrelsy* (1910). As a journalist, Lang was constantly writing leaders, especially for the *Daily News*, with which he was connected for many years.

Bibliography. Agnes Repplier, "Andrew Lang," in *Catholic Review*, vol. xvi (New York, 1912); P. H. Brown, "Andrew Lang, 1844-1912," in *British Academy, Proceedings, 1911-12* (London, 1912); Edward Clodd, "In Memoriam," in *Folk-Lore*, vol. xiii (ib., 1912); Edmund Gosse, in *Portraits and Sketches* (ib., 1912); Joseph Jacobs, "Andrew Lang as Man of Letters and Folk-Lorist," in *Journal of American Folk-Lore*, vol. xxvi (New York, 1913); J. H. Millar, "Andrew Lang," in *Quarterly Review*, vol. ccxviii (London, 1913).

LANG, LĀng, ARNOLD (1855-1914). A German-Swiss zoölogist and anatomist, born at Oftringen, Switzerland. He studied at the universities of Geneva and Jena, where he obtained his degree in 1876, and in the same year became privatdozent in zoölogy at Bern. Between 1878 and 1885 he was assistant at the zoölogical station at Naples; in 1886 he became Ritter professor of phylogeny at Jena; in 1889 professor of zoölogy and comparative anatomy at Zurich; and in 1898-99 was rector of the last-named university. His most important works are: *Die Polycladen (Seeplanarien) des Golfes von Neapel* (1884); *Ueber den Einfluss der fest-sitzenden Lebensweise auf die Thiere*, etc. (Jena, 1888); a *Lehrbuch der vergleichenden Anatomie*, which was translated into English as *Text-Book of Comparative Anatomy* (part i, 1891; part ii, 1896).

LANG, BENJAMIN JOHNSON (1837-1909). An American conductor and teacher, born at Salem, Mass. He studied under his father (a well-known local organist), F. G. Hill, Alfred Jaell, and Gustav Satter. At 15 years of age he was established as a teacher and organist, but some three years later went to Berlin, Germany, for advanced work in composition and a course of instruction under Liszt's direction. Upon his return to America he resumed his musical engagements, paying a return visit to Europe in 1869, during which time he gave concerts in Berlin, Leipzig, and other musical centres. He held many church appointments as organist, was for many years organist of the Handel and Haydn Society, and in 1895-97 conductor. He was also a leading member of the concert committee of the Harvard Musical Association, conductor of the Apollo and the Cecilia clubs from the time of their formation, and was famous for the great number of new works he gave to the various societies. He was on intimate terms with Wagner and was a loyal pioneer in America of that master's music. He also introduced into this country Mendelssohn's *Walpurgis Night* and Berlioz' *Damnation of Faust*.

LANG, lang, HEINRICH (1826-76). A Protestant theologian and Liberal leader, born in Frommern, Württemberg. He studied theology at the University of Tübingen. Banished from his country for taking part in the uprising of 1848, he accepted the post of pastor at Wartau, Switzerland, where he soon became famous as an advocate of the Reformed church. By means of his sermons and his periodical, *Die Zeitstimmen aus der reformirten Kirche der Schweiz*, he endeavored to promulgate views of Christianity, based on the results of modern higher criticism of the Bible. In 1872, when pastor at Meilen (near the Lake of Zurich), he united his paper with Bitzian's *Berner Wochenblätter* into the *Reform*. The most important of Lang's publications are: *Versuch einer christlichen Dogmatik* (1858; 2d ed., 1868), *Ein Gang durch die christliche Welt* (1859; 2d ed., 1870), a considerable number of his sermons, under the title, *Religiose Reden* (2 vols., 1873-74, 3d ed., 1896), in which he denounces the old doctrines of the orthodox Church.

LANG, JOHN MARSHALL (1834-1909). A Scottish Presbyterian minister, born in Glasford, Lanarkshire. He was educated at Glasgow University, was appointed to congregations in Aberdeen (1856), Glasgow (1865), and Edinburgh (1868), but returned to the Barony Church, Glasgow, in 1873 and in 1900 was made chancellor and principal of Aberdeen University. He served as moderator of the Church of Scotland in 1893, as president of the Council of Reformed Churches (Presbyterian) in 1896, and as lecturer on various foundations, and was made honorary member of St. Peterburg University and Military Academy and of the Egyptian institute. His principal publications are: *Gnostic Sects and Heroes* (1873); *Heaven and Home* (1875); *The Last Supper of our Lord* (1881); *Ancient Religions of Central America* (1882); *Life: Is it Worth Living?* (1883); *The Anglican Church*, St. Giles's Lectures (1884); *Homiletics on St. Luke's Gospel* (1889); *Gideon: A Study, Practical and Historical* (1890); *The Church and the People* (1893); *Expansion of the Christian Life*, Duff Lectures (1897); *The Church and its Social Mission*, Baird Lecture (1902).

Consult H. A. Lang, *Memoirs* (Edinburgh, 1910).

LANG, läng, KARL HEINRICH VON (1764-1835). A German author and historian, born at Balgheim and educated at Altdorf and Göttingen. In 1795 he was made privy archivist by Hardenberg, who also sent him to the Congress at Rastatt as Secretary of Legation in 1797. In 1799 he became Councilor of War and of Domains and in 1811 was appointed director of the government archives at Munich. His historical works, which are popular rather than scientific, include: *Beiträge zur Kenntniss der Verfassung des österrichischen Vaterlands* (1786); *Historische Entwicklung der deutschen Steuerverfassung* (1793); *Annalen des Fürstentums Ansbach unter der preussischen Regierung* (1806); *Geschichte der Jesuiten in Bayern* (1819). His other works, *Hammelburger Reisen in elf Fahrten* (last ed., 1822) and *Bairn'sches Strafgesetzbuch* (1822-25), are marked by a sarcastic humor, which enters largely even into his *Memoiren* (1842, last ed., 1881). Consult Petersen, *Aus der bosen alten Zeit: Lebenserinnerungen Langs* (Stuttgart, 1910).

LANG, MARGARET RUTHVEN (1867-). An American composer, born in Boston. She studied the piano with her father, B. J. Lang (q.v.); the violin with Schmidt in Boston, Drechsler and Abel in Munich, composition with Gluth, and orchestration with Chadwick. She wrote three overtures, *Phæbus*, a cantata for soli, chorus, and orchestra; a string quartet, piano pieces, and songs.

LANGAHA, lan-gä'ha (Malagasy name). A brown tree snake (*Dryophis langaha*) of Madagascar, about 3 feet long, having a prolonged, scaly snout, often flattened into a leaflike organ half an inch in length. That it uses this purely as a tactile organ seems doubtful, as it is simply a tree snake, with no hindrance to the ordinary use of the tongue. Some related snakes, like *Trigops* (see TREE SNAKE), have similar fleshy tips, and one, *Herpeton* (q.v.), has two distinct tentacles, but this species is aquatic, and such tentacles would usefully serve the purpose of the tongue, not easily protrusible in the water. Stejneger believes that these appendages serve mainly to increase the opening of the mouth, and thus assist the snakes in capturing prey, as do the bristles about the mouth of fly-catching birds.

LANGBAINE, läng'bän, GERARD (1656-92). An English bibliographer and critic, born in Oxford. He was the son of Gerard Langbaine, provost of Queen's College, Oxford, and came to be known as Langbaine the Younger, to distinguish him from his father. He was educated at University College, Oxford, but was noted for sporting rather than academic proclivities and did not graduate. He married young and later, with but a remnant of his patrimony, devoted himself to the study of dramatic literature and the collection of plays. According to his statement he had at least 980 stage works of various kinds, when, in November, 1687, a limited edition of *Monus Triumphans, or the Plagiarismes of the English Stage Exposed in a Catalogue of Comedies, Tragedies, etc.*, which is supposed to have been the work of Dryden, forestalled *A New Catalogue of English Plays*, which Langbaine published a month later, and in which Dryden's works are acutely criticized. Langbaine's work had a wide circulation and, with numerous amendments and additions, re-

solved itself into *An Account of the English Dramatic Poets, or Some Observations and Remarks on the Lives and Writings of All Those that Have Published Either Comedies, Tragedies, Tragicomedies, Pastorals, Masques, Interludes, Farces, or Operas in the English Tongue* (1691). This work is of substantial value, though weak in bibliographical detail.

LANGBEIN, lāng'bīn, AUGUST FRIEDRICH ERNST (1757-1835). A German humorous poet and novelist, born at Radeberg, near Dresden. He studied law at Leipzig, practiced it afterward in Dresden, and from 1800 on lived in Berlin, devoted entirely to literary pursuits. In 1820 he was appointed censor of belletristic literature. Extremely proficient in metrical composition and commanding an inexhaustible fund of drollery, he cultivated with especial success the comical poetic tale, frequently inclining towards frivolity, but teeming with fun. The widespread popularity of his *Schwanke* (1792; 21st ed., 1888) was almost equaled by that of his merry tales in prose, such as *Thomas Kellerwurm* (1806), *Magister Zimpels Brautfahrt*, and others, . . . for inventive faculty and pleasing . . . ne of his poems became almost folk songs, as *Ich und mein Flaschchen sind immer beisammen, Als der Grossvater die Grossmutter nahm*. He published himself the original edition of his *Sammtliche Schriften* (1835-37), his *Humoristische Gedichte* were edited by Tittmann (Halle, 1872), and *Humoristische Erzählungen* appeared in Leipzig, 1891. Consult Jess, *Langbein und seine Verserzählungen* (Berlin, 1902).

LANGDALE, MARMADUKE, first BARON (c 1598-1661). An English soldier, born in Yorkshire of a Roman Catholic family. Though an opponent of the ship-money tax (1639), he stood valiantly for King Charles when the civil war broke out and raised an infantry regiment to fight for him (1643). He became famous as a cavalry leader, defeated the Scottish horse at Corbridge, Northumberland, won a victory at Melton Mowbray, and raised the siege of Pontefract (1645). He met, however, with disaster at Naseby, his band of 1500 horsemen was scattered by successive defeats before he could join Montrose in Scotland, and Langdale had to flee to the Isle of Man and thence to France. Three years afterward he returned to fight for the Stuarts and surprised Berwick, but was once more defeated by Cromwell at Preston and this time taken prisoner. He was one of the seven Royalists who were absolutely excepted from pardon by the Commonwealth Parliament, but he escaped from Nottingham Castle to the Continent, where he was a soldier of fortune until the Restoration, when he was made Lord Lieutenant of Yorkshire (1660). Charles I had knighted . . . and Charles II made him a peer in . . . sult Gardiner, *History of the Great Civil War* (London, 1898).

LANGDELL, CHRISTOPHER COLUMBUS (1826-1906). An American legal writer and educator, born in New Boston, Hill-borough Co., N. H. He was educated at Phillips Andover Academy and at Harvard College, which he left at the end of his junior year (1849) to begin the study of law. He entered Harvard Law School in 1851 and graduated in 1853, removing immediately to New York, where he practiced until 1870, in partnership with Judges William G. Choate and Addison Brown. In 1870 he was elected Dane professor of law at Harvard Law

School and dean; he retired in 1895. He was prominently associated with the development of legal education in the United States, particularly in the introduction of the "case system" of study. A building and a professorship at Harvard were named for him. His publications include: *Selection of Cases on the Law of Contracts* (1870); *Selection of Cases on the Law of Sales* (1872); *Summary of the Law of Contracts and Equity Pleading* (1877); *Cases in Equity Pleading* (1878); *Brief Survey of Equity Jurisprudence* (1904).

LANGDON, JOHN (1741-1819). An American Revolutionary leader and statesman, born at Portsmouth, N. H. He received a grammar-school education, spent some years in a counting house in Portsmouth, and at the outbreak of the Revolutionary War had become a wealthy merchant and shipowner. He was an ardent champion of the rights of the Colonies and became interested in the organization of the local militia companies, as an officer of which he took part in Sullivan's seizure of Fort William and Mary at New Castle in December, 1774. In the following year he was elected to the Continental Congress, and later, as a naval agent of Congress, he superintended the building of several ships of war at Portsmouth. In 1776 he was appointed a judge of the New Hampshire Court of Common Pleas and in 1777 became a member and Speaker of the General Assembly of the State. At the time of Burgoyne's invasion he pledged his entire personal property to equip the New Hampshire volunteer troops, in which he served as a captain under Stark at the battle of Bennington and afterward at Saratoga. He continued to preside over the New Hampshire Assembly until the close of the war and in 1786-87 was again a member of Congress. In 1787 he was a delegate to the convention which drew up the Federal Constitution, took an active part in the debates, earnestly opposed the proposition to continue the power enjoyed by Congress under the Confederation of issuing unconvertible paper currency or bills of credit, and on the whole at that time approved of the establishment of a strong central government. He signed the Constitution as finally adopted and returned home to work for its ratification. The New Hampshire Convention, largely through his exertions, ratified the Constitution on June 21, 1788, making the necessary ninth State, and thus taking from Virginia, which ratified four days later, the honor of making the instrument effective.

In June, 1788, Langdon was chosen President of New Hampshire, and in November of the same year was elected to the first United States Senate. On April 6, 1789, he was elected President of that body, and in that capacity presided over the joint session of Congress convened for the counting of the electoral votes which made Washington the first President. He served as President pro tempore of the Senate continuously, except for a short period in 1792, when R. H. Lee presided, until 1794. From 1794 to 1804 he was a member of Congress, became a strong Anti-Federalist, and in 1801 declined the offer of the Navy portfolio in President Jefferson's cabinet. From 1802 to 1805 he was again a member of the New Hampshire Assembly, serving as Speaker in 1803-05, and in the latter year was elected Governor of the State, continuing in office by annual reflections until 1809. He was again elected in 1810 and 1811 and refused a renomination in 1812. In 1808 he

received the votes of nine Anti-Federal electors for the office of Vice President. He strongly supported Madison's war policy and measures in 1812-13.

LANGDON, SAMUEL (1723-97). An American clergyman and educator. He was born in Boston, Mass., graduated at Harvard in 1740, and taught a grammar school in Portsmouth. He was chaplain in the Louisburg expedition of 1745, settled at Portsmouth in 1747, and was pastor of the Congregational church there until 1774, when he became president of Harvard University. In 1780 he was forced to resign because of the opposition of the student body to his patriotic sentiments. Langdon received the degree of D.D. from Aberdeen in 1782. He was a charter member of the American Academy of Arts and Sciences and was a prominent advocate of the ratification of the Federal Constitution in the New Hampshire Convention of 1788. He was the author of a number of works on religion and philosophy.

LANGE, Läng'e, ERNST PHILIPP KARL (1813-99). A German novelist, better known by his nom de plume, Philipp Galen. He was born at Potsdam, studied medicine at Berlin, entered the Prussian army as surgeon in 1840, and was in charge of a field hospital in the Holstein campaign of 1849. After 1857 he lived at Potsdam. He wrote: *Der Irre von Saint James* (written in 1844, published in 1854; 9th ed., 1891), the best of his novels; *Walter Lund* (1855), a semi-biographical romance; *Andreas Burns* (1856), a sketch of life in Holstein; *Die Tochter des Diplomaten* (1865); *Der Alte vom Berg* (1873); *Die Moselnixe* (1877); *Die Fürstendiener* (1880); *Der Meyer von Monjardin* (1891). He also wrote the drama *Friedrich in Rheinsberg* (2d ed., 1873). Selected writings appeared in cheap editions (1857-68, 1883).

LANGE, FRIEDRICH ALBERT (1828-75). A German philosopher and economist, born at Wald, near Solingen, and educated at Zurich and at Bonn, where he became a privatdocent. He entered journalism as editor of the *Rhein- und Ruhr-Zeitung* (1862) and showed himself an able opponent of Bismarck's ministry. In 1870 he was appointed to a new chair of inductive philosophy at Zurich. His earlier literary activity was in economics and included such books as *Mills Ansichten über die sociale Frage* (1866), and the valuable work *Die Arbeiterfrage* (6th ed., 1909), which is Socialistic, but remarkably practical and independent. More important is his work in philosophy, especially the *Geschichte des Materialismus* (8th ed., 2 vols., 1908), with a valuable criticism of modern science, ethics, and economics. Consult Braun, *Lange als Socialökonom* (Halle, 1881), and Ellisen, *Lange, eine Lebensbeschreibung* (Leipzig, 1891).

LANGE, HENRY (1821-93). A German cartographer, born at Stettin. He worked with Berghaus and, after laboring three years in Edinburgh on Johnson's physical atlas, studied under Ritter and Dove in Berlin (1847 et seq.). In 1855 he entered the employ of Brockhaus at the head of the geographical department, retired in 1860, and in 1868 became inspector in the Berlin Statistical Bureau. He published: *Atlas von Nordamerika* (1854); *Brockhaus' Reise-atlas* (1858-73); *Land und Seekarte des mittelländischen Meers* (2d ed., 1870); *Südbrasilien, mit Rücksicht auf die deutsche Kolonisation* (1885).

LANGE, JOHANN PETER (1802-84). A German theologian. He was born at Sonnhorn, near Elberfeld, studied at Bonn, and, after serving for several years as pastor, became professor of theology at Zurich in 1841 and at Bonn in 1854. His works include: *Das Leben Jesu* (1844-47; Eng. trans., 1864 and 1872); *Christliche Dogmatik* (1849-52); *Grundriss der theologischen Hermeneutik* (1877); *Grundriss der theologischen Encyclopadie* (1877); *Grundriss der biblischen Hermeneutik* (1878). He is best known as one of the editors of the *Theologisch-homiletisches Bibelwerk* (1857 et seq.), published in English translation, edited and augmented by Philip Schaff, under the title *A Commentary on the Holy Scriptures, Critical, Doctrinal, and Homiletical* (25 vols., New York, 1865-80).

LANGE, lan'gä, JULIUS HENRIK (1838-96). A Danish art critic, born at Vordingborg. He entered the University of Copenhagen in 1858. On the first of his many journeys abroad, a tour of Italy in 1861-62, he decided to take up the study of art and became a constant attendant at Höyen's lectures. He belonged to a circle of young men with æsthetic and philosophic interests—among them Georg Brandes, Lange's personal friend. In 1870, after Höyen's death, he became docent, and in 1888 professor, of the history of art at the university and the academy. He wrote articles and books on ancient and modern art and on architecture. Among his earlier writings are *Om Kunstværket* (1876) and *Roskilde Domkirkes Alder og Stil* (1891). Of much interest are *Haanden paa Brystet, Den apocvndte Ansigtstillung, Den skrævcnde Stilung, and Vor Kunst og Udlændets* (1879). These and the broader *Sergel og Thorvaldsen* (1886; also in German) are preparatory to his great *Billedkunstens Fremstilling af Menneskeskikkelsen* (3 vols., 1892-99; translated into German; completed by P. Köbke), in which he explains his important discovery, the Law of Frontality. Modern art he treated in *Billedkunst* (1884) and *Norsk, svensk, dansk Figurmaleri* (1892). His *Udvalgte Skrifter* were edited by G. Brandes and P. Köbke (3 vols., 1900-03). Consult: Georg Brandes, *Julius H. Lange* (Copenhagen, 1898); P. Köbke, *Breve fra J. H. Lange* (ib., 1902; translated into German); *Efterslæt* (ib., 1903).

LANGE, Läng'e, LUDWIG (1825-85). A German classical scholar, born in Hanover. He studied at Göttingen under Hermann, in 1853 was made professor at Prague, in 1859 went to Giessen, and in 1871 to Leipzig. His principal work was *Handbuch der römischen Altertümer*, (3 vols., 3d ed., 1876-79); he also wrote *Der homerische Gebrauch der Partikel et* (1872-73) and *Die Epheten und der Areopag vor Solon* (1874). In the study of language the historical method, he insisted, was of great importance. His lesser writings were posthumously collected and edited, with a biographical sketch by K. Lange, under the title *Kleine Schriften aus dem Gebiet der klassischen Altertumswissenschaft* (1887). Consult K. G. Neumann, "Ludwig Lange," in *Biographisches Jahrbuch* (Berlin, 1886).

LANGE, SAMUEL GOTTHOLD (1711-81). A German poet. He was born at Halle, the son of the Pietist Joachim Lange (1670-1744), who was famed as the author of the Halle Grammars. The son studied theology at Halle and there became acquainted with Pyra, with whom he wrote *Thyren's' und Damons freundschaftliche Lieder*

(1745), attacked Gottsched (q.v.), whom they had both ardently followed before, and opposed the use of rhyme in poetry. His strongest claim to fame is the feeble version of Horace's *Odes* (1752, dedicated to Frederick the Great), which Lessing (q.v.) criticized and, when roused by Lange's fling that the critic's works because of their small format were only "Vademecums," overpowered with the brilliancy of his *Vade Mecum fur Lange* (1754).

LANGE, lan'gå, THOMAS (1829-87). A Danish novelist, born at Copenhagen. He studied theology, but was not ordained, and afterward devoted himself to literature. His first writings were published anonymously and attracted little attention. It was not until *Eventyrets Land* (1865) appeared that he was fitly appreciated. Later works gave him a place not much inferior to that of Goldschmidt (q.v.) in Danish literature. His works include: *Aaen og Havet* (1870), his best work; *Romantiske Skildringer* (*Romantic D...*; 1872); *De lyse Nætter* (1875); *...* (1877), *Nyt Liv* (1879).

LANGE, THOR NÆVE (1851-1915). A Danish author, born in Copenhagen and educated at the university in that city. In 1877 he went to Moscow as a teacher, becoming Danish Consul there in 1887. He took the degree of Ph.D. at the University of Copenhagen in 1894. His works include admirable translations from Greek, Old French, and Russian, and he made a good translation of Longfellow's "Golden Legend" (3d ed., 1891). He also compiled *Skildringer fra den russiske Literatur* (1886). His original volumes include: *En Maaned i Orienten*, *Flygtige Skizzer* (1887), *Skizzer og Phantasier* (1890), and a collection of his poems, *Gennem farvet Glas* (1894). He wrote also *Fjerne Melodier* (1902), *Strengespil* (1906), and *I danske Farver* (1907).

LANGEBEK, lang'e-bæk, JAKOB (1710-75). A Danish historian, born at Skjoldborg. He first studied Danish history, and it was by critical articles on contemporary writers in this field that he attracted attention. He founded a society for the study of the language and history of Denmark in 1745 and was its perpetual archivist. His works consist of valuable contributions on his favorite subject to the journals and to the *Danske Magazin* (1745-52), which he edited and nearly all of which he wrote himself, and *Scriptores Rerum Danicarum Medi Ævi*... (1772-74), which was completed by Suhm, Schoumø and others from original papers, in 1778. He also collected material for a Danish dictionary. His labors as a collector and publicist laid a foundation for the study of Danish history. A collection of his letters was published in 1895 by H. F. Rørdam.

LANGELAND, lang'e-land. A Danish island, County of Svendborg, at the south entrance to the Great Belt, between Fünen and Laaland (Map: Denmark, D 4). It is 33 miles long and 5 miles broad, area, 106 square miles. It is hilly and well wooded, and the soil is fertile. Grain, peas, butter, and cheese are largely produced. Pop., 1901, 18,995; 1911, 20,335.

LANGELIER, länzh'lyá', SIR FRANÇOIS CHARLES STANISLAS (1838-1915). A Canadian jurist and statesman. He was born at Sainte Rosalie, Quebec, was educated at St. Hyacinthe College and at Laval University, and was admitted to the bar of Lower Canada in 1861. Afterward he was appointed professor of Roman

law, of civil law, and of political economy at Laval University. From 1882 to 1890 he was mayor of Quebec, and after his election as a Liberal member of the Provincial Legislature, he became successively Commissioner of Crown Lands and Treasurer of the Province of Quebec. In 1884-87 and in 1887-98 he was a member of the Dominion Parliament. In the latter year he was appointed a puisne judge, and in 1906 Chief Justice, of the Superior Court of Quebec. In 1907 he was knighted. Several times he served as a Royal Commissioner, and was one of the organizers and in 1907 the first president, of the Antialcoholic League. In 1911 he was appointed Lieutenant Governor of Quebec.

LANGEN, lang'en, JOSEPH (1837-1901). A German theologian born at Cologne. He was educated at Bonn, was ordained to the Roman Catholic priesthood in 1859, and became assistant professor in 1864, and professor of New Testament exegesis in 1867, at the University of Bonn. For supporting Johann Dillinger (q.v.) he was excommunicated by the Vatican and, although he subsequently left the Old Catholic movement, he was not reconciled to the Roman church. He became known chiefly through his published works, which include: *Die deuterokanonischen Stücke des Buches Esther* (1862), *Grundriss der Einleitung in das Neue Testament* (1868; 2d ed., 1873); *Das vatikanische Dogma von dem Universalepiskopat und der Unfehlbarkeit des Papstes* (4 vols., 1871-76; 2d ed., 1876), *Geschichte der römischen Kirche bis zum Innozenz* (4 vols., 1881-93), his most famous work, *Die Klemensromane* (1890).

LANGENBECK, län'g'e-bék, BERNHARD RUDOLPH VON (1810-87). A German surgeon, nephew and pupil of Konrad Johann Martin Langenbeck, born at Pardingbüttel. He studied at Göttingen, then visited France and England, and, after teaching for some time at Göttingen, was called in 1842 to the chair of surgery in the University of Kiel. In 1847 he succeeded Diefenbach at the Berlin Clinical Institute of Surgery. He soon acquired a world-wide reputation, first through skill and success in operations for harelip, then in plastic surgery of the nose, eyelid, and lip, and finally by his noted methods of resection (q.v.), in which only the diseased or injured part of a bone is removed, instead of amputation of the entire limb. For services in the war with Denmark a grant of nobility was accorded him, and he received in 1866 the highest medical rank the Prussian army affords. Langenbeck was in active medical military service during the German campaigns of 1866 and 1870-71. Beginning with 1860, Langenbeck edited, with Billroth and Gurlt, the *Archiv für klinische Chirurgie*, and he published, besides numerous papers on surgical topics, *Chirurgische Beobachtungen aus dem Kriege* (Berlin, 1874).

LANGENBECK, KARL (1861-). An American ceramic chemist. He was born at Cincinnati, Ohio, and was educated in the College of Pharmacy of that city and at the polytechnic schools of Zurich, Switzerland, and Charlottenburg, Germany. He was superintendent of the Rookwood Pottery in Cincinnati in 1885-90 and in that connection originated the Rookwood faience and aventurine pottery glazes. He served as professor of chemistry at Miami Medical College in 1888-90, was chemist of the American Encaustic Tiling Company in 1890-93, and manager of the Mosaic Tile Company of Zanesville, Ohio, and New York City from 1894

to 1904. He directed a ceramic laboratory in Boston after 1904 and was associate editor of the *Journal of Industrial and Engineering Chemistry* after 1908. He is author of *The Chemistry of Pottery* (1895).

LANGENBECK, KONRAD JOHANN MARTIN (1776-1851). A German surgeon, born at Hornburg and educated at Jena, Vienna, and Würzburg. He received his degree at Göttingen (1802) and afterward was appointed a professor there (1804). He was famed for his swift and unerring use of the knife and for his success as a teacher. He edited the *Bibliothek für Chirurgie und Ophthalmologie* (1806-28), the organ of the surgical and optical clinic, which he founded in 1807, and wrote widely on general and special surgery.—His son, MAXIMILIAN ADOLF LANGENBECK (1818-77), born at Göttingen, was also famed as surgeon and oculist. He studied there and at Paris, Vienna, and Berlin for eight years and from 1846 to 1848 was professor at Göttingen. He wrote *Klinische Beiträge* (1849) and *Die Insolation des menschlichen Auges* (1859).

LANGENBIELAU, lāng'en-bē'lou. A group of industrial villages in the Province of Silesia, 35 miles southwest of Breslau. There are extensive cotton, linen, and woolen weaving, bleaching, and dyeing establishments, and manufactures of color goods, starch, sugar, chemicals, and lumber. Pop., 1900, 19,127, 1910, 18,514.

LANGENDIJK, lāng'en-dik, PIETER (1683-1756). A Dutch poet and playwright, born at Haarlem. He lived at The Hague, at Amsterdam, and at Haarlem after 1722, and was by profession a designer in a damask factory. He wrote several dramas, and some of his farces still have a place on the Dutch stage. It was a time when everything French was admired and imitated, and Langendijk felt this influence strongly. His works include the following comedies: *Die Zwaetser* (1712), *Arlequyn Actionist* (1720); *Xantippe of het booze wyf des filosoofs Socrates beteugeld*; *Spiegel der vaderlandsche Koopheden*. He also wrote poems, published in his collected works, *Gedichten* (1760). An edition of his plays appeared in 1851. Consult W. J. A. Jonckbloet, *Geschiedenis der Nederlandsche Letterkunde*, vol. v (Groningen, 1887-92).

LANGENSALZA, lāng'en-zāl'tsa. A town in the Prussian Province of Erfurt, situated on the Salza, 25 miles northwest of Erfurt (Map: Prussia, D 3). It has an old castle, now used as an administration building, and an eighteenth-century Rathaus. The chief manufactures are cotton goods, yarn, cloth, agricultural machinery, fire engines, tobacco, tinware, and bricks. In the vicinity are saline springs. Langensalza has been the scene of numerous battles, of which the best known is that of June 27, 1866, in which the Hanoverians defeated the Prussians, but were compelled to capitulate two days later. Pop., 1900, 11,926; 1910, 12,663.

LANGENSCHIEDT, lāng'en-shit, GUSTAV (1832-95). A German linguist and publisher, born in Berlin. He traveled extensively and about 1856 brought out, with the French teacher of languages Charles Toussaint, *Französische Unterrichtsbrieft zum Selbststudium*, a system of self-instruction in French, which met with a great success and was continued yearly (62d ed., 1902). Using the same method, which is founded on that of Hamilton-Jacotot, he published a book

for self-instruction in English. In this he was assisted by Karl van Dalen and Henry Lloyd. The "Jacotot" method" was applied by others to different languages, and, in accord with it, Langenscheidt published the Sachs-Villatte *Französisch-deutsches Wörterbuch* (1868-94) and the Muret-Sanders *Englisch-deutsches Wörterbuch* (1891-1901).

LANGEN-SCHWALBACH. See SCHWALBACH.

LANGERON, lānz'h'rōn', ANDRAULT, COUNT DE (1763-1831). A Russian general, born in Paris. He went with Rochambeau to America and in 1789 entered the Russian service, taking part in the campaign against Sweden and the Turks. At Austerlitz he was a general of division. From 1807 to 1810 he was engaged against the Turks, doing good work at Silistria in the latter year. He fought against Napoleon I during the invasion of Russia, participated in the battle of the Katzbach (q.v.), and distinguished himself in the battle of Leipzig (1813). In 1814 he stormed the heights of Montmartre and entered Paris with the Allies. In 1822 he was appointed Governor-General of New Russia. His last military service was in the Turkish War of 1828-29. He died in St. Petersburg.

LANGEVIN, lānz'h'vān', SIR HECTOR LOUIS (1826-1906). A French-Canadian politician, born in Quebec. He studied at the Quebec Seminary until 1846, when he entered a law office in Montreal and in 1850 was called to the bar. He became editor of the *Mélanges Reliqués* in 1847 and in 1857 of the *Courrier du Canada*. In the latter year he was elected mayor of Quebec and also a Conservative member of the Legislative Assembly, in which capacity he supported the administration. In 1864 he became a queen's counsel and solicitor-general in the Conservative Taché-Macdonald administration. Two years later he was appointed Postmaster-General. He was active in furthering the cause of confederation, was a delegate to the Charlottetown conference, and to the Quebec conference in 1864; was one of the commissioners sent to London to complete the organization of the Dominion of Canada in 1869, and, after his return, became Secretary of State in the first administration under Confederation. He became Minister of Public Works in 1869, Postmaster-General in 1878, and again Minister of Public Works in 1879. In 1891 he resigned his post under grave charges of malfeasance in office and in 1896 retired from public life.

LANGEVIN, JEAN FRANÇOIS PIERRE LA FORCE (1821-92). A French-Canadian Roman Catholic bishop, born in Quebec. He was educated at the seminary there, became a priest in 1844, and Bishop of Rimouski (1867). He returned to his alma mater in 1840 to teach higher mathematics and remained there nine years, during part of which he was at the head of the normal school in connection with Laval University (1858-69). He wrote: *Traité de calcul différentiel* (1848); *Histoire du Canada en tableaux* (1860); *Cours de pédagogie* (1865).

LANGHAM, lāng'am, SIMON DE (1310-76). An English archbishop and chancellor, born at Langham in Rutland. He was a monk in Westminster before 1346 and became prior and abbot. In 1360 he was Lord High Treasurer of England, a year later was Bishop of Ely, was Lord Chancellor in 1363, and in 1366 was Archbishop of Canterbury. He drew up the new premonition in

1365 and dismissed Wiclif from the wardenship of Canterbury Hall, Oxford; but, having been made Cardinal by Pope Urban V, he angered the King by accepting the promotion without his leave and was driven from his archbishopric and retired to Avignon. Here he occupied a confidential position with Pope Gregory XI until his death. He made large gifts to Westminster Abbey during his life and by will and has been called its second founder.

LANGHANS, lăng'hăns, JOHANN GOTTHARD (1733-1808). A German architect, born at Landeshut (Silesia). The success of his earlier works at Breslau caused him to be called to Berlin by King Frederick William II in 1786, and he subsequently became director of royal buildings. His structures include the palace of Hatzfeld (Breslau); the Brandenburg Gate (Berlin), a design indirectly inspired by the Propylæa at Athens (1789-93), the marble palace at Potsdam; the Herculesbrücke (bridge) at Berlin, and the theatre and Belvedere at Berlin. —His son, KARL FERDINAND, was also an architect of note.

LANGHORNE, lăng'hôrn, JOHN (1735-79). An English poet, born at Kirkby-Stephen, Westmoreland. He studied at Winton and Appleby, then devoted himself to private teaching, having among his pupils Edmund Cartwright, and went to Cambridge, but did not graduate. Taking orders, he became curate at Dagenham Essex (1761); then curate of St John's, Clerkenwell, London, and he attained some fame by his sentimental poems and romances. A short poem in 1765, entitled "Genius and Valor," defending the Scottish nation against the invective of Churchill's "Prophecy of Famine," is said to have obtained for him the degree of D.D. from Edinburgh. He translated from Bion (1759), published *Poetical Works* (1766), and, with his brother, translated *Plutarch's Lives* (1771), his best-known work, reprinted even to the present day.

LANGIEWICZ, lăng-yě'vich, MARYAN (1827-87). A Polish revolutionist, born at Krotoschin. He studied mathematics at Breslau, traveled through Europe, and in 1860 accompanied Garibaldi in the expedition for the liberation of Sicily and Naples. In 1863 he was leader of the insurgents in the District of Sandomir and was named Dictator of Poland by his troops, but, in scarcely more than a week after taking this office, was twice defeated by the Russians, at Chrobrze and Busk. He retired to Austria, where he was imprisoned for nearly two years. In 1865 he went to Switzerland; then to Paris, where he called himself Langlé; and finally to Turkey, where, after service in the artillery, he died at Constantinople.

LANGLADE, lăng'glăd', CHARLES MICHEL DE (1729-1800). A French-Canadian trader and partisan leader, born at Michilimackinac. Both his mother and his wife were Indians, and he had therefore great influence with the Ottawa, Ojibwa, Potawatami, and other Western tribes, of whom he led the party that took such an important part in the defeat of General Brad-dock in his advance upon Fort Duquesne (1755). His following also appeared at the massacre of Fort William Henry (1757), and he laid an ambush around Wolfe's camp at Montmorency (1759), which failed for want of support. He fought under Montcalm on the Plains of Abraham, Sept. 13, 1759, and under Lévis the following spring at Sainte Foye. After the war

he was as faithful to the British as he had been to the French, warned the frontier forts of Pontiac's plans (1763), and joined Burgoyne's army with a large company of Indians (1777). For his services during the Revolutionary War the English government gave him a pension and made him Indian superintendent, with headquarters at Green Bay, where he is still revered as a man of upright and amiable character, "the founder and father of Wisconsin."

LANGLAND, WILLIAM (c.1330-1400). An English poet, born probably about 1330 at Cleobury Mortimer, South Shropshire. He seems to have studied with the Benedictine monks at Great Malvern. He became a tonsured clerk and early drifted to London, where he lived in perpetual poverty, exercising minor functions in the Church. Towards the end of his life he probably returned to the west. He died about 1400. Very little, however, is known about him beyond what may be inferred from his great poem *Piers Plowman*, on which he was engaged probably from 1362 to 1392. The poem opens beautifully with the plowman falling asleep among the Malvern hills and seeing in vision a field full of folk engaged in various occupations. The poem is thus an allegory of life. It contains much vigorous satire on abuses in church and state. Unlike most of the poems of the time, it is written in the alliterative measure that characterized English verse before the Norman Conquest. Into this poem Langland put all his best thought, laboring upon it the rest of his life, as is shown by the many variations in the existing manuscripts, numbering 45 or more. These manuscripts fall into three groups, known as the A, B, and C texts, which are assigned respectively to 1362, 1377, and 1392. This poem should not be confounded with the *Creed of Piers Plowman*, written about 1394 by another hand. Excepting Chaucer, Langland was the greatest English poet of the fourteenth century. His was one of the earliest and most eloquent cries from an oppressed people. It has been contended that Langland was also the author of *Richard the Redeless*, a poem written to remonstrate with Richard II.

Bibliography. Skeat's edition of the three texts of *Piers Plowman* (Oxford, 1886), and his edition of the B text for school use (ib., 1888); Jusserand, *Piers Plowman: A Contribution to the History of English Mysticism* (trans., New York, 1894); id., *A Literary History of the English People* (ib., 1895); *The Vision and Creed of Piers Plowman*, edited by Wright (new ed., London, 1897); *Vision of William Concerning Piers the Plowman*, edited by W. W. Skeat (2 vols., Oxford, 1898); C. W. Stubbs, *The Christ of English Poetry* (New York, 1906).

LANGLES, lăng'glēs', LOUIS MATHIEU (1763-1824). A French Orientalist. He studied Oriental languages at Paris and in 1787 translated *Lamartine's Institutes* from the Persian. In 1789-90 he edited the Manchu-French dictionary of Father Amyot (q.v.) and in 1795 was appointed first administrator and professor of Persian in the School of Oriental Languages. This school, founded by the government as the result of his efforts, represents his chief service to Oriental studies. He was the founder of the Geographical Society of Paris and wrote a number of works on Oriental literature.

LANGLEY, JOHN NEWPORT (1852-). An English physiologist, born at Newbury, Berkshire. He was educated at Exeter Grammar

School and at St. John's College, Cambridge; was lecturer at Trinity College, Cambridge (of which he was a fellow), from 1884 to 1903, and also university lecturer during the same period, and became professor of physiology in the university, where he was also a member of the council in 1898-1900. He was royal medalist (1892) and vice president (1904-05) of the Royal Society, president of the Neurological Society of Great Britain (1893) and of Section I of the British Association (1899); received the Baly medal of the Royal College of Physicians (1903); and was chosen a member of various Continental and American scientific societies. Besides serving as editor of the *Journal of Physiology*, he published numerous papers, including many in the *Proceedings* of the Royal Society. He received honorary degrees from St. Andrews and Dublin universities.

LANGLEY, SAMUEL PIERPONT (1834-1906). An American astronomer, physicist, and a pioneer in the design and construction of aeroplanes, as well as in the investigation of the phenomena of aerial locomotion. He was born at Roxbury, Mass., was educated at the Boston Latin School, studied in Europe, and for a time practiced architecture and civil engineering. In 1865 he became an assistant astronomer at the Observatory, later in the same year assistant professor of mathematics in the United States Naval Academy, and in 1867 director of the Allegheny Observatory. After 1887 he was secretary of the Smithsonian Institution. His solar observations, made at Pike's Peak in 1878, at Mount Etna in 1878-79, and at Mount Whitney, Cal., in 1881, added greatly to our knowledge of the phenomena of solar heat. Langley also invented the bolometer, a very delicate instrument for the measurement of radiant heat. At Washington he established the Astrophysical Observatory and the National Zoological Park. In 1887 he served as president of the American Association for the Advancement of Science; he was a member of many important foreign scientific societies, received honorary degrees from Oxford, Cambridge, Harvard, Princeton, Yale, and other universities, and was awarded the Janssen medal of the Institute of France, the Rumford medal of the Royal Society of London, and the Henry Draper medal of the National (United States) Academy of Sciences. For several years Langley gave much study to aerial locomotion, and in 1896 a motor-driven aeroplane designed and constructed by him accomplished for the first time on record a sustained flight. Further experiments in 1903 with a full-sized machine were hardly as successful, but no inherent defect in the apparatus was shown. Criticism and lack of support led to the abandonment of these experiments, which undoubtedly would have resulted successfully had they been persevered in. In fact, in 1914 the original machine, with slight changes, actually was flown at Hammondsport, N. Y. For some time all aeronautical engineers and scientists had recognized the correctness of Langley's reasoning and fundamental ideas as well as the value of his scientific contributions to modern aeronautical science. See AERONAUTICS.

LANGLEY AÉRODYNAMICAL LABORATORY. See AERONAUTICS; SMITHSONIAN INSTITUTION.

LANGLOIS, lán'glwá', HIPPOLYTE (1839-1912). A French soldier, born at Besançon. After studying at the Ecole Polytechnique at Paris, he was made a sublieutenant in the ar-

tillery in 1858. During the Franco-Prussian War in 1870 he served with the army of Metz, holding the rank of captain. In 1887 he was appointed professor of artillery at the Ecole Supérieure de Guerre, of which he was commandant (1898-1900). Promoted to general of brigade in 1894 and to general of division in 1898, he was made commander of the famous Twentieth Army Corps at Nancy in 1901, and in the following year he became a member of the superior council of war. In 1904 he retired from the army. He was elected to the French Senate in 1906, was chosen a member of the French Academy in 1907, and was also a Grand Officer of the Legion of Honor. His military writings, which gave him an international reputation, include: *L'Artillerie de campagne en liaison avec les autres armes* (1891-92), his greatest work; *Manœuvre d'un détachement de toutes armes avec feux réels* (1897), *Etude sur le terrain* (1903), *Guerre turco-russe et anglo-boer* (1903).

LANGLOIS, VICTOR (1829-69). A French Orientalist, born at Dieppe. After devoting considerable time to the study of Oriental languages, he was sent in 1852-53 by the Minister of Public Instruction to Cilicia and Armenia, where he made extensive excavations and collected numerous antiquities, including 80 new Greek inscriptions and a collection of figures in terra cotta found in the cemetery of Tarsus in Cilicia. He next went to Italy (1857 and 1861), where, besides procuring documents concerning the relations between France and Armenia during the Crusades, he collected data for an important work on the doctrines of the Mechitarists, the most celebrated of the Armenian monks. In addition to this work, which appeared in 1862, he published, among other works, *Le trésor des chartes d'Arménie* (1863) and *Le mont Athos et ses monastères* (1867), with a lithographic copy of the Greek manuscript of the geography of Ptolemy (twelfth century), found by him in the libraries of the monasteries of Mount Athos, Turkey. He also undertook the publication of *Collection des historiens anciens et modernes de l'Arménie* (1869), but his death occurred just after he finished the first volume.

LANGNAU . . . A town in the Canton of Bern, Switzerland, situated on the Ilfis, 13 miles east of Bern (Map Switzerland, B 2). Langnau is the principal market for the cheese and linen thread of the Emmenthal. It makes cloth, leather, tobacco, and bleached goods. Pop., 1900, 8200, 1910, 8584.

LANGRAND-DUMONCEAU, lán'grán'-du-môn'só', ANDREAS, COUNT (1826-1900). A Belgian adventurer, born in Bossem. He attracted attention by his plan for bringing capital under the influence of the Church. Thanks to the patronage of many high Church dignitaries, he was enabled to found a bank in Brussels and often rendered financial assistance to the Pope, who, in recognition of his services, made him Count. Langrand-Dumonceau was intrusted with an enormous amount of capital by many wealthy people and was elected to the Belgian Parliament. He carried on his business transactions till 1870, when he became bankrupt. While judicial inquiries were being made into his affairs, he managed to abscond. He was, however, sentenced in *contumaciam* to 15 years' imprisonment for embezzlement.

LANGREO, lán-grá'ó. A mining town of north Spain, in the Province of Oviedo, situated

among the mountains, 18 miles from the coast and 10 miles east of Oviedo. In the neighborhood are important coal and iron mines, and the town has iron foundries and considerable iron manufactures. Much fruit, cider, wheat, and hemp are also produced. Pop., 1900, 18,751; 1910, 25,444

LANGRES, lán'gr'. An ancient town of France, a first-class fortress and capital of the arrondissement of the same name, on the Marne, in the Department of Haute-Marne (Map: France, N., 1. 5). It is situated on a plateau 21 miles south-southeast of Chaumont. It has the twelfth-century cathedral of St. Mammes in Transition style, numerous convents, a collection of a museum with collections of old tapestries and paintings, a library of 10,000 volumes, and a monument to Diderot, a native of Langres. The chief industry is the manufacture of cutlery, for which the town is famous. The trade is chiefly in iron products, grain, oil, and textiles. The town has been the seat of a bishopric since the Roman period. Pop., 1901, 9021, 1911, 6335. Langres is believed to have derived its name from the Celtic people Lingones, who occupied it in Cæsar's time, when it was known as Andomatunnum.

LANGSHAN (Chinese name). A breed of domestic fowls, the smallest in the Asiatic class. They are active and lively, the cocks weigh 10 pounds and the hens 7 pounds. Howard describes two varieties, the black and the white. The black, in plumage of neck, back, saddle, and sickles, is glossy metallic black, with greenish sheen. breast, primaries, secondaries, tail, fluff, shank, and toe feathers, black; the under color is black or dark slate. The white Langshan is pure white throughout. This is an old and well-known breed, highly esteemed for all good qualities.

LANGSIDE. A village 2 miles south of Glasgow, Scotland, where on May 13, 1568, a skirmish was fought between the forces of Mary Stuart (q.v.) and those of the Regent Murray. On May 2, 1568, Mary had escaped from the castle of Lochleven where she had been a prisoner, and immediately revoked the abdication which she had been compelled to make in favor of her infant son, James VI (later James I of England). An army of 6000 men, commanded by Argyle, collected about her, but she was unable to take Dunbar Castle and so marched in the direction of Dumbarton. At Langside Murray, with 4500 men, stopped the army of Mary and defeated it in three-quarters of an hour. Mary fled to England after the battle, crossing the border on May 16, 1568. In England she was kept a prisoner until her execution, in 1587.

LANGSON, lán'g'son'. The capital of the province of the same name in Tongking, French Indo-China, situated about 80 miles northeast of Hanoi, with which it is connected by rail (Map: Burma, E 2). It is divided into two parts, one contains the strong citadel, and the other the commercial and residential town. It is a station on the railway line from Hanoi to Yunanfu, China, which was completed in 1906. The town was taken by the French, after a hard struggle, in 1885.

LANGSTAFF, LAUNCELOT, ESQ. See IRVING, WASHINGTON.

LANGSTON, JOHN MERCER (1829-97). An American educator, born in Louisa Co., Va. He was born in slavery, the son of a white man, Ralph Quarles, by a negro slave, but was eman-

cipated when he was six years old. He was reared by Col. William D. Gooch as a member of his own family and for several years did not know of his negro blood. He graduated at Oberlin College in 1849 and from the theological department there in 1853. In 1854 he was admitted to the bar in Ohio, where for the next 13 years he practiced his profession and held several town offices. In 1869 he became professor of law at Howard University, was appointed dean of the law department, and in 1873 became vice president of the university. In 1871 he had been appointed a member of the board of health of the District of Columbia and in 1871 was elected secretary of the District. He was United States Minister and Consul General in Haiti from 1877 to 1885 and upon his return accepted the presidency of the Virginia Normal and Collegiate Institute in Petersburg. Elected from Virginia to the National House of Representatives in 1888, he was not seated till two years later, after a contest. He published a volume of addresses, *Freedom and Citizenship* (1883).

LANGTON, STEPHEN (?-1228). Archbishop of Canterbury from 1207 to 1228. Langton was undoubtedly an Englishman, but he received the chief part of his education in Paris. After Innocent III became Pope, he summoned Langton to Rome and made him a cardinal in 1206. In 1205 there had been a disputed election to the see of Canterbury, and the whole matter was taken on appeal to Rome. Innocent compelled the 16 monks of Christ Church, who represented the cathedral chapter at Rome, to elect Stephen Langton, and the Pope consecrated him at Viterbo on June 17, 1207. His appointment, nevertheless, was resisted by King John, who threatened to outlaw any one who would dare to acknowledge Stephen as Archbishop. For six years Langton was excluded from the see, to which he was only admitted in 1213 (See JOHN). The reconciliation of 1213 was but temporary. In the conflict of John with his barons Langton was a warm partisan of the latter, and it was he who, at the Council of St. Albans in 1213, produced the old charter of liberties of Henry I, upon which the Magna Charta was based, of which latter document he was the first of the subscribing witnesses. When the Pope, acting on the representation of John and espousing his cause as that of a vassal of the holy see, excommunicated the barons, Langton refused to publish the excommunication and was in consequence suspended from his functions in 1215. He was restored, probably two years later, and after the accession of Henry III he was reinstated (1218) in the see of Canterbury, from which time he occupied himself with attempts at reform, both in church and state, till his death, which took place July 9, 1228. Langton was a learned and able writer; but most of his writings are lost, and the chief trace which he has left in sacred literature is the division of the Bible into chapters. Consult: Hook, *Lives of the Archbishops of Canterbury*, vol. ii (London, 1862); William Stubbs, *Historical Introduction to the Rolls Series* (London, 1902); Davis, *England under the Normans and Angevins* (New York, 1905).

LANGTRY, MRS. LILLIE (1852-). An English actress, born at Le Breton, the daughter of a clergyman in the island of Jersey. She was married in 1874 to Edward Langtry, and, as the "Jersey Lily," was noted for her beauty in English society before she began her career upon

the stage. Her debut before the London public (December, 1881) was at the Haymarket Theatre in *She Stoops to Conquer*. The following autumn she made her first appearance in America, with a popular success which was repeated subsequently, though the critics generally condemned her interpretations of rôles such as Pauline in the *Lady of Lyons* or Rosalind in *As You Like It*. Mr. Langtry died in 1897, and in 1899 she was married to Sir Hugo Gerald de Bathe, Bart. In 1903 she starred in America in *The Crossways*, written by her in collaboration with J. Hartley Manners. She returned to America in 1906 and again in 1912, appearing in vaudeville.

LANGUAGE (OF., Fr. *language*, from Lat. *lingua*, tongue, language, OLat. *dngua*, tongue; connected with Goth. *tungo*, OHG. *zunga*, Ger. *Zunge*, AS. *tunge*, Eng. *tongue*). In its scientific meaning, a system of symbols employed to communicate thoughts and feelings. Sounds, signs, bodily attitudes, or gestures may form the material of a language, if they are used with the intent to communicate thoughts and feelings. Indeed, there are in existence several highly complex languages in which gestures are employed as symbols (see **GESTURE**, **GESTURE LANGUAGE**), although the paramount form of language is articulate speech. The scientific study of language is concerned with (1) the structure and history of languages, or philology (q.v.), (2) the physical basis of vocalization, or phonetics (q.v.), and (3) the psychology of language. Both philology and phonetics are, it will be observed, limited to articulate speech; psychology, on the other hand, finds its subject matter in all forms of language, although speech is by far the most important.

Psychologically language is regarded as a product of the collective or social mind. By comparing the languages of human society at various levels of human evolution, we may thus expect to gain an insight into the course of mental development in the history of the race. Rightly to interpret the results of such a comparison, however, we must assume that thought and language developed side by side. Thought, it is true, is in our own case possible without language; psychological experiments have shown that thought and reasoning may go on in terms of kinesthetic sensations of the vocal organs, of bodily attitudes, and of visual and auditory images, in such cases these mental processes themselves become the symbols which carry the meaning of the thought. But there is no reason for believing that language supervened upon, or took the place of, any previous system of symbols. Rather must we suppose that language and reasoning are two aspects of the same phase of mental development, and that each implies the other. Evidence for this assumption is gained from a study of the vocal utterances of animals and from the development of language in the child. The primitive sounds in animals are cries of pain and rage and result from movements which express emotion (see **EXPRESSIVE MOVEMENTS**); all vocal utterances in animals may be regarded as having developed from these primitive sounds. Some birds, to be sure, imitate sounds, and parrots even articulate but there is no shred of evidence that the imitation is other than instinctive. Again, the efforts made to find evidence of a conscious use of expressive sounds in the apes have thus far ended in failure.

Finally, animal psychologists are universally of the opinion that animals have no free ideas. The old conundrum—Why don't the animals talk? Because they have nothing to say—contains a sound psychology; if the animals thought, they would talk; since they do not talk, they do not either think. Similarly, the first cries of the child are cries of pain, anger, hunger, discomfort, and the like, which are again to be classed as sounds resulting from expressive movements. At a later stage of development appears the childish babble, a continued reiteration of nonsense sounds, of which many interpretations have been given. It has been urged most frequently that these sounds are the result of imitation, but it seems more reasonable to regard them as "echo" gestures and "echo" speech, i.e., as reflex expressions of emotion aroused by the sight of the same expression of the same emotion in others. Finally, it may be said that there is no ground for believing that the child in the babble stage invents words. Indeed, the most careful studies indicate that there is no conscious imitation or invention of words by the child until speech has been acquired. Since, then, it may be safely assumed that the development of language and of thought go hand in hand, a comparative study of language from the psychological point of view promises the solution of two problems of especial interest—that of the origin of language, which marks an epoch in mental development, and that of the growth of language, which underlies the growth of thought.

The Origin of Language. The problem of the origin of language was, in the seventeenth and eighteenth centuries, the most important problem of what was commonly called the philosophy of language. While the metaphysical discussions of this period included the possibility of a natural origin and development of language, it was generally held that speech is either the product of divine ordinance, a miracle, as was, e.g., the confusion of tongues at the tower of Babel, or that it is the invention of man, that its origin was a matter of social convenience. Neither of these views, however, is scientific, neither offers a true explanation, and both have long since been given up. The theory of evolution revived the view of language as a product of natural origin and development. The first hypothesis proposed is the imitation theory (derisively called by its opponents the "moo-moo" theory). It was assumed by the Stoics (with whom the theory originated) that the first words were imitative of natural sounds, e.g., words like *hiss*, *buzz*, and *roar*. They believed, however, that other words arose through the application of the principles of analogy and opposition. In more modern times this principle of onomatopoeia was supplemented by the theory that the feeling aroused by the word accorded with the feeling aroused by perception of the object. The strength of the theory lies in its original contention rather than in its logical additions; but it offers difficulties which make its acceptance impossible. In the first place, not only are the imitative words in any language too few in number to satisfy the theory, but there are also fewer words of this character in primitive languages than in modern. Furthermore, many onomatopoeic words in modern languages are derived from non-onomatopoeic; as, e.g., "thunder," which comes from the root "tan," meaning "to

stretch.' Again, imitation of natural sounds before man had learned to speak is inconceivable; he would neither know that he could produce sounds, nor would he be able to make the necessary nervous and muscular coordinations. According to a second hypothesis, known as the interjection theory (natural-sound theory, "pooh-pooh" theory), the first words are interjections or exclamations. The perception of an object arouses an emotion which finds its expression in a sound, and this sound becomes associated to the object. There are many variations of the theory, and the principal arguments in its behalf are taken from the interpretations of the child's babble before he learns to speak. While it avoids one of the objections to the imitation theory, in that interjections are natural sounds and may originate in reflexes, it is still open to the objection that there are not in any language enough interjections to render the hypothesis tenable. Moreover, even if it should be granted that the babble of infants is of an interjectional character, this phenomenon is still not primitive, but corresponds to a stage in the maturing of an inherited speech mechanism. A third theory, as definitely psychological as the two former are logical, may be called the gesture-speech theory. The origin of language is traced, not to the utterance of particular sounds at a particular time, but to the expressive movements which are shared by man with the animals. The impulse to communicate, a determining tendency (q.v.) which distinguishes language from expressive movements, arises through social imitation of expression and through the sympathetic feelings awakened by social intercourse. It is, then, but a step from expressive movements to gesture, which is psychologically the first language, and the "origin" of speech is bound up with the origin of gesture language. Certain mimic gestures which involved the muscles of face, mouth, and tongue were accompanied by sound. At first the sound was the incidental, meaningless accompaniment of the gesture. Eventually it derived a meaning from other concomitant gestures, and only gradually, under the influence of continued social intercourse, did it manifest its superiority to gesture and acquire its independence. It may be said, in the large, that the word heard has never had any other than a derivative and symbolic meaning, and that the self-sufficiency of the word-gesture, combined sound and movement, is the origin of language.

The Growth of Language. The growth of language consists not only in the addition of new symbols to old, but also in permutations of the old. Moreover, a symbol may gradually change its meaning. These two modifications are, as a rule, independent of each other, and while the former is of psychological interest, it is in the study and interpretation of the course of semantic change, or change in meaning, that the laws governing the growth of mind are revealed. The general law of development is that thought tends from the concrete to the abstract. For example, a word that designates a perceptive process like smell or taste, which has a meaning more or less abstract, may have been derived from the name of a substance that could be smelled or tasted. Thus, Ger. *riechen*, smell, is ultimately the same with *rauchen*, smoke; and Eng. *smell* is connected with *smoulder*, and with Dan. *smul*, dust. The Lat. *sapio*, to taste, *sapor*, taste, are connected with *sapa*, must,

sapo, soap, *sebum*, tallow, i.e., with names of substances that are readily diluted or liquefied. A further stage of the same process is illustrated by Eng. *feel*, Ger. *fühlen*, which at first meant 'to touch'; cf. Lat. *palma*, Eng. *palm* of the hand. Not until the eighteenth century were the words reserved for the affective or "subjective" side of mind, and even now the shift of meaning is by no means complete.

Finally, it should be said that, in addition to the problems discussed above, psychology has the more immediate problem of describing the mental processes involved in communication and thought at every stage of their development. Briefly it is found that words themselves are represented in consciousness by auditory, visual, and articulatory perceptions and ideas; that their meanings are at first represented in perceptions and ideas by a contextual fringe of supplementary images, while later this context may lapse from consciousness and a nonconscious, nervous set or attitude may take its place; and lastly, that the explanation of the change in meaning as thought develops is to be found in terms of associative and determining tendencies.

LANGUAGE, SIGN. See GESTURE LANGUAGE; SIGN LANGUAGE.

LANGUAGE, UNIVERSAL. See **UNIVERSAL LANGUAGE.**

LANGUAGE OF FLOWERS. See **FLOWERS, LANGUAGE OF**

LANGUED, lāngd (from Fr. *langue*, tongue). In heraldry (q.v.), a term used for the tongue of a beast or bird when that differs in tincture from the animal's body. It is then said to be langued of that color.

LANGUEDOC, lāng-dōk' (OF., from *langue*, language + *de*, of + Prov. *oc*, yes, from Lat. *hoc*, this, the Provençal equivalent of OF. *oui*, oil, Fr. *oui*, yes, from Lat. *hoc illud*, this (is) that, whence the Old French language was termed *Langue d'oui*, *Langue d'oïl*). A name given in the later Middle Ages and down to the French Revolution to a province in the south of France, bounded on the north by Auvergne and Lyonnais, on the east by the river Rhone, on the south by the Mediterranean and the counties of Foix and Roussillon, and on the west by Gascony and Guienne. The region is traversed through its whole length, from the northeast to southwest, by the Cévennes (q.v.) Languedoc included what are now the departments of Lozère, Gard, Aude, Hérault, Tarn and part of Haute-Loire, Ardèche, Haute-Garonne, Tarn-et-Garonne, Ariège and Pyrénées-Orientales. The capital of Languedoc was Toulouse. The counts of Toulouse, whose history is connected with the Albigensian troubles, ruled over Languedoc, which was reunited with the French crown in 1271. Consult De Vic and Vaissète, *Histoire générale de la province de Languedoc avec des notes et les pièces justificatives*, vols i-xvi (Toulouse, 1872-1904), and J. Tissier, "Les sources de l'histoire de Languedoc d'après les inventaires des archives narbonnaises," in *Commission de Narbonne, Bulletin*, vol. xi (1903).

LANGUET, lān'gā', HUBERT (1518-81). A French Huguenot writer and diplomat, born at Vitteaux. He studied at the University of Poitiers from 1536 to 1539, then at the universities of Bologna and Padua. In 1549, through the influence of Melanchthon, he became a Protestant. He traveled extensively through France, Germany, Italy, and Sweden. In 1559 he entered the service of the Elector of Saxony, Augustus I, whom he represented at the court of France almost continuously from 1561 to 1572. At the time of the Massacre of St Bartholomew's Day he was in France and had difficulty in escaping. He withdrew to the Netherlands during the latter part of his life. For a short time he was adviser to William the Silent, of England. His interesting, valuable, and voluminous correspondence throws much light upon the history of the sixteenth century. The work by which Languet is best known, but the authorship of which is disputed, is *Vindiciæ contra Tyrannos, sive de Principis in Populum Populique in Principem Legitima Potestate*. *Stephano Junio Bruto Celta Auctore* (c.1579).

LANGUR, lān-gōōr'. A monkey of the Oriental genus *Pygathrix* or *Semnopithecus*. This name is given in northern India, where these monkeys are most typical and familiar. In Ceylon they are called wanderoos, and in Malayan countries lutongs. Over 50 species and subspecies are differentiated, ranging from the Indus and even Tibet as far south as Borneo and Java. All are of comparatively large size, with slender, loose bodies, the hind limbs longer than the fore, the tail very long and often

tufted, eyebrows bristly, and no cheek pouches. This last feature seems to be correlated with the fact that the stomach is divided into a number of pouches or sacs, much like that of a ruminant. This accords with their prevailing diet of leaves and green shoots, although in cul-

TEETH OF A LANGUR.

Compare illustration under MONKEY

tivated districts they feed greedily upon grain and vegetables. The habits of few species are well known.

Hanuman, Sacred, or Entellus Monkey. The typical and most familiar of these monkeys is the hanuman (*Pygathrix entellus*), to which the native name langur originally applied. Its proper home is in the northern half of peninsular India—the valley of the Ganges and thence to Bombay. The body is about 2 feet long and the tail about three feet, so that the total length is nearly 5 feet (See *Plate of MONKEYS OF THE OLD WORLD*). The movements are not quick and restless, as in most monkeys, but rather slow and sedate, yet it is able to make prodigious leaps, and fatal fights sometimes happen when two troops meet and quarrel over proprietary rights in feeding grounds or seek to capture one another's females. This monkey is held in superstitious reverence by the northern Hindus, it is often to be seen exhibiting impudent familiarity in the precincts of temples, indeed, temples are often specially dedicated to it, and hospitals are erected for its reception when sick or wounded. The Hindu peasant, when his garden is plundered or his house robbed by troops of them, fears, as an act of sacrilege, to drive them away, but he is grateful to any one else who will do so, and the veneration is steadily weakening as European influence spreads (See *HANUMAN*). These monkeys are of great assistance to the tiger hunters. Blanford describes how, safely ensconced in a lofty tree, or jumping from one tree to another as the tiger moves, the monkey, by gesture and cry—a guttural note, very different from its ordinary joyous and often musical whoop—points out the position of his enemy in the thickets or grass beneath, seeming to recognize the hunter as an ally to be assisted in a warfare against a common foe. The familiar ways and easily studied habits of these sacred monkeys have been well detailed in Kipling, *Beast and Man in India* (London, 1891).

A very closely related species of langur (*Pygathrix ochistacea*) dwells in the Himalayas, between 5000 and 12,000 feet of elevation, and

is often seen dashing about among snow-laden branches. They gather into large troops in the autumn and then become a nuisance to hunters by alarming the game as soon as they catch sight of a man with a gun. Another species (*Pygathrix lamia*) inhabits the still higher ranges of Tibet. In southern India and Ceylon several species exist in large numbers and are so bold and familiar about the villages that were they not harmless they might be a serious menace to the people. These are often called wanderers (qv) indiscriminately and are all held more or less sacred by the Hindus.

Other Langurs. The foregoing species form a group agreeing in the fact that the hair upon the forehead radiates forward from a central point. The negro monkey, or budeng (*Pygathrix aurata*, or *maurus*), is a well-known type of a group characterized by the fact that the projecting hairs of the forehead radiate from two points. When adult, this monkey, which is common in Java, Sumatra, and the Malay Peninsula, is fully black, but its young are of a light sandy hue. A closely related species is rust red all its life. The Malay name for all this kind of monkeys is lutong, of which various other species are known, including a crested one of curiously variable coloring. Another large group of langurs is characterized by the fact that the hair of the crown is directed backward with no sign of parting, instead of radiating from one or more points on the forehead. A common example is the Nilgiri langur (*Pygathrix johni*) of the forested hills of southern India, which is becoming rare because constantly hunted by the natives for the sale of its beautiful skin and also for food. The purple-faced monkey of Ceylon is an allied species—a small, active, intelligent creature, a great favorite in captivity for its gentleness and cleanly ways. Several other species of India, Assam, and the Malay Peninsula are called leaf monkeys by the English colonists, and along the coast of Cochinchina is to be found the brightly colored douc (*Pygathrix nemæus*), which is very little known.

LANGWERTH VON SIMMERN, lang'vërt fôn zim'mërn, HEINRICH, BARON (1833-). A German politician and author, born in Hanover. From 1858 to 1861 in the government service of his native country, he was very active, after the annexation of Hanover in 1866, in the interest of the German-Hanoverian faction and endeavored to accentuate its German patriotism, first by his contributions to the public press and from 1880 to 1890 as a member of the Reichstag. A partial list of his publications includes: *Für Oesterreich* (1866); *Von 1806 bis 1866: Zur Vorgeschichte des neuen deutschen Reichs* (1872); *Die deutsch-hannoversche Partei* (1885); *Aus meinem Leben* (1898); *England in Sudafrika* (1902); *Deutschtum und Anglophobie* (1903-04); *Der englische Nationalcharakter* (1906); *Aus Krieg und Frieden* (1906).

LANIARD, lan'yard (formerly *lannier*, *lanier*, from OF *laniere*, Fr. *lanière*, throng, cord for a lanner, from OF., Fr. *lanier*, sort of hawk, from

Lat. *lanarius*, relating to a butcher, from *lanius*, butcher, from *laniare*, to rend; influenced in popular etymology by Eng. *yard*). A small rope used for joining two objects, especially the joining of a large rope to some permanent fixture, as the laniards of a ship's rigging, which are ropes reeving through dead eyes to form a purchase or tackle which keeps the heavy shrouds and stays taut and yet furnishes sufficient elasticity to prevent straining them.

LANIARD KNOT. See KNOTTING AND SPLICING.

LANIER, là-nër', or **LANIÈRE**, NICHOLAS (1588-1666). An English musician, descended from a French family whose members had for several generations been musicians of the royal household in England. By 1604 Nicholas was a member of the court musicians, and his fortune was thereafter identified with that of Charles I and James I. Under both monarchs he held the post of master of the King's music. He wrote the music for a number of masques (notably *Lovers Made Men*, by Ben Jonson) and in them introduced the *style recitativo* for the first time in England. In addition to being a composer, Lanier was a singer and a flutist of ability and took an active part in the masques for which he had composed the music. As a painter and a collector of works of art he was well known, and in 1625 Charles I sent him to Italy to collect pictures and statues, some of which (e.g., Mantegna's "Triumph of Cæsar") are now at Hampton Court. Portraits of Lanier were painted by Van Dyck, Jan Livens, Isaac Oliver, and by himself. His music can be found in *Select Musicales Ayres and Dialogues* (1653), *The Musical Companion* (1667), *The Treasury of Music* (1669); etc. Lanier died in London.

LANIER, SIDNEY (1842-81). An American musician and poet, born at Macon, Ga., Feb. 3, 1842. He died at Lynn, N. C., Sept. 7, 1881. He was of Huguenot stock and inherited great musical ability. His education was obtained at Oglethorpe College, Georgia, where he graduated and served as tutor for one year before he entered the Confederate army. His main experiences during the war were connected with blockade running, but he was much exposed to physical hardships and suffered imprisonment for several months, with the result that he developed consumption. Immediately after the war he went to Alabama, where he was a clerk in a shop and a teacher; but his bad health forced him to return to Macon, where he studied and practiced law with his father until 1873. Then his two dominant passions, poetry and music, overmastered him, and he decided to give his life to them. He had previously published (1867) a rather crude romance entitled *Tiger Lilies*, but its want of success had not discouraged him. He went to Baltimore and obtained a position as first flute in the Peabody Symphony Orchestra, and he also saw something of musical life in New York, his ability, especially for the flute, being everywhere recognized. His literary ability was encouraged by friends like Bayard Taylor, and in 1876 he was invited to write a poem for the Centennial Exposition. A year later a volume of his poems appeared. In 1879 he was made lecturer on English literature at Johns Hopkins University, where he delivered courses afterward published as *The Science of English Verse* (1880) and *The English Novel* (1883). Throughout these years his strength had been steadily waning, and he

had frequently been obliged to seek health in Florida and other favorable regions. It was on such a visit to North Carolina that he finally succumbed. Considering the short time he devoted entirely to literature and the unfavorable conditions under which he worked, his achievement was as remarkable as that of any other American of his generation. Besides the books already named, he adapted Froissart, Percy, and the *Mabinogion* to youthful readers, wrote a guidebook to Florida, and did other miscellaneous work which has recently been gathered and put in permanent form. It is difficult to say whether Lanier's genius was greater for music than for poetry. In his poems and in his writings about poetry the element of music is everywhere and in *The Science of English Verse* rather tends to make less useful and perhaps less trustworthy a remarkably subtle and stimulating book, which is nevertheless of distinctly greater value than the lectures on the English novel. In his other prose works, especially in the *Letters*, Lanier makes the appeal to chosen readers that we always expect from the prose of a genuine poet. And this Lanier was, even if the quality of his work was not infrequently injured by a straining after effect. No American since Poe has been so fully dominated by the idea of beauty in art. Lanier added an ethical element foreign to Poe, and it is a question whether here again there is not a lack of that fusion of powers and qualities that is essential to the production of perfect poetry. Be this as it may, it is quite certain that Lanier must stand in the front rank of the American poets of the last quarter of the nineteenth century. Among his best-known poems may be mentioned: "Corn"; "The Song of the Chatahoochee"; "The Marshes of Glynn"; the cantata sung at the Centennial. His interesting letters have also been published, as well as his complete poems, edited by his widow, Mary Day Lanier, with a memoir by William Hayes Ward (New York, 1881, 1884, 1906), containing a bibliography. His *Shakespeare and his Forerunners* was published in New York (1902). Good selections from his prose and verse appeared in the *Lanier Book* (New York, 1904). Consult Mims, *Sidney Lanier* (Boston, 1905).

LANIVIUM, lá-nív'i-úm. See LANUVIUM.

LANJUINAIS, lán'zhwé'ná', JEAN DENIS, COUNT DE (1753-1827). A French statesman and publicist, born at Rennes. He made an early success at the bar of Rennes and in 1775 became professor of ecclesiastical law in the university there. In 1789 he was chosen deputy to the States-General. He distinguished himself as one of the most advanced members of the party that desired a constitutional monarchy in France, and was one of the founders of the Breton Club which later developed into the Feuillants and Jacobins. In June, 1790, Lanjuinais demanded the abolition of all titles, and in May, 1791, the admission of negroes to all the rights of citizenship. He was returned a member of the Legislative Assembly which succeeded the Constituent Assembly in 1791; but the radical reform movement, of which he had been a leader, was now getting beyond his control, and this gave the color of reaction to his rôle in the new Assembly. In the Convention he acted with the Girondists and protested with vehemence against the act of accusation of the King, against the right of the Assembly to judge him, and against the forms employed, yet at

the last voted with those who found the King guilty under the accusation, but he voted for banishment as the last means to save the King's life. He was eventually proscribed and his arrest ordered, but he escaped and concealed himself at Rennes until the fall of Robespierre. In 1795 he was chosen a member of the Council of Ancients, and in 1800 he became a member of the Senate, where he opposed Bonaparte's monarchical schemes. In 1808 he was created Count, however, and a member of the historical section of the Institute. He favored the deposition of Napoleon and was created a peer at the First Restoration. During the Hundred Days he became President of the Chamber of Deputies, but on the Second Restoration resumed his seat in the Chamber of Peers and was a staunch advocate of constitutionalism against reaction and clericalism. He was a member of the tribunal which tried Marshal Ney and one of the 17 who voted for exile. He died in Paris, Jan. 13, 1827. His political, legal, and historical works were collected and published in four volumes (Paris, 1832), with a life by his son. These include: *Constitutions de la nation française* (1815) and *De l'organisation municipale en France* (1821).—His second son, VICTOR AMBROSE, VICOMTE DE LANJUINAIS, was born in Paris in 1802, studied law, and in 1837-48 was a member of the Chamber of Deputies. In 1848 he was elected to the Constituent Assembly and subsequently to the Legislative body. He was Minister of Commerce and Agriculture from June to October, 1849, resigning, however, to become a member of the opposition. He was imprisoned at the time of the coup d'état of December, 1851. In 1863 he entered the Corps Législatif. He died Jan. 2, 1869. He was the author of several works on political economy.

LANKESTER, lán'kes-tér, EDWIN (1814-74). An English scientist, born at Melton in Suffolk. He was enabled by the generosity of friends to take a short medical course at the University of London, and later went to Heidelberg, where he secured the degree of M.D. On his return to England in 1840 he settled in London and for a number of years devoted most of his time to literary work and to lecturing on scientific subjects. In 1850 he became professor of natural history in New College, London, and in 1853 lectured on anatomy and physiology at the Grosvenor Place School of Medicine. He took a keen interest in the question of public health and strove to arouse general interest in the causes of disease. Many of his works treated of scientific subjects in a popular manner, and he began the distribution of pamphlets dealing with the subject of sanitation, which later was carried on by the National Health Society. From 1853 to 1871 he was an editor of the *Quarterly Journal of Microscopical Science* (with George Busk, 1853-68; with his son, 1869-71); wrote the article on Rotifera for the *Cyclopædia of Anatomy and Physiology*; and published *Lives of Naturalists* (1842), *Memoirs of John Ray* (1845), and *Half-Hours with the Microscope* (1859). For his son, see the following article.

LANKESTER, SIR EDWIN RAY (1847-). An English zoölogist, son of Edwin Lankester. He was born in London and was educated at St. Paul's School, Downing College, Cambridge, and Christ Church, Oxford. He became fellow and lecturer in Exeter College (Oxford) in 1872; was professor of zoölogy and compara-

tive anatomy in the University of London (1874-90); in 1882 became regius professor of natural history at Edinburgh; from 1891 to 1898 served as Linacre professor of comparative anatomy at Oxford, and in 1898-1900 was Fullerian professor of physiology and comparative anatomy in the Royal Institution of London. In 1884 he founded and in 1892 became president of the Marine Biological Association (Plymouth Laboratory), and he was director of the department of natural history of the British Museum in 1898-1907, his removal from that position causing considerable comment. He was president of the British Association at the 1906 meeting and was honored by numerous medals and degrees and by membership in many scientific societies at home and abroad. In 1907 he was created Knight Commander of the Bath. His writings include: *A Monograph of the Cephalaspidean Fishes* (1870), *Developmental History of the Mollusca* (1875); *Degeneration* (1880); *Limulus. An Arachnid* (1881); *The Advancement of Science* (1889), collected essays; *Zoological Articles* (1891); (ed.) *A Treatise on Zoology* (1900-09), *Extinct Animals* (1905), *Nature and Man* (1905); *The Kingdom of Man* (1907); *Science from an Easy Chair* (1st series, 1910, 2d series, 1912). After 1869 he edited the *Quarterly Journal of Microscopical Science* (jointly with his father, 1869-71).

LAN'MAN, CHARLES (1819-95). An American journalist, author, and artist. He was born at Monroe, Mich., but was educated at an academy, while living with his Judge James Lanman, at Norwich, 1835 to 1845 he was a clerk in New York. In the latter year he returned to Michigan and edited the *Monroe Gazette*. Afterward he was connected with papers in Cincinnati and New York, and finally joined the staff of the *National Intelligencer* in Washington, D. C. At various times he was librarian of the War Department, librarian of copyrights, private secretary to Daniel Webster when the latter was Secretary of State, examiner of depositories for the Southern States, and librarian successively of the Interior Department and of the House of Representatives. He prepared the first Congressional biographical directory. From 1871 to 1882 he was Secretary of the Japanese Legation, and while serving in this capacity published *Japanese in America* (1872) and *Leading Men of Japan* (1883), besides painting many landscapes. He made many sketching trips and early called attention to the beauty of the Saguenay River in a *Tour to the River Saguenay* (1848) and to western North Carolina in *Letters from the Alleghany Mountains* (1849). He was a prolific writer, responsible for some 32 volumes.

LANMAN, lán'man, CHARLES ROCKWELL (1850-). An American Sanskrit scholar. He was born at Norwich, Conn., in 1850; graduated at Yale College in 1871; remained there studying Sanskrit and linguistic science until 1873, when he received his Ph.D. degree; continued his Oriental studies at Berlin, Tübingen, and Leipzig, accepted a fellowship at Johns Hopkins University in 1876 and in 1880 was called to Harvard University as professor of Sanskrit. He published in 1880 an important work entitled *Noun-Inflection in the Veda*, and in 1884 and again in 1888 a *Sanskrit Reader with Vocabulary and Notes*. He was president of the American Philological Association for the year 1889-90, and edited vols. x-xiv of its

Transactions, and was vice president of the American Oriental Society from 1897 to 1907 and president in 1907. He projected the *Harvard Oriental Series* (1891), to which he contributed a translation of *Rāja-Qekhara's Karpūra-mañjarī* (1900), and for which he edited Whitney's translation of the *Atharva-Veda* (2 vols., 1905). Yale University gave him the degree of doctor of laws in 1902 and Aberdeen in 1906. In 1909 he published a useful article entitled "Pāli Book-Titles and their Brief Designations," which appeared in the *Proceedings of the American Academy of Arts and Sciences*, vol. xlv, pp. 661-707 (Boston).

LANMAN, JOSEPH (1811-74). An American naval officer, born in Norwich, Conn. He entered the navy in 1825, passed the midshipman grade in 1831, and was commissioned lieutenant in 1835, commander in 1855, and captain in 1861. In 1862 he was raised to the rank of commodore and was assigned to the North Atlantic squadron in the following year. During the two attacks on Fort Fisher he commanded the second division of the flotilla, leading the advance with the flagship *Minnesota*, and won high commendation from Admiral Porter. In 1867 he was made rear admiral and was put in charge of the Portsmouth Navy Yard. From 1869 to 1871 he commanded the South Atlantic squadron and was retired in 1872.

LAN'NER (OF. *lanier, lannier, laner, lenier*, Fr. *lanier*, sort of hawk). A small falcon of southern Europe and Asia. It is "noble," was formerly used for falconry, and was the sacred falcon of ancient Egypt. A very closely related form is the prairie falcon (*Falco mexicanus*) of the western United States, which is abundant on the plains.

LANNER, JOSEPH (1801-43). An Austrian composer of dance music, the creator of the modern Vienna waltz. He was born at Vienna, showed early a great talent for music, and became proficient in playing the violin and in composition without any instruction. He organized a quartet, in which the elder Strauss played the viola, and for which Lanner arranged potpourris from favorite operas and composed marches and other light music. Their performances in the public gardens of Vienna became very popular, and gradually their organization assumed the proportions of a large orchestra, which was in great demand at all important places of amusement, and finally at the court balls, where Lanner conducted the dance music alternately with Strauss. He gave the waltz its present extended form, developing it from the old-fashioned *ländler*, the genuine Vienna national dance, and may virtually be considered the founder of all modern dance music. His published compositions in that line, and his marches number 208 works. Consult Fritz Lange, *Josef Lanner und Johann Strauss* (Vienna, 1904).

LANNES, lán, JEAN, DUKE OF MONTEBELLO (1769-1809). A marshal of the first French Empire, born at Lectoure in the Department of Gers. He entered the army in 1792 and by 1795 commanded a brigade with the rank of colonel. The reorganization which then took place led to his discharge, but he followed Napoleon to Italy as a volunteer, and by his bravery and audacity at Millesimo, Mantua, and Arcole, won notice, and was made in 1797 brigadier general. He took part in the Egyptian expedition and

became general of division. On returning to France he rendered Napoleon service in the execution of the coup d'état of 18th Brumaire. In the second Italian campaign he won an important victory at Montebello (1800), from which he derived his title of Duke. He bore a principal share in the battle of Marengo and was made French plenipotentiary to Portugal (1801). In 1804 he was created a marshal of the Empire, and he distinguished himself at Austerlitz, at Jena, where he commanded the centre, at Eylau and Friedland. Being sent to Spain during the Spanish campaign, he defeated Castaños at Tudela, Nov. 23, 1808, and then besieged Saragossa. In 1809 he again fought against the Austrians and commanded the centre at Aspern (May 22), where he had both legs carried away by a cannon shot. He was removed to Vienna and died there May 31, 1809. He was interred in the Panthéon in Paris, but later his body was removed to the cemetery Père-Lachaise. He is considered as one of the most able marshals of Napoleon, among whose favorites he was included and by whom he was often intrusted with difficult tasks. Consult Perin, *Vie militaire de J. Lannes* (Paris, 1810), and Thoumas, *Le maréchal Lannes* (ib., 1891).

LANOLIN (from Lat. *lana*, wool + *oleum*, oil), or **ADEPS LANÆ HYDROSUS**. The purified fat of the wool of the sheep, mixed with not more than 30 per cent of water. It is a white or yellowish white, fatty substance, insoluble in water, not subject to decomposition, and not irritating to the skin. It is used as an emollient and also as a base for various ointments. Its chief constituents are cholesterin and the ethers of stearic, palmitic, oleic, valerianic, and other acids.

LA NOUE, *lâ nōw*, **FRANÇOIS DE**, called **BRAS DE FER** (1531-91). A celebrated Huguenot soldier, born at Nantes. He was educated in arms, and, after seeing service in Italy, was placed at the court of Henry II at the age of 18 and there became a Protestant through the influence of D'Andelot. After the Massacre of Vassy he joined the great Condé. He took part in the battle of Dreux, where Condé was made prisoner, and assisted Coligny in conducting the retreat. He afterward served under various Huguenot leaders and gained a great reputation for bravery, prudence, and humanity. In 1569 he was captured at Moncontour, but was soon after exchanged. In 1570 he lost his left arm at the siege of Fontenay-le-Comte and had its place supplied with an iron one—hence his sobriquet. In 1571 La Noue went to the assistance of the Dutch Protestants and was captured by Alva at Mons and sent a prisoner to Charles IX of France. He was kindly treated by the King. Escaping before the Massacre of St. Bartholomew, La Noue rallied the Huguenots after that fatal event and fortified La Rochelle. After the Peace of Bergerac put an end to the religious war for the time, La Noue commanded in Holland (1578). In 1580, however, he was again captured by the Spaniards and remained for five years a prisoner in the castle of Limburg, where he composed his *Discours politiques et militaires* (Basel, 1587). In 1586 he aided in the defense of Geneva against the Duke of Savoy, and a little later he was permitted to return to his own country. He immediately resumed command in the Huguenot army under Henry of Navarre and rendered brilliant service at the siege of Paris, at Arques,

and at Ivry. He was mortally wounded at the siege of Lamballe in Brittany and died a few days later at Moncontour, Aug. 4, 1591. His *Correspondance* was published at Paris (1854). Consult Vinien, *Les héros de la réforme: Fr. de la Noue* (Paris, 1875), and Hauser, *François de La Noue* (ib., 1892).

LANSDALE, *lânzd'al*. A borough in Montgomery Co., Pa., 20 miles northwest of Philadelphia, on the Philadelphia and Reading Railroad (Map: Pennsylvania, L 7). There are important industrial interests, including agricultural implement works, a canning factory, foundries, brickyards, a silk mill, and manufactories of cigars, stoves, shirts, rope, iron drain pipe, and glue. The electric-light plant is owned by the borough. Pop., 1900, 2754; 1910, 3551.

LANS'DELL, **HENRY** (1841-). An English clergyman, editor, and traveler, born at Tenterden, Kent. He was educated by his father and at St. John's (Divinity) College, Highbury, was ordained in 1867, and the following year was made a curate at Greenwich. He was stationed successively at Blackheath, Eltham, and Plumstead from 1885 until 1891, with intermissions of travel. Between 1870 and 1904 he traveled in every country of Europe and Asia, five countries of Africa, and across America. His journeys were undertaken largely for the purpose of visiting missionary stations (in 1888-90 he visited 170 stations), but he also inspected foreign prisons and made collections of plants. He became a fellow of the Royal Geographical Society. He was founder and editor (1875-86) of the *Clergyman's Magazine* and the author of *Through Siberia* (1882), *Through Central-Asia* (1887), *Chinese Central Asia* (1893), *The Sacred Tenth* (1906), *The Tithe in Scripture* (1908).

LANSDOWNE. A borough in Delaware Co., Pa., 5 miles southwest of Philadelphia, on the Pennsylvania Railroad. The noteworthy features include the borough hall, new high school, public library, Twentieth Century Club, and St. Philomena and Friends schools. It is essentially a residential suburb of Philadelphia, but has some manufactures, particularly of steel. Pop., 1900, 2630; 1910, 4066.

LANS'DOWNE, **GEORGE GRANVILLE** (or **GREENVILLE**), **LORD** (1667-1735). An English poet and dramatist. He went to school in France, but graduated at Trinity College, Cambridge. Born into a family conspicuous for loyalty to the Stuart kings, he dedicated his earliest verse to the Duchess of York, afterward the wife of James II. During the ascendancy of the Whig party he found consolation in the society of greater poets—Dryden, Pope, Addison, Wycherley—and in writing successfully for the stage, witness the opera, *The British Enchanters* (presented 1706, published 1710), the tragedy *Herack Love* (presented and published 1698), and *She Gallants*, later entitled *Once a Lover and Always a Lover* (presented 1696; published 1696). By the death of an elder brother he became the head of his family, was created a peer of the realm, and taken into the Privy Council of Queen Anne (1712); but three years later, under George I, he was suspected of Jacobite plotting and sent to the Tower for two years. In mature manhood Granville was a consistent Tory, not a rabid Jacobite; but, fearful of further imprisonment and desirous of economizing, he withdrew to Paris (1722), where he remained for 10 years, engaged chiefly in

writing elegant prose and revising his inferior poetry. On his return to England he spent the remainder of his life in retirement, a polished, generous, lovable gentleman, patron of the poets and the last Lord Lansdowne. His *Complete Works* were published in 1732

LANDSDOWNE, HENRY CHARLES KEITH PETTY-FITZMAURICE, fifth MARQUIS OF (1845–) A British statesman. The eldest son of the fourth Marquis, he succeeded to the ancient family titles and estates on his father's death in 1866. After studying at Eton and at Balliol College, Oxford, and serving as a captain of yeomanry cavalry, he entered early on a political career as a Liberal. From 1868 to 1872 he was a Lord of the Treasury and from 1872 to 1874 Undersecretary of State for War. In 1880 he received the appointment of Undersecretary of State for India from Mr Gladstone, but resigned shortly afterward as a protest against the government's Irish Bill on Compensation for Disturbance. In 1883–88 he was Governor-General of Canada, the period was marked by the completion of the Canadian Pacific Railway, an amicable settlement of the North American fisheries dispute, and by the suppression of Riel's Rebellion. From Canada he proceeded as Viceroy to India, where he remained until 1893. In 1895 he entered the Marquis of Salisbury's cabinet as Secretary of State for War, and in 1900 was appointed Secretary of State for Foreign Affairs. He retired in December, 1905. His administration was signalized by the alliance with Japan, by treaties of 1902 and 1905, and the establishment of intimate relations with France by the agreement of April, 1904. For several years he was leader of the Unionist party in the House of Lords, and in 1906 he led the attack in that House against the Liberal Education Bill. In 1909 he was the author of the famous motion which called for the submission to the people of the Lloyd-George (qv) budget of that year. In May, 1915, Lord Lansdowne became Minister without portfolio in the coalition cabinet formed by Asquith.

LANDSDOWNE, HENRY PETTY-FITZMAURICE, third MARQUIS OF (1780–1863). An English statesman. He was born at Lansdowne House, London, July 2, 1780, and was a younger son of Earl Shelburne, Premier of George III, who received the coronet of Marquis in 1784. Lord Henry Petty was sent to Westminster School and afterward to Edinburgh. He took his degree at Trinity College, Cambridge, in 1801, and, when barely of age, entered Parliament as member for Calne. He turned his attention to finance and on Pitt's death became, at the age of 25, Chancellor of the Exchequer in the administration of Lord Grenville. In 1809 he succeeded his half brother in the marquissate, became one of the heads of the Liberal party in the House of Lords, and during a long opposition was a consistent advocate of parliamentary reform, the abolition of slavery, Catholic emancipation, and free trade, all of which he lived to see triumphant. He was Home Secretary in 1827, and when the Whigs, after their long exclusion from power, came into office with Earl Grey at their head, Lansdowne became Lord President of the Council, which post he held with a brief interval from November, 1830, to September, 1841, resuming it in 1846, after the fall of the Peel ministry, and again filling it until 1852. He then formally bade farewell to

office and resigned the leadership of the House of Lords, but consented to hold a seat without office in the Aberdeen cabinet and again in the first administration of Lord Palmerston. After the death of the Duke of Wellington he became the patriarch of the Upper House and the personal friend and adviser of the Queen. He had a keen regard and a cultivated taste for literature and was a generous patron of men of letters. He died Jan 31, 1863.

LANDSDOWNE, WILLIAM PETTY, MARQUIS OF. See SHELburne

LANSFORD. A borough in Carbon Co., Pa., 35 miles (direct) north of Reading, on the Lehigh and New England Railroad (Map: Pennsylvania, K 5). It has extensive coal-mining interests, being situated in the productive anthracite fields of the State, and manufactures of silk knit goods, shirts, garage supplies, etc. About a mile from the borough is an immense electric-power plant. Settled in 1845, Lansford was incorporated in 1876, the charter of that year now operating to provide for a government vested in a burgess, chosen every three years, and a council, which controls appointments to the most of the important administrative offices. Pop., 1900, 4888, 1910, 8321.

LANSING. The capital of the State of Michigan, in Ingham County, at the confluence of the Grand and Cedar rivers, 88 miles northwest of Detroit and 64 miles east by south of Grand Rapids, on the Pere Marquette, the Grand Trunk, the Lake Shore and Michigan Southern, the Michigan United Traction, and the Michigan Central railroads (Map: Michigan, E 6). The rivers are here spanned by several bridges. Lansing occupies an elevated site on a plateau rising from the water level and is laid out with broad and well-shaded streets. The capitol, built in 1872–79, at a cost of \$1,500,000, stands on an eminence in a park of 12 acres near the centre of the city. The State Library contains about 105,000 volumes. Other important buildings are the city hall, the city hospital, high school, Carnegie library, Government building, the State School for the Blind, State Industrial School for Boys, and, in the suburbs, the State Agricultural College, with 60 buildings and a farm of about 684 acres. Among the recreation grounds are Pine Lake and Waverly Park, both summer resorts, and Moores, Potters, and five other parks. A United States Weather Bureau Station is maintained here. The city has abundant water power from the two rivers, the Grand River having a fall of 18 feet. There are more than 200 manufacturing concerns, employing about 11,000 persons, and whose annual product is valued at \$30,000,000. The manufactures include agricultural implements, automobiles, traction engines, gas and gasoline engines, building materials, malleable castings, furniture, wagons, silk and woolen goods, store fixtures, electric supplies, cut glass, candy, ice cream, knit goods, cigars, cement blocks, wheelbarrows, automobile accessories, etc. The government, under a charter of 1897, is vested in a mayor, elected for two years, a unicameral council, and administrative officials, the majority of whom are appointed by the executive, subject to the consent of the council. The clerk, treasurer, and assessors are chosen by popular election. The city owns and operates the water works, supplied from artesian wells and valued at \$300,000, and the electric-light plant. Settled in 1837, Lansing was laid out for the State

capital in 1847, when a single family occupied the site. It was chartered as a city in 1859. Pop., 1900, 16,485; 1910, 31,229; 1914 (U. S. est.). 37 512

LANSING, JOHN (1754-1829). An American jurist, born at Albany, N. Y. He was privately educated and studied law with Robert Yates (q.v.) in his native city and with James Duane in New York, where he was established in practice at the outbreak of the Revolution. During the war he served for about a year (1776-77) as military secretary to Gen. Philip Schuyler. He served in the New York State Assembly in 1780-86 and was also a member of the Continental Congress in 1784-88. In 1786 he was named by the council of appointment mayor of Albany and succeeded John Jay as a member of the Massachusetts-New York boundary commission. In March, 1787, while still a member of Congress, he was appointed, with Yates and Hamilton, to represent New York in the Constitutional Convention, but left it with the first named, after two months' participation, on the grounds that they had not been delegated to form a new Constitution, but only to amend the Articles of Confederation. In June, 1788, with George Clinton and Melancthon Smith (q.v.), he led the opposition to the ratification of the Constitution by New York at the Poughkeepsie Convention. After serving on the New York-Vermont boundary commission, he was, in September, 1790, named a justice of the New York Supreme Court. He succeeded Yates as Chief Justice in 1798 and in 1801 succeeded Robert R. Livingston (q.v.) as Chancellor, which position he retained until 1814, when he in turn was succeeded by James Kent (q.v.). He declined the Anti-Federalist nomination for Governor of New York in 1804. He disappeared mysteriously in New York City on Dec. 12, 1829, after having left his hotel to post a letter on a dock near by.

LANSING, ROBERT (1864-). An American lawyer and authority on international law. Born at Watertown, N. Y., he graduated from Amherst College in 1886 and was admitted to the bar in 1889. From then until 1907 he was a member of the law firm of Lansing & Lansing at Watertown. He served as associate counsel for the United States in the Bering Sea Arbitration in 1892-93, as counsel for the United States Bering Sea Claims Commission in 1896-97, as solicitor for the government before the Alaskan Boundary Tribunal in 1903, as counsel for the North Atlantic Fisheries in the Arbitration at The Hague in 1909-10, and as agent of the United States in the American and British Claims Arbitration in 1912-14. In 1914 Lansing was appointed by President Wilson counselor to the State Department, and in June, 1915, on Mr. Bryan's resignation, he became acting Secretary. He aided greatly in preparing important notes to Great Britain and Germany on American neutral rights. He became associate editor of the *American Journal of International Law*, and with Gary M. Jones is author of *Government: Its Origin, Growth, and Form in the United States* (1902).

LANSINGBURG. A former village in Rensselaer Co., N. Y., annexed to the city of Troy (q.v.) on Jan. 1, 1901.

LANSING MAN. The name given to a partially dismembered human skeleton found in 1902 under 20 feet of earth near the Missouri River, at Lansing, Kans. There was a great

deal of discussion at the time as to the antiquity of the find, but it is now generally agreed that it does not represent an ancient type of man. The skull is in the United States National Museum. Consult Alès Hrdlička, "Skeletal Remains Suggesting or Attributed to Early Man in North America," in *Bureau of American Ethnology, Bulletin*, No. 33 (Washington, 1907).

LANSON, LÂN'SON', GUSTAVE (1857-). A French literary critic, born at Orléans. He was educated at the Orléans and Charlemagne lycées, and after completing the work of the École Normale Supérieure received the degree of doctor of letters. He became professor of rhetoric at Michelet, Charlemagne, and Louis le Grand lycées, and in 1900 was appointed to a chair of French literature at the Sorbonne. His method, one of historical and bibliographical research, has been adopted in several universities in the United States, where he conducted classes at one time. He became an Officer of the Legion of Honor. His writings include: *Nivelle de la chaussée et la comédie larmoyante* (1887); *Bossuet* (1895); *Histoire de la littérature française* (1894, 11th ed., 1909); *Manuel bibliographique de la littérature française, 1500-1900* (4 vols., 1910-12), *Boulevard, Corneille, Voltaire*, in the "Great Writers Series," for Hachette. He edited *Les lettres philosophiques de Voltaire* (1908).

LANSQUENET, lãns'ke-nèt (Fr., from Ger. *Landsknecht*, foot soldier). A game of cards, played with six full packs, and so called from the fifteenth-century soldiers by whom it was introduced. The banker announces his bet, of which fractional parts are wagered by the other players, or the whole amount may be bet by a single player. The banker draws a card for himself and one for his adversaries and then deals until a card like his own or that of his opponents is turned up. In the former case the dealer wins, and also when the second card dealt matches the first.

LANSYER, lãn'syá', MAURICE EMMANUEL (1835-83). A French landscape painter, born at Bouin in La Vendée, Brittany. He studied architecture with Viollet-le-Duc, but gave it up to study painting, first with Courbet, and afterward with Harpignies, who taught him landscape. His subjects are mostly taken from Brittany and the neighborhood of Bordeaux, and his later work shows the influence of his early architectural training. Among his paintings are: "September Morning at Douarnenez", "Promenade in Autumn"; "The Dunes of Donville"; "Nôtre Dame de Paris"; "Château de Pierrefonds," at the Luxembourg; "Mont St. Michel." His work is distinguished for fine feeling and brilliant atmosphere.

LANT, or LANCE. A fish. See SAND EEL.

LANTANA (Neo-Lat., coined by Linnæus). A genus of odoriferous, chiefly tropical shrubs, belonging to the family Verbenacæ. The species contain a stimulant essential oil. *Lantana pseudothea*, or *Lippia pseudothea*, is used in Brazil as a substitute for tea. *Lantana camara* and *Lantana mista* are natives of tropical America. *Lantana camara* has been introduced as an ornamental hedge plant into many tropical countries, where it has spread until it has become very troublesome, as in Ceylon, parts of India and Hawaii. In countries where frost holds them in check they are very ornamental plants. They are not hardy north of the Gulf States.

LANTE, lãn'tã, VULLA. Two villas of this

LANTERN FISHES

1. *IPNOPS MURRAYI*, Gulf of Mexico, collected in 955 fathoms.
2. *PHOTONECTES GRACILIS*, collected off Martinique, in 472 fathoms.
3. *SYNODUS FOETENS*, LIZARD FISH, Coast of South Carolina.
4. *TARLETONBEANIA TENUA*.
5. *BATHYPTEROIS QUADRIFILIS*, collected off St. Vincent, W. I.
6. *MALACOSTEUS NIGER*, North Atlantic.

7. *CHAULIODUS SLOANEI*, VIPER-FISH, North Atlantic.
8. *ALPHEUSIUS ANTERIOR*, OCEANIC LANTERN FISH, North Atlantic.
9. *ALPHEUSIUS FEROX*, LANCET FISH, North Atlantic.
10. *CETOMIMUS GILLII*, collected by the Albatross in N. lat. 39° 38', W. long. 71° 24' in 1043 fathoms.

name exist—one in Rome, on the Trastevere side of the Tiber, northwest of the great Villa Corsini, the other at Bagnaia, near Viterbo, about 40 miles north of Rome. The latter is the one generally referred to, and, although one of the smallest of the important villas of the Renaissance, it is regarded with justice as a perfect example of the type. It was built in 1477 for Cardinal Riario, but was in 1566 and thereafter remodeled for the Cardinals Gambara and Montalto from designs by the great architect Vignola, and 100 years later was given by Pope Alexander VII to the Lante family, who have since held it. The gardens are exceptionally beautiful; while they cover less than four acres, with a total length of 775 feet and a width of 245 feet, they are laid out with such skill that they nowhere appear cramped or insignificant. They occupy a wooded slope, forming four terraces; the two *casini*, or dwellings, occupy the second of these, and the lower, or first, terrace in front of them is laid out in parterres, with a fine sculptured fountain in the centre. The upper levels are occupied by plantations of trees, cascades, and summer houses or loggias, all of admirable design. The villa is well preserved and is one of the most charming examples of Italian Renaissance landscape architecture.

LANTERN (from Lat. *lanterna*, *laterna*, from Gk. *λαμπτήρ*, *lamptēr*, torch, from *λάμπειν*, *lamphein*, to shine). In architecture, an ornamental structure raised above adjoining roofs, etc., to give light and ventilation by openings in its sides. In Gothic architecture, a *lantern tower* is frequently placed over the crossing of cruciform churches, its vault being at a considerable height, and the light admitted by windows in the sides, as in the famous example over the crossing of Saint-Ouen at Rouen, and the equally celebrated octagon of Ely Cathedral. The usual English lantern is a lofty square tower over the crossing; the "Bell Harry" tower of Canterbury, and the central towers of York, Lincoln, and Gloucester cathedrals and of many other large churches, are examples. So also the *Cimborio* of Burgos Cathedral in Spain.

The small circular edicule which crowns most modern domes is called a lantern. The earliest of these is that on the dome of the cathedral of Florence; those of St. Peter's, Rome, and St. Paul's, London, are also famous.

LANTERN FISH. A name given to soft-rayed, pelagic fishes, of a provisional order, *Inioi*, in reference to the fact that most of them possess phosphorescent, luminous organs, required by their residence in the dark oceanic abysses. Their general structure is that of isospondylous fishes, which have become degraded or degenerate by an unfavorable environment. Their forms are often most unusual and grotesque, great heads with enormous eyes and large mouths, often studded with formidable teeth, being united with slender and fragile bodies. The bones are weakly ossified, the mesacoracoid is lacking (an eel-like characteristic), and the connection of the shoulder girdle with the cranium is imperfect. Ichthyologists differ as to whether or not the group should be separated from the Isospondyli, and also whether its component parts should be regarded as families or as genera. Jordan and Evermann take the former view and make the first family that of the lizard fishes (*Synodontidae*), including a group of tropical predacious fishes inhabiting sandy bottoms not far from shore, often brightly

colored and lizard-like in form, whence the common name "lagarto" in Spanish America. (See **LIZARD FISH**.) The other families are almost all inhabitants of the abysses, and the species are largely known only by one or a few specimens. The species illustrated upon the accompanying plate are representative of the range of variety in the group. Thus, *Bathypterois quadrifilis*, remarkable for the four long, whitish filaments of its fins (tactile organs of extreme sensibility), is a little fish, nearly black, and dwells in the tropical Atlantic at a depth of 500 to 800 fathoms. Another small, dark-colored bottom fish ($5\frac{1}{2}$ inches) is *Ipnops murrayi*, found widely distributed at a depth of about 2,000 fathoms, which is provided with an extraordinary sensory apparatus. It is eyeless, but the whole top of the flattened head consists of a pair of large, transparent membrane bones, which cover a peculiar divided organ, one-half lying on each side of the median line of the head. This at first was supposed to be a luminous organ, but Mosely has discovered that it represents the lost eyes, each half of the organ having a flattened cornea along the dividing line, and a large retina of complicated structure, adapted to produce an image and to receive especial luminous rays. Referring especially to this fish, Alexander Agassiz has stated that while in some cases the eyes of these migrants from the shores and the surface to the black depths have not been specially modified, in others there have been modifications of a luminous mucous membrane, leading on the one hand to phosphorescent organs more or less specialized, or on the other to such remarkable structures as the eyes of *Ipnops*, intermediate between true eyes and specialized phosphorescent plates. Where the fishes have become blind, the integument, lateral line, and various tactile appendages acquire extraordinary sensibility, as in cave animals (q.v.). The curious miniature of a whale illustrated in Fig. 9 of the Plate is one of the two known species of the genus *Cetomimus*, less than 6 inches long and living at great depths. For an account of Fig. 8, see **LANCET FISH**.

Lantern Fishes Proper. The foregoing species do not possess light-giving organs to any considerable degree, if at all; but most of the group are provided with phosphorescent lanterns. The family *Myctophidae* contains about 100 species, all of small size, carnivorous, and very widely distributed in the open seas. They sometimes come to the surface at night or in stormy weather, but ordinarily dwell in the depths. All have luminous spots or photophores more or less regularly placed along the sides of the body, while larger light-giving glands are lodged in the head, or near the tail, or both. One of the most vivid light bearers is a steel-blue Pacific coast species (*Tarletonbeania temia*), whose light spots are shown in Fig. 4. It also has large functional eyes and crenulated scales, but no lateral line. The name "viper fishes" has been given to the genus represented by a species (*Chauliodus sloanei*), about 12 inches long, discovered on the Banks of Newfoundland. It has both eyes and photophores and also a tactile ray, extending from the dorsal fin. It is also an inhabitant of the North Pacific. Somewhat similar, and highly endowed with luminous organs, is *Photoneustes gracilis*, known only from a single specimen 7 inches long, taken off Martinique, 472 fathoms below the surface. Even more extraordinary is the small black fish

(*Malacoosteus niger*) represented in Fig. 10. It lives in very deep water, yet has large, useful eyes, as well as two "headlights" in the form of strong luminous organs near the eyes, and many photophores on the body. The curious way in which the lower jaw is attached to the skull is unique among fishes. This connection is made by a cylindrical muscular band, which Gunther believes to be contractile, "serving to give the extremity of the mandible power of resistance when the fish has seized its prey," as without such a contrivance so long and slender a bone as the jaw would be broken by the victim's struggles. *Argyropelecus* (Fig. 7) represents a group of fishes, only 2 or 3 inches long, that come to the surface at night and during the day descend into the depths.

Consult the general authorities mentioned under FISH, and especially Goode and Bean, *Oceanic Ichthyology* (Cambridge, 1896), where complete references to the literature relating to deep-sea fishes will be found.

See DEEP-SEA EXPLORATION for the methods by which many of these fishes have been obtained; and LUMINOSITY OF ANIMALS for a more particular account of their light-giving organs.

LANTERN FLY. An insect of the extensive family Fulgoridæ. Some of these insects are among the largest known, but others are quite small. Some look very much like butterflies or moths, while still others greatly resemble Neuroptera. The family has received its common name because of the peculiarly enlarged, misshapen proboscis of some of the tropical forms, which may equal the length of the body and is said by the natives of the tropics to be luminescent—a statement disputed by scientific observers. Many of the species are beautifully and brilliantly colored. Some of them secrete a valuable white wax, in some cases in masses far exceeding the length of the insect. This is collected by the Chinese from a local species and made into candles. All the lantern flies are herbivorous. Some of the exotic species seriously injure crops, but none in the United States does any appreciable damage. They are common in rank herbage and among the reeds of fresh and salt water swamps, and are usually protectively colored. Several forms that are green in summer turn brown with the reeds in the autumn. A pale-green species (*Ormenis septentrionalis*) occurs on the wild grapevine. *Scolops* is a very common, widely distributed North American genus, with a long proboscis like that of the exotic species. The most injurious of the North American species is *Chlorochroa compta*, which feeds on the leaves of corn and the sugar beet in parts of the West.

LANTERN SHELL. A bivalve mollusk of the genus *Anatina*. The shell is oblong, swollen thin, often inequivalve. The species occur in India, the Philippines, New Zealand, and on the west coast of America.

LANTHANUM, lán'thà-nùm. A metallic chemical element, first separated from its concomitant rare-earth elements by Mosander in 1839. It is usually obtained from the mineral cerite, but occurs also in lanthanite, monazite, orthite, and other minerals. The metal itself is best prepared from lanthanum chloride by electrolysis in the absence of water. Originally it was obtained by Mosander by heating lanthanum chloride with metallic potassium. Lanthanum (symbol, La; atomic weight, 139.0) is more readily attacked by atmospheric moisture than

the other metals of the rare-earth group, and hot water is energetically decomposed by it. Its specific gravity is between 6.15 and 6.19, and it melts at 810° C. (1490° F.). First among the lanthanum compounds may be mentioned the oxide, La₂O₃, which exists in two modifications—a lighter crystalline one (specific gravity, 5.3) and a heavier amorphous one (specific gravity, 5.9 to 6.5); the latter is readily changed to the hydroxide, La (OH)₃, by the direct action of water. The chloride of lanthanum, LaCl₃, is a colorless salt very soluble in both water and alcohol, it forms double salts with the chlorides of gold and platinum. Lanthanum nitrate, La(NO₃)₃·6H₂O, is used for stamping incandescent gas mantles, the mark of which is a brown color on the burnt mantle. . . . oxalate, La₂(C₂O₄)₃, which is usually more or less hydrated, appears as a white precipitate that is somewhat more soluble in aqueous acids than the oxalates of the other rare earths. Lanthanum, further, forms a hydride, a carbide, and a nitride. The hydride is formed by the direct action of hydrogen upon the metal at 240° C. (464° F.). The carbide, LaC₂, is formed by strongly heating lanthanum oxide with carbon; water decomposes it, yielding a mixture of acetylene, ethylene, and methane. The nitride, LaN, may be prepared by passing nitrogen gas over metallic lanthanum at a red heat, water decomposes it, yielding ammonia (qv).

LANUGA. See HAIR.

LANUVIUM, or, later, **LANIVIVM**. An old and important city of Latium near the Appian Way, about 19 miles south of Rome, on a hill commanding an extensive view of the sea. It was probably colonized from Alba Longa. It first became important in the fifth century B.C., by the part it took against Rome as one of the 30 cities of the Latin League. Afterward, in the wars between Rome and the Æqui and the Volsci, it sided with Rome. In the great Latin war (340-338 B.C.) it took part against Rome, but was treated leniently by the victorious Romans, who, instead of punishing the inhabitants, made them Roman citizens. After the time of Cicero it was important only as the chief seat of the worship of Juno Sospita; there was at Lanuvium a very rich temple of that goddess. It was the birthplace of Antoninus Pius and of Milo, the C. Julius; and near it was born the The small town of Civitá Lavinia occupies part of the site of the old Lanuvium, of which a few walls and pavements remain.

LAN'ZA, GAETANO (1848—). An American mathematician, engineer, and educator, born in Boston, Mass. He was educated at the University of Virginia, was an instructor there for two years and from 1872 to 1911 was connected with Massachusetts Institute of Technology—after 1875 as professor of theoretical and applied mechanics and after 1883 as head of the department of mechanical engineering. In 1911 he became professor emeritus. At various times he was active as a consulting engineer. In 1906-11 he served as president of the Mathematical and Physical Club, and he held membership in a large number of American and foreign mathematical and engineering societies. Besides numerous papers and pamphlets, his writings include *Applied Mechanics* (1885; 9th ed., 1905) and *Dynamics of Machinery* (1911).

LANZA, lán'tsà, GIOVANNI (1815-82). An Italian statesman, born at Vignale in Piedmont.

LAOCOÖN
FROM THE GROUP IN THE VATICAN MUSEUM, ROME

He studied medicine at Turin and practiced his profession at Vignale for several years, early joined the Agrarian Society, founded the *Opinione*, and in 1848 was elected to the Sardinian Parliament, where, as a prominent member of the Left Centre, he was chiefly interested in finance and other economic subjects. He was Minister of Education under Cavour (1855-58) and Minister of Finance up to the resignation of Cavour after Villafranca, in July, 1859. After serving as President of the House of Deputies (1860), he acted for a year (1864-65) as Minister of the Interior. He returned to the legislative chamber and served there (in 1867 and 1868 again as President) until 1869, when, having defeated the ministry of Menabrea, he became head of the cabinet and Minister of the Interior. Under his administration, which carried through important educational reforms, the seat of the government was transferred to Rome. He resigned in 1873, owing to a coalition of the Left and the Right against his financial policy. He was a deputy up to the time of his death. Consult Tavallini, *Lanza ed i suoi tempi* (Turin, 1887).

LANZAROTE, lán'tha-rō'tá. One of the Canary Islands (q.v.), the most easterly of the group (Map Spain, G 4). Area, 325 square miles. Pop., 1900, 17,550, 1910, 19,261. It is very irregular in outline and of volcanic origin; its surface is rough and mountainous. It has some agricultural products. The island has no good harbor. Its capital, Arrecife, had a population of 3764 in 1910.

LANZI, lán'tsè, LUIGI (1732-1810). A celebrated Italian antiquary and art critic, born at Monte dell' Olmo, near Macerata. He entered the Order of the Jesuits and resided at Rome and afterward at Florence, where he became president of the Accademia della Crusca. In 1782 he published at Florence his *Descrizione della galleria di Firenze*. His great works are his *Saggio di lingua etrusca* (1789), in which he maintains the influence of Greece upon Etruscan civilization, and his *Storia pittorica d'Italia*, etc. (1792 and 1809). This latter work was translated into English by Thomas Roscoe (1847). He is the author also of several poems, works on Etruscan vases, sculptures, etc. His posthumous works were published in two volumes at Florence in 1817. Consult. Boni, *Elogio dell' abate L. Lanzi* (Pisa, 1816); Giulio Natali, "Nel primo centenario dalla morte di Luigi Lanzi," in *Real deputazione di storia patria per le provincie delle Marche, atti e memorie*, vol. vi (N. S., Ancona, 1911).

LAOAG, lá-wág'. The capital of the Province of Ilocos Norte (q.v.), Philippines (Map: Philippine Islands, C 1). It is situated in a fertile plain in the northwestern part of Luzon, stretching for several miles along the right bank of the Laoag or Pagsán River, 4 miles from the sea. Its houses are for the most part well built, especially the town hall and the church; it has a telegraph station and is the projected terminus of a railroad from Manila. It exports rice, corn, sugar, and tobacco. Pop., 1903, 34,454. The Pueblo of San Nicolás (pop., 10,880) was added in 1903 after the census.

LAOCIUS, lá-ō'shí-ús. See LAOTSE.

LAOCOÖN, lá-ōk'ō-on (Lat., from Gk. Λαοκόων, *Laokoön*). According to classic legend, a brother of Anchises (q.v.), priest of Apollo in Troy, who in vain warned his countrymen against receiving within their walls the wooden

horse. According to the version given by Vergil in the *Æneid* (11, 199 ff.), two serpents then came swimming from Tenedos, attacked the two sons of Laocoön, and, when the father came to their help, destroyed him also. There are many traces of earlier versions: in one only the sons are killed, and the serpents are sent by Apollo as a warning to Æneas; in another destruction falls on the father and one son. The story is not noticed in the Homeric poems, but was told in the later Greek epic and was the subject of a tragedy by Sophocles. It acquires a peculiar interest from being the subject of one of the best-known works of ancient sculpture still in existence—a group discovered in 1506 at Rome, in the Sette Sale, on the side of the Esquiline Hill, and purchased by Pope Julius II for the Vatican. The whole treatment of the subject, the anatomical accuracy of the figures, and the representation both of bodily pain and of passion, have secured for the group a higher place than it properly merits. According to Pliny, a Laocoön was the work of the Rhodian artists Agesander, Polydorus, and Athenodorus. Until lately archæologists differed about the date of the Extant group. Its date, however, has been established by the discovery in Rhodes of a statue of a priest of Athena whose date is 42 B.C. This statue bears the signature of Athenodorus, the son of A. . . . re is little reason to doubt that . . . who later on (22-21 B.C.) appears as priest together with his brother Agesander, was with the latter one of the sculptors of the Extant Laocoön group. Thus the statue antedates Vergil's narrative in the *Æneid*. In spite of its wonderful execution this group is not an example of the best Greek work, but belongs to a period of low artistic ideals.

Bibliography. Lessing, *Laokoon oder über die Grenzen der Malerei und Poesie*, especially in the second edition by Blümner (Berlin, 1880), where the earlier literature is cited; also Robert, *Bild und Lied* (ib., 1881); Kekule, *Zur Deutung und Zeitbestimmung des Laokoon* (Stuttgart, 1883); Fürster, in the *Verhandlungen der vorzüglichsten Philologenversammlung zu Götting* (Leipzig, 1890); J. E. Sandys, *History of Classical Scholarship*, vol. iii (Cambridge, 1908); E. A. Gardner, *Handbook of Greek Sculpture* (London, 1911); H. H. Powers, *Message of Greek Art* (New York, 1913).

LAOD'AMAS (Lat., from Gk. Λαοδάμας). 1. The son of the Phæacian King Alcinoüs and Arete. 2. King of Thebes and son of Eteocles. The expedition of the Epigoni against Thebes took place in his reign, and he was slain by Alcæon, after having killed their leader, Ægialeüs. See EPIGONI; ETEOCLES AND POLYNICES; SEVEN AGAINST THEBES.

LA'ODAMI'A (Lat., from Gk. Λαοδάμεια, *Laodameia*). 1. The daughter of Acastus and Astydamia. Learning of the death of her husband, Protesilaüs (q.v.), in the Trojan War, she consoled herself by keeping constantly with her a wooden image of the hero; and when her father caused it to be burned in order to turn her mind from her sorrow, she threw herself into the fire. According to another tradition, Protesilaüs was restored to life for three hours, and Laodamia accompanied him on his return to the lower world. The story is used by Wordsworth in his poem *Laodamia*. 2. The daughter of Bellerophon and mother by Zeus of Sarpedon.

LAODICE, lá-ōd'ī-sē (Lat., from Gk. Λαοδίκη,

Laodikea). 1. A nymph, and the mother of Niobe (q.v.) by Phoroneus. 2. The daughter of Priam and Hecuba and wife of Helicaon. 3. In Homer, the daughter of Agamemnon and Clytemnestra, called Electra by the tragic poets. See also LAODICEA.

LAODICEA, lă'ôd-i-sē'a (Lat., from Gk. *Λαοδικεα*, *Laodikeia*). The name of several Greek cities in the East, built by the Seleucidæ (q.v.), who ruled the Kingdom of Syria after the death of Alexander the Great. Five of these were named after Laodice, wife of Seleucus Nicator, and one after the wife of Antiochus Theos. Three are of some importance—two in Asia Minor, and one in Syria. Most important was *Laodicea ad Lycum*, situated in southwestern Asia Minor, commonly reckoned in Phrygia, though sometimes included in Caria or Lydia. It was situated about 11 miles west of Colossæ, on the great trade route from the Euphrates and the interior through Apamea (q.v.), at the junction of several important roads from the coast and interior, and was at one time called Diospolis, but was renamed by Antiochus Theos (260 B.C.), who reestablished and fortified the town as a centre of Greek influence. By reason of its favorable position for trade and the fertility of the adjacent country, it soon became a large and wealthy city, and, in spite of the disasters of the Mithridatic wars, it was a chief seat of Roman influence under the Empire. It seems to have early become a Christian centre, as it is mentioned in the Epistle to the Colossians (ii. 1) and is one of the seven churches addressed in the Apocalypse.

The town was a banking centre and famous for its manufacture of cloth from the glossy black wool of the district, but it likewise had obtained great renown for its school of medicine connected with the temple of Men Karu, who was identified with the Greek Asclepius. It changed hands more than once in the wars between the Byzantine Empire and the Turks and gradually fell into decay. The site, known as Eski-hissar, near Gondschei, is deserted, but contains a number of fine ruins of the Roman period, including a well-preserved stadium and two theatres. The town was supplied with water by an aqueduct of which many arches remain. Consult: Sir W. M. Ramsay, *Cities and Bishoprics of Phrygia*, vol. 1 (Oxford, 1895); id., *Letters to the Seven Churches* (New York, 1905); Baedeker, *Konstantinopel, Balkanstaaten, Kleinasien, Archipel, Cypern* (2d ed., Leipzig, 1914).

Another town, founded by Seleucus Nicator, in the territory of Lycaonia, was situated on the highroad from Ephesus to the East. The town was known as *Laodicea Combusta* (Gk. *Λαοδικεα κατακεκαυμένη*), probably because of an early destruction by fire, though Strabo says the name was due to the volcanic rocks in the neighborhood; modern travelers deny that there is any such formation. The modern Sorgan Ladik probably occupies the site of this city, and in the neighborhood are extensive architectural remains.

The third city, also founded by Seleucus, was *Laodicea ad Mare*, in northern Syria, now Latakia (q.v.).

LAODICEA, COUNCIL OF. A council held during the fourth century, but whether towards the beginning, middle, or end has been earnestly debated without being determined. It consisted of 32 bishops from different provinces of Asia and embodied its decisions in 60 canons, relating

to matters of ritual, church order, dignity, precedence, discipline, morals, faith, and heresy. The most important of them is the last, giving a list of the books of Scripture received at that time as canonical, which does not contain the Apocrypha or Revelation. They may be found in Hardouin, *Conciliorum Collectio*, vol. 1 (Paris, 1715). Consult Hefele, *Konziliengeschichte*, vol. ii (Freiburg, 1855-74).

LAODICEANS, lă'ôd-i-sē'an-z, EPISTLE TO THE. See APOCRYPHA; EPHESIANS, EPISTLE TO THE.

LAOKOON, lă-ôk'ô-on. A treatise on the characteristics of poetry and sculpture by Lessing (1766), based upon the Laocoön group in the Vatican. For a description of the treatise, see LESSING, GOTTHOLD EPHRAIM.

LAOM'EDON (Lat., from Gk. *Λαομέδων*). Son and successor of Ilus, who founded the city of Ilium (Troy, q.v.). He is said to have been served by Poseidon and Apollo by command of Zeus—the former erecting the walls of the new city, while Apollo acted as herdsman. Laomedon having refused to pay them according to agreement, Apollo sent a plague and Poseidon a sea monster, which killed many Trojans, until an oracle commanded as an atonement the offering of one of Laomedon's daughters. The lot fell on Hesione, and she was chained to a rock to await the return of the monster. Hercules appeared at this point, on his return from the country of the Amazons (q.v.), and, having been promised the immortal horses given by Zeus to Tros if he should slay the monster, killed the creature, and freed Hesione. When his reward was refused, Hercules gathered a force, killed Laomedon, captured the city, and carried off Hesione as booty, after placing Priam, who had alone protested against his father's acts, upon the throne.

LAON, lăn. A fortress and the capital of the Department of Aisne, France, situated on an isolated hill, 87 miles northeast of Paris (Map: France, N., J 3). It has numerous ancient buildings and three gates belonging to its thirteenth-century fortifications, which have been razed. The cathedral of Notre Dame is one of the finest twelfth-century Gothic edifices in France. It was finished in 1225 and is surmounted by numerous towers, some of them unfinished, and the two flanking the façade being adorned with huge oxen, said to commemorate the animals used in the transportation of the stone for the building. Another noteworthy church is that of St. Martin (twelfth century) in Transition style. The Palais de Justice occupies the thirteenth-century episcopal palace, and the prefecture is housed in the former abbey of St. Jean (twelfth century). The educational institutions comprise a lycée, a communal college, a normal school, a school of agriculture, a fine library of 15,000 volumes and rich in manuscripts and autographs, a museum of local antiquities, and a theatre. Laon manufactures linen and other textiles, sugar and metal products. It is noted for its fruits and vegetables. Pop., 1901, 15,434; 1911, 10,323. Laon is first mentioned as Laudunum in the fifth century. It was fortified by the Romans and eventually attained great importance in the kingdom of the Franks; in the tenth century it was the residence of the Carolingian kings. During the twelfth and thirteenth centuries the place suffered considerably in the struggles with its bishops. The bishopric of Laon, founded at

the beginning of the sixth century, was abolished in 1789. In modern times Laos is associated with the defeat of the French under Napoleon by the Germans under Blücher in 1814. In 1870 Laos capitulated to the Germans, but the entrance of the conquering army into the town was marked by the blowing up of the powder magazine by a French private, with the result that over 500 people were killed and wounded and the town was considerably damaged.

LAOS, lă'ôs. A region in the northern part of Siam, comprising the Middle Mekong District, from about lat. 13° to 23° N. (Map. Burma, D, E, 3). Its boundaries are not well defined, and its area is estimated at about 116,000 square miles. Its political status has been determined by the agreements of 1893, 1896, and 1904. By the first, France obtained possession of the portion east of the Mekong, which now forms a part of French Indo-China, by the second agreement between France and England, which was more clearly defined in the Convention of 1904, the portion west of the Mekong was divided into two parts, of which the eastern, belonging to the basin of the Mekong, was declared within the French sphere of influence, and the western part was declared within the British sphere, finally, by the Treaty of 1904 between Siam and France, the former country agreed to abandon all claim to the Luang Prabang territory on the west side of the Mekong. By a subsequent treaty in 1907, part of the Luang Prabang territory was again passed to Siam. The country is covered largely with forests of valuable woods, but only teak and rattan are exploited. Laos is believed to contain considerable mineral wealth. There are many gum and rubber trees. The climate is healthful during the dry season, from the middle of October to the end of April. The natives raise rice, corn, tobacco, cotton, indigo, sugar cane, and tea. They also produce mats and other objects of Sparta grass. There are a French Resident and a number of French commissioners in the eastern part. The population is estimated at 2,000,000, chiefly Laos. Chief town, Luang Prabang.

LAOS, lă'ôz, or **LAOTIANS**. One of the chief groups of the Thai stock, which includes the Shans, Thos-Muong, Siamese, Burmese, etc. They inhabit the northern parts of Farther India, from Tongking to Assam, but the Laos country belongs chiefly to Siam and French Indo-China, only a few tribes still preserving their independence. The physical characters of the Laotians are medium (sometimes quite low) stature, except in the most favorable districts; somewhat brachycephalic head form; hair black, stiff, and rarely curly, beard scanty, skin among the general population tawny, but among the higher classes lighter and often almost white. The upland Laotians are fairer-skinned than the people of the lowlands. Certain customs and practices, such as the North Laotian tattooing with needles, bodily ornamentation, etc., have been regarded as indicative of Malayan affinities. The character of the primitive Laotians is generally considered as of a higher order than that of many of their more civilized neighbors. They are, at their best, of a pleasanter disposition, franker, and more accessible than many of the other peoples of Farther India and combine the qualities of good subjects with a never-extinct longing for independence. In occupation the Laotians are agriculturists, cultivating rice and the mulberry tree, and raising silkworms; in

part shepherds and hunters. Some of the settled and more civilized Laotians make the wilder tribes of their environment grow rice and other foods for them. Others are expert cutters of teak and other timber. Being on the route of travel between China and Farther India of the south, they have had something to do with the development of trade and commerce in that region, although they are not credited with any keen commercial sense. Some of the Laotians are celebrated for their metal work. Excepting music, the fine arts seem not to be largely cultivated, but there is among them a considerable indigenous as well as borrowed folk literature.

Polygamy is rare with the masses of the people, and the position of woman is not at all low with some of the tribes; for, if she does work hard, she is the head of the household. Those who are not still "heathen" have accepted Buddhism in some form or other, but among the lower and ignorant classes ancestor worship, fetishism, etc., survive. From their neighbors, the Khmers, they have borrowed some superstitious beliefs, as the werewolf and the like. Some of the Laotians have a special form of writing, probably of Indian origin. With the Shans the Laotians shared in the earlier Thai civilizations of this part of Farther India, some of which were in their prime in the thirteenth, fourteenth, and fifteenth centuries. A few of the Laos "states" still exist in a semi-independent condition.

Bibliography Bock, *Temples and Elephants* (London, 1885); Colquhoun, *Among the Shans* (ib., 1885); Taupin, "Voyage d'exploration et d'études au Laos," in the *Bulletin de la Société Normande de Géographie* for 1890; Aymonier, *Voyage dans le Laos* (Paris, 1897); Lefèvre, *Un voyage au Laos* (ib., 1898); Lucien de Reinach, *Le Laos* (ib., 1911).

LAO-TSE, **LAU-TZĚ**, or **LAO-TSU**, lou'tsu' (Chin., venerable philosopher). An ancient Chinese sage, the reputed founder of the philosophy known as Taoism (qv). Little is known regarding him that is absolutely trustworthy. That he existed is beyond doubt, for Sze-ma Ts'ien, the Chinese historian, who wrote about 100 B.C., mentions him and gives the longest sketch of his life that we have. His real name was Li Urh, a name of no special significance, as Li is the commonest of surnames in China. It means 'plum tree' and has served the legend mongers as a peg on which to hang the story that he was born under a plum tree, and that he immediately pointed to the tree, saying, "From this tree I take my name." Another legend is that he was white-haired when he was born, having been carried for 70 years in his mother's womb, and from this circumstance he is known as Lao-tse, which may mean 'old boy' as well as 'venerable philosopher.' His posthumous title was Peh Yang, or Earl Yang, and his appellation Tan, which means 'flat-eared.' He was born, according to Sze-ma, in the village of Kihuh-jin (misdirected benevolence), in the parish of Li (cruelty), the prefecture of Ku (bitterness), and the principality of Ts'u (distress), supposed to have been situated in what is now the Province of Honan, or perhaps the neighboring Province of Anhui. This was in 604 B.C. At some time in his life he became librarian and archivist of the Chou dynasty, whose capital was at Loyang in Honan. He had a considerable influence on Confucius, who visited him about 517 B.C., and learned from him a lesson in humility.

In his old age Lao-tse retired and betook himself to the frontier, whether of his own state or of the Empire is uncertain. There he lingered for a time, instructing Yin-hi, the warden, and at his request wrote a book of about 5000 words, in which he discussed the concepts of Tao and Teh, for which see the article TAOISM. When or where he died is not known. Legend states that when last seen he was riding away into the wilderness of Tibet, mounted on a black ox. Some ill-advised attempts have been made to Latinize his name into *Laocius*. Consult: Waters, *Lao-tzu: A Study in Chinese Philosophy* (London, 1879); Carus, *Lao-tze's Tao-teh-king* (Chicago, 1898); Hirth, *The Ancient History of China* (New York, 1908). See CHINA.

LAPAROTOMY (from Gk. *λαπάρα*, *lapara*, flank, loins + *τομή*, *tomē*, a cutting, from *τέμνω*, *temnō*, to cut) A surgical term, used to designate making an incision through the abdominal walls and peritoneum for the purpose of exploring or operating upon the abdominal or pelvic viscera. The term is being replaced by *celiotomy* (from Gk. *κοιλία*, *koilia*, hollow, abdomen + *τομή*, *tomē*, a cutting), which is more exact. Consult Bryant, *Operative Surgery* (4th ed., 2 vols., New York, 1905), and Ashhurst, *Surgery* (Philadelphia, 1914).

LAPAUZE, JEANNE, née LOISEAU See LE SUEUR, DANIEL.

LA PAZ, la päth, *So Amer. pron.* pás. A city in the Province of Entre Ríos, Argentina, situated on the left bank of the Paraná, 87 miles northeast of the city of Paraná (Map: Argentina, H 4). It is a regular stopping place for steamers on the river and an important port of transit between Buenos Aires and Asunción. Its chief exports are hides and preserved beef. It was founded in 1836. Pop. (est.), 9000.

LA PAZ. The most populous department of Bolivia, occupying the northwest portion of the Republic (Map: Bolivia, D 7). It is bounded by Brazil on the north, the Bolivian departments of Cochabamba and Beni on the east, by Oruro on the south, and Peru on the west. Its area is estimated at 72,970 square miles, and it is formed of 13 provinces. Geographically it is divided into two parts differing radically from each other in surface formation. The northern and larger part, which was formerly included in the Department of Beni, is an extensive plain, thickly wooded and well watered by the numerous tributaries of the Beni and the Purus. This region has a hot and unhealthful climate and is inhabited mostly by Indians. The southern portion belongs mostly to the region of the Cordillera Real and is exceedingly mountainous, containing some of the highest peaks of the continent, such as Illimani and Illampu. It is drained by the upper portion of the Beni and takes in a large part of Lake Titicaca with its outlet, the Desaguadero. The generally mountainous surface is diversified by numerous elevated valleys, covered with luxuriant vegetation and having a delightful climate. The main agricultural products are corn, wheat, potatoes, cocoa, coffee, sugar cane, rice, cacao, bananas, oranges, etc. Cattle raising is carried on extensively, and the natural conditions of the region are very favorable for the development of that industry. Mining industries are also important. Gold, copper, silver, and tin are the chief mineral products. Pop., 1900, 445,616; 1914 (est.), 500,000. Capital, La Paz (q.v.).

LA PAZ. A city and the capital of the De-

partment of La Paz, Bolivia, and also the de facto capital of the Republic. It is situated on the Chuquiapu River, 30 miles southeast of Lake Titicaca, 12,470 feet above sea level, and has a cool and healthful climate (Map: Bolivia, D 7). It has paved streets, some of which are narrow and steep, and there are 20 bridges crossing the river. It has several squares, on one of which, the Plaza Murillo, stand the fine cathedral (as yet incomplete), the Legislative Palace, and the Government Palace. There are several handsome drives and promenades, one of which, the Alameda, is very broad and entered by three iron gates. The city has a tramway and is lighted by electricity. It has a university, with faculties of law, medicine, and theology, a national college and seminary, a museum, a public library, two hospitals, and various scientific and philanthropic societies. The industries of the city are unimportant, but it has an active trade in the agricultural and mining products of the surrounding district as well as in imported articles brought from the Pacific ports. Pop., 1909, 78,856. La Paz was founded in 1548 by Alonso de Mendoza. In its early history it suffered several times from Indian uprisings, being once besieged for four months by 100,000 Indians. It was the first Peruvian city to revolt against Spain.

LA PAZ, la pás. A port on the east shore of Lower California, Mexico, situated on the Bay of La Paz (Map: Mexico, D 5). It is the seat of the most valuable pearl fishery on the Pacific coast and has considerable trade in the products of the fertile district around it and of the mines of Triunfo. The town has a good harbor and is the seat of the United States Consul. Pop., 1900, 5046; 1910, 5536.

LAPEER, lá-pēr' A city and the county seat of Lapeer Co., Mich., 60 miles north of Detroit, on Flint River, and on the Michigan Central and the Grand Trunk railroads (Map: Michigan, F 5). It is the centre of a fertile agricultural region and an important market for farm produce and poultry, it has flouring and planing mills, foundries, stove works, a tannery, and machine works. The Michigan Home and Training School, for the feeble-minded, is here. Settled in 1832, Lapeer was first incorporated in 1875, the charter of that year still being in operation and providing for a mayor, annually elected, and a unicameral council. The city owns and operates the water works. Pop., 1900, 3297; 1910, 3946.

LA PELTRIE, la pèl'trè', MARIE MADELEINE DE, née CHAUVIGNY (1603-71). A French educator and religious, born at Alençon. Though wishing to enter a convent, she was forced by her father to marry, but was left a childless widow at the age of 22. On reading La Jeune's *Relation* (1635), she determined to use her entire fortune in the education of Indian girls. She went to Quebec in 1639 with three nuns and founded the Ursuline Convent there, maintaining a school for both white and Indian girls. In 1642 she joined the Montreal colony, remaining there until 1646, when she returned to Quebec. She is said to have entered as novice in this year. She died in the convent in 1671. Particular reference is made to her in R. G. Thwaites (ed.), *The Jesuit Relations*, vols. xi, xvi (Cleveland, 1896-1901).

LAPÉROUSE, là-pá'rōōz', JEAN-FRANÇOIS DE GALAUP, COUNT DE (1741-188). A French navi-

gator, born near Albia, in the Department of Tarn. He entered the navy in 1756, fought against the English in the Seven Years' War, and was made a captain in 1780. In 1782 he was sent to destroy the British forts in Hudson Bay. Three years later he was chosen to command an expedition of discovery, sent out by the French government for the purpose of completing the explorations of Cook and Clarke in the Japan seas and southeast of Australia and, incidentally, of attempting the Northwest Passage. Lapérouse sailed in August, 1785, with two frigates, the *Boussole* and the *Astrolabe*, taking with him specialists in botany, astronomy, geology, and geography. The expedition was carefully equipped and did good work. The ships crossed the Atlantic to Brazil, rounded Cape Horn, and skirted the coast of the Americas to lat 60° N., Mount St. Elias being sighted. On Nov. 5, 1786, Necker Island, a small island some hundred leagues northwest of the Hawaiian group, was discovered. The explorers sighted the Marian Islands, touched at the Philippines, and by May, 1787, would seem to have been in the neighborhood of Korea. These waters were for the Western world absolutely unknown, and Lapérouse devoted some six or seven months to the exploration of the vicinity. In August he discovered the strait between the islands of Sakhalin and Yezo, which now bears his name. From the Bay of Avatscha in Kamchatka, Lesseps, the interpreter of the expedition, was dispatched in September to France by the overland route across Siberia, carrying with him the records and maps of the expedition. Then, going south Lapérouse landed on one of the Navigator Islands, where 21 of the expedition, including the captain of the *Astrolabe*, were massacred by the natives. Lapérouse touched Tasmania and on Jan. 26, 1788, made Botany Bay. He remained there until February 7, after which there is no trace of the movements of the expedition. The French government offered a reward of 10,000 francs for information and in 1791 sent an expedition in search of Lapérouse, but without success. In 1826 an English captain, Dillon, found some remnants of the wreckage of Lapérouse's ships in the possession of the inhabitants of Vanikoro, one of the New Hebrides. A French expedition sent out in 1828 under Dumont d'Urville ascertained that both ships had been wrecked in a storm off the coast of this island and that all on board had perished, and Dumont d'Urville erected a monument to the memory of Lapérouse on the island. There are three editions of Lapérouse's voyages, prepared from journals sent home by him and published under the title *Voyage autour du monde* in 1797, 1799, and 1831, the last and most exact edited by Lesseps. In April, 1888, the Société de Géographie in Paris commemorated the one hundredth anniversary of Lapérouse's death. Consult *Bulletins de la Société de la Géographie* (Paris, 1888).

LA PEYROUSE, lá pá'rōōz', PHILIPPE PICOT DE (1744-1818). A French naturalist, born near Toulouse, where he was Advocate-General in the Parliament (1768-71). He applied himself to natural history researches, chiefly in the Pyrenees, from 1774 to 1789, when he was recalled to the administration of his native district, became inspector of mines, professor of natural history in the central school of Toulouse, and mayor of the city (1800). In 1811 he was made perpetual secretary of the Toulouse Academy of

Sciences, and during the Hundred Days he was president of the electoral college of Haute-Garonne, but soon retired to private life and cultivated beautiful species of pines on his property. He published: *Description de plusieurs nouvelles espèces d'orthocératites et d'ostracites* (1781); *Flore des Pyrénées* (1795; 4th ed., 1801); *Monographie des saunifrages* (1801); *Histoire abrégée des plantes des Pyrénées* (1813-18).

LAPHAM, lăp'am, INCREASE ALLEN (1811-75). An American naturalist, born in Palmyra, N. Y. For a time he served as assistant on the survey of the Erie Canal and as engineer in the construction of the Welland and Miami canals. After moving to Milwaukee, Wis., in 1836, he turned his attention to scientific study and investigation, particularly in the branches of botany, meteorology, and geology. From 1873 to 1875 he acted as chief geologist of Wisconsin. He was a member of the Wisconsin Historical Society and of the Wisconsin Academy of Sciences. His best-known publications are: *A Geographical and Topographical Description of Wisconsin* (1844); *Antiquities of Wisconsin* (1855). *Geological Map of Wisconsin* (1855).

LAPIDANUS. See HEYNLIN, JOHANN.

LAPIDARY WORK. (Fr. *lapidaire*, Lat. *lapidarius*, stonecutter, from *lapis*, stone). The art of cutting, grinding, and polishing stones, especially gems (qv). The earliest examples of lapidary work are the engraved cylindrical seals of Babylonia and Assyria and the scarabæoids of Egypt, dating back at least as far as 4500 B.C. At first the cylindrical seals were made of shell, later from diorite, serpentine, chalcedony, quartz, rock crystal, amazon, amethyst, and fossil coral; but no specimens are known of ruby, sapphire, emerald, diamond, or tourmaline. The earliest engraving was done slowly and laboriously by hand with the *sapphire point* only, the *bow drill* being introduced about 3000 B.C. In the bow drill the point is made to revolve rapidly by moving up and down a horizontal crossbar, to each end of which is attached a string wound around the vertical stick in which is set the drill point. Phœnician work shows a mixture of Babylonian and Assyrian designs. Greek work modified Egyptian scarabs by adding Greek and Etruscan symbols and mysterious signs. During the first three or four centuries of the Christian era many pagan gems were recut with Gnostic and other obscure devices. With the Renaissance the art revived, and work equal to that of the greatest Greek and Roman masters was produced. During the sixteenth, seventeenth, and eighteenth centuries many copies were made that can with difficulty be told from the ancient originals. Until the fourteenth century gems were mostly cut *en cabochon* (polished smooth, preserving the original size and color of the stone as far as possible), or like beads with a hole drilled through the centre. Faceting, or finishing with a surface of flat faces geometrically arranged as in cut diamonds, is a modern invention. Modern gem cutting and engraving is done on a lathe carrying a point or disk of soft iron, primed with diamond dust and oil. Opaque and translucent stones such as opals, moonstones, turquoises, and caruncles are still cut *en cabochon*, but transparent gems are almost always faceted, in order to enhance their brilliancy by reflection and refraction of light. Important centres of garnet cutting are the region around Merowitz

in Bohemia and Jaipur in India. The world's centres of agate cutting are the German cities of Walldkirch in Breisgau and Idar and Oberstein in Oldenburg. In Russia lapidary work is especially encouraged by the state, and there are great Imperial establishments at Ekaterinburg and Peterhof, and at Kolyvan in Siberia. Königsburg and Danzig in Germany are centres of amber cutting. China has for centuries been the centre of jade cutting. For diamonds and diamond cutting, see DIAMOND. Consult: L. Pannier, *Les lapidaires français du moyen âge* (Paris, 1882); Leopold Clarendon, *The Gem-Cutter's Craft* (London, 1906); Paul Meyer, "Les plus anciens lapidaires français," in *Romania*, vol. xxxviii (Paris, 1909). See GEMS.

LAPIDE, CORNELIUS À See CORNELIUS À LAPIDE

LA PIEDAD, là pyá-dá'd. A town of the State of Michoacán, Mexico, situated at the north boundary of the state, 62 miles southwest of Guanajuato, and on the left bank of the river Lerma, which is here crossed by a fine bridge (Map: Mexico, H 7). Adjacent to it is an important agricultural district. Pop, 1910, 10,604. In 1871 it received the title of city.

LA PIJARDIÈRE, la pézhár'dyâr', LOUIS DE LA COUR DE (1832-91). A French author and antiquary, born at Nantes and educated at the Ecole des Chartes. He became keeper of the archives of the Ste. Geneviève Library in 1860 and of that of Hérault in 1872. He committed suicide at Montpellier in 1891. He was a special student of Molière. Among his works (some under the name Louis La Cour) are: *Les garçons de café de Paris, par Gaston Vorlac* (1856); *Le parc aux cerfs* (1859); *Rapport sur la découverte d'un autographe de Molière* (1873); *Molière à Pézénas en 1650-51* (1885); *Molière, son séjour à Montpellier en 1654-55* (1887); besides editions of Brantôme, of Bonaventure, Des Périers, of Rabelais, and of a facsimile of the earliest editions of Molière for the Académie des Bibliophiles. He founded the historical review *Chroniques du Languedoc*.

LAPIS LAZULI, or LAZURITE (Neo-Lat., stone of azure, from Lat *lapis*, stone, and ML *lazulus*, *lazurus*, *lazur*, MGK. λαζούριον, *lazourion*, from Ar. *lāzward*, from Pers. *lāzward*, named from *Lāzward* in Persia, where the mineral abounds). A mineral substance, consisting of sodium and aluminium orthosilicate and sodium sulphide. It crystallizes in the isometric system, but is usually found massive, having a beautiful ultramarine or azure-blue color. The mineral was highly esteemed for its medicinal qualities by the ancients, who pulverized it and mixed it with milk, using it as a dressing for boils and ulcerations. Pliny and other Roman writers called it *sapphire*. It was used among the Egyptians in their jewelry, and among the modern nations it has been employed for engraving, for vases, in ornamental and mosaic work, and for altars and shrines. Lapis lazuli occurs in granite and in crystalline limestone, the finest specimens coming from China, Siberia, Persia, and Chile. When powdered, it forms the pigment called *ultramarine*, which, however, has been replaced by an artificial product. See GEMS; ULTRAMARINE

LAPIS OLLARIS, lá'pis ol-lá'ris. See POSTSTONE.

LAPITHÆ (Lat., from Gk. Λαπίθαι, *Lapithai*). In Greek legend, a people who inhabited

the Valley of the Peneus in Thessaly. They derived their name from a mythical ancestor, *Lapithes*, a son of Apollo and the brother of Centaurus, the equally mythical ancestor of the centaurs (q.v.). In legend the Lapithæ appear especially in their conflict with the centaurs. At the marriage of their King Pirithous to Hippodamia, the centaurs, flushed with wine, offered violence to the women, and in the war that followed the centaurs were nearly destroyed. Theseus was said to have helped Pirithous in this struggle, and it consequently assumed a prominent place in Athenian literature and art. It is represented on the friezes of the Theseum at Athens and of the temple of Apollo at Phigaleia, and on the metopes of the Parthenon as well as on vases. The Lapithæ were said to have been crushed by Agimius and the Dorians, assisted by Hercules. There seems reason to believe amid all these legends that the Lapithæ were a folk of some degree of civilization, dwelling in early times in Thessaly. Another King of the Lapithæ was Ixion (q.v.). For the metopes of the Parthenon showing the Centaurs and the Lapithæ, consult E. A. Gardner, *Ancient Athens* (New York, 1902).

LAPLACE, lá'plàs', JOSUÉ DE (1606-55), better known as PLACEUS. A French Reformed clergyman. He was a preacher at Nantes and in 1632 was appointed professor of theology at Saumur. His great work is *De Statu Hominis Lapsi* (1640), in which, like Amyraut (q.v.), he sought to modify the strict Calvinism of his church, but unsuccessfully. His complete works were published at Franeker in 1699 in two volumes.

LAPLACE, PIERRE SIMON, MARQUIS DE (1749-1827). The greatest of the French astronomers. He was born at Beaumont-en-Auge (Calvados). His father, a poor farmer, was unable to give him any educational advantages, but, probably through the generosity of friends, he was able to carry on his studies in the College of Caen and the Military School at Beaumont. In the latter institution he was for a short time a teacher of mathematics, but at the age of 18 he resolved to try his fortune in Paris. Having secured the attention of D'Alembert (q.v.), then in the height of his power, he was, on the latter's recommendation, made professor of mathematics in the Ecole Militaire. Scarcely 20 years of age, his remarkable power of mathematical analysis had already become manifest in his *Recherches sur le calcul intégral* (1766-69). These researches were followed by a series of brilliant memoirs on the theory of probability, which immediately attracted the attention of the scientific world and were the object of special commendation by the Academy of Sciences. As a result of their publication, Laplace was in 1773 made an associate and in 1785 a member of this distinguished body. In 1784 he succeeded Bézout as examiner in the Royal Artillery Corps and in 1794 was made professor of analysis at the Ecole Normale. After the organization of the new Institute he received, through the excellency of his style as shown in his *Système du monde*, a place among "the forty" of the Academy in 1816 and in 1817 was made its president. Laplace was not without political ambition and did not hesitate to resort to flattery to secure place. Napoleon made him Minister of the Interior in 1799, but after six weeks he was compelled to dismiss him with the epigrammatic remark that he carried

the spirit of the infinitesimal into his administration. He was recompensed, however, by a seat in the Senate, of which body he later became the Vice President, and Chancellor in 1803. In 1804 the Emperor also created him Count. His political views conveniently shifting with the change of power, he received his reward from Louis XVIII by being elevated to the peerage with the title of Marquis. He was a member (1795), and a little later became president, of the Bureau of Longitudes, he was president of the commission for the Ecole Polytechnique, a member of the Académie des Sciences to establish the metric system, a Grand Officer of the Legion of Honor, and a member of most of the prominent learned societies of the world. Laplace was indefatigable in his scientific labors and richly deserved the honors which they brought to him. He has justly been called "the Newton of France," "the titanic geometer," and "the greatest mathematician of his age." Self-sufficient in the presence of his fellows, he was humble in his contemplation of the great domain in which he labored, his humility showing itself in the dying words ascribed to him: "What we know is little, what we do not know is immense."

Laplace was celebrated chiefly for his labors in celestial mechanics, especially in relation to the lunar theory, the opposite inequalities of the motions of Jupiter and Saturn, the question of the tides, and the general problem of the stability of the solar system. The conciliation of the results of observations on the motions of Jupiter and Saturn, to the Newtonian theory, had baffled even Euler and Lagrange, and it was the failure of such eminent predecessors that led him as a young man to study the subject. The results of his investigations were given when he was only 23 years old, in a memoir read before the Academy of Sciences, entitled *Sur les solutions particulières des équations différentielles et sur les inégalités séculaires des planètes*. This was followed by a series of brilliant discoveries in the planetary theory. It was in connection with this extended investigation that Laplace discovered in 1786 the dependence of the moon's acceleration upon the secular changes in the eccentricity of the earth's orbit, the keystone in the theory of the stability of the solar system. He also announced the laws of motion of the first three moons of Jupiter, in a form since known as the Laws of Laplace: (1) the sum of the mean movement of the first satellite and of twice the third equals three times that of the second; (2) the sum of the mean longitude of the first satellite and of double that of the second diminished by three times that of the third, equals 180° . Laplace's most celebrated treatise is the *Mécanique céleste* (5 vols., 1799-1825; trans. by Bowditch, 4 vols., Boston, 1829-39). The aim of this work was to give a complete solution of the great mechanical problem of the solar system and to bring the results of observation into harmony with the Newtonian hypothesis. The work will stand as one of the world's greatest contributions to science. At the same time it cannot be denied that it has two serious faults. In the first place, Laplace has justly been blamed for not recognizing the unquestionable discoveries of his predecessors and contemporaries, inferentially making them as his own. The second blemish is the fact that there are many serious omissions in the theory, covered by the frequently recur-

ring expression, "It is easy to see." These two defects in the work were in part removed by the admirable English translation mentioned above. Laplace's *Exposition du système du monde* (1796) was called by Arago the *Mécanique céleste*, disrobed of its analytic attire. The work is more popular and clear and is especially valuable for its condensed but masterly résumé of the history of astronomy to the close of the eighteenth century. In this work appeared the famous nebular hypothesis (see COSMOGONY), an hypothesis so foreign to Laplace's habit of mathematical treatment as to lead him to the apologetic statement that it was suggested "with the mistrust which should inspire everything that is not a result of observation or calculation," but to it he frequently alludes as highly probable. The theory had already been suggested by Kant (1755) and by the Japanese mathematician Shizuki Tadao (1760-1806) in 1793.

In physics Laplace joined with Lavoisier in important experiments (1782-84) on the specific heats of bodies, and contributed in a noteworthy manner to the theories of capillary action, of electricity, and of the equilibrium of a rotating fluid mass. His investigation of the discrepancy between the theoretical and observed velocity of sound led him to take into mathematical account various secondary factors by which the velocity of sound may be influenced. "Laplace's coefficients," also called spherical functions and spherical harmonics, already known to Legendre, were first given in their general form by Laplace, in his *Théorie des attractions des sphéroïdes et de la figure des planètes* (1782). In pure mathematics Laplace made his greatest reputation in the theory of probabilities (q.v.). This doctrine, already created by Pascal and Fermat, and brought to a high degree of perfection by Jakob Bernoulli (q.v.), was investigated by Laplace soon after his arrival at Paris as a young man, and first brought him to the attention of the Academy. He made much use of the subject in his *Mécanique céleste* and was the first to treat the new theory of least squares as a problem of probabilities. His *Théorie analytique des probabilités* appeared in 1812 and his *Essai philosophique sur les probabilités* in 1814. Laplace's complete works have been twice published by the French government respectively under the titles *Œuvres de Laplace* (7 vols., 1843-47), *Les œuvres complètes de Laplace* (13 vols., beginning in 1878). The *Mécanique céleste* is also known in English from an adaptation of a portion of the work under the title *Mechanism of the Heavens*, by Mrs. Somerville (London, 1831), and the first book through a translation by Toplis under the title *Treatise upon Analytical Mechanics* (Nottingham 1814). One of Laplace's works on probabilities was translated into English by Truscott and Emory, under the title *Philosophical Essay on Probabilities* (New York, 1902). Consult: Kaufman, *Laplace* (Paris, 1841); D. F. J. Arago, *Biographies of Scientific Men* (Boston, 1859); August Döring "Kant, Lambert, und die Laplacesche Theorie," in *Preussische Jahrbücher*, vol. lviii (Berlin, 1886); Friedrich Ratzel, "Die Kant-Laplacesche Hypothese und die Geographie," in *Petermann's Mitteilungen*, vol. xlvii (Gotha, 1901).

LAPLAND. A region embracing an area of about 150,000 square miles in northwest Europe. It is not a political entity, but derives its name from the fact that it is the home of

the Lapps, or Laplanders. Its south boundary is not definitely defined, but it may be said to extend south in Norway approximately to lat. 65°, in Sweden to lat. 64°, and in Russia to lat. 66°, including northern Finland and the Kola Peninsula (Map: Europe, F 2). Norwegian Lapland is included under the provinces of Nordland, Tromsø, and Finnmarken; Swedish Lapland occupies the northern part of the Province of Norrland and the whole of Norrbotten (North Bothnia) and is divided into Torneå-, Luleå-, Piteå-, Umeå-, and Asele-Lappland. Scandinavian Lapland is mountainous in Norway, except in the northeastern district of Finnmarken; while in Sweden, though very rough and uneven, the country inclines to flatness. In Finland the country of the Lapps is chiefly flat, with many glacial lakes; about one-half of the Kola Peninsula is tundra or swampy. The rocks of Lapland are chiefly of Plutonic origin, covered with a thin layer of humus. The Swedish and Finnish portions are drained by rivers which empty into the Baltic Sea.

The climate of the whole of Lapland is very severe for nine months in the year, even along the coasts, where some ameliorating influence of the Atlantic is felt, which extends even to the Murman coast of the Kola Peninsula. The snowfall in Sweden is very heavy. A large mileage of snowsheds has been built on the Swedish portion of the railroad. All the most exposed parts of the line are thus protected. The heat of July and August is extreme, but these hot months are separated from the cold seasons by a spring and autumn that are only two or three weeks long. Barley may be grown as far north as 70°, but the general limit of cereals is lat. 66° N. A large part of the country, particularly in the south, is covered with a thin growth of birch, pine, fir, and alder, but trees entirely disappear in the Kola Peninsula. The more elevated tracts, except in Norway, are destitute of vegetation and have no inhabitants; but in the valleys and the lower parts of Lapland there is an undergrowth of lichens and mosses which provide abundant food for the numerous herds of reindeer that are the chief riches of the inhabitants. Some of the southern Laplanders carry on a little agriculture with indifferent success.

Economically this whole region has only one preëminent resource, and that is the beds of iron ore scattered over the southern part of Swedish Lapland. The development of these mines at Gellivare and Kiruna, 44 and 100 miles north of the Arctic circle, resulted in the building of a railroad from the port of Luleå, on the Gulf of Bothnia, to those mining centres, and its extension (completed in 1902) across Lapland to Narvik, at the head of the deep Ofoten Fjord in Norway, on the Atlantic, the railroad being about 280 miles long, of which 230 miles is north of the Arctic circle. This railroad was extended to the Atlantic to give our vessels an ice-free port, Narvik, the year round, as the Gulf of Bothnia is frozen during the winter. The mines of Gellivare yielded 1,076,000 tons of ore in 1901. The district of Norrbotten, wherein Gellivare and Kiruna are located, yielded, in 1913, 4,913,603 tons of ore. These Swedish ores are regarded as among the best steel ores in the world, and there is a large market for them in England and Germany. At Kirunavaara, on the line of the railroad, is a ridge about 700 feet in height, several miles long, of solid magnetic ore,

perhaps the largest and most compact mass of this superior iron ore in the world. The diamond drill has proved the continuity of this metallic rock throughout the ridge, and Swedish engineers estimate that the mass contains 740,000,000 tons of ore, yielding often as high as 70 per cent pure metal.

The Laplanders do not number more than 30,000. They are short in stature (height, 1.529–1.555 meters) and brachycephalic. They have triangular faces, high cheek bones, flat noses, gray, blue, or brown eyes, chestnut or black hair, and they are nimble and lively. Over two-thirds of them live in Norway, about 5000 in Sweden, and 3000 in Russia. Many Norwegians, Swedes, Finns, and Russians have moved into the country, and it is quite certain that the Lapps, who are of Asiatic origin, will ultimately disappear by absorption among the surrounding peoples. They are called Lapps by the Swedes, the name meaning "nomads"; they call themselves Sameh, or Samelats. Virchow believed them to be a branch of the Finns, though they seem to be clearly distinguished from the Finns proper by the form of the crania and their physical features. Schaaflhausen regarded them as the descendants of Mongolian tribes driven northward and migrating west along the Arctic shores. Their language is allied to that of the Finns, and they are not a pure race, as is shown by their family names, which include Swedish, Norwegian, Finnish, and Russian names. The Lapps living on or not far from the seacoast are more numerous than those of the interior and are known as the coast Lapps. Their living is largely derived from fishing and hunting, though the Norwegian Lapps keep many reindeer as well as those of the interior, who are known as the mountain Lapps. The huts of both the fishing and reindeer Lapps are made of a conical framework covered with canvas or some woolen fabric, with a hole at the top to permit the smoke to escape. Those fishing Lapps who have no reindeer lead a more settled life than their kinsmen, who are compelled to be migratory in their habits, because of the frequent need of supplying their reindeer with fresh pasturage. While the fishing Lapps have some small settlements of more or less permanency, each family of the nomadic natives lives by itself, because a herd of reindeer requires a considerable area in which to live. The lichens grow very slowly after having been nibbled, and pasturage once closely cropped is not regarded as usable again for at least 10 years. A family is very poor that does not own at least 25 reindeer, while 50 to 200 head are regarded as a modest competence. The middle class has 300 to 700, the rich over 1000. A few of the wealthier Lapps own as many as 2000. Eight thousand is the largest number one man is known to have owned. The staple food is the flesh, blood, and milk of these animals, the herd also supplying the clothing and implements.

The Lapps are honest and strongly attached to their people and country. The Bible and a few religious books have been translated into their language, and they embrace the forms of religion prescribed by their local government. Thus they are all Lutherans in Scandinavia and Finland and Orthodox Greeks in Russia. Those who have come so far under the influence of missionaries or civilized immigrants as to learn to read and to adopt some of the ways of civi-

lization usually abandon the nomad life and remain in the settlements, blending with the more southern peoples. Towns or villages are unknown among the Lapps proper. The mining town of Gellivare has 10,000 inhabitants, and the ice-free port of Alexandrovsk, on the north shore of the Kola Peninsula, founded by the Russians, is developing into an important town.

LAPLAND LONGSPUR. See LONGSPUR.

LA PLATA, la plá'ta. Capital of the Province of Buenos Aires, Argentina, situated 32 miles southeast of the city of Buenos Aires and 5 miles from the port of Ensenada on La Plata Estuary (Map Argentina, H 5). The city is laid out after the plan of Washington. In form it is a perfect square, with an area of 6 square miles, and is surrounded by an avenue 330 feet wide. The streets cross each other at right angles, forming a regular block, which are intersected by broad avenues, and there are 23 open squares or parks of various sizes. The public buildings, constructed principally of brick and stucco, are many and handsome, the most notable being the capitol, the courthouse, the cathedral, the museum, the public library, and the railway station. The museum, especially in the departments of paleontology and anthropology, is one of the most important in South America. The observatory stands in the beautiful Buenos Aires Park, which is entered through a handsome arch. Education is well provided for by a system of public and private schools and by a national university. The city has a good supply of water, pumped from wells into a reservoir 72 feet high. The

streets are lighted by electricity and traversed by surface railroads. An artificial harbor, 1450 yards long, 150 yards wide, and 20 feet deep, formed by means of a dike, is connected by canal with La Plata Estuary at Ensenada. Two drainage canals keep the water from becoming stagnant. The town has increased very rapidly in population, numbering over 30,000 three years after its foundation in 1882, in 1912, 106,382. It was established to provide a capital for the Province of Buenos Aires after the city of that name was ceded to the national government.

LA PLATA, RIO DE. A river of South America. See PLATA, RIO DE LA.

LAPPO GIANNI. See GIANNI.

LA PORTA SEBASTIANI, FRANÇOIS HORACE DE. See SEBASTIANI, F. H. DE LA PORTA.

LA PORTE, la pôrt'. A city and the county seat of La Porte Co., Ind., 59 miles by rail east-southeast of Chicago, on the Lake Shore and Michigan Southern, the Lake Erie and Western, and the Père Marquette railroads (Map. Indiana, D 1). It is a city of great natural beauty, is situated in a lake country, and is a popular summer resort. The surrounding agricultural region is unusually rich. There are extensive industrial establishments, including saw mills, cooperages, braiding mills, foundry and machine shops, wheel works, a sash and door factory, a brewery, and manufactories of furniture, sleeping garments, carriages, woolen goods, radiators, blankets, pianos, bicycles, brooms, flour, etc. Among the noteworthy features of the city are the Ruth C. Sabin Home, the Association House for women and girls, a hospital, the Federal building, and Fox Memorial Park. The government is administered by a mayor and a unicameral council, elected every four years. The water works are owned and operated by the city. Pop., 1900, 7113, 1910, 10,525, 1914 (U. S. est.), 12,533. Settled in 1830, La Porte was incorporated as a town in 1832 and in 1852 was chartered as a city. Consult Packard's and Daniel's *History of La Porte County* (La Porte, 1876).

LA PORTE DU THEIL, la pôrt du tá'y', FRANÇOIS JEAN GABRIEL (1742-1815). A French Hellenist, born in Paris. He left the army in 1763 to devote himself to the study of Greek. In 1779 he went to Italy and by the help of Cardinal de Bernis received permission to examine the archives of the Vatican and made important discoveries there, especially in mediæval history. He took back to Paris 18,000 documents, many of which were afterward printed at the expense of the government before the Revolution. His works include: *Hymnes de Callimaque, avec une version française et des notes* (1775), *Les amours de Léander et de Héro, par Musée, traduits du grec en français* (1784), *Théâtre d'Eschyle, traduit du grec en français* (1794).

LAPPARENT, lá'pá'rân', ALBERT AUGUSTE COCHON DE (1839-1908). A French engineer and geologist, born at Bourges. He was educated at the Polytechnique (1858-60) and at the Ecole des Mines; for some time was connected with the great geological survey and map of France, and in 1875 was chosen professor of geology and mineralogy at the Catholic Institute of Paris. He was elected president of the French Geological Society in 1880, was made a member of the Académie des Sciences in 1897, and also appointed to a chair of mineralogy, geology, and physical geography in the Ecole Libre des

Hautes-Etudes. With Potier he undertook the geological survey for the projected Channel tunnel. His publications include: *Traité de géologie* (5th ed., 3 vols., 1906); *Cours de minéralogie* (2d ed., 1889); *Les tremblements de terre* (1887); *La géologie en chemin de fer* (1888); *Le siècle du fer* (1890); *Science et apologetique* (1905; 7th ed., 1908); *Leçons de géographie physique* (3d ed., 1907); *La philosophie minérale* (5th printing, 1910).

LAPPENBERG, lăp'pən-bĕrk, JOHANN MARTIN (1794-1865). A German historian, born in Hamburg. He studied medicine at Edinburgh, but afterward devoted himself to historical and political studies. He resided for some time in London and afterward studied law and history at Berlin and Göttingen. He became the representative of his native city at the Prussian court in 1820 and in 1823 was appointed archivist to the Hamburg Senate, an appointment which led to his discovery of many valuable historic records which were supposed to have been lost. He died Nov. 28, 1865. His principal work is the *Geschichte von England* (1834-37), the first volume of which was translated by Benjamin Thorpe as *A History of England under the Anglo-Saxons* (1845), and the second as *A History of England under the Norman Kings* (1857). He wrote also a continuation of Sartorius, *Urkundliche Geschichte der deutschen Hanse* (1830), *Ueber den ehemaligen Umfang und die Geschichte Helgolands* (1831); *Urkundliche Geschichte des hansischen Stahlhofs zu London* (1851); *Zeitschrift des Vereins für Hamburger Geschichte* (1841-51), *Hamburger Rechtsaltertümer* (1845). He was a collaborator on the *Monumenta Germaniae Historica* and also edited many specimens of early German literature. Consult E. H. Mayer, *Johann Martin Lappenberg, eine biographische Schilderung* (Hamburg, 1867).

LAPPS. See LAPLAND.

LAPRADE, lă'prăd', VICTOR DE (1812-83). A French poet and essayist. He was born at Montbrison and studied law at Lyons; but literature claimed him, and after travels in Italy (1845), he was appointed professor of French literature at Lyons (1847). From this position he was removed in 1861 because of the satiric poem "Les muses d'état," published in the *Correspondant*, in which he replied to Augier's ironical *Effrontés*. His patriotic poems written in 1870 procured him an election as deputy in 1871. His poetry, largely symbolic, grave, and dignified, includes *Les parfums de la Madeleine* (1839); *La colère de Jésus* (1840); *Psyché* (1842), in which, with the Greek myth, the Christian doctrine of expiation is treated symbolically, *Odes et poèmes* (1844); *Idylles héroïques* (1850), which won him a place in the Academy after De Musset's death; the Hellenic tragedy *Harmodius* (1870), *Le livre d'un père* (1876); *Le livre des adieux* (1878). Among his prose writings mention should be made of *Questions d'art et de morale* (1861); and the attacks on modern education, *L'Education homicide* (1867) and *L'Education libérale* (1873). Consult Biré, *Victor de Laprade, sa vie et ses œuvres* (1886).

LAPRADELLE, lă'pră'dĕl', GEOFFRE DE (1871-). A French juriconsult. He was born in Paris and taught in the law faculties of the universities of Grenoble and Paris and published numerous works on international questions, such as disarmament, rights over terri-

torial waters, and the international aspects of the Monroe Doctrine. He became a member of numerous commissions at the ministries of Justice, Foreign Affairs, and Public Works, and he edited or contributed to many reviews on international law. In 1914 he was French exchange professor at Columbia University, which gave him the degree of LL.D. His writings include: *Théories et pratiques des fondations* (1894); *La mer territoriale* (1898); *La conférence de la Paix* and *La question du désarmement* (1899); *La question du Maroc* (1904); *La guerre maritime et le droit des gens* (1908). In 1905 he began publishing, with Professor Politis, *Recueils des arbitrages internationaux*.

LAPRAIRIE, lă-pră'rĕ. A town and the capital of Laprairie Co., Quebec, Canada, on the south shore of the St. Lawrence River, near Lachine Rapids, and on the Grand Trunk Railway (Map: Quebec, E 5). There is a ferry to Montreal, 6 miles distant. The industrial establishments include saw and carding mills, brickyards, a tannery, an agricultural-implement factory, butter factories, a foundry, and a tomato-canning factory. Laprairie is a summer resort. It was the starting point in 1832 of the first railway in British North America. Pop., 1901, 1451; 1911, 2388.

LAPSAKI, lăp'să-kĕ. See LAMPSCUS.

LAPSE (from Lat. *lapsus*, a falling, slipping, from *labi*, to fall, to slip). In the law of wills, the failure of a legacy or devise to take effect, by reason of the death of the beneficiary before that of the testator, or because it becomes inoperative, subsequent to the execution of the will, for some cause or condition contained in the terms of the will. The term therefore applies only where the legacy or devise is good and capable of taking effect at the time it is made, and becomes inoperative thereafter, and is to be distinguished from the term "void" when applied to a legacy or devise which is not a testamentary act because the beneficiary named is dead at the time of the execution of the will, or by reason of being in contravention of some rule of law. Thus, where A makes a devise to B, who is alive at the time, but who dies before A, the devise is said to lapse, whereas, if B is dead at the time, the devise is void, as it was never capable of taking effect. A bequest to a society of anarchists, to be applied for the purpose of destroying the government, would be void as being in contravention of law. This distinction is important under the common-law rules in regard to the interpretation of wills, under which a devise in a will has reference to the time when the will is executed, and only such real property will pass under a residuary devise as remains undisposed of at that time. Therefore, if a devise is valid at the time when made, but subsequently lapses, a residuary devisee could not claim the property attempted to be disposed of thereby, as it was not a part of the residuum at the time the will was made. However, if a devise is void from the beginning for any reason, the property is never disposed of in contemplation of law and therefore continues a part of the residuum to which the residuary devisees are entitled under the will.

As to personal property, even under the common law the will is construed as if executed immediately before the testator's death and as affecting that which is undisposed of at the time. Therefore personal property attempted to be

disposed of by a legacy which subsequently lapses will go to the residuary legatees, if any.

The rule in regard to the interpretation of wills as to devises has been abolished in England and most of the United States, and as a consequence many States hold that all distinction in this regard as to real and personal property is abolished, and accordingly that lapsed devises fall into the residuum as in case of legacies. However, a considerable number of States still adhere to the common-law rules, notwithstanding the changes effected by their statutes, as above referred to. The statutes of many States tend to prevent the lapse of legacies and devises, by provisions to the effect that in the absence of contrary provisions in the will, the children of a deceased beneficiary shall take the gift intended for the parent. This law does not operate to give such children vested interests, as a devise or bequest is always subject to revocation by the testator. It is quite common for testators to provide against lapses by designating alternative beneficiaries, who will inherit in event of the deaths of those first mentioned. Consult the authorities and references under WILL. See ADEPTION; ADVANCEMENT; DEVISE; LEGACY.

In the English ecclesiastical law, where an officer of the Church of England has a right to designate or "present" a curate or other officer to a particular church and unreasonably neglects to do so, his right is said to lapse, i.e., it is forfeited. See BENEFICE.

LAPSED (Lat. *lapsi*, nom. pl. of p.p. of *labi*, to slip; connected with OChurch Slav. *slabŭ*, OHG. *slaf*, Ger. *schlaff*, slack). The designation applied, in the early centuries of the Christian Church, to those who, overcome by heathen persecution, did not continue faithful to the Christian religion. The lapsed were divided into classes, such as the *sacrificate*, who had actually sacrificed to the heathen gods; the *thurificate*, who had burned incense to them; the *libellatici*, who presented papers testifying that they had done one or the other, whereas they really had not. These papers were obtained either from some heathen neighbor or by bribery. In the persecution under Diocletian (303) a fourth class arose, the *traditores*, consisting of those who at command gave up their sacred books and vessels. Those who saved themselves by flight were reckoned among the lapsed, although their case was not regarded as equally bad with that of those who sacrificed to idols. The lapsed were at first punished by excommunication, and their reception into the Church again was strenuously resisted; but later a milder course was generally adopted with regard to them, though at the cost of schisms in the Church on the part of those who held that the holiness of the Church was compromised by their membership. See AUGUSTINE; CYPRIAN; NOVAIAN; DONATISTS.

LAPUTA, lâ-pŭ'tă. An island described as floating in the air, in Swift's *Gulliver's Travels* (1726). Its movements were guided by a shuttle-shaped loadstone, under the control of the wise men of the island, and it followed the direction in which the loadstone was pointed. The imaginary inhabitants of this remarkable island were grave philosophers devoted to mathematics and music, who wore garments adorned with representations of harps, trumpets, fiddles, flutes, guitars, and other instruments, and with suns, moons, and stars. These philosophers were wont to be so absorbed in their specula-

tions that they neither spoke nor attended to what was said by others, until gently reminded by servants, who were supplied with blown bladders, fastened like flails to the end of a sharp stick. With the bladders it was the duty of the servants to strike gently the mouths or ears of their masters in order to arouse them from their abstracted state of mind to answer questions. The island is a satire on the Royal Society and especially on Sir Isaac Newton. See SWIFT, JONATHAN.

LAP'WING (AS. *hlæpewince*, lapwing, from *hlæpan*, OHG. *hlaufan*, Ger. *laufen*, to run, Goth. *us-hlaupan*, to spring up + AS. *wincian*, OHG. *wincan*, Ger. *winken*, Eng. *wink*; so called from the jerky motion of the wings, but confused by popular etymology with *lap* + *wing*), or PEE-

THE LAPWING.

WIT. An Old World plover (*Vanellus vanellus*, or *cristatus*), differing from the true plovers chiefly in having a hind toe. It is numerous in summer in all the temperate parts of Europe and Asia, but the majority migrate southward in winter. It is very plover-like in form and habits, and among the most beautiful of shore birds. The head, which is surmounted with a beautiful crest, is black; the throat black in summer and white in winter; the back is green, glossed with purple and copper color. The lapwing is very plentiful in moors, open commons, and marshy tracts, in pairs during the breeding season, and in winter in flocks, chiefly on the seashore, where its plaintive cry suggests the name peewit (or in Scotland peesweep), by which it is known in popular speech. Its artifices to prevent the discovery of its nest are as eager and ingenious as those of other plovers, and, like them, its nest is little more than a depression in the ground containing four eggs. These eggs are esteemed a great delicacy, and great numbers are sent to the London market under the name of plovers' eggs. The bird itself is also highly esteemed for the table. The resulting persecution was so great that the bird nearly vanished from Great Britain; it is now, however, protected by law and is again numerous. Consult: Newton, *Dictionary of Birds* (London, 1893-96); "The Lapwing, Green Plover, or Peewit," in *Agriculture and Fisheries Board of Great Britain, Leaflet No. 44* (9th ed., ib., 1905); and other authorities on British birds. See PLATE OF PLOVERS.

LAP'WORTH, CHARLES (1842-). **AN**

English geologist. He was born at Faringdon, Berkshire; received a pedagogical training at Culham College; taught at Galashiels, Scotland (1864-75), and at Madras College, St. Andrews (1875-81); and from 1881 to 1913 was professor of geology and physiography in the institution at Birmingham early known as Mason College and later as Birmingham University. He also served as a consulting geologist on matters of mining and civil engineering. Lapworth urged strongly the theory of rock fold; investigated the graptolites—*The Geological Distribution of the Rhabdophora* (1879-80)—showing, against Barrande's theory of colonies, the chronological and zonal sequence; and made great contributions to the stratigraphy of the Darness Eribole district of the Scotch Highlands. He received numerous honors—was Bigsby medalist (1887) and Wollaston medalist (1889) of the Geological Society, Royal medalist of the Royal Society (1891), Wilde medalist of the Manchester Philosophical Society (1905), president of Section C of the British Association (1892), and president of the Geological Society (1902-04). The University of Aberdeen gave him an honorary LL.D. in 1883. Besides preparing scientific papers and memoirs, largely on the graptolites and the Lower Paleozoic rocks, he revised the tenth edition of Page's *Physical Geography* (1881), also his *Geology* (1888); edited for the Paleontographical Society a monograph on *British Graptolites* (1900-08), and published *The Geology of South Shropshire* (rev. issue, 1894); *Intermediate Text-Book of Geology* (1899, new ed., 1913); *Relations of Geology* (1904), *Sketch of the Geology of the Birmingham District* (1907); *Tripoli and Young Italy* (1912), with Helen Zimmern.

LA QUINA (la kē'ná') **MAN.** See **MAN**, SCIENCE OF, Ancient Types

LAR, lär. The capital of the Province of Laristan, Persia, situated on a well-wooded plain, at the foot of a ridge of hills, 75 miles from the Persian Gulf and about 180 miles south-southeast of Shiraz (Map. Asia, Central, F 9). The bazar of Lar is said to be the finest and most elaborate in Persia. The chief product is tobacco. Pop. (est.), 8000.

LARA, là'rá. A poem by Byron (1814) and the name assumed by its hero

LA RABIDA, la rá'né-ná. A Franciscan convent near Palos, Spain, restored in 1855. Columbus stopped at the convent on his proposed journey to France to seek assistance in his plans, and through the interest which his conversation aroused in the prior was brought to the notice of Queen Isabella.

LARAMIE, lär'á-mé. A city and the county seat of Albany Co., Wyo., 57 miles by rail northwest of Cheyenne, the State capital, on the Big Laramie River, and on the Union Pacific and the Colorado, Wyoming, and Eastern railroads (Map: Wyoming, F 4). The city is a popular summer resort, being situated on the Laramie plains, near mountains which afford fine scenery and are rich in minerals. It is the see of the Protestant Episcopal missionary bishopric of Wyoming, and among its chief institutions are the State University, the State Agricultural College, and the State Fish Hatchery. Other noteworthy features are the Carnegie library, fine courthouse and Federal buildings, the Elks Home, and the State Museum. The principal industries are stock raising and manufacturing, the industrial plants including flouring mills, a large

ice plant, stockyards, plaster mills, the preserving plant, planing mills, a tannery, a packing plant, and the extensive machine and repair shops and rolling mills of the Union Pacific Railroad Company. First settled in 1868, Laramie was incorporated in 1869 and was chartered as a city in 1884. The present government, under a charter of 1887, is vested in a mayor, elected biennially, a unicameral council, and administrative officials, all appointed by the executive, subject to the consent of the council. The city owns and operates the water works. Pop., 1900, 8207; 1910, 8237, 1914 (U. S. est.), 8250.

LARAMIE MOUNTAINS. A range of the Rocky Mountains in southeastern Wyoming (Map: Wyoming, F 3). It begins on the south bank of the North Platte River, in Natrona County, somewhat southeast of the centre of the State, and extends in a southeasterly direction through Albany and Laramie counties, being cut by the Laramie River and its North Branch. The range is mostly a broad upland, of from 7000 to 8000 feet elevation, with no outstanding summits.

LARAMIE STAGE. A geological formation of western North America, constituting a transition between the marine deposits of the Cretaceous and the fresh-water strata of the Tertiary system. It is now generally classed with the Cretaceous. The Laramie rocks comprise sandstones, conglomerates, and clays, with a thickness of several thousand feet, outcropping along the eastern border of the Rocky Mountains from Mexico northward across the United States into Canada. The formation is of great economical importance, owing to the included deposits of coal. Much of the coal mined in Colorado, Wyoming, Montana, and New Mexico is of Laramie age. The fossils include fresh and brackish water mollusks, land plants, and many species of reptiles, among the reptiles are Plesiosaurus, Claosaurus, and Ceratops. Consult White, "Correlation Papers—Cretaceous," in *United States Geological Survey, Bulletin No. 82* (Washington, 1891). See **CRETACEOUS SYSTEM**.

LARAN'DA. The ancient name of Karaman (q.v.).

LARARIUM. The name given by the Romans to a chapel or spot sacred to the lares (q.v.).

LARASH, là-râsh', or **EL-ARASH**, el-â-rîsh'. A picturesque port of Spanish Morocco, the capital of the Province of Azgar, on the Atlantic coast, 43 miles southwest of Tangier (Map: Africa, D 1). It has ancient walls, an old imposing hall or house for grain trading, a fine mosque, and many ruined edifices. The district is low and unhealthy, but produces considerable fruit. It exports cereals, grain, fruit, goat and sheep skins. Its annual trade amounts to nearly \$2,500,000. The harbor, which is poorly fortified, admits only small vessels. Pop. about 6000, consisting chiefly of Moors.

LARBOARD (ME. *laddebord*, possibly from *lade*, load, from AS., OHG. *hladan*, Ger. *laden*, to load + *bord*, AS. *bord*, OHG. *bort*, Ger. *Bord*, Eng. *board*, side of a ship, probably influenced by the analogy of *starboard*). An obsolete naval term for the left side of a vessel looking forward. From its liability to be confused by the steersman with the not very different sound "starboard," the word was officially abolished, and the expression "port" arbitrarily substituted. In 1913 the United States Navy Department changed the expressions—so far as they concern orders to the steersman—from "port" and "starboard"

to "right rudder" and "left rudder." (See HELM.) The terms "port" and "starboard" are still used in all matters not pertaining to steering.

LARCENY (OF. *larrecin*, *larcin*, Fr. *larcin*, from Lat. *latrocinium*, robbery, from *latrocinari*, to commit highway robbery, from *latro*, highwayman). The wrongful appropriation and carrying away by one person of the personal property of another, with a felonious intent to convert such property to his own use without the consent of the owner. By the common law, larceny was either compound—i.e., the taking and carrying away with felonious intent of personal property from the person or house of the owner—or simple. Simple larceny was called grand larceny where the value of the stolen property was more than 12 pence, and petit larceny where the value was less.

Only personal property can be the subject of larceny at common law. For injuries to the realty a remedy must be sought in trespass. Thus, if one enter upon another's premises and sever and carry away growing crops from the soil or fruit from the trees, he is not guilty of larceny, but is chargeable only in a civil action of trespass for goods carried away; but if an interval elapse after the severing, and the wrongdoer come upon the premises and carry away the property, previously detached from the realty, so that his taking amounts to a distinct transaction from the severance, he is guilty of larceny if other necessary elements of the offense, as intent, etc., concur. By the common law, undomesticated animals (see *FERÆ NATURÆ*) were not the subject of larceny, nor even when domesticated, unless their flesh were used for food. Accordingly, e.g., there was not such right of property in a dog that larceny of him could be committed. The property taken must have some value, however small; but the common law refused to recognize any value in assignable evidences of debt or mere rights to the recovery of debt, so that there could be no larceny of account books or notes or mere personal securities of any kind. But it is otherwise by statute law, which has also removed in most of the United States the distinction between different degrees of larceny.

To constitute larceny, the property must be actually taken and carried away; must be in the absolute possession of the thief; the taking and carrying must be against the consent of the owner or possessor and must be accompanied by a simultaneous felonious intent at the time the property is taken. Every larceny includes a trespass—i.e., an unlawful act—with force real or implied, to another's property; so that the intent necessary to constitute that offense really comprehends two separate items, viz., an intent to commit a trespass upon personal property of another and an intent to deprive him of his property. As trespass is a necessary part of larceny, and possession on the part of the owner is necessary in order to maintain an action of trespass, there can be no trespass against, and consequently no larceny from, an owner not in possession of the property taken. Thus, a common carrier does not commit larceny if he steal a bundle which has been intrusted to him, for he, and not the owner, has the legal possession of the property. The carrier, having possession of the goods, cannot commit trespass. But if he tear the bundle open and steal goods contained in it, he commits larceny; for by breaking open

the bundle he terminates his contract with the owner and loses his right to the possession of, the goods, the taking and conversion of which, added to his act of trespass, make him guilty of larceny. A servant who is intrusted by his master with the care of goods has no legal possession and is chargeable with larceny of such goods.

The taking necessary to constitute larceny must be against the owner's consent, and if such consent be had, though fraudulently gained, there will be no larceny, but an obtaining of goods by false pretenses (q.v.). But it has been held that there is a distinction between the cases of an owner who by fraudulent representations is induced to transfer his goods, and who intends and expects to be divested of his rights of property in them, and the case of an owner who parts for a time, as he supposes, with his property, while at the same time the person who gets possession of the goods intends to convert them to his own use and to deprive the owner permanently of them. It is held that the latter case may be larceny.

The common-law rules on this topic have been materially changed by statute, both in Great Britain and in the United States, and the conversion of goods to one's own use with felonious intent, as in the embezzlement of money which has been intrusted to one, is now generally defined and punished as larceny. This legislation should be examined in each jurisdiction. Consult Bishop, *Commentaries on the Law of Statutory Crimes* (Chicago, 1901), and Clark and Marshall, *The Law of Crimes* (2d ed., St. Paul, 1905).

LARCH (OF. *larege*, *larice*, from Lat. *larix*, Gk. *λάριξ*, larch), *Larix*. A genus of trees of the family Pinacæ, differing from firs (*Abies*) in having the leaves deciduous and in clusters, instead of solitary and persistent. The character of deciduous leaves is a common one with *Taxodium*, the cypress, as distinguished from the other common conifers. The common larch (*Larix decidua*) is a beautiful tree, growing wild on the mountains of the south and middle of Europe and found also in Asia, where it extends much farther north than in Europe. Its perfectly erect and regularly tapering stem, which rapidly attains a height of from 60 to 100 feet, its small branches, its regular conical form, and its very numerous and very small leaves make its aspect peculiar. It is extensively planted as an ornamental tree, for windbreaks, etc., in the United States. It is useful even at an early age, the thinnings of a plantation being employed for hop poles, palings, etc. The older timber is used for a great variety of purposes. It is close-grained, very resinous, has great strength and durability, is not readily attacked by worms, and is much used in shipbuilding. It is, however, very apt to warp and is therefore not well suited for planks. Larch bark is used for tanning, although not nearly equal in value to oak bark. In Siberia the scorched stems yield a gum similar to gum arabic, which is known as Orenburgh gum. In warm countries a kind of sweetish manna (q.v.), with a slight flavor of turpentine, exudes from the leaves of the larch in the hottest season of the year. In France it is known as Briançon manna. The larch woods have of late suffered greatly from a disease in which the centre of the stem decays. The trouble is attributed to the attack of *Polyporus sulphureus* and *Polyporus schœnietzii*, two shelf fungi. The larch is subject to a canker that destroys many trees. The fungus causing it

is known as *Peziza willkommii*. It gains entrance through wounds, destroying the bark. The canker spots enlarge each year. A leaf rust occurs on larch, due to the fungus *Melampsora laricina*, which forms yellow pustules on the leaves. The other stages of the fungus are passed on the poplar. In pure wood plantations or forests the larch frequently suffers severely from these diseases, as well as from the attacks of numerous insects. The larch does not dislike moisture, but stagnant water is very injurious to it, and thorough drainage is therefore necessary.

The American larch, tamarack, or hackmatack (*Larix laricina*), distinguished by very small cones, is common in the northern parts of North

AMERICAN LARCH.

America. It is a noble tree, which sometimes attains a height of 90 feet, and its timber is highly valued in shipbuilding, for fence posts, telegraph poles, railway ties, etc. It is found in North America from Virginia to Hudson Bay and is called hackmatack in parts of Canada, but in the Middle and Western States tamarack. It is occasionally found on uplands, especially in its northern habitats, but in the Middle States it grows mostly in moist soils and shallow swamps, often where the muck or peat is deep. The American larch is inferior to the European tree for ornamental purposes, the latter having more fully leaved and pendulous branches and cones one-half larger. The Himalayan larch (*Larix griffithii*) abounds in the Himalayas, but is generally a small tree of 20 to 40 feet high. Its cones are larger than those of the common larch. See Plate of TAMARACK AND LARCH.

LARCH CONES. See COPROLITES.

LARCHER, lâr'shâ', PIERRE HENRI (1726-1812). A French classical scholar, born at Dijon. After devoting some time to the study of law, he turned to the classics and won fame by a translation, published at first anonymously, of the Greek romance, *Chæreas and Callirrhoe*, of Chariton (q.v.). Through his *Mémoire sur Vénus* (1775), a work in the field of archaeology and mythology, once rated highly, he won admission to the Académie des Inscriptions (1778). In 1809 he became professor of Greek literature at the University of Paris. He translated the *Electra* of Euripides and the *Cyropædia* of Xenophon; but his most important work, the fruit of the labors of 15 years, was his translation of Herodotus, with important notes on historical, geographical, and chronological ques-

tions, with many illustrative citations from ancient and modern authors (7 vols., 1786; repeatedly republished; reëdited as late as 1880, by L. Humbert; translated into English, London, 1829; new edition of the translation, by Cooley, 1844). Consult J. F. Boissonade, *Notice sur la vie et les écrits de Pierre Larcher* (Paris, 1813).

LARCHEY, lâr'shâ', ETIENNE LORÉDAN (1831-1902). A French author and antiquary, born at Metz, son of an artillery general. He was educated at the Collège Saint-Louis and at the Ecole des Chartes. In 1852 he was first employed in the Mazarin Library, and after he had become its librarian went to the library of the arsenal as adjunct curator, of which he was appointed curator in 1880, and where he specialized in historical research and in linguistic study. He edited much correspondence and historical matter and wrote *Un mois à Constantinople* (1855), *Origines de l'artillerie française* (1862), and *Planches autographiées d'après les monuments du XIV^{ème} et du XV^{ème} siècles* (1863); and the linguistic studies, *Les eccentricités du langage* (1860), reprinted in 1883, with the title *Dictionnaire historique, étymologique et anecdotique de l'argot français*, as well as much miscellaneous matter.

LARCHMONT. A village of New York. See MAMARONECK.

LARCH SAWFLY. A sawfly (*Nematus erichsonii*) whose larvæ are very destructive to larch forests in the United States and Canada, especially in northern New England. It also occurs in northern Europe. The eggs are laid in a row upon and within the young larch shoots in June or July, and the larvæ feed upon the leaves until August, sometimes defoliating all of the trees over a large area of hackmatack swamps.

LARCIUS. The name borne by two Romans in early Roman history. 1. Spurius Larcus with Horatius Cocles defended the Pons Sublicius against the Etruscans. See HORATII. 2. Titus Larcus, consul and dictator in 501 B.C., and commander in that year against the Latin cities, which were seeking to restore the Tarquins to Rome. He showed statesmanlike qualities in opposing severe measures against the Latins and in seeking to relieve the lot of the plebeians.

LARCHOM, Lucy (1826-93). An American poet, born at Beverly, Mass. She passed most of her childhood at the seaside and worked as a young woman in the mills at Lowell, Mass. Here she contributed to the *Lowell Offering*, a periodical which existed about 1840-45 as a literary journal for the mill operatives. Her work attracted the notice of Whittier, with whom she afterward compiled *Child-Life and Songs of Three Centuries*. Later she became a student in the Monticello Female Seminary in Illinois and after that a teacher in the Wheaton Female Seminary, at Norton, Mass. In 1865 she became assistant editor (and from 1866 to 1874 was editor) of *Our Young Folks*, since merged in *St. Nicholas*. Before this she published *Similitudes* (1854); *Ships in the Mist, and Other Stories* (1859); *The Sun-Beam, and Other Stories* (1860); *Leila among the Mountains* (1861); *Poems* (1868); *Childhood Songs* (1877); *Wild Roses of Cape Ann* (1880). Her later years were passed chiefly at Beverly Farms, Mass. She died in Boston. Her *Poetical Works* were collected in 1884. Consult Addison, *Life, Letters, and Diary of Lucy Larchom* (Boston, 1894).

LARD (OF., Fr. *lard*, from Lat. *lardum*, *lardum*, *larida*, fat of bacon; perhaps connected with Gk. *λάριος*, *larinos*, fat, *λαρός*, *laros*, pleasant). The fat of the hog. Until after the first quarter of the nineteenth century lard was only used for culinary purposes and as the base of various ointments. Owing to the enormous extent, however, to which pork was produced in America, numerous other uses for lard were discovered, and large quantities were pressed at low temperature to separate the stearin and olein—of which it is composed in the proportion of 62 parts of olein to 38 parts of stearin and palmitin. The stearin was used for candle making, and the olein soon became a very important article of commerce, under the name of lard oil, which was found to be a valuable lubricant for machinery. Ordinary lard is extracted from the fat of the entire animal, *leaf lard* is taken only from the fat that surrounds the kidneys. It is exported from the United States in large quantities. Before the enactment of pure-food legislation in the United States lard was often adulterated. This is seldom the case now.

When fresh and well rendered, lard is white, has a pleasant odor and a mild flavor. As a culinary fat, it is wholesome and is extensively used in pastry making and for shortening doughs of many sorts and for frying.

There are many commercial lard substitutes, with trade names, which resemble it in appearance. Some consist in part, and others wholly, of vegetable fat—the latter sometimes a fat solid at ordinary temperature, made by adding hydrogen to liquid fat by means of some agent as a catalyzer.

LARDER BEETLE. See BACON BEETLE; DERMESTID BEETLE

LARD'NER, DIONYSIUS (1793–1859). An Irish writer on science. He was born in Dublin, graduated at Trinity College there in 1817, and took holy orders, but devoted himself almost entirely to scientific work. He first became known by his *Treatise on Algebraical Geometry* (1823) and by a work on the *Differential and Integral Calculus* (1825). In 1827 he was appointed professor of natural philosophy and astronomy in London University, now University College. He published several original memoirs, but devoted himself mainly to the popular exposition of science, and published a number of excellent "handbooks" of the various branches of natural philosophy; also a book, in 12 volumes, entitled *Museum of Science and Art*. He is best remembered, however, for his *Cabinet Cyclopaedia*, for which he secured the collaboration of the best scientists and authors of the time. In 1840 he eloped with a Mrs. Heavyside and found himself compelled to leave England. He spent five years (1840–45) in the United States, delivering courses of popular scientific lectures in all the principal cities. In 1845 he settled in Paris. His last months were spent at Naples.

LARDY, CHARLES (EDOUARD) (1847–). A Swiss jurist and diplomat, born in Neuchâtel and educated at the University of Geneva. In 1869 he became First Secretary of the Swiss Legation and in 1883 Minister to France. He represented Switzerland in many international congresses, was a member and in 1899 and 1902 president of the Institut de Droit International, and was first Swiss member of the Permanent Arbitration Court at The Hague. He translated into French

(1870; 4th ed., 1886) Bluntschli's *Codified International Law* and wrote on the legislation of the Swiss cantons, on sorcery trials in Neuchâtel, etc., and reports of congresses to which he was a delegate.

LAREAU, lă'rô', EDMOND (1848–90). A French-Canadian politician and author, born at St. Grégoire d'Iberville, Quebec. After completing his education at Ste. Marie de Monnoir, Victoria College, and McGill University, Montreal, he was admitted to the bar (1870) and six years afterward was appointed law professor at McGill. In 1886 he was elected to the Legislature of Quebec Province as Liberal member for Rouville County and retained his seat until his death. Besides editorial work, he wrote: *Histoire du droit canadien* (1872); *L'Histoire de la littérature canadienne* (1874); *Mélanges historiques et littéraires* (1877).

LAREDO, la-ră'dô. A city, port of entry, and the county seat of Webb Co., Tex., 154 miles by rail southwest of San Antonio, on the Rio Grande, opposite Nuevo Laredo, with which it is connected by a bridge and on the International and Great Northern, the Mexican National, and the Rio Grande and Eagle Pass railroads (Map-Texas, C 6). Among the features of the city are the market, Federal building, an old Spanish cathedral, the railroad bridge over the river, a convent, Mercy Hospital, a fine courthouse and jail, Laredo Seminary (Methodist Episcopal South), established in 1882, and a city park of about 65 acres. Laredo is in a fertile agricultural and stock-raising district, which has also valuable mineral deposits, especially of coal; is an important commercial centre with a large international and local trade, exporting bricks, wool, live stock, Bermuda onions, coal, etc.; and has sheet-metal works, broom and mattress factories, car and machine shops, several brick-works, coal mines, wagon, pickle, and cracker factories, a hide establishment, foundries, etc. The city's imports in 1913 amounted to more than \$2,500,000, while its exports were about \$14,000,000. Settled by Spaniards and laid out in 1767, Laredo was long a frontier town of Mexico and bore the reputation of a border town. It was first incorporated about 1848. Pop., 1900, 13,429; 1910, 14,855; 1914 (U. S. est.), 15,461.

LARENTA, LAR'ENTA'LIA. See AOCIA LARENTIA

LA'RES (Lat. pl.; sing. *Lar*; early pl. *Lases*; no satisfactory derivation of the word has been given). Local divinities of the ancient Romans, originally protectors of the tilled land. They belong to the original element in the Roman religion and were in early times worshiped especially in the country. At crossroads or where several pieces of property joined were erected *compita*, or chapels for the *lares compitales*, with an altar on each separate piece of property so that the owner could make his offerings on his own land. At the hearth also was an image or shrine of the *lar familiaris* (the singular is always used till the time of Augustus, in the singular, too, the word came to mean "home"), though properly he is the guardian of the land rather than of the house. The worship of this guardian spirit seems to have been especially connected with the servants of the house or the slave tenants. At the Compitalia, an annual festival held in late December or early January, the slaves were allowed much license, and the rustic feast was an occasion for general merry-

making. At the hearth the lar received an offering on the Kalends, the Nones, and the Ides (see *KALENDS*), as well as at all family festivals. This offering usually consisted of food or drink, or merely garlands or incense, only on very solemn occasions, as after a death, was a victim sacrificed. Alongside these *lares privati*, or lares of the individual estate or household, were the *lares publici*, or *lares praestites*, who watched over the public lands, and whom the Arval Brothers (q.v.) invoked in their ancient hymn. They had a temple and altar on the Via Sacra, near the Palatine, they wore the chlamys (q.v.), carried lances, and had a watchdog at their feet. The worship of the *lares compitales* even entered the city of Rome, though under the Republic it does not seem to have been found within the ancient limits of the Septimontium. The *collegia compitalicia*, who celebrated this worship, were made up of freedmen and slaves, thus to the lower classes, and proving

a source of disorder that the Senate in 64 B.C. attempted their suppression; they were finally abolished by Cæsar. Under Augustus the whole worship received a new direction. He established a *compitum* in each of the *vici* into which he divided the city of Rome, where the lares, now called *lares Augusti*, were worshiped, between them was worshiped also the genius of the Emperor. This worship spread through Italy and the provinces and even was adopted in the household cult, where we now find the two lares with the genius of the house owner between them. There were also *lares vales* and *lares permarini*. The lares are regularly represented as dancing youths, in short tunics, high girt, holding a cup or patera in one hand, into which they pour wine from a horn held aloft in the other. For an illustration showing the lares, consult Mau-Kelsey, *Pompeii: Its Life and Art* (2d ed., New York, 1902). The type was an old one and evidently refers to the feasting and dancing of the early rural festival. Though originally distinct from the penates (q.v.), the lares came ultimately to be virtually identified with them. Consult: Fowler, *Roman Festivals* (London, 1899); Mau-Kelsey, *Pompeii: Its Life and Art* (2d ed., New York, 1902); Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

LA REY, JACOB HENDRICK DE. See DE LA REY, J. H.

LAR'GESSE, or **LAR'GESSE** (OF., Fr. *largesse*, It. *larghezza*, bounty, from Lat. *largiri*, to give generously, from *largus*, large, abundant). Literally, 'giving freely'; later meaning 'equal to bounty.' It was a term used commonly by the minstrels in the Middle Ages, who cried "a largesse." At a later period it became the custom to grant certain fees to heralds for their services on state occasions, and these were called a largesse. According to Skeat, "the term is still used in some parts by gleaners, who cry 'largesse' when they see a stranger passing by."

LARGHETTO, lăr'gĕt'tō. See LARGO.

LAR GIBBON. See GIBBON.

LARGILLIÈRE, lăr'zhĕl'yâr', NICOLAS (1656-1746). A French portrait painter. He was born in Paris, the son of a wealthy hatter, who afterward settled at Antwerp. In this city, still dominated by the art of Rubens, he passed most of his youth, and he studied under Antoine Goubaux. In 1674 he went to England and worked under Sir Peter Lely, who employed him in restorations. He soon received the favor of Charles II, but was expelled in 1678 by an ordi-

nance of Parliament against Catholic strangers. Returning to Paris, he was befriended by Lebrun and Van der Meulen and soon became one of the foremost portrait painters. On the invitation of James II he returned to London in 1685 and painted portraits of the King and his Queen, but declined flattering offers to remain, and afterward lived in Paris, where he became rector (1722) and chancellor of the Academy (1743). Besides single pictures, he also excelled in large portrait groups, such as the votive picture once at Saint-Étienne du Mont (1694). He painted single portraits of all the celebrities of the time, with lively color and much elegance, and is said to have produced more than 1500 portraits. His works have often been engraved, notably by Brevet. They are best represented in the Louvre, which possesses 13 examples, among others the portraits of Largillière and his family, the painter Le Brun, "Un Echevin" (alderman), the Count of Chatre, and others. He is well represented in French provincial museums; in the Berlin Museum by the portrait of his father-in-law, Jean Forest; in the National Portrait Gallery, London, by portraits of Prince Charles Edward Stuart, and the latter's brother Cardinal York. In the Wallace collection, London, by Louis XIV and his family, and in the Metropolitan Museum, New York, by Madame de Thorigny. Consult Foster, *French Art from Watteau to Prudhon*, vol. 1 (London, 1905), and Roujon, *Les peintres illustres* (Paris, 1913).

LARGO, lăr'gō (It., large). A word used in music to denote the slowest of all the tempi and especially in compositions where the sentiment is quite solemn. It is very seldom used for entire movements, because the characteristic heaviness of this tempo is too oppressing. For a short introduction (q.v.) to a following allegro the largo is very effective, and a great favorite with composers writing in the sonata form. Beethoven in his Sonata op. 13 employs this tempo in a masterly manner for the introduction, and also, for the sake of contrast, for an episode within the allegro itself. The diminutive of largo is larghetto and denotes a time somewhat faster than largo. It is not an uncommon designation for the slow movement of a symphony or sonata.

LARGS, lăr'gz. A favorite resort for seabathers in Ayrshire, Scotland. It is situated on the Firth of Clyde, 36 miles southwest of Glasgow (Map: Scotland, D 4). It is known as a yachting centre; there is some fishing. Pop., 1901, 3246, 1911, 3724. Here, in 1263, Alexander III of Scotland, in the course of a war with the Norwegian colonies of Man and the Isles, defeated Haakon, the King of Norway, who, with 160 ships and 20,000 men, had descended upon the coast of Ayrshire.

LARI, lăr'rĕ. A city in the Province of Pisa, Italy, 8 miles by stage from Pontedera, which is 13 miles by rail east of Pisa. The city has an infant asylum and a theatre. The country produces grain, wine, and oil, and there are hot springs in the vicinity. Pop. (commune), 1901, 12,432; 1911, 12,268.

LA'RI (Neo-Lat. nom. pl., from Lat. *larus*, Gk. *λάρος*, gull). A suborder of birds, including gulls, terns, skuas, and skimmers (qq.v.), characterized by their long, pointed wings, nostrils open but not tubular, hind toe small and free, or rarely wanting. The bill is very variable, but never has lamellæ. The feet are fully

LARKS AND STARLINGS

1. ROSE-BREASTED PASTOR (*Pastor roseus*).
2. HORNED or SHORE LARK (*Otocoris alpestris*).
3. ENGLISH STARLING (*Sturnus vulgaris*).

4. SKYLARK (*Alauda arvensis*).
5. MEADOW LARK (*Sturnella magna*).
6. RED-BILLED OXPECKER (*Buphaga erythroryncha*).

webbed and provided with compressed curved claws. The plumage is soft, dense, and simply colored; bright colors are rare, except on the bill and feet, and the sexes are alike in color. The nest is ordinarily on the ground, and the eggs are about three, white with heavy blotches. They are chiefly marine birds, but are also found about large bodies of fresh water. More than 125 species are known, residing in all parts of the world.

LARIO, lá'rè-ò, LAKE (Lago di Lario). Another name for Lake Como (q.v.), Italy.

LAR'IOSAURUS (Neo-Lat., from Lat. *Laurus*, ancient name of the Lago di Como + Gk. *sauros*, *sauros*, lizard) A small extinct reptile. 3 feet long, of the order Sauropterygia, found fossil in the Triassic shales of northern Italy. It is related to the Plesiosaurs. See PLESIOSAURUS; REPTILE.

LARISA. See LARISSA.

LARIS'SA. The capital of the nomarchy or province of the same name in Thessaly, Greece (Map: Balkan Peninsula, D 5) It is situated on the Salamvria (ancient Peneus), 33 miles northwest of the port of Volo, with which it is connected by rail. It carries on an important transit trade, has manufactures of silk and cotton goods, and is a military headquarters as well as the seat of a Greek metropolitan. Pop., 1880, 13,610, 1896, 15,517; 1907, 18,041. In ancient times Larissa (Larisa) was regarded as the capital of Thessaly and was the residence of the reigning family of the Aleuadae. It was a large and wealthy city far into the Middle Ages. Long held by the Ottoman Turks, it was finally ceded to Greece in 1881. At that time fully one-third of the population was Turkish, a proportion which has since steadily declined. It was the headquarters of the Greek army in the war against Turkey in 1897, and an important centre of activity at the beginning of the Balkan War in 1913.

LA RIVE, la rév, AUGUSTE DE. See DE LA RIVE.

LA RIVE, CHARLES GASPARD DE (1770-1834). A Swiss physicist and chemist, born in Geneva. He studied medicine and the natural sciences in Edinburgh, became associate in the Academy of Geneva in 1802, and distinguished himself by researches in chemistry and natural history. He invented a galvanometer. Among his works may be noted: *Observations* (upon the conversion of starch into sugar), and *Essai sur la théorie des proportions chimiques et sur l'influence chimique de l'électricité*. De la Rive took an active part in the political life of Switzerland, was a member of the provisional council in 1813, and in 1817 became president of both councils of the Republic, but retired from public life in 1818 to proceed with his scientific work. He founded the museum of natural history and the botanic garden at Geneva.

LARIVEY, lá'rèvâ', PIERRE DE (c.1550-c.1612). A French dramatist, born at Troyes. His family was Italian, and he was a canon of the church of St Etienne at Troyes, but aside from these facts little is known of his life. In 1577 he began to write a series of prose comedies adapted from the Italian. Their fresh, natural dialogue and lively scenes make them the most important contribution to this kind of literature produced in the latter part of the sixteenth century. They were borrowed from by Molière. Six of them appeared in 1579 and three in 1611. They have been reprinted in

Viollet-le-Duc and Jannet's *L'Ancien théâtre français*, vols. v-vii (1879).

LA RIVIERE, lá'rèvyâr', ALPHONSE ALFRED CLÉMENT (1842-). A Canadian journalist and official. He was born in Montreal and was educated at St. Mary's College, Montreal. His journalistic experience was gained as special correspondent of *La Minerve* of Montreal and as editor of *Le Manitoba* and of *Le Canada* of Ottawa. In 1871 he was appointed to a position in the Dominion Lands Office, Winnipeg, and afterward became prominent in the affairs of Manitoba, as member of the Provincial Assembly, Provincial Secretary, Minister of Agriculture, and Treasurer. He served as president of the Board of Arts and Manufactures of the Province of Quebec, also as superintendent of Roman Catholic schools of Manitoba. In 1889-1904 he was a Conservative member of the Dominion Parliament and in 1905 was appointed Immigration Commissioner for Manitoba. In 1911 he was called to the Dominion Senate.

LA'RIX. The name of a genus of coniferous trees. See LARCH.

LARK (AS. *lærfce*, *lauerce*, OHG. *lërähhâ*, *lërehhâ*, *lërihhâ*, Ger. *Lerche*). Several different birds are called larks, but properly only those of the family Alaudidæ, of which skylarks and shore larks are good examples. The Alaudidæ are a small family of scarcely more than 100 species, very well characterized by the structure of the feet, in which the hind claw is very long and straight, and the tarsi are scutellate behind as well as in front, and the two series of plates meet along a vertical groove on the inner side of the tarsus. By many this is regarded as a very generalized character, and the group is accordingly assigned to one of the lowest positions in the order Passeres. Larks are small and mostly brownish birds, more or less streaked, but the shore larks show more or less yellow, white, black, rufous, and pinkish. They are most abundant in Africa, but are common in Europe and parts of Asia, while uncommon in Australia and America. Only a single genus occurs in the New World, that of the shore or horned larks (*Otocoris*). All of the larks are terrestrial birds, which nest and feed on the ground, and the food consists of seeds, worms, and insects. They are generally migratory, and some of them are great wanderers. Except during the breeding season they are very gregarious and are often seen in enormous numbers. The nests are generally made in open fields and the eggs, four or five in number, are dull and more or less speckled and blotched. The titlarks and meadow larks of America are not true larks, but belong to totally distinct families. See SHORE LARK; SKYLARK; and Plate of LARKS and STARLINGS.

LARKA-KOLS. See KOLARIAN PEOPLES.

LARK BUNTING. An American fringilline bird (*Calamospiza melanocorys*) which inhabits the plains and mountain valleys of the West from Kansas to Utah. It curiously combines the features of a grosbeak with the habits of a lark, being eminently a terrestrial bird in all its relations. It has a remarkably varied and brilliant song, which it often utters while soaring, much after the manner of the skylark. The plumage of the male, at the height of the breeding season, is uniform black, with a large conspicuous white patch on the upper part of the wing; the female is a streaked brownish gray with a smaller wing patch. At the close of the

breeding season the males lose their black color and assume the colors of the females and young, very much as does the bobolink. Excellent accounts of the habits and singing of this bird may be found in Coues, *Birds of the Northwest* (Washington, 1874), and Keyser, *Birds of the Rockies* (Chicago, 1902).

LARK FINCH, or **LARK SPARROW**. A small, pale-colored sparrow (*Chondestes grammacus*), very numerous on the prairies and plains of the western United States. Its song is animated and larklike and is very pleasing. It is not wholly terrestrial and is found in wooded and hilly places as well as on open lands.

LARKIN, JAMES (?-). An Irish labor leader. He organized the Irish Transport and General Workers' Union, of which he was secretary until his resignation in 1914. In this union he attempted to unite all Irish workmen, both skilled and unskilled, in one organization. He was especially active in the Dublin timber strike and the Irish railways' strike in 1911 and in the Dublin Transport Workers' strike in 1913. In connection with his labor agitation he was convicted on a charge of false pretenses in 1910, but the sentence was remitted; and in October, 1913, he was found guilty of sedition, was sentenced to seven months' imprisonment, but was released shortly afterward. The imprisonment served only to increase his reputation among his followers, besides arousing sympathy among other classes. In 1912 Larkin was elected to a seat on the Dublin Corporation. He was editor of a weekly labor paper, the *Irish Worker*. The movement which grew from his extraordinary influence among Irish workers came to be described as Larkinism; it represents in Ireland much the same phase of the whole labor movement as the revolutionary syndicalism of Europe or the American I. W. W.

LARK'SPUR (so called from the spurlike

LARKSPUR.

formation of the calyx and petals), *Delphinium*. A genus of plants of the family Ranunculaceæ,

annual and perennial herbaceous plants, natives of the temperate and cold regions of the Northern Hemisphere. The species, of which about 100 have been described, have five sepals, the upper spurred; four petals, distinct or united into one, the two upper having spurs inserted into the sepaline spur; and one to five many-seeded follicles. Many species are cultivated as ornamentals, among which the annuals *Delphinium ajacis* and *Delphinium consolida*, natives of Europe, and the perennials *Delphinium grandiflorum*, *Delphinium hybridum*, and *Delphinium formosum*, all natives of Asia, and their many varieties are the most popular. Among the more common American species are *Delphinium tricornis* and *Delphinium exaltatum*, found from Pennsylvania to Minnesota, and southward; and *Delphinium menziesii*, *Delphinium nudicaule*, and *Delphinium scopulorum* of the Western States and Pacific coast. *Delphinium staphisagria*, called stavesacre, cultivated in Europe, is used in medicine. It contains a number of alkaloids, having in general the same action as aconite. Numerous cases of stock poisoning due to eating larkspur are reported from the Western ranges. Horses and cattle seem subject to larkspur poisoning, while sheep are practically immune.

LARKSPUR, YELLOW. See TROPÆOLUM.

LARKSVILLE. A borough in Luzerne Co., Pa., 2 miles west of Wilkes-Barre, on the Susquehanna River. It is situated in a rich coal district, the mining of which constitutes the chief industry. Pop., 1910, 9288.

LARMES, larm (Fr., tears). A charge in heraldry (q.v.). When the field is bestrewn with an indefinite number of drops of a blue color, it is said to be *gutté de larmes*—a term peculiar to British heraldry.

LARMINIE, WILLIAM (?-1899). An Irish poet, born in County Mayo, Ireland. He lived most of his life in or near Dublin, and his work is a part of the movement known as the Irish Literary Revival (see IRISH LITERATURE, *In English*). He is of that group of Irish poets who chose to use Gaelic myth and romance as the machinery of their poetry and to inspire the ancient legends and sagas with modern and living hopes and aspirations. At his best, as in his dramatic poem, "Moytura," he shows himself a poet of sustained imaginative power. His books are: *Glanlua and Other Poems* (1889); *Fand and Other Poems* (1892); *West Irish Folk Tales and Romances* (1893).

LARMOR, lăr'mor, SIR JOSEPH (1857-). A British physicist, born in Maghergall, County Antrim, Ireland. He was educated at Queen's College, Belfast, and at St. John's College, Cambridge; taught natural philosophy in Queen's College, Galway, from 1880 to 1885; and from 1885 to 1903 was lecturer on mathematics and then Lucasian professor of mathematics at Cambridge University, which elected him, as a Unionist, to Parliament in 1911. He was knighted in 1909, was secretary of the Royal Society in 1901-12, and received honorary degrees from most of the British universities. Besides many contributions to technical journals, he wrote *Æther and Matter* (1900), particularly important for its theory that an atom is an aggregation of positive and negative electrons.

LARNACA, or **LARNAKA**, or **LARNICA** (Lat. *Citium*, Gk. *Klriov*, *Kition*). A town of Cyprus (q.v.) in lat. 34° 55' N. and long. 33°

38' E., on the south coast of the island (Map: Turkey in Asia, B 3). It has a good roadstead, but the town is not attractive, though it has improved since the English occupation. The chief public buildings in Larnaca are the Greek church of St. Lazarus, a Roman Catholic church, and a Franciscan monastery. Larnaca is the chief seat of the commerce of the island, and the residence of European merchants and consuls, whose homes are for the most part in the Marina, or part of the city situated on the shore and a short distance from Larnaca proper. At the Marina are also the public offices. The facilities for landing have been improved by the erection of two iron piers, though large vessels are still obliged to anchor in the roadstead. Pop., 1914, about 9000. The ancient Citium was probably a Phœnician settlement, and many scholars hold that it gave its name to the island, which is identified with the land of Kittim mentioned in the Bible. The city seems to have long kept its Phœnician character, as a number of inscriptions in that language have been found on the site, though later the population was largely Greek. Mycenaean tombs, too, have been found. It was the native place of Zeno, the founder of the Stoic school of philosophy.

LARNAUDIAN EPOCH. The name applied to an epoch in European prehistoric archaeology at the close of the Bronze age and so called from the station of Larnaud in the Jura Mountains. See NEOLITHIC PERIOD.

LARNE, larn. A seaport town and summer resort of Ireland, in County Antrim, on Lough Larne, 20 miles north of Belfast (Map. Ireland, F 2). A mail steamer sails daily between Larne and Stranraer in Scotland, 35 miles distant, the shortest sea passage between Great Britain and Ireland. The project of a tunnel to Portpatrick, Scotland, has long been mooted. Pop., 1911, 8036.

LARNED. A city and the county seat of Pawnee Co., Kans., 240 miles by rail west by south of Topeka, at the confluence of the Arkansas and Pawnee rivers, and on the Atchison, Topeka, and Santa Fe and the Missouri Pacific railroads (Map. Kansas, C 6). It is the shipping centre of a fertile wheat and stock-raising country and has flour mills, foundry and machine shops, an ice factory, etc. The city contains a State hospital for the insane, a large experimental farm, the Larned Sanitarium, a hospital, city library, and old Fort Larned military reservation and fort. There are municipally owned water works and an electric-light plant. Pop., 1900, 1583; 1910, 2511.

LARNED, JOSEPHUS NELSON (1836-1913). An American author and librarian, born at Chatham, Ontario, Canada, and educated in the public schools of Buffalo, N. Y. He was on the editorial staff of the *Buffalo Express* in 1859-72, superintendent of education in Buffalo in 1872-73, and superintendent of the Buffalo library in 1877-97. In 1893-94 he served as president of the American Library Association. He is author of *Talks about Labor* (1877); *A Talk about Books* (1897); *History of England for Schools* (1900); *A Multitude of Counsellors* (1901); *Primer of Right and Wrong* (1902); *History of the United States for Secondary Schools* (1903); *Seventy Centuries. A Survey* (1905); *Books, Culture, and Character* (1906); *A Study of Greatness in Men* (1911); *A History of Buffalo* (1911). He edited *The Litera-*

ture of American History (1902) and *History for Ready Reference* (7 vols., 1895-1910; rev. ed., 1913).

LAR/NICA. A town in Cyprus. See LARNACA.

LA ROCHE, là rôsh, KARL (1794-1884). An Austrian actor, born in Berlin. Thanks to Iffland's influence, he went on the stage, making his first appearance in Dresden at 17 and playing in Danzig, Lemberg, Berlin, Königsberg, and, in 1823, Weimar, where he met Goethe. In 1883, after several tours, he was engaged for life in the Vienna Hofburgtheater. He received the order of the Iron Crown, with the title of Chevalier, in 1873. His rôles were many and varied and were famed for their naturalness and the conscientious study of the author which they evidenced. Chief among them were Mephistopheles (a part La Roche learned under Goethe's supervision), Lear, Shylock, Cromwell, and Malvolio. Consult Mautner, *Karl La Roche* (Vienna, 1873).

LA ROCHE, SOPHIE. (1731-1807). A German novelist, born at Kaufbeuren. After her father's second marriage Sophie was sent (1750) to Biberach to live with the Wieland family. Her love affair with the young son of this family, Christoph Martin Wieland (q.v.), ended in a platonic friendship. The young poet wrote of her under the names Doris, Serena, and Sylvia. In 1754 she married Georg Michael Frank von La Roche (or Lichtenfels); their home near Coblenz became a meeting place for the literary men of the day. Goethe celebrates it in the thirteenth book of his *Dichtung und Wahrheit*. Her novels are written in the letter form of Richardson, and the characters of her best-known novel, *Geschichte des Fräulein von Sternheim* (1771), resemble those in *Clarissa Harlowe*. Her other books are: *Moralische Erzählungen* (1782); *Geschichte von Miss Long* (1789); *Schönes Bild der Resignation* (1795), and *Melusiens Sommerabende* (1806). Consult: Ludmilla Assing, *Sophie Laroche* (Berlin, 1859); H. Loeper, *Goethes Briefe an Sophie Laroche* (ib., 1879); Ridderhoff, *Sophie La Roche, die Schülerin Richardsons und Rousseaus* (Einbeck, 1895).

LA ROCHEFOUCAULD, là rôsh'fôô'kô', FRANÇOIS (1613-80), sixth DUKE OF, PRINCE OF MARCILLAC. A French epigrammatic moralist, born in Paris, Dec. 15, 1613. He is a type of the cynical satirist of human nature. Of ancient and powerful family, he had little scholastic education, but was an apt pupil in the school of public life. He joined the army at 16, being already nominally married to Andrée de Vivonne, of whom little is known. He served in the army for some years bravely but without distinction, became attached to Madame de Chevreuse and through her to Queen Anne, and engaged in intrigues against Richelieu and in the plots of the Fronde. His *Apologie du prince de Marcollac* appeared in 1649. His father died in 1650. He was shot in the head at the battle of the Faubourg Saint-Antoine, 1652, spent some years in country retirement, returned to court shortly before Mazarin's death, became a leading light of the literary salon of Madame de Sablé, was vexed and imperiled by the publication of alleged *Mémoires* in 1662, and in 1665 published anonymously his famous *Maximes*, under the title *Réflexions ou sentences et maximes morales*. From this year till his death (March 17, 1680) he was a close friend of Madame de La Fa-

yette (q.v.) and lived in dignity and honor, troubled only by the gout, of which he died. His *Mémoires*, first published in an approximately genuine form in 1817, are among the best of a time peculiarly rich in this form of writing; his *Lettres*, first published in 1818, are of great historic and social interest; his *Maximes*, passing through five editions in his lifetime and increased by 50 in an edition of 1893, are astonishingly acute analyses of motive. They combine to a degree never surpassed clearness, point, pregnancy, and brevity. The social philosophy that they enforce is that of self-interest, "in which all virtues are lost like rivers in the sea"; but it is an inference, not a doctrine. There are some 700 of these maxims, often of but two or three lines, never of more than 20, and all so expressed as to be an enduring artistic delight. La Rochefoucauld's *Œuvres* are admirably edited by Gilbert and Gourdault (3 vols., Paris, 1868-84). Editions of the *Maximes* are many. The finest is the *Édition des bibliophiles* (1870).

Bibliography. Levasseur, *La Rochefoucauld* (Paris, 1862); Sainte-Beuve, *Causeries*, vol. ii (ib., 1881); Deschanel, *Pascal, La Rochefoucauld, Bossuet* (ib., 1885); Rahstedt, *Studien zu La Rochefoucauld* (Brunswick, 1888); Bourdeau, *La Rochefoucauld* (Paris, 1895); Hémon, *La Rochefoucauld* (ib., 1896); R. Grandsaignes d'Hauterive, *Le Pessimisme de La Rochefoucauld* (ib., 1914), containing a bibliography.

LA ROCHEFOUCAULD-LIANCOURT, lyān'kōōr', FRANÇOIS ALEXANDRE FRÉDÉRIC, DUKE OF (1747-1827). An eminent French philanthropist. In the period preceding the outbreak of the French Revolution he devoted himself to the study and practice of benevolent works, founding on his estate near Clermont a model school for the education of the children of poor soldiers. He was a representative of the nobles of Clermont in the States-General, where he displayed remarkable activity in matters concerning the amelioration of the condition of the poor and the defective. After the dissolution of the National Assembly he was made lieutenant général and placed in command of the Department of Normandy. He fled from the Terror to England (1792) and visited North America (1795-97), a journey on which he published *Voyage dans les États-Uns d'Amérique* (8 vols., 1798). He wrote also *Les prisons de Philadelphie* (1796), in which he advocated radical penological reforms and the abolition of capital punishment. From 1799 La Rochefoucauld-Liancourt lived quietly in Paris, occupied only with the extension of vaccination and similar works of benevolence. Napoleon restored to him his ducal title in 1809. After the Restoration he was made a peer, but soon gave offense to the court by opposing its unconstitutional policy. He founded the first savings bank in France.—His second son, ALEXANDRE, Count of La Rochefoucauld (1767-1841), served under Lafayette in the early years of the Revolution, but fled the country at the same time as his father. Under Napoleon he was diplomatic representative at the Saxon court, at Vienna, and in Holland. After the fall of Napoleon III he was a member repeatedly of the Chamber of Deputies and in 1833 was raised to the peerage.

LAROCHEJACQUELEIN, là-rōsh'zhāk'lān', DU VERGER DE. An ancient and noble family of Poitou in France, distinguished for its devotion to the cause of the Bourbons after 1789.—HENRI

DU VERGER, Count de Larochejacquelein (1772-94), was born at the château of La Darbellière, near Châtillon, became an officer in the Guard of Louis XVI, and after the bloody event of Aug. 10, 1792, left Paris and joined the Royalists in La Vendée. He fought in all the long series of battles at Aubiers, Beaupréaux, Thouars, Fontenay, Saumur, and Chatonay. After the decisive defeat at Cholet (October, 1793) he was made generalissimo of the Vendean forces, though only 21 years of age. He led his men successfully for a time, took Laval, but was defeated by Westerman and Marceau at Le Mans, Dec. 13, 1793, and his army was scattered. He raised a new body of troops in Upper Poitou, but was killed in a battle at Nouaille, March 4, 1794.—His brother, LOUIS DU VERGER, Marquis de Larochejacquelein (1777-1815), was born at Saint-Aubin, emigrated at the commencement of the Revolution, returned to France in 1801, but resisted all Napoleon's efforts to win him, and in 1813 placed himself at the head of the Royalists in La Vendée. Louis XVIII appointed him in 1814 to the command of the Army of La Vendée, and during the Hundred Days he maintained the Royalist cause there, supported by the British. He fell in battle at Pont-des-Mathis, June 4, 1815.—His wife, MARIE LOUISE VICTOIRE, Marquise de Larochejacquelein (1772-1857), published *Mémoires* (1855) treating of the war in La Vendée, of which she was an eyewitness.—HENRI AUGUSTE GEORGES DU VERGER, Marquis de Larochejacquelein (1805-67), son of Louis, was made a peer in 1815, fought for the Holy Alliance in Spain in 1823, and joined the Russians against the Turks in 1828. He brought about a rising in La Vendée against the July monarchy and was an uncompromising Legitimist till 1848, when he accepted the Republic, sat in the Constituent and Legislative assemblies and became an adherent of Louis Napoleon, who made him senator in 1852.—JULIEN MARIE GASTON DU VERGER, Marquis de Larochejacquelein (1833-97), was elected in 1871 as a member of the National Assembly and later of the Chamber of Deputies, where he was one of the leaders of the monarchist opposition, to which he belonged until his death. He approved of the parliamentary coup d'état of 1877 and voted regularly against the Republic, thus upholding the Royalist traditions of his family.

Consult: Nethut, *Vie de Mme la Marquise de Larochejacquelein* (Paris, 1870); Anon., *Henri de la Rochejacquelein et la Guerre de Vendée* (Nivet 1890); M. M. Scott, *Life of Madame de la Rochejacquelein* (London, 1911).

LA ROCHELLE. See ROCHELLE, LA.

LAROMIGUIÈRE, là'rō'mé'gyār', PIERRE (1756-1837). A French philosopher, born at Lévignac. He was professor of philosophy at Toulouse, but was not acceptable because of the views he published on the relations of property and taxation. But his success was greater when he went to Paris, where he was professor of logic in the Ecole Centrale, later held a chair in the Prytanée (Lycée Louis-le-Grand), and in 1811 became professor in the faculty of letters, University of Paris. In 1796 he was made an associate of the Institute and in 1833 a member of the Academy of Moral and Political Sciences. He became a member of the Tribunate (see end of article FRENCH REVOLUTION) in 1799. His works are: *Projet d'éléments de métaphysique* (1793), two *Mémoires* read before the Institute, treating the

analysis of thought and the meaning of the term "idea"; *Les paradoxes de Condillac* (1805), completing his work as editor of his teacher (1798) and enunciating the equational theory of the judgment after the manner of Condillac, but with his own addition of the important part played by attention, and *Leçons de philosophie* (1815-18).

LA RONCIÈRE LE NOURY, là rôn'syâr' lê nōō'rê', CAMILLE ADALBERT MARIE CLÉMENT, BARON DE (1813-81). A French vice admiral, born in Turin. He entered the navy in 1830 and became captain in 1855. In 1856 he commanded Prince Napoleon's expedition to the Polar Sea and, in 1860-61, in the Levant. He was promoted rear admiral in 1861, conducted the evacuation of Mexico in 1867, became vice admiral in 1868, and in 1870 commanded the marines at the Paris forts. He was commander in chief at Saint-Denis and took a conspicuous part in the battles before Paris. In the National Assembly and in the Senate, to which he was elected in 1871 and 1876 respectively, he favored the Bonapartists. He wrote *Considérations sur les marines à voiles et à vapeur de France et d'Angleterre* (1844) and *La marine au siège de Paris* (1872). His biography was written by Jancigny (Evreux, 1881).

LA ROTHIERE, là rô'tyâr'. A village in the Department of Aube, France, about 7 miles southwest of Brienne. Pop., 1911, 94. It is noted as the scene of a stubborn contest between Napoleon I and the allies under Blücher, Feb. 1, 1814. The French, who numbered some 45,000 men, were attacked in a strong position by Blücher with more than twice the number of troops, and after a sanguinary struggle the allies succeeded in driving the French from La Rothière. The loss on each side was about 4000 men.

LAROUSSE, là'rōōs', PIERRE ATHANASE (1817-75). A distinguished French grammarian, lexicographer, and encyclopædist, born at Toucy. He was the son of a village blacksmith. He became a high-minded Republican, identified with the dominating influences of his time. He gained notice and wealth as a writer of textbooks and an educational publisher. In his works the general aim—new in that day—was to aid the pupil to think for himself rather than to depend on his memory. In 1858 Larousse founded a journal of instruction, *L'Ecole Normale*. He finally employed his fortune in starting the *Grand dictionnaire universel du XIXe siècle* (1865-76). On this great undertaking rests his fame. It is a vast compilation of 15 volumes, with supplementary volumes, all in nonpareil. (See *ENCYCLOPÆDIA*.) The success of this work, which was first published in installments by subscription, was immediate and enormous, owing in part to its anecdotic character and the facilities it afforded journalists. It may be described as discursive, conversational, entertaining, rather than scholastic and critical, diffusive and liberal rather than methodical and imposing. The work is kept abreast of the times by the weekly *Revue Encyclopédique*; and there is published also, in connection, the small and popular *Dictionnaire complet illustré*, which is revised annually. The *Nouveau Larousse illustré* was published by Claude Augé (1898-1904). It is supplemented by a volume which appeared in 1906-07 and by the *Nouveau Larousse Mensuel*, which is indexed annually.

LARRA, lăr'râ, MARIANO JOSÉ DE (1809-37), best known as FIGARO. A Spanish satirist and critic, born in Madrid. He studied law at Valladolid and made his appearance in literature with a series of letters (1828-32), published in various short-lived sheets (*El Duende Satírico*, *El Pobrecito Hablador*) and written under several pseudonyms (*El Duende Satírico*, *El Pobrecito Hablador*, Andrés Niporeas, Ramón Arriala, an anagram, and *El Bachiller Juan Pérez de Munguía*). After the fourteenth number the pamphlet called *El Pobrecito Hablador* was suppressed by the government. Then Larra began his brilliant satirical studies, printed in *La Revista española*, in *El Mundo*, and elsewhere, under the pseudonym Figaro. He was bitter, pessimistic, and often savage in his attacks on contemporary politics, society, art, and letters; "but," a biographer says, "for unflinching courage, insight, and sombre humor, Larra has no equal in modern Spanish literature and scarcely any superior in the past." Made desperate by domestic difficulties and his own unfortunate temperament, he committed suicide in Madrid. Among his unpublished writings were found a completed historical drama *El Conde de Fernán González*, some verses, and a complete translation of Cooper's novel *The Pilot*. Besides his journalistic work he wrote a comedy, *No más mostrador* (1831); an historical drama, *Macías* (1834); a novel, *El doncel de Don Enrique el Doliente* (1834); and an essay, *De 1830 á 1835, ó la España desde Fernando VII hasta Mendizábal* (1836). His complete works were published under the title *Obras completas de Figaro* (Madrid, 1837; Barcelona, 1884). Consult M. Chaves, *M. J. de Larra (Figaro) su tiempo, su vida, sus obras* (Seville, 1898). F. Piñeyro, *El romanticismo en España* (Paris, 1904). J. Nombela y Campos, *Larra (Figaro)* (Madrid, 1909), a work not finished.

LARRABEE, WILLIAM CLARK (1802-59). An American Methodist Episcopal minister and educator, born at Cape Elizabeth, Me. In 1831-35 he was principal of the Oneida Conference Seminary, Cazenovia, N. Y., and afterward occupied the same position in the Wesleyan School at Kent's Hill, Me., where he also assisted in the State Survey (1837). In 1840 he went to Ind., to teach mathematics and natural science in Indiana Asbury (later De Pauw) University, and he was State Superintendent of Public Instruction in 1852-54 and again in 1856. Though an ordained minister, he never took a pastoral charge, but concentrated his energy upon raising the educational standards of his own church, in which work he met with a great measure of success. He published: *Scientific Evidences of Natural and Revealed Religion* (1850); *Wesley and his Co-Laborers* (1851); *Asbury and his Co-Laborers* (1853); and a collection of the articles he had written for the *Ladies' Repository*, entitled *Rosabower* (1854).

LARRAMENDI, lăr'râ-mên'dê, MANUEL DE (born near the end of the seventeenth century, c 1690; died in the second half of the eighteenth century, various authorities giving 1750, 1766, and 1776 as the date). A Spanish Jesuit, one of the earliest students of the Basque language. Born at Andoain, the son of Domingo de Garagorri, he took his mother's name. He studied at Bilbao; was professor of theology at Valencia, at Valladolid, and at Salamanca; and

lived for some time at court as confessor of the Dowager Queen Maria Anna, widow of Charles II, but in 1733 retired to Loyola and spent the remainder of his life in study. His *Antigüedad y universalidad en España del vascoense* (1728) attempts to prove that all the dialects used in Spain are derived from the Basque; and he is quite as fanciful in the statement, in *El imposible vencido: arte de la lengua vascongada* (1729), that, although all other dialects are imperfect, the Basque is as it was when God made it. His other works are *Discurso histórico sobre la antigua y hermosa Cantabria* (1736) and *Diccionario trilingüe, castellano, vascoense y latino* (2 vols., 1745).

LARREY, lá'râ', DOMINIQUE JEAN, BABON (1766-1842). A French military surgeon, born at Baudéan, near Bagnères-de-Bigorre. He studied medicine with his uncle, Alexis Larrey, and later attended two hospitals, the Hôtel Dieu and the Hôtel des Invalides, after having served for a short time both in the army and in the navy. In 1792 Larrey was appointed second physician to the Hôtel des Invalides and in 1793 accompanied the French army to Germany and Spain, making at this time the important invention of the *ambulance volante*, or flying hospital, for transporting the wounded. Napoleon summoned him to Italy in 1797, after he had taught for a short time at Toulon and been a professor in the medicosurgical school at Val de Grâce. Larrey accompanied Napoleon's expedition in 1798 to Egypt. Later he was placed at the head of the medicosurgical department of the French army, and was created Baron of the Empire in 1810, receiving also a considerable pension. He was wounded and taken prisoner at Waterloo. At the Restoration he lost his rank and pension, though the latter was restored in 1818. Larrey continued to fill important offices till 1836. He was appointed inspector of military hospitals in Algeria and sailed for Africa May 15, 1842. Returning in a few months after completing the work assigned, he died at Lyons. Apart from his talent, skill, courage, and humanity, Larrey gained great scientific reputation. He published *Mémoires de médecine et de chirurgie militaire* (1812-18) and *Ouvrage chirurgical* (1829-36). Consult Werner, *Jean Dominique Larrey, ein Lebensbild* (Stuttgart, 1885).

L'ARRONGE, lá'rônzh', ADOLF (1838-1908). A German dramatist, theatrical manager, and musical conductor, born in Hamburg. He studied music at the conservatory in Leipzig, was kapellmeister successively in Cologne, Stuttgart, Budapest, and from 1866 to 1869 at Kroll's Opera House in Berlin. He then became editor of the *Berliner Gerichtszeitung* and, after attaining popularity as a playwright, became theatre director at Breslau (1874). Subsequently (1882), in association with Förster, Haase, Barnay, and Friedmann, he bought the Friedrich-Wilhelm-Indische Theater, which he managed as the Deutsches Theater. Among his best-known plays are *Mein Leopold* (1872); *Hasemanns Töchter* (1874); *Doktor Klaus* (1878); *Die Sorglosen* (1882); *Der Weg zum Herzen* (1885); *Pastor Brose* (1895); *Die Wohltätigen* (1901); *Sanatorium Siebenberg* (1903). Many are still given. He also wrote a tragedy, *Die Loreley* (1886), made an adaptation of the second part of Goethe's *Faust*, entitled *Fausts Tod* (1889), omitting the Helena scenes, and published *Deutsches Theater und*

deutsche Schauspielkunst (1896). His complete works were issued in 1908.

LARSEN, lâr'sên, KARL HALFDAN EDUARD (1860-). A Danish dramatist and novelist, born at Rendsborg. He studied law and political science at the University of Copenhagen and in Berlin. From 1883 to 1888 he lived abroad. His two dramas, *Kvinder* (1889) and *Ære* (1889), won him a name for keen psychological observation and descriptive power. There followed *Den brogede Bog* (1891), well-told stories, *Cirkler* (1893); *Lystfart* (1896); *Poetisk Tyskland* (1898); *Det skønne Portugal* (1904), travel sketches. In *Udenfor Rangklaserne* (1896), *Dansk Soldatersprog tillands og tilvands* (1895), *Kresjan Vesterbro* (1897), *Danske Mænd* (1898), he has presented the life, and especially in masterly manner the language, of Copenhagen's lower classes. Another drama, similar to his first two, was *Ej blot til Lyst* (1894). Other works are *Dr Iw* (1896), *En Kvinde's Skriftmaal* (1901), *De ensomme* (1903), *Japansk Aand* (1909), *Danske Nybyggere* (1910), *Det springende Punkt* (1911), and *De der drog hjemmefra* (1912). In 1900 he became editor of *Juleroser*. Consult C. E. Jensen, *Vore Dages Digtere* (Copenhagen, 1898).

LARSSON, lâr'sôn, CARL OLOF (1853-). A Swedish painter, illustrator, and etcher. He was born in Stockholm and studied at the academy there and afterward in Paris. Beginning as an illustrator, he became known for his witty drawings and grotesque caricatures, then he took up water-color painting, in which he developed a remarkable technique, applying the colors unusually wet. He rapidly gained popularity as a delineator of homely scenes, but in late years devoted himself chiefly to decorative painting. Larsson became known as a clever and precise draftsman; his extraordinary facility, fantastic and charming originality. His water colors are soft and delicate; his decorative paintings fresh, graceful, and effective in color. Among the best of the latter are the mural paintings in the Fürstenberg Gallery, Stockholm, and in the National Museum, Stockholm, representing "Gustavus Vasa's Entry into Stockholm, 1523." The illustrations for Rydberg's *Singoalla* are good examples of his imaginative work. Four albums, filled with sketches made near his home, contain his best work in the medium of water colors.

LARTIGUE, lâr'têg', JEAN (1791-1876). A French navigator and hydrographer, born at Vic-en-Bigorre. He made voyages (1820-24) to South America and the South Sea and in 1844 carried on important hydrographic investigations in the West Indies. After 1860 he was attached to the French navigation bureau. Among other works he published *Description de la côte du Pérou* (1842) and *Exposition du système des vents* (1840; 2d ed., 1855).

LARUN'DA. See ACCA LARENTIA

LARVA (Lat., ghost, mask, given to the caterpillar because it was thought by the ancients to mask the form of the perfect insect or butterfly). When animals become free from the parent tissue or from the egg, they either have the form, if not the size, of the adult, or they differ very markedly from the adults both in form and structure, and spend more or less time as free individuals before maturity is gained. The latter method of development we denominate larval, in contrast to the former,

which is foetal. Larval development may take place either slowly and by gradual stages, or by abrupt changes which we call metamorphosis (q.v.). The development of both the embryo and the larva is a series of ontogenetic recapitulations of stages or conditions which the animal has passed through in its phylogenetic history. Secondary changes may frequently have come in to complicate and obscure the phylogenetic inheritance. Such changes are brought about by variations in the larval, pupal, or adult stage, which prove of advantage to the organism and hence are perpetuated by inheritance. A certain kind of secondary change—viz., shortening of development—is more possible in foetal than in larval development. Many organs that must be retained in larval development, because useful for the individual during some stage in its free life, can be dropped altogether in the foetus, because it is so well protected within the maternal body. Possibilities of variations are, however, greater in larval than in foetal development. Indeed, larvæ, such as those of many insects, may exist with secondary characters only. This tendency to acquire secondary characters is in a measure held in check by the necessity of retaining ancestral organs which are functionally useful to the larva at some stage in its transformations.

In order to allow every organ in its development to repeat even in an abbreviated way its phylogenetic history, there is a tendency to put off the differentiation of the tissues into their definitive organs as long as possible. Thus, when an organ is hatched certain organs are as yet wholly undifferentiated, while certain others, such as muscles and nerves, are histologically differentiated. The shorter the larval period the earlier certain organs must appear, and this fact sometimes necessitates their development out of their phylogenetic order and hence obscures the ancestral history. Many of the secondary modifications which are produced in larvæ are for the purpose of adapting the larvæ to escape from their enemies, such as transparency, protective coloration, or netting organs, and many of the spinous processes on larval crustaceans and fishes. Most of the marine larvæ are free-swimming, and are well provided with organs of locomotion for the purpose of scattering the larvæ over a wide region and thus preventing undue crowding of the adults by enlarging their area of distribution.

Larval stages exist in the development of certain species in all the groups from Infusoria up to Amphibia. A number of these larvæ differ so much in form and habitat from the adult that their nature was often unsuspected by earlier observers, and they were given generic and specific names. This is the case with the zœæ of crabs, the alima, erichthus, and squillerichthus of the *Squilla*, the pilidium of certain Nemertinea (q.v.) (at first named *Pilidium gyrans*), the scolex of the tapeworm, and the axolotl stage of the *Amblystoma*. Some of the larval forms, such as those of diplopod myriapods, crustaceans, and chordates, have few or no affinities to other than their own groups. There are a goodly number of larvæ, such as the cercaria of trematodes, about which we cannot make statements as yet, and there are a great many larvæ that possess affinities with two or more groups. These stages or affinities we consider to be the representatives of a common

ancestry. Thus, the planula, with its simple double-layered and bilateral structure, is probably the ancestral form of the Cœlenterata. The common ancestor of the vertebrates seems to have been a hydra-like organism, double-layered, and with a central digestive cavity and with only one opening. In the ontogenetic development of vertebrates this stage is represented by the gastrula.

The larvæ of insects, to which at first the term alone referred, differ very much in the degree of their development, depending on the order to which they belong. Some are almost like the adult, except for the lack of wings, as in the case of the Orthoptera, and others are legless larvæ depending entirely for food on the provision made for them by their parent. The larvæ of beetles we call "grubs," those of flies "maggots," and of butterflies and moths "caterpillars." In general, the larvæ of insects may be divided into two types, the *campodeaform* of Brauer and the *cruciform* of Packard, the latter being applied to the more or less wormlike, secondary larvæ, such as caterpillars and the maggots of flies, and of ants, wasps, and bees. The campodeaform larva is so called from its resemblance to the stem form of insects, campodea, such are the nymphs of the white ant, dragon fly, ephemera, etc. Active and voracious larvæ store up little reserve material; but the forms that pupate, such as the grubs, maggots, and caterpillars, store up a large amount of fat. The larval forms of certain species of flies are capable of reproducing their kind before they have reached maturity in all other respects. See PARthenogenesis, *Pedogenesis*.

Bibliography. Fritz Müller, *Facts for Darwin* (London, 1869); Balfour, *Comparative Embryology* (ib., 1880-81), A. S. Packard, *Text-Book of Entomology* (New York, 1898); Mitchell, *The Childhood of Animals* (ib., 1912), with the writings of J. Müller, Brauer, Claus, De Geer, Dohrn, Réaumur, Lyonnnet, Faxon, Brooks, Riley, Hyatt, J. V. Thompson, and others.

LARVÆ. A term used by Romans originally of the souls of the dead, conceived of as flitting about at night. Later, the term was used of malevolent spirits, the spirits of those who died stained with crime, then of ghosts in general. The larvæ were represented in various hideous forms, or as skeletons, in which shape they appeared in the *Atellanæ* (q.v.).

LARVIK, lår'væk. A seaport of Norway. See LAURVIK.

LARYNGITIS (Neo-Lat., from Gk. λάρυγξ, *larynx*, larynx), or INFLAMMATION OF THE LARYNX. The usual catarrhal form may be either an acute or a chronic affection. In its milder form there is hoarseness, with discomfort or pain in the surrounding parts. This soon yields to warm inhalations and purgation. Acute laryngitis in its more severe form commences with a chill, which is followed by fever, with a strong pulse, a hot skin, and a flushed face. There are also soreness of the throat, hoarseness of the voice, great difficulty in swallowing, and a feeling of extreme constriction of the larynx. There is a painful stridulous cough, but only a little mucus is ejected. Great difficulty of breathing soon comes on, the act of inspiration being prolonged, with wheezing, in consequence of the swollen membrane of the glottis impeding the entrance of air. On examining the fauces the epiglottis (see LARYNX) is observed to be of a bright-red color, erect;

and so much swollen as not to be able to descend and close the glottis during deglutition. After an hour or two the symptoms subside and the patient falls asleep, breathing noisily. The trouble may recur during the night. In the morning the patient awakes apparently well, except for a cough.

In very rare cases death results, after cyanosis of the face, drowsiness, delirium, and feeble, rapid pulse. In most cases the patient suffers every night until the disease disappears at the end of four or five days. The cause of acute laryngitis is exposure to cold, inhalation of dust or irritating gases, or swallowing corrosive liquids. Ipecacuanha, tartar emetic, and a little alcoholic stimulant afford quick relief in most cases. If suffocation appears imminent, intubation or tracheotomy must be employed. A cold pack to the throat, inhalations of warm steam, or of steam impregnated with compound tincture of benzoin, as well as internal administration of the bromides, give relief. Chronic laryngitis occurs in public speakers or singers from overuse of the vocal cords (generally in neurotics or those having imperfect nasal chambers), as well as in millers, masons, and others who habitually inhale dust. The constant drainage of diseased and irritating nasal or pharyngeal secretions into the larynx is responsible for a large number of cases of chronic laryngitis. Local applications of nitrate of silver and other astringents, as also change of climate, improve these cases. Another form is tubercular laryngitis; this occurs usually as a complication of pulmonary tuberculosis. The symptoms are hoarseness or complete loss of voice, pain in the throat, increased by coughing, speaking, or swallowing. Laryngoscopic examination reveals an unnatural pallor of the laryngeal mucous membrane and the presence of localized swellings or of small ulcers. The prognosis for recovery in this form is unfavorable. The treatment consists in local applications of lactic acid, solution of nitrate of silver, etc. For croupous laryngitis, see DIPHTHERIA.

LARYNGOSCOPE (from Gk. *λάρυγξ*, *larynx*, *larynx* + *σκοπεῖν*, *skopein*, to look). A small round mirror, mounted on a long handle, employed for the examination of the throat. The laryngoscope was invented in 1854 by Manuel Garcia (1805-1906), a vocalist and teacher of Paris and later of London. It was improved by Türek and Czermak. In order to use the laryngoscopic mirror a head mirror is necessary. The former is placed on a stalk attached to its margin, at an angle of from 120° to 150°, the stalk being about 6 inches in length and being composed of flexible metal, so that it can be bent at the will of the operator. The head mirror is a reflecting mirror, 4 to 6 inches in diameter, with a central opening through which the observer looks. It is attached by a stiffly working ball-and-socket joint to a band passing about the forehead. The rays from an electric light or from a good lamp are concentrated by means of this reflector on the laryngeal mirror, which is placed against the soft palate and uvula. The laryngeal mirror, introduced with the right hand, is maintained at such an inclination that it throws the light downward and illuminates the parts to be examined, while at the same time it reflects the images of the parts into the eye of the observer through the central opening of the reflector. By this means he can look through the larynx into the trachea

or windpipe. The tongue, covered with a handkerchief or with a small towel, is held lightly with the left hand and thus kept out of the way. By means of this instrument we can see the actual position of small tumors, ulcers, etc., and ascertain the color and condition of the mucous lining of the upper part of the respiratory tract. The same arrangement is also employed in examination of the posterior aspect of the nasal cavities, a smaller mirror being used, with its face turned upward.

LARYNGOTOMY (Gk. *λάρυγγοτομία*, *laryngotomia*, from *λάρυγξ*, *larynx*, *larynx* + *-τομία*, *-tomia*, a cutting, from *τέμνειν*, *temnein*, to cut). A medical term signifying the operation of cutting into the larynx (q.v.). This operation is performed in some cases of diphtheria by preference over tracheotomy (q.v.), when for special reasons the trachea is to be avoided. Laryngotracheotomy is the term applied to an incision made through the lower part of the laryngeal cartilages and extending down into the trachea. The incision in each case is made for the purpose of placing in position a tube through which the patient breathes while the glottis is closed by the disease.

LARYNX (Neo-Lat., from Gk. *λάρυγξ*, *larynx*, *larynx*). The organ of voice. It also takes a part in the respiratory process, as all air passing either to or from the lungs must pass through it. It is a complex piece of mechanism resembling a box composed of pieces of cartilage, which may be moved on each other, and inclosing the membranous bands (the *chordæ vocales*) by which the vocal vibrations are produced. It is situated between the *trachea*, or windpipe, and the base of the tongue, at the upper and front part of the neck, where it forms a considerable projection (especially in men) in the middle line; it opens superiorly into the *pharynx*, or throat, and inferiorly into the windpipe. The cartilages of which the skeleton of

SIDE VIEW OF THE CARTILAGES OF THE LARYNX.

hy.b., hyoid bone; *th.hy.mem.*, thyrohyoid membrane; *th.car.*, thyroid cartilage; *c.th.mem.*, cricothyroid membrane; *ra.tr.*, rings of trachea; *th.hy.lig.*, thyrohyoid ligament; *sup.cor.*, superior cornu; *sup.tub.*, superior tubercle; *a.w.*, surface of wing overlapped by inferior constrictor; *inf.con.*, inferior constrictor.

the larynx is composed are nine in number, viz., the thyroid and the cricoid cartilages, the epiglottis, the two arytenoid and the two cuneiform cartilages, and the two *cornicula laryngis*.

The *thyroid* (Gr., shieldlike) cartilage consists of two square plates of cartilage united in front at an acute angle, which forms the projection which is commonly known as the *pomum*

Adami, or Adam's apple. Each of these plates is prolonged at the upper and lower posterior corners. The thyroid cartilage forms almost the whole of the anterior and lateral walls of the larynx.

The *cricoid* (Gr., ringlike) cartilage is a ring whose lower margin is parallel to the first ring of the trachea, to which it is united by fibrous membrane. Its upper border is connected in front with the lower border of the thyroid cartilage by a thick yellow fibrous tissue. It presents two articular surfaces on either side, viz., a lower one, which articulates with the inferior cornua of the thyroid cartilage, and an upper one, which is oval in form and supports an arytenoid cartilage. The *arytenoid* (Gr., ladle-like) cartilages are pyramidal bodies resting on the oval articular surfaces at the upper and posterior part of the cricoid cartilage. When *in situ*, they present a concave posterior surface. From their connection with the vocal cords, and from their great mobility as compared with the two larger cartilages, the arytenoids play a very important part in the mechanism of the larynx. The *epiglottis* is a very flexible cartilaginous valve, situated at the base of the tongue and covering the opening of the larynx. Its direction is vertical, except during deglutition, when it becomes horizontal. It is attached inferiorly, by a kind of pedicle, to the angle of the thyroid cartilage. Upon removing the investing mucous membrane the cartilage is found to be perforated by numerous foramina. Each perforation admits some fasciculi of yellow, elastic, ligamentous tissue, which expands on its anterior aspect and secures the return of the epiglottis to its vertical position, independently of any muscular action. The *cornicula laryngis* are two small fibrocartilages which articulate with the apices of the arytenoids. The cuneiform cartilages lie on either side in the fold of mucous membrane extending from the epiglottis to the arytenoids. Such is the skeleton of the larynx which hangs from the hyoid bone, with which it is connected by means of the thyrohyoid ligament and certain muscles.

The various cartilages are connected one to another by ligaments, the chief of which are those known as the true and false vocal cords. In their quiescent state the true vocal cords do not lie parallel to each other, but converge from behind forward. The length of the vocal cords is greater in the adult male than in the adult female, in the ratio of three to two. In infancy they are very short and increase regularly from that period to the age of puberty. The mucous membrane of the larynx is part of the great respiratory tract (see MUCOUS MEMBRANE) and is remarkable for its great sensibility.

The length of the chink or aperture of the glottis, which is directed horizontally from before backward, varies, like the vocal cords, until the period of puberty, when its length in the male undergoes a sudden development, while in the female it remains stationary. In the adult male it is about 11 lines in length, a line being one-twelfth of an inch.

The larynx is provided with two sets of muscles; viz., the *extrinsic*, by which the whole organ is elevated or depressed, and the *intrinsic*, which regulate the movements of the various segments of the organ in relation to one another. By the action of these latter muscles, aided in some cases by the extrinsic muscles, the tension of the vocal cords may be increased or dimin-

ished, and the size of the opening of the glottis regulated at will.

The nerves of the larynx are derived from the superior and inferior laryngeal branches of the pneumogastric or vagus nerve. The superior branch is for the most part sensory (being mainly distributed to the mucous membrane), while the inferior branch communicates motor power to all the intrinsic muscles except the cricothyroid. See Cut in article BRONCHUS.

LARYNX, DISEASES OF THE. The most common disease of the larynx is *laryngitis* (q.v.) *Edema*, or *swelling of the glottis*, although of frequent occurrence in laryngitis, may be developed independently of inflammation, from obstruction of the veins leading from that part or from other causes. The symptoms are hoarseness and dyspnea. Tracheotomy (the operation of making an opening into the windpipe, into which a tube is passed) below the seat of the disease, or intubation, affords relief. *Chronic inflammation and ulceration of the larynx* may occur in tuberculosis and in secondary syphilis. In these cases the laryngeal affection is a local manifestation of a general disease.

LA SAGRA, RAMÓN DE. See SAGRA.

LA SALE, la'sal', ANTOINE DE (1398?-1461). The most important satirist and prose narrator in the fifteenth century. He wrote *Le petit Jehan de Saintré* (dated 1459), a romantic story of chivalrous love, yet with an undercurrent of satiric irony such as finds frank expression in *Les quinze joies de mariage*. He was a tutor of Jean of Anjou, the eldest son of René, and to this youth he dedicated *La salade* (written between 1437 and 1442). Several of the sketches are lively and dramatic, the characters are clearly defined, and the whole is a good specimen of early renescent literature and wit, though less important than La Sale's last work, the compilation of the *Cent nouvelles nouvelles*, gathered perhaps from the lips of Prince Louis (afterward King Louis XI of France) and his courtiers while they were refugees in Burgundy, though La Sale also drew on Poggio and Sacchetti. The tales are in part from old fabliaux, in part from Italian and Latin collections. La Sale's merit is in the treatment. There had been good French narrative prose before (Villehardouin, Joinville, Froissart), but La Sale took conscious delight in his art, and grew, as his work proceeded, in artistic sense and power. Most of the *Cent nouvelles nouvelles* have a frankness of speech that does not accord with the conventions of modern literary propriety, the humor is often cynical, the ethical tone low; but there is no snickering, as there is in the *Decamerone*, and though La Sale is far inferior as a stylist to Boccaccio, some of the *Cent nouvelles* are really polished. *Le petit Jehan de Saintré* was published (Guichard ed.) in 1843 and *Les cent nouvelles nouvelles* (Elzevir ed.) in 1858.

LA SALETTE, la sa'lét'. A famous place of pilgrimage in southern France, 21½ miles southeast of Grenoble. Here, on Sept. 19, 1846, the Virgin Mary is said to have appeared to a girl of 15 and a boy of 11. The story gave rise to a long and bitter controversy, but meantime a large church was built, and the place now has a reputation second only to that of Lourdes (q.v.). Consult: Rousselot, *Le vérité sur l'événement de La Salette* (Grenoble, 1848); De Toytot, *Voyage de Grenoble à La Salette* (ib., 1863); Bertrand, *La Salette* (Paris, 1889), against the truth of

the miracle, Donnadirn, *La Salette-Fallavaux* (Grenoble, 1852, 1853); Deléon and Cartellier, *La Salette devant le Pape* (ib., 1854).

LA SALLE, la sál'. A city in La Salle Co., Ill., 99 miles by rail southwest of Chicago, on the Illinois River, at the head of navigation, on the Illinois and Michigan Canal, and on the Chicago, Rock Island, and Pacific, the Chicago, Burlington, and Quincy, the Illinois Central, and other railroads (Map: Illinois, F 3). It is surrounded by fertile agricultural country and productive bituminous coal fields and is the centre of a large trade. There are several coal mines in operation in the city and the immediate vicinity, and the industries include also sheet-zinc smelting and rolling and the manufacture of ornamental pressed brick, common brick, hydraulic cement, Portland cement, sulphuric acid, plows, acid phosphate, nickeloid, sheet metal, tools, machinery, and alarm clocks. Besides coal, cement rock, silica sand, and fire clay are found in the vicinity. The city has a public library, a State mine-rescue station, and a fine bridge of the Illinois Central Railroad. Near here is Starved Rock, settled by the explorer La Salle. The government is vested in a city council and in a mayor, who appoints all subordinate officials excepting the clerk, attorney, and treasurer, who are chosen by popular vote. There are municipal water works. Pop., 1900, 10,446, 1910, 11,537. La Salle was settled in 1830 and named in honor of La Salle. It was chartered in 1852. Consult *History of La Salle County, Ill.* (2 vols., Chicago, 1886).

LA SALLE, JEAN BAPTISTE DE, SAINT (1651-1719). A French priest, the founder of the Brothers of the Christian Schools (q.v.). He was born at Rheims, April 30, 1651. In 1678, soon after his ordination to the priesthood, he was placed in charge of a congregation of teaching sisters. The impression he here gained of the need of good schools for the children of the masses led him a year later to gather around him the nucleus of a body of men devoted, as he was, to the cause of Christian education. In 1683 he resigned his canonry and in 1684, with 12 others, took vows of obedience and of perseverance, at least for three years. He was invited to Paris in 1688 by the curé of Saint-Sulpice, to build up a school in that parish. In 1691 he took a house at Vaugirard, near Paris, and made lifelong vows with two others. James II of England intrusted the education of 50 Irish boys of good family to him in 1698. A year later he established a technical school, which met every Sunday from 12 to 3 and soon numbered 300 members. In this, the first school of the kind in Europe, geography, geometry, building, drawing, and bookkeeping were taught, the session closing with religious instruction. In 1705 the novitiate was transferred from Vaugirard to Saint-Yon, near Rouen, where a large establishment was erected. The founder died at Boulogne in 1719, leaving 274 brothers, with nearly 10,000 pupils. He was beatified by Pius IX and canonized by Leo XIII, May 24, 1900. Some of his books have appeared in English: *The Rules of Christian Politeness* (Dublin, 1862); *Management of Christian Schools* (New York, 1893). Consult: J. Guibert, *Histoire de St. Jean Baptiste de La Salle* (Paris, 1901); J. B. Blain, *Vie de St. Jean Baptist de La Salle* (2 vols., Lille, 1901); F. Thompson, *Life and Labours of St. John de La Salle* (St. Louis, 1912).

LA SALLE, RENÉ ROBERT CAVELIER, SIEUR DE (1643-87). The discoverer of the Ohio and the first explorer of the greater part of the Mississippi River. He was a member of a wealthy merchant family of Rouen, but on becoming a Jesuit novice he lost the right of inheriting his father's fortune and in his twenty-fourth year emigrated to Canada, where the superior of the Seminary of St. Sulpice made him a grant of a large tract of land at the place now called Lachine, 8 or 9 miles above Montreal, on the St. Lawrence. His imagination was stirred by the tales of the Indians respecting a mighty river which they called the Ohio, which flowed into the sea at a distance of some eight months' journey. La Salle conceived that "the sea" could be no other than the long-sought Gulf of California, and that the northern water route to China was probably within his reach. He disclosed his views to Courcelles, the Governor of New France, and received letters patent authorizing his venture. In order to obtain the necessary funds, he sold his seigniory. He bought four canoes and hired 14 men, and was joined by another expedition under Dollier de Casson, which was fitted out by the seminary priests for the conversion of the Indians. The combined forces consisted of seven canoes and 24 men. They started up the St. Lawrence on July 6, 1669. They went through Lake Ontario, at the western end of which they met the explorer Joliet, returning to Canada. From him a map of the northern lakes was obtained, and with it such accounts of the spiritual destitution of the Indians in that region as determined Dollier to strike north and establish a mission.

La Salle separated from the missionaries and for the next two years devoted himself to explorations, of which we have only vague and unsatisfactory information. His maps and journals have disappeared, although it was asserted, as late as 1756, that they were in existence. It would seem that La Salle turned southeast from Lake Erie, reached a branch of the Ohio, and followed that river certainly as far as the Louisville Rapids, possibly to its junction with the Mississippi. Here his men deserted, and La Salle returned to Lake Erie alone. In 1671 he organized another expedition, respecting which we have no authentic and detailed information; passed up the Detroit River to Lake Huron; thence to Lake Michigan, and across the Chicago portage to the Illinois River, and may have descended this stream to the Mississippi. He returned to Montreal before 1673, when he laid before Count Frontenac his project for the exploration of the Mississippi. The Governor placed La Salle in command of a party sent to erect the new Fort Frontenac, near the present town of Kingston, on Lake Ontario. In 1674, and again in 1677, Frontenac sent La Salle to France, to push his fortunes at court. He was favorably received on both occasions, and on his first visit was granted the seigniory of Frontenac on condition that he reconstruct the fort of masonry and maintain it at his own charge, and on his second visit received a patent empowering him to pursue his discoveries at his own expense, on condition of completing them within five years, to build forts, and to monopolize the trade in buffalo skins. He raised funds and returned to Canada with 30 men and the equipment for another expedition.

Seventeen men under La Mothe Cadillac, and including the Franciscan Hennepin (q.v.), sailed

from Fort Frontenac in a little vessel of 10 tons on Nov. 18, 1678. They reached Niagara River on December 5 and began the construction of a palisade fort. They were joined by La Salle and Tonty on Jan. 8, 1679. The vessel was wrecked soon after, but the stores were saved, and the keel of a new vessel of 45 tons was soon laid at the mouth of Sayuga Creek, an affluent of the Niagara River. This was named the *Griffon*. La Salle returned to Fort Frontenac for supplies, and on Aug. 7, 1679, the voyagers set sail on Lake Erie for the great river. By September they had reached Green Bay (Lake Michigan). Here La Salle loaded the *Griffon* with furs and sent her back to the settlements. She was never again heard from. With four canoes and 14 men La Salle followed up the western shores of Lake Michigan, while his lieutenant, Tonty, with 20 men, took the eastern. The two finally met at the Miami, or St. Joseph River, at the southeast corner of the lake, where Fort Miami was built. The party started up the St. Joseph on Dec. 3, 1679, and crossed the portage to the Kankakee, a tributary of the Illinois River. Near the present town of Utica, Ill., they found an Indian village of 460 lodges. A little below Peoria Lake another Indian village was reached, and there La Salle heard circumstantial accounts of the efforts made by his enemies—both Jesuits and fur traders in Canada—to thwart his plans and even endanger his life. Several of the party deserted at this place. In January (1680) La Salle built a fortified camp, which he named Fort Crèvecoeur, and soon after began the construction of another vessel of 40 tons. Leaving Tonty in command of the fort, La Salle with four men and a guide started in March to return to Fort Frontenac for supplies. He arrived there in safety, in May, to find his supplies lost and the revenues plundered by dishonest agents. News followed him that Tonty's men had mutinied and deserted. La Salle at once organized another expedition and started in search of his friend. The Illinois country had suffered a terrible invasion of the Iroquois, and devastation met him everywhere. He reached the ruins of Fort Crèvecoeur and went down the Illinois to the Mississippi, finding no trace of Tonty, who had made his way down the western side of Lake Michigan to Green Bay.

La Salle returned to Fort Miami. He now exerted himself to form a league of the Western Indian tribes, under his own leadership, and thus to keep the Iroquois in check. The Indians received the idea with favor, and, after spending the spring of 1681 in negotiation, he returned in May to Fort Frontenac where he found Tonty, and thence to Fort Frontenac for supplies. Count Frontenac exerted his influence in behalf of the discoverer, and another expedition was equipped. In December La Salle crossed the Chicago portage to the Illinois, followed the frozen river on sledges to Lake Peoria, and from there floated downstream, reaching the Mississippi on Feb. 6, 1682. He kept on down the great river to the mouths of the Arkansas and Red rivers, where he took formal possession of the country in the name of his King. On April 6 the party reached the delta. There La Salle divided his men into three bands, and each took one of the branches which led to the Gulf. On April 9, 1682, they reunited, and La Salle erected at one of the mouths of the river a monument and a cross bearing the arms of

France, and proclaimed the river and all the lands drained by it to be by right of discovery the dominions of Louis XIV, King of France. To La Salle belongs the glory of tracing the great river for the first time from its upper waters to the sea, and of determining the connection between the discoveries of De Soto near its mouth and those of Joliet and Marquette in the north.

La Salle now formulated plans to establish colonies throughout this new-found country. Ascending the river in December, he built Fort St. Louis at Starved Rock, on the Illinois, as a rallying point for the Indians, 20,000 of whom established themselves in villages in the vicinity. It proved, however, impossible to obtain the necessary supplies from Canada. Frontenac had been succeeded by De la Barre, and La Salle was without a friend at court. The new Governor was a weak and avaricious man, who looked upon La Salle's monopolies and privileges as legitimate spoil. He seized Fort Frontenac and sent an officer to supersede La Salle at Fort St. Louis, ordering him at the same time to return to Quebec. La Salle obeyed and sailed at once for France. In Paris the discoverer and his plans for colonizing the West found favor at court. Royal letters were sent to De la Barre, commanding him to make restitution. Four vessels with about 400 men were placed at the disposal of La Salle, that he might make the voyage directly from France to the mouth of the Mississippi, and he was authorized to govern the country from Lake Michigan to the Gulf of Mexico. The fleet left La Rochelle July 24, 1684. The naval officer of the fleet, Captain Beaujeu, did not act harmoniously with La Salle, and the voyage was inauspicious from the outset. When at length the shore of the Gulf of Mexico was sighted, the expedition was unable to find the mouth of the Mississippi, amid the confusion of lagoons and inlets. La Salle knew its latitude, but had been unable to take its longitude. Mistakes were followed by recriminations. La Salle became convinced that Beaujeu was attempting to thwart his designs and finally established his men on shore, at Matagorda Bay, mistaking its inlets for the mouths of the Mississippi. Beaujeu sailed away on March 12, 1685, reaching La Rochelle about July 1. La Salle realized his mistake, established his colony on Lavaca River, and, leaving his lieutenant, Joutel, in charge, started (October, 1685) on a fruitless search for the Mississippi. In March, 1686, he was back again, and in April had started for Canada, but was obliged to turn back. His colony had dwindled from 180 to 45 men. Another attempt to reach Canada was made in January, 1687. The party wandered about for two months. Repeated quarrels led to a mutiny, and La Salle was treacherously shot from ambush. Joutel assumed the leadership of the few men who remained loyal and succeeded in reaching one of Tonty's posts on the Arkansas River. Little is known of the fate of those who took part in the mutiny, except that most of the men joined the roving troops of Indians, and two of them eventually made themselves known to Spanish exploring expeditions and returned to civilization by way of Mexico.

York, 1903); R. G. Thwaites, *France in America* (ib., 1906); Francis Parkman, "La Salle and the Discovery of the Great West," in *France and England in North America*, part iii (Boston, 1907). The original narratives are translated from the French, *Historical Collections of Louisiana* (New York, 1853), and Shea, *Early Voyages Up and Down the Mississippi* (Albany, 1861), and have been republished by the Caxton Club of Chicago. Consult also Pierre Margry, *Découvertes et établissements des Français dans l'ouest et dans le sud de l'Amérique septentrionale, 1614-1754; Mémoires et documents*, vol. ii (Paris, 1879), for a large number of other documents relating to La Salle.

LA SALLE COLLEGE. A Roman Catholic institution of higher learning, incorporated in 1863 as La Salle College in the city of Philadelphia. It is under the management of the Brothers of the Christian Schools and has collegiate, high-school, commercial, and preparatory departments, with a total enrollment in 1914 of about 240, of whom 85 were collegiate students. The instructors numbered 21, the library contained 10,325 books, and the value of the college grounds and buildings was \$250,000. The college confers the degrees of B.A., B.S., and M.A., besides honorary degrees given at the discretion of the faculty. The president in 1914 was Bro. D. Edward

LASAULX, la'zô', ERNST VON (1805-61). A German archaeologist. He was born at Coblenz, Germany. He studied at Bonn and Munich, was appointed professor at Würzburg in 1835, and nine years later was made professor of philology and æsthetics at Munich. His works have little scientific but some personal value, he was a mystic and was continually finding Christian ideas in Hellenic philosophy, parallels between Prometheus or Socrates and Christ. Among his books are: *Zur Geschichte und Philosophie der Ehe bei den Griechen* (1852), *Der Untergang des Hellenismus* (1854), *Neuer Versuch einer Philosophie der Geschichte* (1856), *Des Sokrates Leben* (1857). Consult Holland, *Erinnerungen an Ernst von Lasaulx* (Munich, 1861)

LA SAUSSAYE, là sô'sâ', PIERRE DANIEL CHANTEPIE DE (1848-). A Dutch scholar. He was born at Leeuwarden and in 1878 became professor of the history of religions in the University of Amsterdam; in 1900 professor of the theological encyclopædia. ethics, symbolics, and history of theology in Leyden. He is the author of *Lehrbuch der Religionsgeschichte* (2 vols., Freiburg, 1887-89; 2d ed., 1897; Eng. trans., *Manual of the Science of Religion*, London, 1891); *The Religion of the Teutons* (Eng. trans., Boston, 1902)

LASCA, lās'ká, IL. The name generally applied to the Italian poet Antonio Francesco Grazzini (qv).

LASCARIS, CONSTANTINE (c.1434-1501). A celebrated Greek grammarian, one of the founders of Greek studies in the West. He was a member of a noble Bithynian family, and was born at Constantinople. After the capture of Constantinople by the Turks (1453), he fled to Corfu and then to Italy, where he became tutor in Greek to Hippolita, daughter of Francesco Sforza, Duke of Milan. Later he taught at Rome (where he became an intimate friend of the learned Greek Cardinal Bessarion), at Naples, and at Messina. His Greek grammar, the so-called *Ἑρωδιάρια*, published at Milan in 1476, was the first Greek book ever printed. After his

death his valuable library was carried to Spain, where it is now preserved in the Escorial.—ANDREAS JOHANNES or JANUS LASCARIS (c.1445-1535), a brother or cousin of Constantine Lascaris, was also prominent as a missionary of Greek learning in the West. After studying at Padua he settled at the court of Lorenzo de' Medici and was sent by him to the East, where he acquired many manuscripts for the Medici Library, especially from Mount Athos. After the death of Lorenzo (1492) he was summoned to Paris by Charles VIII (1495). Here he taught Greek until 1513, when he was called to Rome by Leo X; but in 1518 he returned to France, as an Ambassador to Francis I, and helped to found the Royal Library. Later he resided for some time at Venice, until Paul III recalled him to Rome, where he remained until his death. He is to-day best known as the editor of five *editiones principes*, including a famous *Anthologia Epigrammatum Græcorum* (1494). Consult: Villemain, *Lascaris, ou les Grecs au XVème siècle* (Paris, 1825); Symonds, *Renaissance*, vol. ii (London, 1877); Väst, *De Vita et Operibus J. Lascaris* (Paris, 1878); Voigt, *Wiederbelebung des klassischen Altertums* (3d ed., Leipzig, 1893); Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908)

LASCARIS, THEODORE I. Emperor of Nicæa (1206-22). During the siege of Constantinople by the Crusaders in 1204 he was active in the defense and probably was chosen as Emperor, but declined the office. After the capture of the city he went to Nicæa and established his power, first as despot, later as Emperor. He made extensive conquests and showed great ability. He was succeeded by his son John, who ruled for 32 or 33 years with great success and made himself loved by his people—John's son, THEODORE II, was Emperor for about four years, until 1258. He is usually described as degenerate, but of remarkable ability, which he showed in statesmanship and to a lesser degree in religious and scientific writings. His character is somewhat enigmatical, and the authorities differ with regard to many points. His heir was a child who was blinded and imprisoned by Michael Palæologus. Consult Gardner, *The Lascaris of Nicæa* (London, 1912)

LAS CASAS, lās kâ'sás, BARTOLOMÉ DE (1474-1566). A Spanish monk of the Dominican Order, known as the Apostle of the Indies. He was born in Seville of an old family which probably originated in France. He studied philosophy, theology, and jurisprudence at the old University of Salamanca and in 1502 went to Hispaniola, where he became a planter. At first he held Indian slaves, as did the rest of his countrymen. Though he was soon aroused by the powerful sermons of a Dominican monk, named Montesino, to some sense of the injustice thus inflicted on the natives, it was not until 1514, four years after he had been ordained priest (the first ordained in America), that he realized the full enormity of the system. He then released his slaves and began his long-continued crusade against Indian slavery. First he preached to the Spaniards about it, but his appeals fell on deaf ears; so in 1515 he returned to Spain to lay the case before the King. Soon after his arrival, however, Ferdinand died; his successor, afterward the Emperor Charles V, was absent in Flanders. Repulsed by the powerful Fonseca, Las Casas was contemplating a journey to Flanders when he was sympatheti-

cally received by the regents, Cardinal Ximenes and Adrian, who conferred upon him the title Universal Protector of the Indians. He then returned to the Indies; but his zeal and plain speaking soon stirred up against him active and powerful enemies, not only in the New World but also in Spain. Among the most formidable were Oviedo (qv) and Sepúlveda, an intimate of the King. Scarcely less troublesome than the openly declared enmity of powerful courtiers was the more secret opposition of the Jeronymite Order, several members of which were sent out with him in 1516 to aid in ameliorating the condition of the natives. Their efforts nullified his to such an extent that after only a few months Las Casas sailed again for Spain, where he gathered 50 picked men with whom he planned to found a new colony on the shores of the Caribbean Sea. It was during this visit to Spain that he made his unhappy concession to negro slavery. Believing that an increase in the numbers of negro slaves might result in the freeing of Indian captives, he advised that each colonist be allowed to import 12 negroes. It was not long, however, before he realized the terrible mistake he had made.

In 1520 he established his little colony at Cumana, on the Pearl Coast, the modern Venezuela, but soon afterward, during his absence in Hispaniola, it was destroyed by the Indians. Las Casas then retired to the Dominican convent in Hispaniola, where he remained for eight years, receiving the tonsure in 1522. It was here that he began to write his *Historia general de las Indias*. In 1531 he was in Mexico, and three years later in Nicaragua, where he did much to save the natives from the ferocity of the conquerors, and where he succeeded in converting the warlike people of Tuzulutlan, who had thrice defeated the Spanish forces. From 1539 to 1544 he was in Spain as adviser to the Council of the Indies. During this period he wrote his tracts *1cynte razones* and *Breussima relación de la destruycion de las Indias occidentales*, the first and most important of the series published at Seville in 1552-53, to which we owe most of our knowledge of Spanish misrule in the New World. He obtained from the Emperor, Charles V, the "New Laws," which absolutely forbade the enslavement of Indians. So drastic were these new laws that their promulgation led to an insurrection in Peru under the leadership of Gonzalo Pizarro, which might have resulted in the setting up of an independent kingdom, had not the Emperor modified them, besides choosing as his representative the able Pedro de la Gasca. However, much permanent good was accomplished, the system of encomiendas gave place again to the milder system of repartimientos, and abject slavery to something like European villeinage. In 1544 Las Casas was consecrated Bishop of Chiapa, a little see in Mexico, after having refused other and wealthier bishoprics. Three years later he returned to Spain, where he passed most of the remainder of his life in the quiet of the Dominican College of San Gregorio at Valladolid, engaged in the preparation of those works which finally opened the eyes of his countrymen to the enormity of their conduct towards the Indians. His *Historia general de las Indias*, a great source of information on the Spanish discoveries and conquests in the New World, was not printed until 1875 (Madrid, 5 vols.).

Bibliography. Arthur Helps, *The Spanish*

Conquest of America (London, 1861); id., *Life of Las Casas* (Philadelphia, 1868); Sabin, *Works of Las Casas* (New York, 1870); A. M. Fabié, "Vida y Escritos de Las Casas," in *Colección de Documentos inéditos para la Historia de España*, vol. lxx (Madrid, 1879); Justin Winsor, *Narrative and Critical History of America*, vol. ii (Boston, 1886); W. H. Prescott, *Conquest of Mexico* (Philadelphia, 1902); F. A. MacNutt, *Bartholomew de Las Casas* (New York, 1909).

LAS CASES, lās káz, EMMANUEL AUGUSTIN DIEUDONNÉ, MARQUIS DE (1766-1842). The companion and historian of Napoleon in St. Helena. He was born in the château of Las Cases, near Revel, in Languedoc; was a lieutenant in the navy before the Revolution, served in the Prince of Condé's army (1792); spent some time in England, where he supported himself by private teaching, and took part in the expedition to Quiberon (1795). After Napoleon's accession to power he returned to France and labored in the preparation of his admirable *Atlas historique*, which was published under the name of Lesage (1803-04). Napoleon made him Baron, employed him in offices connected with the home administration, and gave him the office of chamberlain. After the battle of Waterloo Las Cases offered to share the exile of Napoleon, and in St. Helena the ex-Emperor dictated to him a part of his memoirs. A letter which Las Cases contrived to send to Lucien Bonaparte led to his being arrested by the British authorities and separated from Napoleon in 1816. He returned to Europe and resided till Napoleon's death at Frankfort-on-the-Main and in Belgium, where he wrote his memoirs, *Mémoires de E. A. D. Comte de las Cases* (Brussels, 1818). He then returned to France and published the *Mémorial de Sainte Hélène* (1823). After the July revolution he entered the Chamber of Deputies as a member of the Extreme Left. Consult Grille et Musset-Pathay, *La Suite au mémorial* (Paris, 1824).—His son, EMMANUEL PONS DIEUDONNÉ (1800-54), acted as secretary to Napoleon I at St. Helena and was deported from there with his father. When, after the death of Napoleon, the Governor of St. Helena, Hudson Low (qv), returned to London, Dieudonné attacked him with a horsewhip and was compelled to leave England. A later attempt to murder Las Cases was connected by some with this episode. In 1830 he participated as a Constitutionalist in the July revolution and was a member of the Chamber of Deputies until 1848. He left an account of his voyage with the Prince de Joinville in 1840 to bring back the remains of Napoleon I, *Journal écrit à bord de la frigate, la Belle Poule* (Paris, 1844). In 1852 he was made a senator by Napoleon III.

LASCO, lās'kō, JOHANNES A. See ALASCO.

LAS CRUCES, lās krō'sēs. A city and the county seat of Dona Ana Co., N. Mex., on the Rio Grande, opposite Mesilla, 44 miles north-northwest of El Paso, Tex., on the Atchison, Topeka, and Santa Fe Railroad (Map: New Mexico, C 6). It is the seat of the State College of Agriculture and Mechanics Arts. The city is situated in a region having fruit-growing, farming, and silver, copper, lead, and zinc-mining interests; and there are canning factories, wineries, and concentrating works. This district is included in the Elephant Butte Dam irrigation project. (See DAMS AND RESERVOIRS.) Las Cruces owns its water works. Pop., 1910, 3386.

LASCY, lăs'ă, or **LACY**, FRANZ MORITZ, COUNT (1725-1801). An Austrian general, son of Count Peter Lacy (1678-1751), an Irishman in the Russian service. He was born at St. Petersburg, was educated for the army in Vienna, and in 1743 entered the Austrian service. He fought bravely in Italy, Silesia, and the Netherlands, was promoted to major general for his bravery at Lobositz, and, with the rank of major general commanding a division, undertook the reorganization of the army in 1758. His strategy during the years 1759 and 1761 won him in 1762 the rank of field marshal. In 1766-73 he was the head of the military advisory board. He was unsuccessful in the war with Turkey (1788-90) and was retired.

LA SERENA, là sâ-ră'nă. The capital of the Department of Coquimbo, Chile. It is situated on an eminence overlooking a small bay of the Pacific Ocean, 215 miles north of the city of Valparaíso (Map: Chile, E 3). It has a delightful climate, is surrounded by gardens, and is a well-built and handsome town, with straight and regular streets, several plazas, and promenades. A railroad 8 miles long connects it with its port, Coquimbo (q.v.). Other railroads run to the interior towns of Vicuña and Rivadavia, and a line running southward, but not yet completed, will connect it with Valparaíso and Santiago. It is the seat of a bishopric and of a Court of Appeals. Pop., 1895, 16,561; 1907, 15,996.

LA SERNA Y DE HINOJOSA, là sâr'nă ă dă ă'nô-hô'să, JOSÉ DE (1770-1832). A Spanish general and viceroy, born at Jerez de la Frontera. He fought against the French in the Peninsular War and served under Wellington in 1813. Having been promoted to the rank of field marshal in 1815, he was in 1816 placed in command of the Royalist army in Upper Peru, with the rank of commander in chief. The Viceroy, Pezuela, was from the first antagonistic; and La Serna, after several times acting against his own judgment, notably in the battles of Salta and Jujuy, where the patriots were victorious, was persuaded to remain at his post only by the prospect of San Martín's invasion. He then received command of the army and also the title of Viceroy in Pezuela's place (1821). After San Martín entered Lima, La Serna retreated to Cuzco, where he maintained his army against the patriots for three years without assistance from Spain. On Dec. 9, 1824, the decisive battle of Ayacucho was fought between General Sucre, the patriot leader, and the Viceroy. Despite the Royalist odds, the patriots won the battle, and La Serna was wounded and captured. He was afterward released, and returned to Spain in 1825. In 1824 he had been advanced to the rank of lieutenant general, and on his return to Spain his grateful sovereign rewarded his devotion and his services in South America by creating him Count of the Andes. Among other decorations and knighthoods there were bestowed upon him the grand crosses of San Fernando, San Hermenegildo, and Isabel la Católica. He was the last and the most patriotic and illustrious Viceroy of Peru.

LASHKAR. See GWALIOR

LASTOPYGIDÆ, là'si-ô-pîj'î-dă. The name of a family of Old World Primates recently considered as replacing the name Cercopithecidæ (q.v.).

LA SIZERANNE, là sâz-rân', MAURICE DE (1857-). A French philanthropist, born at

Tain (Drôme), a brother of Robert de la Sizeranne. Becoming blind himself when nine years old, he devoted his whole life to benefiting those unfortunate in the same way. He was educated at the Jeunes Aveugles in Paris, was made a professor there, and afterward developed the abbreviated orthography for the blind now in use in France. La Sizeranne was made a Chevalier of the Legion of Honor and filled several high offices in societies. In 1883 he founded *La Revue Braille*, later the Braille Library, he compiled a bibliography of books especially printed for the blind; and wrote himself. *Les aveugles utiles* (1881); *Jean Guadet et les aveugles* (1886); *Les aveugles par un aveugle* (1888; 5th ed., 1912; Eng. trans. by F. Park Lewis, *The Blind as Seen through Blind Eyes*, 1893); *Deux ans d'études et de propagande en faveur des aveugles* (1890; new series, *Études et propagande en faveur des aveugles*, 1899); *Mes notes sur les aveugles* (1895); *Les sœurs aveugles* (1901, Eng. trans. by L. M. Leggatt, *The Blind Sisters of St. Paul*, 1907), *Impressions et souvenirs* (1904), *La question des aveugles* (1911).

LA SIZERANNE, ROBERT DE (1866-). A French writer, especially on art. A brother of Maurice de la Sizeranne, he was born at Tain (Drôme), was educated at the Collège de Vauguard, Paris, then studied law, and was admitted to the bar (cour d'appel) in 1895. He devoted himself to the study of art, and particularly English art, contributing to the *Revue des Deux Mondes* and the *Revue Encyclopédique*. For his writings as a whole he received the Vitet prize of the French Academy in 1909, and his *La peinture anglaise contemporaine* (Eng. trans. by H. M. Poynter, *English Contemporary Art*, 1898) had been crowned by the Academy in 1895. Other works include *La référendum communal* (1893); *Ruskin et la religion de la beauté* (1897, Eng. trans. by the Countess of Galloway, *Ruskin and the Religion of Beauty*, 1899); *La photographie, est-elle une art?* (1899); *Le miroir de la vie* (1902; 2d series, 1909); *Les questions esthétiques contemporaines* (1904). In 1908 he published *Pages choisies de Ruskin*.

LASK. A town in the government of Piotrkow, Russian Poland, 20 miles southwest of Lodz on the Nowolka River. It is on the Warsaw-Kalisz Railroad and is an important cloth manufacturing centre. Population, 1897, 4439. Lask was the scene of exceedingly heavy fighting during the European War of 1914, in the battles around Lodz. See WAR IN EUROPE.

LASKER, lăs'kër, EDUARD (1829-84). A Prussian statesman of Jewish descent, born at Jarotschin (Posen). He was educated at the universities of Breslau and Berlin and in 1851 obtained a post in the Berlin municipal court. Subsequently he spent three years in England in the study of public affairs. Upon his return in 1856, he again entered the government service of Prussia. In 1865 he was first elected to the Lower House, where in 1868-73 he represented Magdeburg and in 1875-79 Frankfort-on-the-Main. He sat for the first electoral district of Berlin in the Constituent North German Diet, and later, until his death, in the North German and the German Diet for the second electoral district of Sax-Meiningen. He was identified with the Fortschrittliche or Progressives, until 1866, when he assisted in founding the National Liberal party. (See POLITICAL PARTIES, Germany.) In the civil consolidation of the German Empire Lasker played a very con-

spicuous part, and he largely shared many of the most important legislative and administrative enactments. Differences ultimately arose between Bismarck and himself, and at last the Chancellor's economic and tax-reform policy led him to withdraw from the National Liberal party. He was soon joined by others, and the "secessionist" faction thus formed constituted a vigorous opposition. In the hope of benefiting his health Lasker visited the United States in 1883. His death in New York, Jan. 5, 1884, was followed by what is known as the "Lasker incident." Resolutions of condolence, passed by the House of Representatives of the United States, were forwarded to Minister Sargent at Berlin, to be by him transmitted through the legitimate channel to the Reichstag. These resolutions were returned undelivered by Bismarck, through the German Minister at Washington. Lasker's chief publication was *Zur Verfassungsgeschichte Preussens* (1874), a collection of essays. Consult Bamberger, *Eduard Lasker* (Leipzig, 1884).

LASKER, EMANUEL (1868-). A German chess player and mathematician, born at Berlinchen, Prussia. He was educated at Berlin, Gottingen, and Heidelberg, and made a special study of mathematics in 1888-91 and in 1896-97. His first noteworthy chess playing was in 1880, when he won first prize in the Breslau Hauptturnier. He won second prize in the Amsterdam tournament of 1889, and in the following year won matches with Mieses and Bardeleben and prizes at the tournaments held in Graz and Berlin. In 1892 the first honors of the London national tournament were his, and, after winning the English championship by defeating the well-known expert Blackburn, he visited the United States, where he met most of the leading players and won the American championship from Showalter. On May 24, 1894, he won the championship of the world by defeating the veteran Steinitz. His other successes were at the Hastings tournament in 1895, the St. Petersburg tournament in 1896, and the tournaments of Nuremberg (1896), London (1899), and Paris (1900). The match between Lasker and the Russian Rubinstein, scheduled for August, 1914, was canceled because of the European War. In 1902 he acted as assistant lecturer in mathematics at Victoria University, Manchester, England. Lasker published a collection of letters under the title *Common Sense in Chess* (1896), contributed to the proceedings of various mathematical societies, and in 1904 founded *Lasker's Chess Magazine*. He was given the degree of Phil.D. by the University of Erlangen in 1900.

LASKI, lās'kē, JAN. See ALASCO, JOHANNES.

LASO DE LA VEGA, lās'ō dā lā vā'gā, GAROI (1503-36). A Spanish soldier and poet. He was born at Toledo and early adopted the profession of arms. He gained a distinguished reputation for bravery in the wars carried on by the Emperor Charles V against the French and Turks, but was mortally wounded while storming a castle near Fréjus, in the south of France, and died at Nice. Laso, though prematurely cut off, lived long enough to win immortality by the part which he played, in conjunction with his friend Boscán, in revolutionizing the national poetic taste of his countrymen. Like Boscán, he imitated the Italian poetical manner and substituted Italian verse forms for the older national measures, which he used in only very few cases. His eclogues, it should be said, show

also a Vergilian influence. His pieces consist of only 37 sonnets, five canzones, two elegies, one epistle, and three pastorals. Singular to say, they do not contain a trace of military ardor, but are inspired by a tender sweetness and melancholy which appear to have deeply affected his countrymen. Laso's poems were first published in 1543, in an edition of Boscán's works. They are most accessible in the collection of Spanish masterpieces called the *Biblioteca de autores españoles*, vols. xxxii and xlii (cf. Wiffen's Eng. trans., published in 1823). For the best account of his life, consult Fernández de Navarrete, in Salvá y Sainz de Baranda, *Documentos inéditos para la historia de España*, vol. xvi (Madrid, 1850). See also A. M. Huntington's facsimile reproduction of the (Lisbon) edition of 1628 of his *Obras* (New York, 1903) and the bibliography in James Fitzmaurice-Kelly, *Bibliographie de l'Histoire de la Littérature Espagnole* (Paris, 1913).

LASO DE LA VEGA (EL INCA), GAROI (c.1540-1616). A Peruvian historian, known as "the Inca." He was the son of one of the Spanish Conquistadores and grew up amid the civil turmoil of the early years of Spanish rule in Peru. He became familiar with the men and events of the time, so that his history has all the flavor of actuality. At his home he met relatives of his mother, an Inca princess, who told him much of the history of his family and of the land over which they had ruled. After his father's death Laso decided to go to Spain. He entered the army as a captain and served against the Moriscos. Becoming involved in debt, he retired from the military service and entered on a literary career. He translated Abarbanel's *Dialogues of Love* from the Italian, published in 1590, which was soon placed on the Index, and then turned his attention to history. From an old soldier, a companion of De Soto, he learned the story of the conquest of Florida, which he wrote out in a bombastic literary style, *La Florida del Ynca* (1605). Meanwhile he had gathered from his early schoolmates their recollections of early days in Peru, and by combining these with his own memories, especially of what he had heard from his mother's people, he prepared the *Royal Commentaries of Peru*, a work of prime importance, filled with interesting detail and in the main authoritative, despite a certain exuberance of fancy. It is of special value to folklorists. The first part was published in 1609, and the second in 1617, a year after the author's death, which took place at Cordova, where he had passed the latter half of his life. The *Commentaries* have been translated, with notes and an introduction by Markham, and published by the Hakluyt Society (London, 1869).

LAS PALMAS, lās pāl'más. The capital of the island of Grand Canary, the largest city of the Canary Islands, and until 1833 the capital of the entire archipelago (Map: Spain, G 5). It is beautifully situated on the northeast shore of the island in a fertile valley dotted with palms. It has a magnificent harbor, capacious and deep enough for the largest ships, sheltered by the peninsula called La Isleta. Enormous amounts of coal are stored here, and the tonnage passing through this harbor exceeds that of any other Spanish port. There is regular steamship communication with the west coast of Africa, the Cape, Australia, New Zealand, and America, besides European ports. The port, which bears

the name of La Luz, and which is protected by two forts and several batteries, is connected by railroad with the city itself, which lies 4 miles to the south. Las Palmas proper is built on two sides of a stream. Though the streets in the older portion are narrow and irregular, the new quarters are largely of well-built two-story houses. The cathedral, which was begun in the sixteenth century and finished at the beginning of the nineteenth, has a handsome Ionic façade. There are several other churches, a large city hall, an episcopal palace, a college and seminary, a library, an art academy, an atheneum and museum, and a large theatre, seating 1400 persons. Fishing is still one of the chief occupations of the inhabitants, but the city is rapidly developing and is becoming the principal industry. There are also manufactures of glass, leather goods, and hats, and a famous brand of wine is exported. Pop., 1887, 21,018, 1900, 44,517; 1910, 62,886. Las Palmas is said to have been founded in 1478 by Juan Rejon at the time of his conquest of the island.

LASSA. The capital of Tibet. See LIASA.

LASSALLE, la'säl', FERDINAND (1825-64). A celebrated Socialistic agitator, born at Breslau in 1825. His father, a Jewish silk merchant, planned a commercial career for him and sent him at 16 to the commercial high school at Leipzig. But Lassalle conceived an antipathy for trade, left the college after two years, and entered upon philosophical, philological, and archaeological studies at Breslau and Berlin. His extraordinary brilliancy won him many admirers at the university, among them Alexander von Humboldt. At the university he began a philosophical work on Heraclitus the Obscure, but, becoming interested in the case of the misused wife of Count von Hatzfeldt, he spent his best energies for eight years in conducting her suit for separation and won a brilliant victory. *Die Philosophie Herakleitos des Dunkeln* appeared in 1858 and was received with great favor in Berlin. In 1861 Lassalle published *Das System der erworbenen Rechte*, pronounced by Savigny to be the ablest legal work written since the sixteenth century.

As early as 1848 Lassalle had become a radical disciple of Marx. In that year he was arrested for his bold denunciations of the reactionary party and after a long trial was condemned to six months' imprisonment. In 1862 he broke with the Progressists (Fortschrittspartei) and appeared as the champion of the working classes. He published several pamphlets, the circulation of which was prohibited. Nevertheless, copies of them were widely circulated and created a general interest in Socialism among the working classes. His main theory was that there was no satisfactory prospect for the working classes under the wage system. He proposed to found cooperative associations for production, employing public credit to secure capital. In 1863 he founded *Der allgemeine deutsche Arbeiterverein*, the object of which was to secure to the workers political power, to be employed for the overthrow of the existing economic order. While the society was still in its infancy, Lassalle was killed in a duel, the result of a love affair. Lassalle must be regarded as the virtual founder of the German Social Democratic party, although the present leaders of the party repudiate his ideas as antiquated.

Lassalle's Socialistic writings added practically nothing to the teaching of Marx, but his learn-

ing and eloquence and his fascinating personality gave the labor movement a powerful impulse. Modern Socialism as a political movement owes more to Lassalle than to any other man. The best edition of Lassalle's works is that of Bernstein, *Ferdinand Lassalles Reden und Schriften* (3 vols., Berlin, 1892-93), which includes a biography. A new edition of his *Gesamttwerke* is by Blum, vols. i-xiv. Several volumes of Lassalle's letters have been published: to Hans von Bülow, 1862-64 (Dresden, 1885); to Karl Rodbertus (Berlin, 1878), to Georg Herwegh (Zürich, 1896); to Karl Marx and Friedrich Engel (Stuttgart, 1902).

Bibliography. Aaberg, *Ferdinand Lassalle* (Leipzig, 1883); Ely, *French and German Socialism* (New York, 1883); Bernstein, *Lassalle as a Social Reformer* (London, 1893); Kohut, *Ferdinand Lassalle* (Leipzig, 1899); Brandes, *Ferdinand Lassalle* (London, 1911); Hermann Oncken, "Lassalle," in *Politiker und Nationalökonomien*, vol. ii (2d ed., Stuttgart, 1911), containing a bibliography; Karl Lautmann, *Ueber Ferdinand Lassalle und sein Verhältnis zur Fichteschen Sozialphilosophie* (Jena, 1913), containing a bibliography.

LASSAR, la'sär', OSKAR (1849-1907). A German dermatologist. Born at Hamburg, he studied at Heidelberg, Göttingen, Strasbourg, and Berlin, where he established a private clinical hospital for the treatment of skin diseases. In 1893 he was appointed professor of dermatology at the University of Berlin. He became known for his investigations of parasitic diseases of the hair, was one of the first to use Roentgen rays to examine cancerous growths, and was successful in the symptomatic treatment of skin diseases. He promoted also the regulation of the sanitary condition of public baths. His extensive collection of pathological plaster casts was bequeathed to the Kaiserin Friedrich Haus, Berlin. After 1893 he was editor of the *Dermatologische Zeitschrift*.

LASSBERG, la'sbërk, JOSEPH, BARON (1770-1855). A German antiquary, born at Donaueschingen. In 1817 he gave up the office of Privy Councillor to the Prince of Furstenberg, which he had held since 1806, and devoted himself to the study of older German literature. At the castle of Meersburg, on Lake Constance, he collected a valuable library, after his death incorporated in the library at his birthplace. His collection of manuscripts is famed as containing one of the three most important codices of the Nibelungenlied. Lassberg edited, under the name Meister Sepp von Eppishusen, *Ein schon und anmutig Gedicht, der Littover* (1826), *Sigenot* (1830), *EGgenheld* (1832), *Ein schön alt Lied von Grave Fritz von Zolre* (1842), and the collection called *Liedersaal* (4 vols., 1820-25). Consult Franz Pfeiffer (ed.), *Briefwechsel zwischen Lassberg und Uhl-land* (Vienna, 1870).

LASSELL, WILLIAM (1799-1880). An English astronomer, born at Bolton, Lancashire. He had very little opportunity for schooling, and it was during his mercantile apprenticeship at Liverpool that he made his own telescopes, and afterward he built a private observatory near that city. He not only built and mounted reflecting telescopes equatorially, which were the first of the kind to be used, but invented an excellent method of polishing the specula. With a 2-foot reflector of his own construction he discovered the satellite of Neptune in 1847, and two

new satellites of Uranus in 1851. He also detected Hyperion, the eighth satellite of Saturn, almost simultaneously with Bond in 1848. In 1861 he mounted equatorially a reflecting telescope at Valletta on the island of Malta and remained there four years observing and describing new nebulae and perfecting the results of many of his first observations. He returned to England in 1865 and established an observatory near Maidenhead, where he remained until his death. He served as president of the Royal Astronomical Society in 1870-72.

LASSEN, läs'sen, CHRISTIAN (1800-76). An eminent Norwegian Orientalist. He was born at Bergen, Norway, studied at Christiania and afterward (1822) at Hildesheim and Bonn, and assisted Schlegel in the publication of the *Ramayana* and *Hitopadesa*. He was also associated with Eugène Burnouf in the production of the *Essai sur le Pali* (1826). In 1830 he became extraordinary, and in 1840 full, professor of ancient Indian languages and literature at Bonn. In 1870 he gave a large part of his library to the University of Christiania. He died at Bonn. Lassen edited many Sanskrit works and published several very important works, the chief of which are: *Die altpersischen Keilschriften* (1836), *Vollständige Zusammenstellung aller bis 1845 bekannt gemachten altpersischen Keilschriften mit Füllraum* embodying Westergaard's investigations (1845), *Beiträge zur Geschichte der griechischen und indo-scythischen Könige in Bactrien, Kabul und Indien* (1838), *Institutiones Linguae Pracriticae* (1837), *Gita Govinda Jayadeva* (1836); *Anthologia Sanscritica* (1838, new ed. by Gildemeister, 1865 and 1868), *Indische Altertumskunde*, his principal work, a monumental critical history of Indian civilization (1847-61; 2d ed. of vols. i and ii, 1867-74). Consult *Allgemeine Deutsche Biographie*, vol. xvii (Leipzig, 1883), and *Norsk Forfatter-Lexikon*, vol. iii (Christiania, 1892).

LASSEN, EDUARD (1830-1904) A German composer, born at Copenhagen. His parents moved to Brussels when he was but an infant, and at 10 years of age he was registered as a student in the conservatory of that city, winning all the important prizes as well as the Grand Prix de Rome. He became court music director at Weimar in 1858, and through the influence of Liszt was enabled to give his opera *Landgraf Ludwigs Brautfahrt* (1857). He was court kapellmeister at Weimar from 1861 to 1895, during which time he successfully produced Wagner's *Tristan und Isolde* (1874), besides the following operas of his own: *Frauentöb* (1860), *Le captif* (1865); and a ballet, *Diana*. He also wrote music to *Œdipus in Kolonus* (1874), to *Faust* (1876), to *Pandora*, to Hebbel's *Nibelungen*, and very many popular songs.

LASSEN PEAK. A volcanic peak in northern California in the southern end of the Cascade Range, about 135 miles north of Sacramento (Map: California, D 2). Its ancient lavas reach the Sacramento valley on the south and on the northeast join the great Columbia lava beds. While indications of volcanic energy have been displayed in the numerous hot springs and boiling mud lakes near the base, Lassen itself has been quiescent until 1914, when eruption and outbursts of steam began and actively increased, inflicting little damage.

LASSERRE, là'sâr', PAUL JOSEPH HENRI DE MONZIE- (1828-1900). A French writer on religious subjects, born at Carlux. He studied law at Paris until 1851 and in that year wrote, in favor of the coup d'état, *L'Opinion et le coup d'état*. He took up the cause of Poland, traveled to Rome in her behalf, and helped gain the Pope's condemnation of the massacres of Warsaw. A few years later he made himself famous by his attack on Renan's *Vie de Jésus*; by his claim that he had been healed at Lourdes, his consequent literary activity in favor of the pilgrimages thither, and his quarrels with Zola over the question, and by his translation of the Gospels, which, under the title of *Saints Evangeliques* (1887), was first highly praised by the Vatican, but later put on the Index Expurgatorius. His great successes were *Notre-Dame de Lourdes* (1863), which has been translated into most of the European languages, and *Les épisodes miraculeux de Lourdes* (1883). In English these are to be had as *Our Lady of Lourdes* and *History of the Miraculous Sanctuary of Our Lady of Lourdes*. Lasserre wrote also *De la réforme et de l'organisation normale du suffrage universel* (1873).

LAS'SO (Portug. laço, Sp. lazo, snare, from Lat. *laqueus*, snare, probably from *lacere*, to allure). A rope of braided rawhide, braided linen, or twisted hemp, with a running noose at one end. The noose is usually protected by running through a brass or rawhide ring called a *hondo*. The length of the lasso varies with the locality; working in corrals and steep brush-clad mountains ropes as short as 40 feet are used, while in open and level country a length of 100 feet is occasionally found. It is thrown, mostly from horseback, with a whirl which takes the expanded noose over the horns or legs of the animal to be captured. It was in use in South America and Mexico before their discovery by the Spaniards and is still used for catching wild horses on the Pampas. It is an essential part of the outfit of the American cowboys, many of whom become astonishingly expert in its use. This was most conclusively demonstrated in 1910, when Col. Charles J. Jones ("Buffalo" Jones), an American plainsman, Marshall Loveless and Ambrose Means, American cowboys, went to Africa and actually "roped" not only the fleetest of the wild animals, but some of the most dangerous, including a rhinoceros and a lioness. Consult Scull, *Lassoing Wild Animals in Africa* (New York, 1911).

LASSO, läs'sò, ORLANDO DI (ORLANDUS LASSUS) (1532-94). A celebrated composer, born at Mons in Hainault. After having been a choir boy in the church of St. Nicholas at Mons, he was taken, as a protégé of the Viceroy of Sicily, to Sicily and Milan, where he remained till about 1550. In 1555 we find him at Antwerp; in 1557 he went to Munich on the invitation of Duke Albert V of Bavaria, and, after being identified with the court chapel, became in 1563 the *maestro di cappella*. This post he retained till his death. Lasso was the forerunner of Palestrina. At first he wrote madrigals and songs in the style of Marenzio and Vicentino, but he soon devoted his attention to sacred compositions, and it is upon these that his reputation rests. Although he wrote in the strict contrapuntal and imitative style of his predecessors, he led his voices in such a way as to obtain massive harmonic effects.

His best work, the *Penitential Psalms of David* (republished in modern notation by Dehn, 1828), compares favorably with the works of his greater contemporary, and his influence on church music of his day was scarcely less than Palestrina's. Without exception he is the most fertile composer known in the history of music, the number of his works exceeding 2000. In 1894 Breitkopf and Härtel began a complete edition of his works (under the editorship of F. X. Haberl and A. Sandberger) in 60 volumes, of which so far 20 have appeared. Consult Adolf Sandberger, *Beiträge zur Geschichte der bayerischen Musikcapelle unter O. di Lasso* (3 vols., Leipzig, 1894), and Jules Declève, *Roland de Lassus, sa vie et ses œuvres* (Mons, 1894).

L'ASSOMPTION, lă'sôn'syôn'. A town and the capital of L'Assomption Co., Quebec, Canada, on the Canada Northern Railway, 22 miles north by east (direct) of Montreal (Map: Quebec, E 5). It is the seat of L'Assomption College and has a Roman Catholic convent and a hospital. Its industrial establishments include three molding factories, a foundry, a cigar factory, a tobacco factory, two carriage and four butter factories. Native wine is also made. Pop., 1901, 1605; 1911, 1747.

LASSON, lă'sôn, ADOLF (1832-). A German metaphysician, born at Altstrelitz, Mecklenburg. He studied in Berlin, where he was made philosophical docent at the University in 1877 and honorary professor in 1897. He also became chairman of the Philosophical Society. The more important of his writings include: *Baco von Verulam's wissenschaftliche Principien* (1860); *Johann Gottlieb Fichte im Verhältnis zu Kirche und Staat* (1863); *Meister Eckhart der Mystiker* (1868); *Das Kulturideal und der Krieg* (1868); *Princip und Zukunft des Völkerrechts* (1871); *Giordano Bruno* (1872); *System der Rechtsphilosophie* (1882); *Das Gedächtnis* (1894); *Der Leib* (1898); *Aristotelische Metaphysik* (1907); *Aristotelische nikomachische Ethik* (1909).

LASSUS, lă'sus', JEAN BAPTISTE ANTOINE (1807-57). A French architect and archaeologist, born in Paris. He entered the Ecole des Beaux-Arts in 1828 and was a pupil of Lebas and Labrousse. He was one of the inspectors of the religious edifices on the Seine, and in 1840 he and Viollet-le-Duc were associated with Duban in the restoration of the Sainte Chapelle, which was not entirely completed until 1856. In 1842 Lassus and Viollet-le-Duc were intrusted with the restoration of Notre Dame. This work was interrupted by the restoration of Saint-Germain l'Auxerrois and of the cathedrals of Chartres and Le Mans, and the building of the parish church at Belleville. He prepared the *Album de Villard de Honnecourt* for publication (1858), and illustrated the elaborate *Monographie de la cathédrale de Chartres* (1843) prepared by Didron and Amaury Duval for the government. He contributed largely to the *Annales archéologiques*. Lassus stands at the head of the nineteenth-century Gothic revival in France.

LAS'SUS, ORLANDUS. A Dutch composer. See LASSO, ORLANDO DI.

LAST DAYS OF POMPEII, THE. A novel by Bulwer (1834). The story is laid immediately before and during the destruction of Pompeii (79 A.D.).

LAST JUDGMENT, THE. A favorite subject with painters of religious subjects, repre-

senting the episode described in Matt. xxv. 31 et seq. Christ is depicted, surrounded by the Apostles, prophets, and other holy personages, as the supreme Judge of the world, separating the blessed from the damned. The episode is usually accompanied by representations of heaven and hell. The Last Judgment was a favorite theme with mediæval painters; the most celebrated examples by them are Giotto's fresco in the Arena Chapel, Padua, Andrea Orcagna's in Santa Maria Novella, Florence, and the very large and celebrated mural painting in the Campo Santo, Pisa, formerly ascribed to Orcagna, but now to a follower of the Lorenzetti. The subject was painted frequently in the Renaissance, the most celebrated examples being the altarpiece by Fra Angelico in the Florence Academy, the frescoes by Luca Signorelli in the cathedral of Orvieto, the painting by Michelangelo in the Sistine Chapel, the most celebrated of all and the largest fresco in the world (for description, see MICHELANGELO), and the canvas by Tintoretto in Santa Maria dell'Orto. Among the Flemings it was represented by Rogier van der Weyden in the Hospital of Beaune, France, and several times by Rubens, the best example being in the Munich Academy. The most celebrated modern painting of the Last Judgment is the large fresco by Peter von Cornelius in the Ludwigskirche, Munich.

LAST MAN. A title used of Charles I of England by the Parliamentary party, intended to signify that he was the last King that England should have. Charles II was called the Son of the Last Man.

LASTMAN, lăst'mân, PIETER (1583-1633). A Dutch painter and engraver, born at Amsterdam. He was the son of a goldsmith and a pupil of Gerrit Pietersz Siveligh in Amsterdam. From about 1604 to 1607 he was in Italy, where he developed under the influence of Correggio and was associated with Elsheimer, Thoman, and Pinas. Afterward he practiced at Amsterdam, painting both religious and portrait subjects. His paintings recall the work of Elsheimer (q.v.), but his chief claim to fame consists in his having been the teacher of Rembrandt, in whose early works his influence may be seen. The great poet Joost van Vondel wrote several verses on a portrait of Thomas de Keyser (q.v.) painted by Lastman. There are old engravings of many of his paintings. Consult Kurt Freise, *Pieter Lastman, sein Leben und seine Kunst* (Leipzig, 1911).

LAST OF THE BARONS, THE. A novel by Bulwer (1843). The hero is Richard Neville, Earl of Warwick, and the scene is the Wars of the Roses in the fifteenth century.

LAST OF THE MOHICANS, mò-hé'kanz, THE. A novel by James Fenimore Cooper (1826). One of the so-called *Leatherstocking Tales*.

LAST OF THE ROMANS. A name used of Brutus, Cassius, Aëtius, and Cola di Rienzi. In modern times the title has been applied also to Congreve, Horace Walpole, and others.

LAST OF THE TRIBUNES. A title used of Cola di Rienzi (q.v.). His brief term of office is the subject of Bulwer's novel *Rienzi*, the *Last of the Tribunes*.

LAST OF THE TROUBADOURS. A title given to the Gascon poet Jacques Jaamin.

LAST ROSE OF SUMMER, THE. One of the most familiar of the songs written by

Thomas Moore for his *Irish Melodies*. The air was changed from an old melody, "The Groves of Blarney."

LAST SIGH OF THE MOOR, THE (Sp. *El ultimo suspiro del Moro*). The name given to a sandy hillock near Granada, Spain. On it Boabdil is said to have taken his last view of the Alhambra on Jan 2, 1492, after the conquest of the city by Ferdinand and Isabella.

LAST SUPPER, THE. See **LORD'S SUPPER** IN ART, THE.

LASUS (Lat., from Gk. *Λᾶσος*) (c.515 B.C.). A Greek poet, born at Hermione in Argolis, who lived at Athens during the reign of Hipparchus. He developed the dithyrambus (q.v.). He composed also a treatise (the first) on the theory of music. He is reputed to have had Pindar as his pupil. The few fragments of his poems are given by Bergk, *Poetae Lyrici Graeci*, iii (4th ed., Leipzig, 1887).

LAS VEGAS, las vā'gās. A town and the county seat of San Miguel Co., N. Mex., 132 miles east of Albuquerque, on the Gallinas, a branch of the Pecos River, and on the Atchison, Topeka, and Santa Fe Railroad (Map: New Mexico, D 3). It includes the city of Las Vegas, incorporated under the name East Las Vegas in 1888 and chartered as a city in 1896. It is the seat of the New Mexico Normal University and the New Mexico Insane Asylum, and contains a Carnegie library, and St. Anthony's Sanatorium. Las Vegas is an important wool market and the commercial centre for the adjacent country, which is interested principally in farming and stock raising. Its industrial establishments include railroad machine shops, wool-scouring mills, flour mills, carriage and wagon shops, planing mills, a foundry and machine shop, tie-preserving works, lumber and brick yards, candy and cigar factories, a brewery, etc. Six miles distant is the famous Las Vegas Hot Springs, a popular health resort, 6765 feet above sea level, noted for its fine scenery and clear and equable climate, as well as for its medicinal springs, which number some 40, with temperatures ranging from 75° to 140° F. Pop. (of the town), 1900, 2767; 1910, 3179, (of the city), 1910, 3755.

LASZLO VON LANLOS, lās'tō fōn lān'lōs, PHILIP ALEXIUS (1869-). A Hungarian portrait painter. He was born in Budapest and studied under Lotz at the Budapest Academy and afterward in Munich under Liesen-Mayer and in Paris under Lefebvre and Benjamin Constant. His earliest works are genre paintings, such as "In the Hofbräu House" and the "Old Woman Telling Fairy Tales" (1891). In 1892 he turned to portraiture, in which branch he manifested a power of characterization, sense of style, and sureness of brushwork which placed him in the front rank of modern portraitists. His most celebrated sitters included Prince Hohenlohe-Schillingsfürst (1899), Pope Leo XIII (1900), Jan Kubelik (1904), Theodore Roosevelt (1908), Princess Victoria Luise (1908), Emperor William II and Empress Auguste Victoria (1909), the King and Queen of Spain (1910), Lord Roberts (1911). The artist's portrait of himself is in the Uffizi, Florence. Among his charming portraits of children are "Miss Olive Trouton" (1910) and the artist's two sons (1910). Laszlo received gold medals at Munich, Düsseldorf, Vienna, St. Louis, Paris, and Venice. Among many marks of distinction he received that of

ennoblement in 1912 from the Emperor of Austria. After 1907 he resided in England.

LATACUNGA, lā'tā-kōōn'gā. The capital of the Province of León, Ecuador (Map: Ecuador, B 4). It is situated on a plateau 9000 feet above the sea and between the two neighboring volcanoes of Chimborazo and Cotopaxi. The region is volcanic, and the city has several times been destroyed by earthquakes; nevertheless, it has been rebuilt and is now one of the handsomest towns in the country, with fine public buildings and churches and a national college. It is on the railway from Guayaquil to Quito, 56 miles from the latter. The chief export is saltpetre, and it has some trade in fabrics, ceramics, hides, and alcohol. Near the city are a number of pumice-stone quarries. It was, however, an important place before the conquest and contained a palace of the Incas which still exists. It was occupied by the Spaniards in 1534. Pop. (est.), 12,000, largely Indians.

LA TAILLE, lā tī'y', JEAN DE (c.1540-c.1607). A French dramatist, born at Bondaroy. He studied law at Orléans and fought under Henry IV in his numerous wars. In his writing he imitated the ancients in the manner of Jodelle and produced tragedies, such as *Saul le furieux* (1572), and comedies, such as *Les corvauux* (1574), in which he is one of the first to introduce natural dialogue. He also wrote *Élégies, chansons, sonnets* (1574). His works were edited by De Naulde (1878-82)—His brother, JACQUES DE LA TAILLE (1542-62), wrote *La mort d'Alexandre* (1573) and *La mort de Daire* (1574), tragedies.

LATAKIA, lā'tā-ke'ā. A seaport of Syria, in the Vilayet of Beirut, opposite the island of Cyprus, and 75 miles north of the town of Tripoli (Map: Turkey, in Asia, C 3). It is poorly built, but has some Roman antiquities, notably a triumphal arch, generally assigned to Septimius Severus. In ancient times it was called Laodicea and in the Middle Ages was a flourishing port of considerable importance to the Crusaders. The commercial importance of the place now depends chiefly on the famous Latakia tobacco, which is grown in the vicinity and exported to Egypt and England. The harbor is small and shallow, and steamers usually anchor in the roadstead, there is a lively export trade in tobacco, silk, sponges, and eggs. Latakia is the seat of an American mission. Pop., according to latest estimates, 25,000, mostly Mohammedans.

LATEAU, lā'tō', LOUISE (1850-83). A Belgian visionary, born at Bois d'Haine. After entering the Third Order of St. Francis of Assisi she had a vision of Christ and was thereafter thought to be stigmatized with wounds which bled each Friday (1868). Some of the Catholic clergy urged the miraculous nature of the phenomenon, and the girl's home became a place of pilgrimage. A Belgian pathologist diagnosed her disease as stigmatic neuropathy. When Bishop Dumont, of Tournay, who had seen in her case a miracle in behalf of the Catholic church, was deposed, she sided with him and left the Roman Catholic communion. Consult August Rohling, *Louise Lateau, die Stigmatisirte von Bois d'Haine* (Paderborn, 1874), and Warlomont, *Rapport médical* (Brussels, 1875).

LATEEN' SAIL (Fr. *latine*, Latin, from Lat. *Latinus*, Latin; so called in allusion to the use of this sail in the Mediterranean). A large triangular sail, common in the Mediterranean,

The upper edge is fastened to the lateen yard, a long tapering spar which is held at an angle of about 45° with the deck by means of a short mast crossing it at a third or a fourth of the way up from the lower or forward end.

LATENCY. See **HEREDITY**.

LA TÈNE (là tân) **PERIOD.** The name applied to the second early Iron age in Europe, the first being called Hallstattian. It lasted from the seventh century until the first century B.C. in France, Bohemia, and England, but in Scandinavia it was prolonged until the tenth century A.D. See **NEOLITHIC PERIOD**.

LATENT FAULT, or DEFECT. A defect in an article which is not discoverable upon ordinary inspection. In general, the vendor of a chattel is under a duty to disclose to the buyer latent, but not patent, defects in the article sold. A gratuitous lender may be legally liable in damages for an injury sustained by the borrower through a latent and undisclosed defect in the borrowed article. He is not bound, however, to put the thing into a safe condition for use, nor does he impliedly undertake or warrant that it is fit for use. One who hires an article to another, however, does impliedly engage that it is free from all latent faults which reasonable care and skill could detect or guard against. A caterer is held to a similar engagement as to the wholesomeness of the food he supplies to guests. For the discussion of this topic in some of its important connections, see **CAVEAT EMP-TORE**; **CARRIER, COMMON**; **MASTER AND SERVANT**; **NEGLIGENCE**.

LATENT HEAT. See **HEAT**.

LATERAN, CHURCH AND PALACE. The church of St. John Lateran is the first in dignity of the Roman churches, styled in Roman usage "the mother and head of all the churches of the city and of the world." It occupies the site of the palace of Plautius Lateranus, confiscated by Nero and later an Imperial residence. The palace was given by Constantine to Pope Melchiades in 312, and the first basilica built here by Pope Sylvester I in 324, of which a few fragments still remain. This was overthrown by an earthquake in 894; the second church, dedicated now to St. John Baptist, was burned in 1308; and the third met a similar fate in 1360. The fourth restoration was made by Urban V (1362-70). Through all these reconstructions the original basilican form of the building was measurably preserved; but the edifice has since been largely modernized with unhappy effect. Especially destructive of its pristine beauty and dignity was the reconstruction by Borromini in the sixteenth century, in a vulgar baroque style; but the east front by Galilei (1734) is a highly impressive work. The solemn entrance of the Pope into office is celebrated by his taking possession of this church; at St. Peter's he is Pope, but here Bishop of Rome. Over the portico is the balcony from which, before 1870, the pontiffs gave their solemn benediction *urbis et orbi*. Five councils regarded as ecumenical by the Roman Catholic church have been held here (see **LATERAN COUNCILS**); and it is here that tradition places the first meeting of St. Francis and St. Dominic. Incorporated in the group formed by the church and palace is the Lateran baptistery, believed to have been erected by Constantine. The Lateran Palace was the habitual residence of the popes from the fourth century until the migration to Avignon; after their return they re-

moved to the Vatican. The ancient building was destroyed by Sixtus V, the only remnants are the private chapel of the popes, and one end of their dining hall, known as the Triclinium, in the building behind which, attached to a Passionist convent, is the *Scala Santa* (holy staircase), supposed to have been that of Pilate's palace at Jerusalem, said to have been brought to Rome by St. Helena. Those who believe that the feet of Christ touched it ascend it only on their knees, and the 28 stone steps are covered by a wooden casing. The ancient chapel above it, where no one but the Pope is permitted to say mass, contains a portrait of Christ reputed to have been begun by St. Luke and finished by an angel, whence it is known as the *Acheiropoieton*, or picture made without hands. The modern Palace of the Lateran, built by Domenico Fontana (c 1580) for Sixtus V, and now under the control of the Italian government, contains two extremely valuable museums—the *Museo profano*, of objects of pagan antiquity, and the *Museo Cristiano*, a museum of Christian archaeology, due principally to Pius IX. Consult C. J. K. Bunsen, *Die Basiliken des christlichen Roms* (Munich, 1843). De Fleury, *La Letéran au moyen âge* (Paris, 1877). R A Lanciani, *Pagan and Christian Rome* (Boston, 1893); A. J. C. Hare, *Walks in Rome* (London, 1913).

LATERAN COUNCILS. The councils held in the Lateran Basilica at Rome. (See **LATERAN, CHURCH AND PALACE**) The first one of importance was called by Martin I in 649 to condemn those who denied that there were two wills in Christ, the divine and the human. (See **MONOTHELITISM**.) It was attended by more than 100 bishops of Italy, the adjacent islands, and Africa. The numerous reforming synods of the eleventh century were usually held in the Lateran, since it was then the residence of the popes. That of 1059, under Nicholas II, is important for its decisions on clerical celibacy and papal elections. Those of 1105, 1112, and 1116 dealt with the question of investiture (q.v.), as did the Council of 1123, known among Roman Catholics as the First Lateran Council in the list of those which they account ecumenical. (See **COUNCIL**.) It was called by Calixtus II, was attended by more than 300 bishops, and confirmed the articles of the Concordat of Worms, an agreement between the Emperor and the Pope. The Second Lateran Council in this classification was held by Innocent II in 1139 and was composed of over 1000 bishops. It provided for the healing of the schism caused by the Antipope Anacletus II and condemned the innovations of the Petrobrusians and Arnold of Brescia. The third, held by Alexander III in 1179 after the conclusion of peace with Frederick Barbarossa, regulated papal elections (requiring two-thirds of the electors for validity), settled the qualifications for the episcopate, and passed a number of disciplinary canons. The fourth, convened by Innocent III in 1215, known as "the General Council of Lateran" or "the Great Council," strongly supported the Crusades, condemned the doctrines of the Cathari and Waldenses, giving ecclesiastical sanction for the first time to the expression "transubstantiation" as an explanation of the mode of Christ's presence in the Eucharist, required every member of the Church who had reached the age of discretion to approach the sacrament of penance at least once a year, forbade clandestine marriages, and passed many other important dis-

ciplinary canons. The fifth, opened by Julius II in 1512, and closed by Leo X in 1517, dealt with the schism growing out of the Council of Pisa, provided for resistance to the Turks, and replaced the Pragmatic Sanction by a concordat with France. In 1725 the Pope called the bishops directly dependent on Rome to the Lateran to consult regarding the suppression of Jansenism (q.v.) and the confirmation of the bull "Unigenitus." Consult K. J. von Hefele, *Concilien-geschichte* (9 vols., Freiburg, 1855-90).

LATERES COCTI, COCTILES, CRUDI.

The ancient Roman names for various kinds of bricks. Consult Smith, *A Dictionary of Greek and Roman Antiquities*, vol. ii (3d ed., London, 1890), and Middleton, *The Remains of Ancient Rome* (2 vols., ib., 1892). See BRICK.

LATERITE (from Lat. later, brick, tile).

The name given to a superficial deposit or soil which covers wide areas in tropical lands, especially in the Sudan, Sahara Desert, Brazil, and India. It is a loose, porous, reddish, or yellowish mass, composed largely of a claylike substance and iron oxides, the latter determining the color. The clayey material consists partly of hydrargyllite, the hydrate of aluminium. Laterite is formed by the decomposition of various rocks, especially feldspathic ones like granite, under tropical climates; in the process of decomposition the more soluble constituents, represented by the alkalies and alkali earths, are removed and the aluminium and iron remain behind to form new compounds. When freshly quarried, laterite is soft, but hardens on exposure to a rather firm rock.

LATEX (Lat., juice). The milky or colored juice which is found in special cells or tubes in plants, confined to certain families of the angiosperms, viz., the Papaveraceæ, Asclepiadaceæ, Apocynaceæ, Euphorbiaceæ, Urticaceæ, Lobeliaceæ, Campanulaceæ, Cichoriaceæ, Aroidæ, and Musaceæ. The first eight families belong to the dicotyledons, and the last two to the monocotyledons. Other monocots contain mucilage vessels, which agree in many features with the latex vessels; the contents, however, lack the milky appearance and are slimy. In most plants the latex is whitish or cream color; in the blood-root, however, it is of a deep orange red and in some other members of the poppy family of a lemon yellow. It is a watery fluid, containing many different substances in solution, and a considerable number in the form of minute droplets or in the solid state, merely suspended in water. The latter fact gives to it somewhat the character of an emulsion and probably promotes turgor (q.v.) of the latex tubes. That they are highly turgid is shown by the fact that when a plant containing latex is wounded the juice exudes promptly and in considerable amount. The dissolved substances are (1) salts, especially those of calcium and magnesium, varying much in relative amount and character in different species; (2) sugars, gums, and other carbohydrates; (3) proteids; (4) tannins, alkaloids, enzymes, and various waste products. The substances held in suspension are (1) minute granules of gums, resins, and caoutchouc, (2) oils, and (3) tannins, the two latter in the form of fluid droplets. Other substances, such as starch grains, proteid grains and crystals, oil drops, etc., are embedded in the protoplasm with which each tube is lined. (See below.)

The latex vessels are of two distinct kinds, (1) articulated and (2) nonarticulated. The

articulated tubes arise from the early fusion of rows of cells by the partial or complete absorption of their end walls. A row of cells extending sideways may fuse with the main line and so form side branches; or, outgrowths may arise from the main tube, penetrate between the adjacent cells, and finally fuse with a neighboring

FIG. 1. ARTICULATED LATEX VESSELS FROM THE STEM OF LACTUCA.

tube. The articulated latex vessels, therefore, are distinguished not only by their irregular outline, in which the mode of origin may be traced, but also by the numerous branches connecting with one another and so forming a network (Fig. 1). The nonarticulated vessels arise in the very young embryo through the differentiation of meristem tissue. The cells destined for latex tubes elongate, grow, and branch as fast as the neighboring tissue grows, and push their way almost independently among the adjacent

FIG. 2. NON ARTICULATED LATEX VESSELS. Longitudinal section of the cortex of *Euphorbia resinifera*.

young cells. While they branch abundantly, the branches do not join others and form a network as the articulated tubes do. They are distinguished by their smooth contour, often thick walls, and the absence of anastomosing branches (Fig. 2). The latex vessels extend through the whole body of the plant, standing in close rela-

tion to the nutritive tissue of the leaves on the one hand (Fig. 3) and the growing regions on the other. In the older parts of the stem they are most abundant in the cortex and the phloem. They may be considered as a special form of conducting tissue by means of which the various

FIG. 3. ENDINGS OF LATEX VESSELS IN THE LEAVES OF TWO SPURGES.

a, *Euphorbia myrsinites*; b, *E. biglandulosa*. In a the latex vessel is shown lengthwise; in b it is seen in section. The shaded cells are the palisade parenchyma, which makes food.

foods contained in the latex are readily distributed from regions of manufacture or storage to the regions of use. When rich in food substances, the latex is very opaque, becoming more translucent as the food diminishes. These variations in the food content of the latex are found to be parallel with the nutritive necessities of the plant. The latex tubes are lined with a delicate layer of protoplasm, in which are embedded the various special organs, nuclei of peculiar form, starch formers (leucoplasts, q.v.), etc. The latex itself lies within this protoplasmic body, occupying the same position as the cell sap in an ordinary cell. The latex therefore may be looked upon as corresponding to the cell sap which is present in every active cell, from which it differs only in the abundance and nature of the dissolved and suspended materials. Economically the most important substance in the latex is caoutchouc, which after manufacture constitutes the rubber of commerce. See CONDUCTION; RUBBER.

LATH. See LATHS AND LATHWOOD.

LATHAM, JOHN (1740-1837). An English ornithologist, born at Eltham, Kent. He studied anatomy in London under Hunter and until 1796 practiced medicine at Dartford. He then settled at Romsey, Hampshire, and devoted himself entirely to the study of nature. In 1788 he had been one of the founders of the Linnean Society. Especially interested in ornithology, he made a fine collection of birds and published *A General Synopsis of Birds* (3 vols., 1781-85) and *A General History of Birds* (11 vols., 1821-28), finished when he was 88 years old. For this latter important work he himself designed, etched, and colored the illustrations.

LATHAM, ROBERT GORDON (1812-88). An English philologist and ethnologist, born at Billingborough, Lincolnshire. He was educated at Cambridge and took the degree of M.D., but, having made a tour in Denmark and Nor-

way, he was led to direct his attention particularly to the Scandinavian languages. For several years he was professor of the English language and literature in University College, London. His chief works are: *English Language* (1841); *Natural History of the Varieties of Mankind* (London, 1850); *Ethnology of the British Colonies*; *Man and his Migrations* (ib., 1851); *Descriptive Ethnology* (1859); *The Nationalities of Europe* (1863); *Outlines of General or Developmental Philology* (1878); *Russian and Turk from a Geographical, Ethnological, and Historical Point of View* (1878).

LATHE, lATH. See METAL-WORKING MACHINERY; WOODWORKING MACHINERY.

LATHE, or LATH (AS. *læþ*, *lēþ*, district; possibly connected with Dan. *lægd*, levying district, situation, and with AS. *liegan*, Goth. *ligan*, OHG. *ligen*, Ger. *liegen*, OChurch Slav. *ležati*, to lie, Lat. *lectus*, Gk. *λέχος*, *lechos*, couch). Formerly a part or a division of a county among the Anglo-Saxons consisting of several hundreds. At present it consists of four or five hundreds and is confined to the County of Kent. Formerly there was a lathe reeve, or bailiff, in each lathe. The same number of hundreds which constitute the *lathe*s of Kent are called the *rapes* of Sussex. In Ireland the lathe is intermediate between the tithing and the hundred.

LATHOM HOUSE. An historic mansion in Lancashire, England, some 13 miles northeast of Liverpool. In the era of the Plantagenets the place gave its name to the proprietor, Robert Fitzhenry (Earl of Lathom). In the reign of Edward III it passed with the heiress Isabel into the family of the Stanleys, who owned it for about three centuries. At that time it was a mansion strongly fortified by a moat, palisades, and a wall with nine towers. In 1644 Charlotte, Countess of Derby, in the absence of the Earl, defended it heroically for four months against a Parliamentary army under Fairfax. Later, however, it was taken and destroyed. The present house, erected about 1750, is a large fine building, in the Italian style of architecture, furnished with a colonnade of Ionic pillars, and the park belonging to it is 4 miles in circuit. Consult Draper, *The House of Stanley* (Ormeskirk, 1864), and, for a journal of the siege in 1644, Mrs. Hutchinson, *Memoirs of the Life of Colonel Hutchinson* (London, 1846).

LA'THROP, FRANCIS (1849-1909). An American decorative and portrait painter. He was born at sea near the Hawaiian Islands and studied under Farrer in New York, then at the Dresden Academy. Later he was a pupil of Madox Brown and Burne Jones in London and he also studied the technique of stained glasses in William Morris's school. The influence of these Pre-Raphaelite teachers is visible in all Lathrop's work. On his return to America in 1873 he devoted himself to portraiture, to stained glasses, and especially to decorative painting. He assisted La Farge in the decoration of Trinity Church, Boston, the chancel of which he designed. Other good examples of his decorative works are the mural paintings "Moses with the Tablets of the Law," in Bowdoin College chapel; "Apollo," over the proscenium of the Metropolitan Opera House, New York; "The Light of the World," in St. Bartholomew's, New York; designs for a marble mosaic, "Widows and Orphans," in the old Equitable Building, New York. His best-known

stained glasses are the Marquand Memorial window in Princeton College chapel and the chancel window of Bethesda Church, Saratoga, N. Y., for which he received a gold medal at Philadelphia in 1889. Lathrop also illustrated artistic publications like Clarence Cook's *House Beautiful*. He was one of the founders of the Society of American Artists, where some of his early portraits, including those of Ross and Thomas Winant, were exhibited. In 1906 he was elected associate of the National Academy of Design.

LATHROP, GEORGE PARSONS (1851-98). An American journalist and poet, born at Oahu, Hawaiian Islands, Aug. 25, 1851. He was educated in New York and Dresden (1867-70), returned thence to New York, began, but soon abandoned, the study of law, went to England, there married (1871) Rose, second daughter of Nathaniel Hawthorne. (See **LATHROP, ROSE HAWTHORNE**.) He was from 1875 to 1877 assistant editor of the *Atlantic Monthly*, then till 1879 editor of the *Boston Courier*, and afterward resided in Concord and New York. He founded the American Copyright League (1883). His writings include: *Rose and Roof Tree* (1875), poems, *Study of Hawthorne* (1876); *Afterglow* (1876), a novel; *A Masque of Poets* (1877); an edition of Nathaniel Hawthorne's *Works* (1883), with a biography; *An Echo of Passion* (1882); *In the Distance* (1882); *Spanish Vistas* (1883); *History of the Union League in Philadelphia* (1883); *Newport* (1884); *Gold of Pleasure* (1892); *Dreams and Days* (1892), verses; and other works of minor significance. With his wife he published *Annals of Georgetown Convent* and *A Story of Courage* (1894).

LATHROP, JOHN (?-1653). An American Congregational clergyman, whose name is also spelled Lothrop, Lothrop, and Laythrop. He was born in England, studied at Oxford, took holy orders, and was rector of a church at Egerton, Kent, until about 1624, when he succeeded Henry Jacob as pastor of the first Independent or Congregational church in England. This London congregation was much harried by the ecclesiastical authorities. Lathrop's wife died while he was imprisoned (1632-34), and, having lost a part of his church through a schism on the question of baptism, in 1634 he removed to Massachusetts, becoming first pastor at Scituate and in 1639 at Barnstable. One of the authorities for Prince's history of New England is "an original register, wrote by the Rev. John Lothrop," which contains a record of the affairs of these two towns.

LATHROP, JOHN HIRAM (1799-1866). An American educator, born at Sherburne, N. Y. He graduated at Yale in 1819, was tutor there from 1822 to 1826, and then entered the legal profession, but after six years left it and became a teacher first at Norwich, Vt., then at Gardiner, Me. He was professor of mathematics and natural philosophy from 1829 to 1833, and of law, history, and economics from 1835 to 1840, at Hamilton College, and was president of the University of Missouri from 1840 until 1849, after which he was successively chancellor of the University of Wisconsin, president of Indiana University, professor of English literature in the University of Missouri, and again president of the last-named institution from 1865 until his death.

LATHROP, JULIA CLIFFORD (1858-). An American social worker. She was born at

Rockford, Ill., studied at Rockford College, and graduated from Vassar College in 1880. She made special studies in the care of the insane, in the better education of children, and in juvenile laws, spending much of her time at Hull House, Chicago, after 1899, and making special investigations in foreign countries. Except for four years she was a member of the Illinois State Board of Charities from 1893 to 1909. For a time she was president of the Illinois Society for Mental Hygiene and vice president of the Chicago School of Civics and Philanthropy and of the Juvenile Protective Association. She became the first chief of the Children's Bureau of the United States Department of Labor, provided for by law in 1912. She is author of *The Children's Bureau* (1912).

LATHROP, ROSE HAWTHORNE (1851-). An American poet and philanthropist, daughter of Nathaniel Hawthorne. She was born at Lenox, Mass., lived in England and Portugal (1853-60), and studied art at Dresden and in London, where she married George Parsons Lathrop (q.v.) in 1871. She wrote many stories and sketches; a volume of poems, *Along the Shore* (1888); and *Memories of Hawthorne*, with her husband (1897). In 1896 she established in New York City St. Rose's Free Home for Cancer, and soon after, with the title of Mother Mary Alphonsa, she became head of a Dominican community of the Third Order and director of a charitable home in that city.

LATHROP, WILLIAM LANGSON (1859-). An American landscape painter, born in Warren, Ill. Practically self-taught in his art, his work is to be found in the Metropolitan Museum, New York ("The Meadows"); the Carnegie Institute, Pittsburgh ("Abandoned Quarry"); the Albright Art Gallery, Buffalo; Minneapolis Art Museum ("Clouds and Hills"); National Museum of Art, Washington ("Three Trees"); and elsewhere. He was elected to the National Academy in 1907 and won numerous medals and prizes. His landscapes are characterized by refreshing sincerity of conception united to a vigorous and able technique.

LATHS AND LATHWOOD (AS. *latta*, OHG. *latta*, Ger. *Latte*, lath, thin plate; connected with MHG *laden*, *lade*, board, and with Ir. *slat*, Bret *laz*, rod, Welsh, *lath*, rod). Laths are thin and narrow strips of wood (usually 4 feet long, 1½ inches wide, and ¼ inch thick), made either by splitting lathwood, which is the Norway spruce fir (*Pinus abies*), or by sawing them from the shorter lengths of the lumber. Laths are nailed to the studs or furring strips of walls and to the rafters of ceilings; they are placed slightly apart to receive the plaster, which, by being pressed into the intervals between the laths, is retained, and when dry is held securely on the wall. Slaters' laths are longer strips of wood nailed on to the framework of the roof for the purpose of sustaining the slates or tiles, which are fastened to the laths by nails. "Metallic lath" and "wire lath" are modern American inventions, now widely used in place of wooden laths in fireproof construction (q.v.). The first is made in various forms from sheets of steel, perforated in various ways, as in "expanded metal" lathing; the second is a species of netting of galvanized steel wire.

LATHYRISM, lath'ri-z'm. See LUPINOSIS.

LATHYRUS (Neo-Lat., from Gk. *ἄδυρος*, sort of pulse). A genus of plants of the family

Leguminosæ. The leaves of many species are furnished with tendrils and are pinnate, but often with only one pair of leaflets. Some species have the leaves reduced to tendrils, the enlarged stipules performing the usual functions of the leaves. The species are numerous, annual and perennial herbs, natives of temperate countries in the Northern Hemisphere and the mountains of tropical Africa and South America. Few are American; several of the European species have been introduced in cultivation and have escaped and become established; some are

LATHYRUS.

natives of Great Britain; some have very beautiful flowers of considerable size, on account of which they find a place in flower gardens, as *Lathyrus latifolius* and *Lathyrus sylvestris*, the latter a native of England and the former of the south of Europe, both perennials and known by the name of everlasting pea. The sweet pea (*Lathyrus odoratus*), a native of the East, one of the best-known ornaments of our flower gardens, is a hardy annual, esteemed not only on account of the beauty of its flowers but of their delightful fragrance. The most common British species is the meadow vetchling (*Lathyrus pratensis*), with bright yellow flowers. *Lathyrus sativus*, the chickling vetch or lentil of Spain, a native of the south of Europe, with flowers generally of a bright blue color and winged pods, is cultivated in India, and in Germany, France, and other countries for its seeds, the flour of which, however, is mixed with other flour rather than used alone, on account of narcotic principles which it possesses, and which caused its cultivation for food to be interdicted in Württemberg in 1871. The seeds of *Lathyrus cicera*, although sometimes used by the country people of France, are even more dangerous. Those of *Lathyrus aphaca*, a species sometimes found on gravelly soils in England, possess similar qualities when ripe, but in an unripe state are wholesome. They are eaten with the pods which contain them. *Lathyrus tuberosus*, a native of Germany and other parts of Europe but not of Great Britain, is cultivated on the Continent for its small, starchy tubers, which are sometimes called Dutch mice; in Germany they are

known as earthnuts. The herbage of the plant is relished by cattle. In Alaska and elsewhere the unripe seeds of the beach pea (*Lathyrus maritimus*) are eaten as a vegetable. *Lathyrus sylvestris wagneri* has been extensively exploited as a fodder plant in Germany, France, and the United States. It is very resistant to drought when once established and yields abundant green forage of a nutritious character.

LATICIFEROUS TISSUE. Latex. See HISTOLOGY; LATEX.

LATIMER, HUGH (c.1490–1555). One of the most distinguished of the English reformers. He was born at Thurcaston in Leicestershire. He was educated at Cambridge and became attached to the new learning and divinity which had begun to establish themselves there. He soon became a zealous preacher of the reformed doctrines and in consequence was embroiled in many controversies. The dispute about Henry VIII's marriage with Catharine of Aragon brought Latimer more into notice. He was one of the divines appointed by the University of Cambridge to examine as to its lawfulness, and he declared on the King's side. This secured Henry's favor, and he was appointed one of his chaplains and received a living in Wiltshire (1531). In 1535 he was appointed Bishop of Worcester, and at the opening of Convocation on June 9, 1536, he preached two very powerful and impressive sermons, urging the necessity of reform. After a while the work of reform rather retrograded than advanced, and Latimer found himself with his bold opinions in little favor at court. He retired to his diocese and labored there in a continual round of "teaching, preaching, exhorting, writing, correcting, and reforming, either as his ability would serve or the time would bear." This was his true function. He was an eminently practical reformer. Towards the close of Henry's reign, and when the reactionary party, headed by Gardiner and Bonner, was in the ascendant, Latimer resigned his bishopric (1539) and till 1546 lived in great privacy. He was looked upon with jealousy and closely watched, and finally, on coming up to London for medical advice, he was brought before the Privy Council and cast into the Tower. On the accession of Edward VI, the next year, he was released and again appeared in public. He declined, however, to resume his episcopal functions, although his old bishopric was offered to him. He devoted himself to preaching and practical works of benevolence. After the death of Edward and the accession of Mary (1553) he and other reformers were arrested in their career of activity. Latimer was put in prison, and examined at Oxford in 1554. After his examination he was transferred to the common jail there, where he lay for more than a year, feeble, sickly, and worn out with his hardships. On Sept. 30, 1555, he was summoned before certain commissioners appointed to sit in judgment upon him and Ridley, and after trial, on October 1, he was condemned to be burned. He suffered along with Ridley, opposite Balliol College, on Oct. 16, 1555. The account of his trial and execution is in Foxe's *Book of Martyrs*. His *Remains and Sermons* were issued by the Parker Society (2 vols., Oxford, 1844–45). Consult his biography by R. Demaus (London, 1869; new ed., 1881), and by R. M. and A. J. Carlyle (ib., 1899).

LATIMER, JAMES ELIJAH (1826–85). An American Methodist Episcopal clergyman and

educator, born at Hartford, Conn. Graduating from Wesleyan University in 1848, he was professor of ancient languages in Newbury (Vt.) Seminary for one year, professor of Latin and geology in Genesee Wesleyan Seminary, Lima, N. Y., for two years, and from 1854 to 1857 principal of the Fort Plain (N. Y.) Seminary. In 1858 he served as a professor in Elmira Female College, in the same year entering the ministry in the East Genesee conference of his church. He visited Europe in 1868 to study methods of instruction. In 1870 he was elected professor of historical theology in Boston University School of Theology, eight years later he became dean of the faculty, and was transferred to the chair of systematic theology, which he retained until his death.

LATIN AMERICA. A name given to those portions of America which are inhabited chiefly by races of Latin stock, thus including Mexico, Central America, South America, and parts of the West Indies.

LATINA VIA. See LATIN WAY.

LATIN CROSS. A cross with the lower limb considerably longer than the other three, as distinguished from the Greek cross, which has the four arms equal.

LATIN EMPIRE. The name given to the Empire established by the Crusaders, in 1204, after their capture of Constantinople. It came to an end in 1261. See BYZANTINE EMPIRE, CRUSADE.

LATIN GATE (Lat *Porta Latina*) A former gate in the Aurelian Wall of Rome, through which the Latin Way (q.v.) left the city. It was closed in 1829, but has recently been opened again.

LATINI. An Italic race, already settled in prehistoric times in the broad plains south of the Tiber, between the sea and the Apennines. Their origin is obscure. The Latin language (q.v.) is most closely related to that of the Faliscans (see FALERII) north of the Tiber, and more remotely to those of the Oscans, Umbrians, and Sabellians. Their territory, called Latium, originally extended not far south of the Alban hills, but was carried, under Rome's dominion, as far as the river Liris (now Garigliano), where Campania adjoined. In very early times the Latini were subdued by the Etruscans, as the names of many Latin towns, e.g., Tusculum, show. At the traditional landing of Æneas in Italy, we find the Latini (typified by the fabulous King Latinus, q.v.) settled in independent towns. At a later time we find Alba Longa as the head of a loose confederacy of 30 Latin towns, with their common sanctuary of Jupiter Latialis (see JUPITER) on the Alban Mount. Rome was looked upon as a colony of Alba Longa, but early became the ruler of all Latium. In the Latin War (340-338 B.C.) the Latins were allied with the Campanians against the Romans, but on the defeat of the former the Latin confederacy was dissolved, and its parts were gradually absorbed in the Roman stock. For a statement of the results of some researches into their origin, consult Duff, *A Literary History of Rome* (London, 1909).

LATINI, là-tè-nè, BRUNETTO (c.1220-c.1295) An Italian writer, born at Florence. He belonged to the party of the Guelphs and was sent on an embassy to Alfonso X of Castile in 1260. The Guelphs were defeated at Montaperti during his absence, and he had therefore

to keep out of Tuscany. He may have spent the next six or seven years in France, but at any rate he was back in Tuscany again by 1269, holding office under Charles of Anjou. Occupying in turn various offices, he attained in 1287 the high rank of prior. Dante's indebtedness to his work and affectionate esteem for him as a scholar transpire in *Inferno*, xv. Before his sojourn in France he had already written something; during that period he composed the poem in Italian heptasyllables which is now generally known as the *Tesoretto*, to distinguish it from the Italian translation of his *Trésor*. The *Tesoretto* is the earliest Italian example of the allegorical and didactic poem so important in old French literature and there best represented by the *Roman de la rose*. It is incomplete and may have been intended as an introduction to the encyclopædic *Li livres dou tresor*. This prose work, a compendium of mediæval lore, Brunetto put in French, because he esteemed this language more delightful and wore widely known than Italian. Its subject matter was derived from various Latin and French sources (*Roman de la rose*, Isidor of Seville, Bible, etc.); the work was probably composed between 1262 and 1266. To his friend Rustico di Filippo he addressed the *Favolello*, a treatise, in seven-syllabled verse like the *Tesoretto*, on the duties of friendship. To Brunetto has also been attributed a vulgarization of Cicero's *De Inventione*. Consult: Zannoni, *Il tesoretto e il Favolello di Ser B. L.* (Florence, 1824), edition of *Li livres dou tresor* by Chabaille (Paris, 1863); the editions of the *Tesoretto* by Gaiter (Bologna, 1878-83) and by Wiese, in the *Zeitschrift für romanische Philologie*, vol vii (Halle, 1882); Tho. Sundby, *Della vita e delle opere di Brunetto Latini*, translated from the Danish by Renier (Florence, 1884); Marchesini, *Due studi biografici su Brunetto Latini* (Venice, 1887), id., *Brunetto Latini notaro* (Verona, 1890); Bertoni, *Il Duecento* (Milano, 1890).

LATIN KINGDOM OF JERUSALEM.

The kingdom established by the Crusaders in 1099, which lasted until 1187. When, on July 15, 1099, Jerusalem was taken, it became necessary for the Christian conquerors to establish some permanent rule. Naturally the only system of government well known to them, the feudal, was adopted. The written code known as the "Assize of Jerusalem" (q.v.), however, belongs to a later period. Godfrey de Bouillon (q.v.) was elected Baron and Defender of the Holy Sepulchre. Godfrey died in 1100 and was succeeded by Baldwin I, who took the title of King and ruled until 1118. He was in turn succeeded by his nephew, Baldwin II (1118-31), who was followed by his son-in-law, Fulk, Count of Anjou (1131-43). Under him the Kingdom reached its highest development, and most of Syria was in the hands of the Christians. Meanwhile, however, a strong Mohammedan power was being formed, Edessa was captured, and the Christians were threatened. The reign of Baldwin III (1143-62) was marked by some coöperation between the Greeks and the Latins, due to the marriage of Baldwin with the daughter of the Emperor Manuel. The brother and successor of Baldwin III, Amalric I (1162-74), also married a Byzantine princess. His son and successor, Baldwin IV (1174-85), was a leper. He was succeeded by a child, Baldwin V, who ruled only a year.

The Kingdom was weakened by an unwise attack upon Egypt, and the leading nobles were not united in policy. The last monarch was Guy of Lusignan (1185-87), an adventurer from the west who married the heiress. On July 4, 1187, Saladin (q.v.) defeated King Guy at Hattin and took him prisoner. On Oct. 2, 1187, Jerusalem fell. After this Jerusalem was in the hands of the Christians for the years 1229-44, and the Kingdom remained in existence nominally until the fall of Acre in 1291. The title of King of Jerusalem was inherited by several royal lines. Consult Röhrich, *Geschichte des Königreichs Jerusalem* (Berlin, 1898). See CRUSADE.

LATIN LANGUAGE. The language of ancient Rome. It was originally the vernacular of the Latini (q.v.), a small tribe of central Italy, occupying the plain of Latium (q.v.), south of the Tiber, between the Apennines and the sea, and was thus the language of the founders of Rome. With the growth and the conquests of that city it spread until it became the almost universal language of the Western civilized world. (Consult Abbott, *The Common People of Ancient Rome*, first two papers, New York, 1911, and Budinsky, *Die Ausbreitung der lateinischen Sprache*, Berlin, 1891.) Latin belongs in its origin to the so-called Indo-European (Indo-Germanic, Aryan) group of languages, which comprises, in Asia, the non-Dravidian tongues of India, Persian, and Armenian; and in Europe, the Hellenic, Italic, Celtic, Teutonic (Germanic), Balto-Slavonic, and Albanian languages. A similarity of sound, inflection, and vocabulary shows that these languages are all descended from a common source, or *Ursprache*.

The Latin language is not original in Italy. A wave of migration from the north in prehistoric times brought into the peninsula the hordes of Italic people, who pushed their way to the southward, driving before them or assimilating the earlier inhabitants, until they occupied all the central and northern regions from sea to sea. Of these Italic invaders there were, according to one theory, two ethnic and linguistic divisions of quite unequal extent—the Umbro-Sabellians (see ETRURIA) and the Latino-Faliscans. (See FALERII; ITALIC LANGUAGES.) The former, with closely related dialects, occupied in historic times all the vast mountainous country south of the Rubicon and east of the Tiber, far into Apulia and Lucania—in fact, all central Italy except the narrow coast plain north and south of the Tiber mouth (which was held by the lesser division of Latins and Faliscans). Doubtless in earlier times the Umbro-Sabellians had extended still farther to the north and the west, whence they were dislodged by the invasions, first of the Etruscans, then of the Gauls.

The Umbro-Sabellian races—Umbrians, Volscians, Æquians, Sabines, Marsi, Hirpini, Frentani, Samnites, and others—spoke a congeries of related dialects, of which relatively little is known to-day, and that entirely from inscriptions, place names, and glosses or casual references in the ancient writers. But it is certain that there were two main divisions of language, the Umbrian and the Oscan; the former was spoken in the north, the latter in the centre and the south of the region. For details, see ITALIC LANGUAGES.

The second group of Italic dialects (the

Latin-Faliscan) was spoken over a very limited area. The Latin was used south of the Tiber, in Latium (q.v.); the Faliscan, so far as we know now, was spoken in historical times only in Falerii (q.v.) and in the Ager Faliscus, the district about Falerii.

But of all the members of the Italic group, Latin alone, so far as we know, certainly attained the rank of a literary language, and, owing in part to Roman conquests, extended itself not only over all Italy, but over northern Africa and all western Europe, where it still holds ground, as it were, in the form of the Romance languages (q.v.). Some have held, however, that there was an Oscan literature.

Three stages or states of development are distinguishable in the history of the Latin language. (For a slightly different classification and for information supplementary to the present article, see LATIN LITERATURE.) The first is anterior to the beginning of literary culture and may be termed the archaic stage. This period may be regarded as continuing to the time of Ennius (born 239 B.C.). Its monuments consist in the main of inscriptions, some isolated forms have been preserved by the grammarians, and a few characteristic tendencies are revealed by the early dramatists. Among the most ancient relics are the quadrangular cippus of tufa, broken, inscribed with very primitive characters running alternately from left to right and right to left, found in 1899 in the Roman Forum, known as the Forum Stele, or the *Lapis Romuli* (stone of Romulus); the gold fibula of Numasios, found in a tomb at Præneste (Palestrina, see FIBULA PRÆNESTINA); and the vase inscribed with a long "curse," known as the Dueros Inscription, found on the Quirinal Hill in Rome in 1880. (See also COLUMNA ROSTRATA; INSCRIPTIONS, Latin.) Other monuments are the very ancient *Carmina Salaria* preserved by Varro (*De Ling. Lat.*, vii, 26, 27), hymns sung by the Salii (q.v.), the *Carmen Prætrium Arvalium*, dating from the time of the kings and engraved on a bronze tablet of the reign of Numa Pompilius, which was dug up in 1778 on the wall of the grove of the ancient college (see ARVAL BROTHERS); the text of the 12 tables (about 450 B.C.), which is known to us in quotations only and even in these has not been preserved in its integrity (see DECEMVIRI, TWELVE TABLES, LAW OF THE); and the *Scipionum Elogia*, or epitaphs of the Scipios, the earliest of which is perhaps that of L. Cornelius Scipio, son of Barbatus, and consul in 259 B.C. Most of these and many others are given by Wordsworth, *Fragments and Specimens of Early Latin* (Oxford, 1874); Allen, *Remnants of Early Latin* (Boston, 1880); Ritschl, *Præcæ Latinitatis Monumenta Epigraphica* (Berlin, 1862); Egbert, *Latin Inscriptions* (New York, 1896); Diehl, *Inscriptiones Latine* (Bonn, 1912); Cagnat, *Cours d'épigraphie latine* (4th ed., Paris, 1914).

Cicero called the age of the Scipios the age of the true Latinity. Yet modern scholars hold that Latin is full of loan words derived not only from other Italic languages and Etruscan, but also from Greek, in the preliterate period.

The second stage is that of literary culture. Its history may be conveniently traced through three distinct periods, viz. the Anteclassical, the Classical, and the Postclassical; of these periods the middle may be conveniently subdivided into the Golden age and the Silver age.

The first period (240–84 B.C.) includes all the writers from Livius Andronicus to Lucilius (died 103) and is rendered conspicuous by the names of Nævius, Plautus, Ennius, Cato, Terentius, Pacuvius, and Attius, whose language is characterized not only by the frequent use of archaic forms and expressions, but by more or less imitation of Greek models. The Romans had been brought by conquest into close contact with the Greek cities of southern Italy and Sicily, Macedonia and Achaia, and Greek literature had become a subject of study and imitation. This imitative tendency, however, is combined with great originality and vigor in Plautus, and unlimited freedom of thought and expression in Lucilius.

The Golden age (84 B.C.–14 A.D.) is ushered in, as it were, by Varro and Cicero and may be said to come to an end with the death of Livy. The writings of Lucretius, Cæsar, Catullus, Sallust, Vergil, Horace, Propertius, Tibullus, and Ovid lend lustre to this interval and exhibit the literary language in its fullest maturity, its most perfect stage. The standard of prose was set by Cicero and Cæsar, that of poetic art by Vergil. To Cicero in particular the language of prose owed that elaboration and finish which have rendered it a standard of perfection in style for all time and evoked the gratitude of his countrymen towards the man who alone among prose writers had brought to light the utmost capacities of Roman speech. His diction, even in his letters, is an exemplification of the true Roman *urbanitas* and is everywhere, except in his letters (see the next paragraph), a protest against the intrusion into literature of the *sermo plebeius*, the spoken language of the untrained people. But the changes wrought by Vergil are more marked even than those which Cicero accomplished, and his language became the norm in poetry, departures from which were accounted irregularities. Consult Nettleship, *Lectures and Essays*, chap. iv (2d series, Oxford, 1895), and Norden, *Die Antike Kunstprosa* (2d ed., Leipzig, 1909).

Meanwhile the speech of ordinary life may be traced in the plays of Plautus (q.v.), and writings of minor character, such as the accounts of the African and Spanish wars appended to Cæsar's Commentaries, book viii of the *De Bello Gallico*, and the *Bellum Alexandrinum*. To these add many of the letters of Cicero, the *Sermones* of Horace, the writings of Vitruvius, Pompeian inscriptions, and the *Satyricon* of Petronius (q.v.), a work remarkable for the number of examples it affords of the *sermo cotidianus*, the form of Latin in general use in the speech of everyday life. Consult Tyrrell, *Cicero in his Letters*, lxxii–lxxxii (London, 1891), and Cooper, *Word Formation in the Roman Sermo Plebeius* (Boston, 1895).

The Silver age (17–180 A.D.) is marked by the gradual disappearance from literature of simplicity and directness of expression, and a constant striving after effect by means of rhetorical elaboration and ornament. The Silver Latinity is most thoroughly represented in the writings of Tacitus (q.v.). His style and diction are typical and present this stage of the language in the best as well as the truest light. Consult Nettleship, as cited above; Krebs-Schmalz, *Antibarbarus der lateinischen Sprache*, i, 1–16 (7th ed., Basel, 1905); Draeger, *Syntax und Stil des Tacitus* (3d ed., Leipzig, 1882); and the introductions to the editions of the

Dialogus of Tacitus by Peterson (Oxford, 1898) and Gudeman (Boston, 1894; 2d ed. in German, Leipzig, 1914).

But the language, like the Empire itself, was on the decline. The African Latinity of the time of Hadrian (117–138 A.D.) and Fronto (q.v.) shows a great falling off in refinement and general quality, when compared with the Spanish Latinity of the preceding century (the Latin, e.g., of Seneca the philosopher, Lucan, Quintilian, and Martial, all of whom were natives of Spain). Affected archaisms, wearisome repetitions, and Græcisms are especially noticeable, as well as numberless newly created forms and extensive drafts on the plebeian dialect, all of which mark an extreme departure from classical usage. Consult Cooper, *Word Formation in the Roman Sermo Plebeius* (New York, 1895); Knapp, "Archaism in Aulus Gellius," in *Classical Studies in Honour of Henry Drisler*, 126–141 (New York, 1894). In support of the view that there was no distinctive African Latinity, consult Brock, *Studies in Fronto and His Age* (Cambridge, 1911), and chap. iii of the introduction to Purser's edition of the "Cupid and Psyche" episode of the *Metamorphoses of Apuleius* (q.v.) (London, 1910); on the other side consult W. E. Foster, *Studies in Archaism in Aulus Gellius* (New York, 1912). See LATIN LITERATURE, V, *The Middle Empire*.

The death of Fronto (170 A.D.) may be conveniently assigned as the close of the classical period. The postclassical period is commensurate with the third and last stage in the history of the Latin tongue—the stage which exhibits the popular speech (which since the time of Plautus had entered as an insignificant factor into literary expression) as reappearing in literature and as developing into the languages of the Romance period. Thus, the literary language itself was impoverished and disorganized, for its approximation to the vulgar Latin could no longer be checked even by Claudian and other poets of the revival.

This state of things was due in no small measure to the influence of Tertullian (q.v.) and the other fathers of the Christian Church, who introduced the barbarisms of the people into their religious writings. The transformation begun in the second century was completed in the fifth. The events which mainly conduced to it were the transplanting of the seat of the Empire to Constantinople and the invasions of the barbarians. In the East secular literature again found an organ in the Greek language; in the West the Latin language was flooded with foreign forms and idioms through the inroads of the Goths, the Vandals, and the Longobards. In this condition it was termed the *lingua Romana* and distinguished from the *lingua Latina*, which was cultivated only by the learned.

From the *lingua Romana* sprang the eight so-called Romance languages (q.v.) of modern Europe: Portuguese, Spanish, Catalan (in northeastern Spain and Roussillon), Provençal, French, Italian, Rhetoromanic (in the Tirol, Engadine, etc.), and Rumanian or Wallachian. As perpetuated by Christianity, the Latin language continued to live, though in a state of deterioration, long after the total dismemberment of the Roman Empire. It remained, in fact, for centuries the ecclesiastical, political, and official language of Europe.

General Characteristics. Alphabet, pronunciation, and vocabulary.

Alphabet.—The Romans derived their alphabet via Cumæ (q.v.) from the Greeks of southern Italy, who used the Chalcidian, or Western Greek, alphabet, in which the letters differed in many respects from the Ionian, which became later the common alphabet of the Hellenic world. (See ALPHABET, the paragraph preceding the *Bibliography*; GREEK LANGUAGE, *Alphabet and Pronunciation*.) Thus, the Chalcidian alphabet had the forms α, C for Γ; β, D for Δ; γ for Α; Γ for Π; Ρ for Π; Σ for Σ; V for T. It used X for ξ (Eng. *x*) instead of for χ and ψ for χ (Eng. *ch*, hard) instead of for ψ, and had also the digamma F and the Koppa Q; while the aspirate was the full letter H. From this the Romans adopted their original alphabet of 21 letters: ABCDEFZHIKLMN OPQRSTVX. They had no use for the aspirated consonants, Φ = *ph*, Θ = *th*, X = *ch*, and so accepted these letters only as numerals. C occupies the place and has the value of the Greek gamma (Eng. *g*, as in *go*), while the corresponding voiceless sound is represented wholly by K. But in course of time C came to take also the K sound; and K, thus becoming superfluous, was dropped except in a few special words and names, as *Kalendar*, *Kæso*. The fact that C now represented both K and G led to much confusion, and a new letter was invented by a slight modification, so that C was left with the voiceless sound of K, and G was used for the voiced sound, and substituted in the alphabet for Z, which had ceased to be used. A reminiscence of the original sound of C as G is preserved, however, in the abbreviations C. = *Gaius* and CN. = *Gnaeus*. In transcribing Greek words into Latin in the early period, V was used for Y, and S (initial) and SS (medial) for ζ—as in *Burrus* = *Pyrrhus*, *sona* = ζώνη, *atticisso* = ἀττικίζω. It was only in the first century B.C. that the Greek letters Y and Z were actually introduced into Latin, for the better transliteration of Greek names and words. The alphabet then had 23 letters: ABCDEFGHIKLMNOPQRSTVXYZ. The Emperor Claudius (41–54 A.D.) endeavored to add three new letters, to represent the consonantal V (our W), the modified V (as German *ü* with *umlaut*), and the sound PS; but these had only an ephemeral existence. Latin was first written *boustrophedon*, i.e., alternately from right to left and from left to right, as on the primitive stele found in the Forum. The *fibula Praenestina* and the Duenos Inscription show it written from right to left; but later it was always written from left to right. On the Latin alphabet, consult, e.g., Lindsay, *The Latin Language* (Oxford, 1894).

For phonetic changes in Latin, consult any Latin Grammar, e.g., those of Allen and Greenough (Boston, 1903); Gildersleeve-Lodge (ib., 1894); Hale and Buck (ib., 1903); Lane (2d ed., New York, 1903).

Pronunciation.—In the modern teaching of Latin various methods of pronunciation have been employed, as the Roman method, the Continental method, the English method. As Latin has never ceased to be spoken as a learned language, its pronunciation has followed in general the principles governing the language of each country in which it is used. Thus, *Cicero*, as a Latin name, would usually be pronounced in Germany *Tsitsero*, in Italy *Chichero*, in Spain *Thithero*, in France *Siséro*, in England *Siséro*.

The Church of Rome uses a form of pronunciation developed from that of the modern languages during the Middle Ages; and this is essentially the same in all countries, though modified, of course, by the native language of the speaker. This is the so-called Continental pronunciation. The English method, still used in England, consists in pronouncing Latin words precisely as if they were English, each syllable, however, being pronounced as such. The Roman method, an attempt to attain to the real pronunciation of Latin in the time of Cicero, is now almost universally employed, in theory at least, in the universities, colleges, and schools of the United States, within recent years vigorous efforts have been put forth to make it the standard pronunciation also in England. The vowels are pronounced almost as in the Romance languages (Italian, French, Spanish), i.e., long and short A, I, U, close E and O, and open E and O. The diphthongs are Æ (like *i* in *mine*), Œ and OI (as in *soul*), EI (as in *reim*), AU (like *ou* in *out*), EU (sounded separately, with greater stress on the E), UI (a true diphthong, with stress on the first member). The consonants have their English sounds, with the exception that C and G are *always* hard, as in *can* and *go*; R is trilled; S is voiceless; PH, TH, CH are really aspirated consonants. Compare the English “chop-house,” “hot-house,” “block-house.” Latin accent was originally recessive (i.e., on the first syllable), as is shown by such changes in unaccented vowels as *captus*, *acceptus*, afterward *accēptus*, *fācilis* (so in Plautus), later *facīlis*, and such changes in composition as *fūcio*, *cōnfacio*, yielding *cōnficio*, later *conficio*. In the classical period, however, the accent fell always on the penult if the penult was long, if the penult was short, the accent fell on the antepenult. Examples: *occīdo*, I kill; *ōccīdo*, I fall.

On the pronunciation of Latin, consult: Peck, *Latin Pronunciation* (New York, 1894); Lindsay, *The Latin Language* (Oxford, 1894); and especially Seelmann, *Aussprache des Latein* (Heilbronn, 1885).

Vocabulary.—As the language of a rude and hardy race, slow to attain culture, Latin was at first far more limited in vocabulary than Greek. The latter was remarkably rich in terminations that lent themselves to the formation at will of new words, especially for abstract ideas, and its possibilities for the forming of self-explaining compounds were boundless. Thus, biprepositional compounds are common in Greek, they are very rare in Latin, even in plebeian Latin (consult Munro's *Lucretius*, vol. ii, 16–17, 4th ed., London, 1886). This power of making compounds at will was indeed possessed at first by Latin and was probably retained in popular Latin, the Latin of everyday speech; compounds were, however, largely avoided of set purpose by the writers of Latin literature. Herein literary Latin was severely handicapped as against Greek or German. For *ὀψυμαβείς* Horace could or would find nothing better than the awkward periphrasis *seri studiorum* (*Sermones*, i, 10, 21). Simple compounds like *consors*, *benemerens* were numerous. Poetry added many, such as *floriger*, *velivolus*, and the later popular speech increased them considerably. Compare such expressive words as *mulomedicus*, *campidoctor*, *domnædus*, *domnæpræda*. When the Romans began to study the literature and philosophy of the Greeks, they felt sadly the limitations of their own language; but the

genius of a succession of writers culminating in Cicero did much to overcome the difficulty—Greek words were borrowed in large numbers along with the ideas they express. (Consult, e.g., Reiley, *Studies in the Philosophical Terminology of Lucretius and Cicero*, New York, 1909.) The vocabulary of Greek, however, as known to us now, is more extensive than that of Latin—chiefly, however, because we know many Greek dialects, with varying vocabularies. Latin increased its vocabulary materially from other languages besides the Greek: from the Etruscan (cf. *histrio*, actor), Oscan, Celtic (especially war terms, names of animals and vehicles, articles of dress), Syrian, Hebrew, etc.

Bibliography. Among the host of works upon the Latin language in its various phases, in addition to those referred to in the body of this article, the following will be found especially useful:

GRAMMAR The most comprehensive works are those of Draeger, *Historische Syntax der lateinischen Sprache* (2d ed., Leipzig, 1878-81); Smalz, Stolz, etc., *Historische Grammatik der lateinischen Sprache* (ib., 1894-); "Lateinische Grammatik und Stilistik," in Muller's *Handbuch der klassischen Altertumswissenschaft* (4th ed., Munich, 1910); Kühner, *Ausführliche Grammatik* (2d ed., 2 vols., Hanover, 1912-14). Good recent students' grammars in English are those of Roby (1896), Allen and Greenough (1903), Gilder-leave-Lodge (1894), Bennett (1895), Lane (1899), Harkness (1898), and Hale and Buck (Boston, 1903).

DICTIONARIES. A monumental dictionary of the Latin language is in course of preparation in Germany *Thesaurus Linguae Latinae* (Leipzig, Teubner, 1900-). For ordinary use, Harper's *Latin Dictionary* and Georges's *Lateinisch-Deutsches Handwörterbuch* (2 vols., Leipzig, 1879-80) are recommended. For Latin composition, consult Smith, *English-Latin Dictionary* (New York, 1890). For word formation and stylistics, consult Lindsay, *The Latin Language* (Oxford, 1894), Neue-Wagener, *Formenlehre der lateinischen Sprache* (Berlin, 1894-1902), Nägelsbach, *Lateinische Stilistik* (Nuremberg, 1889); Krebs, *Antibarbarus* (Basel, 1886-88). See **DICTIONARY, History** (end).

LATIN LITERATURE. In this article an attempt is made only to trace briefly the origin, development, and decay of Latin literature, with slight notices of the principal authors who aided in its growth and left the stamp of their genius on its progress. For further information regarding the life and works of the various authors, the reader is referred to the individual articles on those authors, in their alphabetical order. For convenience of classification, the story of Latin literature may be divided into six broad periods, of which three fall under the Republic and three under the Empire, as follows:

I. The Preliterary Period (crude beginnings)

II The Early, or Preclassical Period (from the end of the First Punic War, c.240 B.C., to Sulla, c.84 B.C.)

III The Golden Age, or Classical Period (from Sulla, c.84 B.C., to the death of Augustus, A.D. 14).

Of this period there are two divisions:

A The Ciceronian Period (c.84-43 B.C.).

B. The Augustan Age (43 B.C.-14 A.D.).

IV The Silver Age Period of Spanish Latinity (from the death of Augustus, 14 A.D., to the accession of Hadrian, 117 A.D.)

V. The Period of African Latinity—Early Christian Writers (from Hadrian, 117 A.D., to the fourth century).

VI. The Period of Actual Decline (from the early fourth century to the end).

I. The Preliterary Period (crude beginnings). The native character of the Italic peoples, in contrast with that of the Greeks, was relatively unimaginative and practical. The agricultural and pastoral life and the arts of war engrossed all their faculties to the exclusion of literary effort. Only in connection with their simple communal religious rites do we find the dawning of a literary sense, and this of the crudest type. While the Hellenic world, including the powerful Greek cities of southern Italy, was steeped in the poetry of its great epic, lyric, tragic, and comic writers, Rome and central Italy had not risen above the simplest ballads, farces, and mimes. Yet here we must seek the beginnings of Latin literature, the earliest germs of the drama. At the country festivals of the Latin and Oscan villages and towns the native wit and repartee found its expression in simple public shows, where the young men sang, danced, and recited for the edification of the merry-makers. These performances, at first spontaneous, gradually assumed loose plots, in connection with which the actors were free to indulge to the full their spirit of ribaldry, abuse, and fun. They wore masks or painted their faces; their songs and dances were accompanied by the notes of the *tibia*, an instrument similar to the flute, and their dialogue was in the rough Saturnian metre, which from its looseness readily admitted of improvisation. Several varieties of these early farces are mentioned by Latin writers, all of which found their way to Rome, some of them later assumed a really literary character. There were the (*Versus*) *Fescennini* (see **FESCENNINE VERSES**) among the Faliscans just north of Rome—full of abuse and coarse jokes; the (*Fabulae*) *Atellanae* (q.v.) of the Oscan peasants in Campania—uncouth and indelicate, with their comic descriptions of rustic life, gradually assuming a sort of plot with fixed characters, the *Satura*, perhaps native to Latium itself—more dramatic in style than the *Fescennini* and the *Atellanae*—a sort of medley or vaudeville of songs and dances interspersed with stories; and *Mimi* (see **MIME**), probably introduced from Magna Græcia, a sort of farce performed on a rude stage. These, with a few bits of early ritual, such as the "Arval Song" preserved in the record of the *Fratres Arvales* (see **ARVAL BROTHERS**) of the time of Elagabalus, represent the literary level of the Romans before an active and direct contact with Greek culture made them aware of their literary and artistic deficiencies. It may be noted that the traditional account of the development of Latin literature given above has been vigorously challenged by German scholars, especially Jahn and Leo, and by an American scholar, Hendrickson. For a summary and criticism of the views of these scholars, consult Knapp, "The Sceptical Assault on the Roman Tradition Concerning the Dramatic *Satura*," in *American Journal of Philology*, vol. xxxiii (New York, 1912), and id., "Horace, *Epistles*, ii, 1, 139 ff. and Livy, vii, 2," in *Transactions of the American Philological Association*, vol. xliii (Boston, 1912).

II. The Early, or Preclassical Period (from the end of the First Punic War, c.240 B.C., to Sulla, c.84 B.C.) With the end of the

First Punic War and the humiliation of her enemy Carthage, Rome began to enjoy a period of repose, which, with a sense of her growing greatness among nations and the rise of a leisure class, led to a realization of the crudity of life in Rome and a longing to know something of the beauty and culture of Greek life and art. The first attempts at real Latin literature were translations from the Greek into the rough Saturnian metre, the work of a Greek captive, Livius Andronicus (c.290-204 B.C.), brought to Rome after the taking of Tarentum in 272 B.C., and employed as a teacher of Greek. The work in question was a translation of Homer's *Odyssey*, the fragments that happily survive show no high degree of genius and demonstrate clearly that the rough native Latin metre was but ill adapted to express the versatility and lightness of touch of the great original. Andronicus, however, deserves much credit for attempting to employ Latin at all for poetic purposes. The literary successors of Andronicus broke ground along new lines, discarding the Saturnian metre, they attempted the far more difficult task of adapting the Greek metres—iambic, trochaic, dactylic—to the heavy, archaic Latin speech, and instead of mere translations, produced new works based on Greek originals. The real founder of Latin poetry was Gnaeus Nævius (?-c.199 B.C.), a native of Campania, writer of tragedies and comedies. The majority of these were derived from Greek sources; but in two of the tragedies we have examples of the so-called (*Fabula*) *Prætexta*, or strictly Roman tragedy, with plot derived from purely Roman events, and characters in Roman costume, viz., the *Clautidium*, on the victory won at that place by M. Marcellus in 222 B.C., and the *Alimonium Romuli et Remi*, dealing with the legendary events of the founding of Rome. Nævius was especially successful in comedy, but he had the hardihood to attack in his plays the policy of the powerful Metelli, for which he was imprisoned and exiled. Besides his plays he wrote also an epic poem in the Saturnian metre, the *Bellum Pœnicum*, relating the events of the First Punic War. His works long remained popular at Rome; from the few fragments that survive we are able to detect the originality and force of his talent.

A younger contemporary of Nævius was Titus Maccius Plautus (c.254-184 B.C.), whose surpassing importance for us rests on the fact that no fewer than 20 of his plays have survived in whole or in part. Hence, while our estimate of early Roman tragedies, which survive only in fragments, must be based largely on the testimony of ancient writers, that of Roman comedies is drawn from original sources; for besides the 20 plays of Plautus we have also six by his more polished successor, Terence. Plautus, who was not a native of Rome (a like remark may be made of very many of the most important Latin writers), was born in Sarsina, a small town of Umbria, in poor circumstances, but early came to Rome, where, according to the account of Aulus Gellius (q.v.), he secured employment as a stage carpenter. How he got his Latin education is a mystery, especially as he is said to have lost his savings in speculation and in consequence to have been obliged to work in a treadmill. None the less, his literary activity continued unabated until his death. His popularity was very great, and, as is so apt to happen, many plays were foisted on him, in later times, that

were not from his pen. In the Ciceronian age the scholar and critic Varro (see below) selected from the large number that passed under Plautus's name 21 as genuine. His list is nowhere given in any extant Latin author. Since, however, Varro's great authority would be likely to give special currency to the plays selected by him, it is probable, though not demonstrable, that the 21 plays now extant are the plays approved by Varro as genuinely Plautus's. They are the *Amphitruo*, *Asinaria*, *Aulularia*, *Bacchides*, *Captivi*, *Curculio*, *Casina*, *Cistellaria*, *Epidicus*, *Mostellaria*, *Menæchmi*, *Miles Gloriosus*, *Mercator*, *Pseudolus*, *Pœnulus*, *Persa*, *Rudens*, *Stichus*, *Trinummus*, *Truculentus*, and the *Vidularia* that was lost in the Middle Ages.

From the crude beginnings of a Livius Andronicus and the talented but experimental plays of a Nævius to the well-developed art of Plautus is a long step, but it was accomplished within a single generation. This is partly due to the source from which Plautus drew his plots, but largely also to the versatile genius of the man himself and his command of the cumbersome Latin language, as then spoken, which he molded to the iambic *senarii* and *septenarii* with such ease as to create a new Latin poetry that has stood the test of time. Plautus did not invent his plots; his sources were the Greek plays of the New Attic comedy and especially the works (now lost) of Menander, Diphilus, and Philemon—comedies from which the strong personal and political satire of Aristophanes had been perforce wholly expunged. But while the plots and scenes are Greek, and even the titles can often be identified with those of the Greek playwrights, Plautus shows his own originality in all his work. He thoroughly knew his audience, and his plays are brimful of situations and humorous touches that could not fail to appeal to his contemporaries, while still to-day the best of them, where they do not offend modern taste, afford delightful reading and have influenced not a little modern poetry from Shakespeare to Molière. Among the best are the *Amphitruo*, the sole surviving example of the ancient tragic-comedy, an inimitable burlesque of the Alcmena-Amphitruo-Hercules story, which even the genius of Molière could not reproduce; the *Bacchides*, with its masterly plot and characters; the *Captivi*, which, though sentimental, is wholly without female characters; the *Menæchmi*, a charming comedy of errors, the basis of Shakespeare's *Comedy of Errors*; the *Miles Gloriosus*, a brilliant comedy beginning to end, which influenced Molière's *Ralph Roister Doister*; the *Rudens*, a merry romance; and the *Trinummus*, also without female characters, a lively comedy of virtuous middle-class life. These plays represent Plautus at his best; though he wrote for a peculiar and not highly cultured audience, his genius was broad and deep, and he stamped his work with a permanent interest and value. For the influence of Plautus on later literatures, consult Reinhardtsoettner, *Plautus: Spätere Bearbeitungen plautinischer Lustspiele* (Leipzig, 1886).

It was now an age of great names in literary Rome. Quintus Ennius (239-169 B.C.), born at about the same time as Plautus, attained even a greater fame among his countrymen and was honored with the title Father of Roman Poetry. Born at the village of Rudia in Calabria, he fought in the Roman army in Sardinia, where he attracted the notice of M. Porcius Cato, who

brought him to Rome. At Rome, during a long and active life wholly devoted to literary pursuits, Ennius wrote an astonishing number of poetical works, including tragedies, comedies, a great national epic, and miscellanies. But notwithstanding his fame and popularity—Cicero was among his most ardent admirers—only the very barest fragments of his writings have survived, quoted here and there in other authors. His earlier work consisted mainly of translations from the Greek, both tragedies and comedies, notably some of the tragedies of Euripides. His miscellanies, in a variety of metres, received the name *Natura* and were the first of a series of medleys which, by a gradual development, culminated in real *Satires*, as the word is used to-day. (See LUCILIUS; SATIRE.) But the greatest work of Ennius was his *Annales*, in 18 books, an epic in hexameter verse of the chief events in Roman tradition and history from the earliest times to his own. Of course Homer was his model, but the *Annales* fell far short of the Homeric perfection. The clumsy Latin had to be remodeled, as it were, to the easy flow of the Greek metre. The difficulties were of the greatest, but, according to the almost universal judgment of his successors, Ennius' *Annales* was a masterpiece, which only the deeper study of Greek models and the genius of a Vergil could supplant. Ennius' introduction of the hexameter into Latin verse writing, through his use of it in the *Annales*, influenced immensely the whole subsequent history of the Latin language. While the story of Rome was thus being written in verse, we find also an attempt at the elements of history in prose. Doubtless simple accounts of yearly events, of the victories and the defeats, the imposing triumphs, the succession of high civil officers, had long been drawn up in a formal way without any embellishment. (See ANNALS; FASTI.) The first important prose annalist was Q. Fabius Pictor (born about 254 B.C.), who wrote, however, in Greek, under the title of *Ἱστορία*; but his work was early translated into Latin. It covered about the same period as the *Annales* of Ennius, i.e., from the traditional landing of Æneas in Italy to his own time, narrating in some detail the events of the Second Punic War, during which Fabius lived. Both the Greek original and its Latin version are lost, but Polybius and Livy both drew upon him materially for their accounts of the Punic War. His style was crude, and he is censured for his unfairness as an historian (he was partial to the Fabii).

In the long period of construction following the Second Punic War, no name in politics or literature at Rome stands out more brightly than that of M. Porcius Cato (234–149 B.C.), a native of Tusculum, who held all the high offices at Rome and is familiarly known as Cato the Censor. Rigid and conservative, a true type of the stern old Roman, he set his face against the modern spirit of innovation that was steadily strengthening as a result of closer contact with the culture of Greece. Cato was no less great in his private than in his public life; he was a typical Roman gentleman farmer, watching his estate and his servants with an eagle eye; and in his hours of repose from the Senate and the farm he devoted himself to reading and to writing. In spite of his opposition to things Greek, he had no small acquaintance with Greek rhetoric and used that knowledge in teaching (in a manual of rhetoric) and in writing. Ora-

tory was a native talent of the Romans, and Cato was a great orator. Moreover, he was the first Roman to write down and publish his speeches. Of these, no fewer than 150 were extant in Cicero's day; unfortunately we know them only from fragments, but these fragments suffice to show his effective, mordant style. In historical studies, also, Cato was no less active, and the loss of his important work *Origines*, in seven books, is greatly to be deplored. It was the labor of his old age. Far more comprehensive than the bare *Annales* of Fabius Pictor, it was a sort of loose historical narrative, interspersing history proper with researches in the field of geography, politics, and social life and accounts of his personal experiences. The name *Origines* arises from the fact that in the first three books he went far afield and sought to trace the origin not only of Rome, but of all the important tribes of ancient Italy, in so far as the Romans had come into contact with such tribes. We are able to judge of Cato's style and of his painstaking accuracy from the one work of his that has survived entire—*De Agri Cultura*, or *De Re Rustica*, the outcome of his practical experience on the farm. Its naïveté is wholly charming. Cato lays down the rules for the conduct of the farm and the management of slaves, describes the methods of planting and harvesting, the sacrifices to be made and rites to be performed, household receipts and house-keeping, simple medicines, and legal forms for leases and sales. Vergil's debt to Cato in the writing of his *Georgics* (for material, not in matters of style) can well be imagined. For Cato's style as an orator, consult Nettleship, "The Historical Development of Classical Latin Prose," in *Lectures and Essays: Second Series* (Oxford, 1895).

A sketch of the development of Roman literature would not be complete without a brief notice of M. Pacuvius of Brundisium (220–132 B.C.), though all his works are lost. He was a nephew of Ennius, who brought him to Rome and set him on the road to success as a writer of tragedies. The judgment of posterity placed the nephew, as a writer of tragedies, above the uncle. Comedy, in this intermediate period between Plautus and Terence, was represented by Statius Cæcilius (c.219–166 B.C.), an Insubrian Gaul who was probably carried to Rome among the prisoners of war from that region. His comedies were transcriptions from the Greek, less free than those of Plautus, but more original than those of Terence.

At this period Fabius Pictor, the annalist, finds a follower in L. Cincius Alimentus (prætor in 210 B.C.), an officer in the war with Hannibal; but he too wrote his annals in Greek. In the second century B.C., however, there were a number of Latin annalists, whose works, now lost, served more or less as source books for the later historians. Such were L. Cassius Hemina, L. Calpurnius Piso Frugi, L. Cælius Antipater, and Q. Claudius Quadrigarius. (See ANNALS.) The fragments of the historical works of these and other annalists may be found in Peter, *Historicorum Romanorum Reliquiæ* (2 vols., Leipzig, 1870–1914).

After considering so many authors that are hardly more than names to us, it is refreshing to meet again one of whom we can form a judgment from his actual works. This is P. Terentius Afer (c.185–159 B.C.), commonly known as Terence. Not only was Terence not a Roman;

he was not even a native of Italy, but an African by birth. Born after the end of the Second Punic War (218-201 B.C.), though the year of his birth cannot be surely fixed, he was brought to Rome as a slave boy and came into the possession of the wealthy and cultivated senator P. (?) Terentius Lucanus, who, recognizing his ability, gave him education and freedom. There was at this time a little coterie of litterateurs headed by Scipio Africanus Minor and Gaius Lælius (see LÆLIUS, 2), men of the highest rank and the most aristocratic bias, in literature as in politics. The brilliant young playwright was admitted to their society and friendship; his plays were read before them and there subjected to criticism and suggestions before being given to the world. A new element was thus introduced into the nascent Latin literature. In Plautus and Ennius the Greek models are worked over and adapted to the Roman reading public, with a freedom from restriction and a breadth of genius which promises for the Latin literature a great future development almost independent of its Greek origins, or, at least, with wholly national tendencies drawn from the inner life of the Romans themselves. To the Scipios, however, and to Terence, guided by their tendencies, literature was the prerogative of the cultivated nobility and was dependent upon study and learning. The Greek masterpieces were no longer regarded merely as a source of inspiration, but as an end in themselves, a standard by which Latin productions were to be judged alike artistically and metrically. This did not, indeed, hinder the growth of Roman genius, but gave it a new direction. What it gained in grandeur and precision it lost in spontaneity. The same is true of the Latin language itself, which at the hands of a succession of writers culminating in Cicero became that magnificent but restricted and artificial vehicle of thought which we call classical Latin (See LATIN LANGUAGE.) The six plays of Terence, all derived from Greek plays of Menander and his contemporaries, are faultless in their diction and full of dramatic merit. One decidedly misses, none the less, the sprightly, virile, thoroughly Italian genius of a Plautus. All Terence's plays were prepared for representation at the Megalensian festival in honor of *Magna Mater* (see CYBELE) under the stage management of Ambivius Turpio. Their titles are: (1) *Andria* (The Maid of Andros), first performed in 166 B.C.; (2) *Eunuchus*; (3) *Heauton Timorumenos* (The Self-Tormentor), containing the oft-quoted line:

Homosum; humani nil a me alienum puto,

(4) *Phormio*, (5) *Hecyra* (The Mother-in-Law), the least important of all; (6) *Adelphoe* (The Brothers). These are the sum of Terence's published work, and all are preserved. Their author died young, perhaps of a fever contracted in the course of an extended tour in Greece (159 B.C.).

Another member of the Scipionic circle, a man who played a great rôle in the literature of the day, and the loss of whose works is a calamity to us, is Gaius Lucilius (?168-103 B.C.), a native of Suessa Aurunca in Campania, who so defined the scope of application of the *satura* as to deserve the name of Father of Roman Satire. (See SATIRE.) To him was due the popularizing of a kind of poetic miscellany of reflection, criticism, and description, now serious, now pungent, now

witty, that was singularly adapted to the genius and the habits of the Romans. The particular direction which Lucilius gave to satire was that of a systematic criticism of literature and life, which often took the form of parody. Nothing escaped his trenchant pen; politics, morals, society, all things sacred and profane received from him their share of attention. Later Roman writers repeatedly comment on his censoriousness; thanks to this the term "satire" ever since has conveyed the meaning that now attaches to the word. Even his own life and personality were laid bare to his readers. The later satirists, and especially Horace, while frankly criticizing his careless style, willingly admit their debt to Lucilius. Horace, indeed, often follows him closely, as in the piece describing his journey to Brundisium in the company of Mæcenas and his party (*Sermones*, i, 5), which is, in part at least, a copy of Lucilius' account of his own trip to the Straits of Messina. The satires of Lucilius were published in 30 books. The predominant metre was the hexameter. In this he differed from his predecessor Ennius, whose *Satura* mingled trocheas, hexameters, and iambs indifferently, and from Varro (see below), whose "Menippean Satires" were written in both prose and verse. By making the hexameter, the heroic verse of the Greeks and the Romans, the vehicle of satire, he invented a new literary form—the one new literary form invented since Greek days. Formal satire among the Greeks had been written in iambic or choliambic verse, as by Archilochus (q.v.) and Hipponax (q.v.), or in the iambic and trochaic verse of the Old Attic comedy.

To this period belongs the last of the great Latin tragic poets, Lucius Attius (170-94 B.C.), of Pisaurum, the modern Pesaro. As a young man (140 B.C.), he was already putting tragedies on the stage when the aged Pacuvius was still writing. Attius, too, lived to be an old man. Of his many tragedies only some titles and a few fragments survive. His style is marked by such old-fashioned ornament as assonance, alliteration, plays upon words, and archaic forms, which connect him more closely with the age of Ennius than with the literary period immediately following him. With Attius the old character drama came to an end.

The old Latin comedy ended also in this period, with Lucius Afranius, born about 154-144 B.C., author of *fabula togata*, or comedies of Latin life, which achieved a great popularity and were still acted a century after Afranius' death. All are now lost, but we have the titles of many, which serve to show the general character of the plots.

It only remains, in closing this brief sketch of the literature of the Preclassical period, to mention the many orations that were reduced to writing and formed no unimportant part of the literature of the time. This was a branch of intellectual activity in which the Romans excelled. The first published orations of importance were those of Cato (see above), whose eloquence, though rough and rude, was dignified and forceful and touched upon every department of public life. Among Cato's contemporaries in oratory were the younger Scipio and C. Lælius (185-129 B.C.). The advent of the Gracchi, too, formed an epoch in oratory. Their diction was far freer than that of their predecessors. The fame of Tiberius Gracchus (163-133 B.C.) was obscured by that of his brother Gaius Gracchus

(154-121 B.C.), whose most striking characteristic was vehemence. On early Roman oratory, consult: Nettleship, as referred to above in the paragraph on Cato; the introduction to Sandys's edition of Cicero's *Orator* (Cambridge, 1885); the introduction to Wilkins's edition of Cicero, *De Oratore* (2d ed., Oxford, 1888). Meanwhile grammar, rhetoric, philosophy, and law were not without their devotees; but no work of this class has reached us except the treatise on rhetoric known as *Ad Herennium*, which was long wrongly ascribed to Cicero. See CORNFICIUS.

On this earlier period of Latin literature, consult an admirable work, Leo, *Geschichte der römischen Literatur*, vol. i (Berlin, 1913). For the language of the authors, consult Bennett, *Syntax of Early Latin*, vols. i, ii (Boston, 1910-14).

III. The Classical or Golden Age. A. The Ciceronian Period (87-43 B.C.). The Golden age marks the culmination of stylistic perfection in the literature of the Romans. Rome was no longer struggling for a place among the nations, but was seeking to be the dominant world power, and her life was cosmopolitan. At the hands of her masters of prose, Cicero and Caesar, Latin now had cast off the last remnants of archaism and provincialism, and the deep and passionate study of the Greek poets had infused into Latin verse a new, strong, and original beauty. In the earlier part of the Golden age—the Ciceronian period—the newly found national aspirations of the Romans expressed themselves mostly in prose, though great poets, such as Lucretius and Catullus, were not lacking; the later period, or Augustan age, was rendered glorious chiefly by a galaxy of poets, high at the head of which stand Vergil and Horace.

If the life of Rome was now become cosmopolitan, so too the intellectual horizon was immeasurably extended. Every branch of human knowledge was studied with avidity, and, though the scientific method was not yet developed, the scientific spirit was certainly not wanting. There was a thirst for knowledge, especially along historical lines, and the Romans began to study themselves, their glorious past, their religion, and their language. Among the many scholars of the day one stands far above the rest, and in his encyclopædic knowledge and the broad range of his studies reminds us much of the great scholars of the modern classical revival. M. Terentius Varro (116-c.27 B.C.), a native of Reate, devoted a life of prodigious industry to the study of Roman antiquities and literature. When Julius Caesar planned a great library for Rome among his public works, he selected Varro to be its first librarian. The scheme, however, like many others of the great dictator, was never realized, owing to Caesar's death. In 38 B.C. Asinius Pollio established a public library and adorned it with the busts of great literary men. Varro alone, of living authors, was accorded the honor of a place in this gallery. He lived to be almost 90 years of age and during his long life published between 600 and 700 "books" (many books sometimes were included in a single work), on no fewer than 74 different topics, in both prose and verse. The *Satura Menippeæ*, in 150 books, of which fragments remain, were a miscellany in verse and prose, modeled on the works of Menippus of Gadara. The *Antiquitates Rerum Humanarum et Divinarum*, in 41 books, was a repository of the religious and secular

antiquities of the Romans and long remained a standard source of information on those subjects, being quoted frequently by the Christian Fathers down to St. Augustine. It is unfortunately lost. A better fate awaited his *De Lingua Latina Libri XXIV*, of which books v to x are in large part extant and furnish us invaluable information regarding little-known points of Roman antiquities. The etymologies are often ludicrous, but Greek and Roman scholarship was always faulty in this respect. His last work, the product of Varro's old age, *De Re Rustica*, which has come down to us entire, is an essay in the form of a dialogue, marked by a pleasant and readable style, on agriculture, cattle raising, and bird and fish breeding.

The foremost orator of Rome, until his fame was far eclipsed by Cicero, was Q. Hortensius Hortalus (or Ortalus, 114-50 B.C.), who, like many of his predecessors, published his speeches; these, however, are not preserved. He was addicted to the florid style of Asiatic oratory. He and Cicero were good friends, though often opponents in court and in politics. And this brings us to Marcus Tullius Cicero (106-43 B.C.), the greatest name in all Latin literature, as well as the foremost statesman of his time. He was such a master of style that his works have remained a model for succeeding ages. Born at the village of Arpinum, of equestrian rank, he early came to Rome and devoted himself to the study of rhetoric. With remarkable boldness the young man courted the hostility of the dictator Sulla by undertaking and carrying through successfully the defense of Sextus Roscius, of Ameria, on a charge of parricide. The speech is extant. Realizing the need of further study, he spent two years (79-77 B.C.) in Greece and Asia Minor and upon his return to Rome threw himself heartily into the forensic life of the metropolis. He cultivated a style of delivery midway between that of extreme simplicity and that of rhetorical adornment so popular with his contemporaries. Though a *novus homo*—for none of his ancestors had held public office—he became quaestor in 75 B.C., curule ædile in 69, prætor urbanus in 66, and finally, in 63, reached the consulship, the height of his political ambition. As quaestor in Sicily, he became aware of the corrupt and tyrannical rule of Verres (q.v.), the governor of that province, whom he impeached in six masterly orations that, happily, are still preserved. Technically the speeches against Verres consist of (a) the *Divinatio in Q. Cæcilium*, a speech actually delivered in a legal process to determine whether Verres should be prosecuted by Cicero or by a certain Cæcilius, who had claimed the right to prosecute, and (b) an *Actio in C. Verrem*, in five books or parts. The *actio* was never delivered, since, as the result of Cicero's success in the *divinatio*, Verres went into exile. In politics Cicero allied himself with the aristocratic party, at whose head was Cn. Pompey, and was instrumental in securing for him the sovereign command in the East by the Manilian Law in 66 B.C.; his speech in favor of this law, known as *De Imperio Cn. Pompeii*, is among the extant orations. The acme of his oratorical career was attained in the year of his consulship by the orations involved in the suppression of Cataline's conspiracy (63 B.C.). (See CATILINE.) Of the four Catilinarian orations, two were delivered before the Senate and two to the people in the Forum. Nor were his orations confined

wholly to political cases and criminal trials. In 62 B.C. he undertook the defense of the poet Archias (q.v.), a Greek of Heraclea in southern Italy, in his claim to Roman citizenship; and this gave Cicero an opportunity of expressing his keen interest in and love of poetry, of which the speech is a rather declamatory eulogy. In 58 B.C., through the machinations of his political enemies, and particularly of the notorious Clodius Pulcher (q.v.), he was banished from Italy and spent a miserable year in exile at Thessalonica and Dyrrhachium. His return in 57 is marked by four orations, in which he offered thanks for his recall to the Senate and people of Rome and discussed the question of his house, which had been confiscated and destroyed. The following years saw the publication of a number of speeches, which it is not necessary to name here. His last important efforts in oratory were the 14 so-called *Philippics*, violent personal invectives directed against Antonius (Marc Antony), which led to the disgraceful murder of Cicero in 43 B.C. We possess 57 of Cicero's orations, with fragments of 20 more and the titles of 30 that are lost.

It is not only as a consummate orator, however, that Cicero stands high in the world of letters. Indeed, much of his fame rests on his more purely literary work. He was an essayist, a philosopher, a letter writer, and, if not a poet, at least an excellent versifier. His earlier rhetorical and philosophical studies were pursued as an aid to perfection in oratory, but in his riper years his leisure time was devoted to writing, and the number of his literary essays attests his industry and omnivorous reading and his facility with the pen. Already as a young man he wrote an essay known as *Rhetorica*, or *De Inventione*, in two books. It was after his return from exile, however, when the uncertain state of political affairs led him to seek rest and refreshment in study and writing, that he put forth his greatest rhetorical work, the *De Oratore*, perhaps the most careful and finished of all his writings. It is an imaginary dialogue, in three books, between the former orators Crassus and Antonius, supposed to have taken place in 91 B.C. The point of view of Crassus is Cicero's own: Cicero held in practice, as Crassus does in the *De Oratore*, that no training can be too broad or too deep for the orator. Antonius held rather to a narrower, more vocational view of oratorical training. Consult the introduction to Wilkins's edition of Cicero's *De Oratore* (2d ed., Oxford, 1888). It may be noted that Cicero himself was, in fact, probably the best-trained man Rome ever produced; his preparation for his career as orator was extraordinarily wide and deep. See his *Brutus*, 304 ff. Cicero was particularly fond of the dialogue form of essay and used it also in other works, as in the *Brutus de Claris Oratoribus*, published in 46 B.C.—a history of oratory down to his own time, with interesting sketches of almost 200 Roman orators. In the same year appeared his *Orator*, dedicated to M. Brutus. This work sums up Cicero's ideal of what an orator should be; in it Cicero again tries, as he had in his *De Oratore* and in his *Brutus*, to bring his country to adopt, as he had himself, an oratorical style intermediate between the Attic style of Lysias and the Asiatic style of Hortensius. His other rhetorical works, *Partitiones Oratoriae*, *Topica*, and *De Optimo Genere Oratorum*, are of less importance. The philosophical essays are more

numerous. In philosophy Cicero was an eclectic with a decided bias, in the field of speculative philosophy, towards the New Academy (q.v.). In ethics he sympathized with the Stoics and was repelled by the Epicureans. His philosophic works show a fine perfection of style and a wonderful adaptation of the Latin language to the niceties of thought, but display no very profound study and are careless in citation and in the treatment of his authorities, a not unnatural result of the rapidity with which they were written. Many of them belong to the last years of his life, when, sorely distressed by the death of his beloved daughter and barred from public life by the supremacy of Cæsar, he wrote with almost feverish energy. We notice only the more important: 1. *De Re Publica*, a dialogue planned on the lines of Plato's *Republic*, written in 54 B.C. Only about a third of the work is preserved. 2. *De Legibus*, never completed, also based on Plato. Three entire books are extant. 3. *De Finibus Bonorum et Malorum*, in five books (45 B.C.), a discussion of the Greek ideas of good and evil. It is in many respects the finest of Cicero's philosophic essays. 4. *Tusculanæ Disputationes* (45–44 B.C.), imaginary conversations at Cicero's country house at Tusculum, in five books, dedicated to Brutus. 5. *De Natura Deorum* (44 B.C.), an exposition of the value of religion. 6. *Cato Maior de Senectute* (44 B.C.), a very interesting essay in championship of old age. The argument is put into the mouth of Cato Censor, 84 years old at the supposed date of the dialogue, who expounds the beauties of old age to Scipio and Lælius. 7. *Lælius de Amicitia* (44 B.C.), a similar discussion of friendship by Lælius Sapiens (see LÆLIUS, 2) and his two sons-in-law. 8. *De Officiis* (44 B.C.), a discussion of moral and political duties, addressed to Cicero's son Marcus.

The correspondence of Cicero occupies a unique place in Latin literature. We have other Latin letters, but none so spontaneous, so sincerely the expression of the writer's thoughts and moods without regard to the public or the future, none that disclose so completely the intimate thoughts and emotions of a great intellect, none that afford so clear an insight into the real life of the Roman world at one of the most critical and interesting periods of its history. Here we see Cicero the man, in strength and weakness, in success and failure, in public life and with family and friends, as writer and thinker, as wit and connoisseur. Here, too, we may gain an idea of the colloquial Latin of the Roman gentleman, as contrasted with the more elegant but less elastic diction of literature. The best English edition of the letters is that by Tyrrell and Purser (7 vols., London, 1882–1901); good English translations are those by E. S. Schuckburgh (2d ed., 4 vols., ib., 1900–05), and Winstedt, in the Loeb Classical Library (New York, 1912–). On the language of the letters, consult R. Y. Tyrrell, *Cicero in his Letters* (London, 1891).

The greatest genius of the ancient world, the statesman, general, orator, student, and writer C. Julius Cæsar (100–44 B.C.), exercised but a minor influence upon Latin literature as compared with Cicero, yet his *Commentarii de Bello Gallico* has always been a model of Latinity for simplicity and clearness of style, straightforwardness of narrative, and utter absence of self-praise, though the writer was at the same time the hero of his story. The book makes no

pretensions to being an elaborate history; it gives, ostensibly, merely the memoirs of the seven campaigns in Gaul (58-52 B.C.), written by the general in chief during the long idle hours in winter quarters after the crushing of Vercingetorix. Cæsar also prepared an account of the civil wars, which was published after his death from the manuscript draft which he had never carefully revised. His army officers, men of little or no literary ability, followed their gifted leader also into the domain of history. Aulus Hirtius, one of his *Legati*, added an eighth book to the *Commentaries*, and the Alexandrian, African, and Spanish campaigns were written up by other officers. These works are decidedly inferior in style, language, and accuracy to Cæsar's; they are, indeed, sources of our knowledge, rather, of the *sermo plebeius* than of the literary language. (See LATIN LANGUAGE, in the following that on the Golden Age.) The only works of Cæsar that have survived.

A contemporary of Cæsar, but of very inferior importance, was D. Laberius (105-43 B.C.), a Roman *eques*, who raised the *munus*, or farce comedy, to a literary level. We have no more than the titles of his plays. A younger writer in the same line of work, Publilius Syrus, of Antioch (?), was extremely popular for more than a century. The name of T. Lucretius Carus (c.99-55 B.C.) is among the most noted of this epoch, yet, though he was a member of one of Rome's noblest families and a unique poetic and philosophic genius, we know but little of his personal history. He was the author of a profound didactic poem, *De Rerum Natura*, in six books, which is most fortunately preserved and forms our best authority on the philosophic system of the Epicureans. Lucretius himself explains his purpose in writing it, viz., to free the mind from the fear of the gods and of death and to combat the many forms of prevalent superstition by a rational contemplation of nature. As poetry, the work is of a very high order, though varying in quality, for Lucretius died before it was perfected.

Cornelius Nepos (c.99-24 B.C.) was, like his friend Atticus, a man of letters who took no part in the political turmoils of the time. Though he wrote several works of varied character, he is known to us only by the surviving portion of his extensive biographical work *De Viris Illustribus*, in which separate sections (or "books") were devoted to lives of illustrious Greeks and Romans, grouped according to profession, etc. The extant portion gives about 25 lives of Greeks, mostly soldiers or public men, besides lives of Hamilcar, Hannibal, Cato Censor, and Atticus, the friend of Cicero.

In the literary life of Rome at this time there was a group of poets bound together by friendship and by a community of tastes and studies, and all thoroughly steeped in the Greek poetry of the Alexandrian school. (See ALEXANDRIAN AGE; GREEK LITERATURE, *The Alexandrian Age*.) The greatest of these—and indeed one of the greatest in all Latin literature, so far as down-right genius, spontaneity, and sincerity of feeling are concerned—was C. Valerius Catullus (87-c.54 B.C.), a native of Verona, where his father lived and often entertained Julius Cæsar at his house. As a young man he came to Rome and, being of good family, gifted, and of independent means, quickly gained access to the most fashionable society of the capital. Here

he formed the acquaintance of the most prominent persons of the time. A man of strong emotional instincts, of violent love and hate, his poems are pervaded with his own personality. In love, friendship, and politics he shows himself full of zeal and enthusiasm or governed by the most venomous dislikes. He was the last great poet of the free Republic and certainly one of the greatest lyric geniuses that the world has produced.

Besides his shorter lyrics, Catullus wrote also longer poems of quite another character, a "Song to Diana", two *epithalamia*, or marriage songs, one mythological in character, treating of the *Marriage of Peleus and Thetis*, the other in honor of the actual marriage of Manlius and Vinia; a wild study of the Phrygian Attis myth, in the galliambic metre, a translation of Callimachus' *Coma Berenices*, and others. The poems in which he sings of his sorrow for the death of his brother (65, 68, and especially 101), whose tomb he visited in the Troad, of his unhappy journey in Asia Minor (46), and of his joyous return to his beloved Sirmio (31), with the eulogy of his yacht, *Phaselus* (4), are full of subtle charm.

The first Roman to treat historical writing as an art, and thus to distinguish it from personal memoirs and annals, was C. Sallustius Crispus, generally called Sallust in English (86-34 B.C.). After playing an active part in public life, he settled down into private life on his large estate just outside the walls of Rome, to enjoy the wealth he had acquired while proconsul in Africa and to devote himself to literary pursuits. He took Thucydides (q.v.) as his model and followed him closely both in arrangement and style. His works were: (1) *Bellum Catilinæ*, an essay on the famous conspiracy of Catiline in 63 B.C.; (2) *Bellum Jugurthinum*, an essay on the war with Jugurtha (q.v.), King of Numidia, who was conquered by Marius; (3) *Historiæ*, in five books, an account of events from 78 B.C. to 67 B.C. The last is preserved only in fragments.

B. *The Augustan Period* (43 B.C.-14 A.D.).—The overthrow of Antonius at the battle of Actium (31 B.C.) and the gradual establishment of the Empire mark a new order of things in Roman literature. The impulse communicated to poetry in the last days of the Republic was carried, it is true, without interruption into the succeeding age. The poems of Catullus are separated by only a few years from the *Eclogues* of Vergil, but a very different spirit pervades them. The frankness and fearlessness of the earlier poet, which are in harmony with the political activity and freedom of the time in which he wrote, have given place in the later one to a guarded restraint which seeks the approval of a patron or a monarch. In fact, the position of the aristocratic class to which literature had for generations owed its support and encouragement was now changed. No longer free to share in the conduct of national affairs, this class found its chief interests in the affairs of "society" life and expended its energies amid the enervating influences of the court. The state of things had its immediate effect upon literature. Oratory lost its most stirring themes and began to degenerate, becoming ultimately mere declamation; history, fearing to deal unreservedly with the present, fell back upon an artistic elaboration of the past, while poetry, though still on the upward path, tended to become disproportionately

erotic. This period unfolds a list of brilliant writers whose works are conspicuous above those of other periods for their beauty of finish and artistic skill and for a breadth of sympathy which brings them into genuine touch with human life the world over. It saw the perfection of the Latin hexameter verse in the national epic of Vergil, of lyric poetry at the hands of Horace, and of elegiac verse in the works of Tibullus, Propertius, and Ovid. In the domain of prose, Livy did for the story of Rome what Vergil did in verse for the myth of its origin.

P. Vergilius Maro (70-19 B.C.) is the name that is most closely linked with the new order of things ushered in by the Empire. Born at a small town near Mantua in northern Italy, he found himself, when still a young man, deprived of his inherited estate, which, like all the good land of that region, was confiscated after the death of Cæsar and given to the veterans of Octavianus. But Vergil had influential friends, who secured for him from Octavianus a restitution of his property; his gratitude towards the future Emperor was boundless. At this time he began writing his bucolic poems, *Eclogues*, modeled upon the Greek poems of Theocritus; in the first of these the shepherd Tityrus expresses the thought of Vergil himself when he says: *Deus nobis hæc otia fecit* (It is a god who has secured us these comforts). This admiration for Octavianus, born of gratitude, increased with time and personal acquaintance and made of Vergil a devoted adherent of the new order of things and the logical exponent of the new national glory. The 10 *Eclogues* of Vergil are all preserved. He next turned his attention to didactic poetry and wrote four books of *Georgics* at the request of Mæcenas (q.v.), the minister of Octavianus and great patron of literature and learning. The *Georgics*, one of the most charming of the longer Latin poems, treats in an ideal way, and with intimate personal knowledge, agriculture, arboriculture, domestic animals, and beekeeping. Vergil had now taken up his residence at Rome, with frequent sojourns in Campania, and was an esteemed member of the higher literary and cultured circle of the capital and a friend of Augustus. The last years of his life (29-19 B.C.) were devoted to the writing of the *Æneid*, the great national epic, glorifying at the same time Rome and the Julian house and forming the connecting link between the Republic and the Empire. It is an hexameter poem of 12 books, the first six modeled on the *Odyssey*, the last six upon the *Iliad*; the whole describes the adventures of Æneas and his companions from the destruction of Troy to the settlement in Italy leading to the founding of Rome. It was left unfinished at the poet's death in 19 B.C. Indeed, Vergil had made up his mind to destroy the *Æneid*, for failing health warned him that he could never perfect it, but he was compelled by the Emperor and by his friends to save the manuscript, and the work was published by L. Varius Rufus and Plotius Tucca after his death. Besides the greater poetry of Vergil, a number of smaller poems have passed under his name: *Culex* (Gnat), *Ciris*, *Moretum* (Salad), *Copa* (Mine Hostess), and *Catalepton* (a poetic miscellany of 14 pieces). The *Moretum*, *Copa*, and part of the *Catalepton* may really be the work of Vergil.

Closely associated with Vergil, though differing widely from him as a poet, was Q. Horatius Flaccus (65-8 B.C.), who also belonged to the

coterie of authors that gathered about Augustus and his minister Mæcenas. A native of Venusia in Apulia, the son of a freedman who had given him every possible educational advantage, a partisan of Brutus, for whom he fought at the battle of Philippi, then a clerk in the quaestor's office at Rome, Horace gained access to the literary world by his genius, his wit, and his admirable disposition. Vergil introduced him to Mæcenas and thus assured him fame and a competency, for Horace was extremely fond of the quiet country life and passed happy years on the Sabine farm presented to him by his patron. His earliest poems were the *Sermones* (usually mis-called *Satires*), in hexameter verse, in two books, completed respectively in 35 B.C. and 30, and the *Epodes*, completed also in 30 B.C. The *Sermones*, written in a familiar and colloquial style for the delectation of his friends, are modeled upon Lucilius (see above) and are either humorous narratives or mild rebukes of particular moral obliquities and weaknesses. The *Epodes*, which are related to the *Sermones* in subject matter, have more of the character of personal invective. The first three books of the *Odes* were published together, with a dedication to Mæcenas, in 23 B.C. and were followed, after an interval, by the fourth book of *Odes*, written by request and published in 13 B.C. They represent the highest perfection of Latin lyric poetry. It was only by long and patient effort, however, that Horace acquired a mastery over the lyric metres. His verse is no irresistible outburst of genius, but the result of ripe study and a matured power of expression. But, despite the actual labor in the execution, the language of the *Odes* has all the effect of ease; it is brief without being abrupt, subtle without being obscure, and possesses a liveliness which sustains the interest of the reader. The *Epistles*, of which the first book was published in 20 B.C., are full of a genial criticism of life and, with the *Sermones*, furnish the most complete and vivid picture that we have of the condition of Roman society in the Augustan age. The *Carmen Saeculare* (q.v.) was written to be sung at the great Secular Games of 17 B.C. The last work of Horace's life was his poem in literary criticism, *De Arte Poetica*, in reality an epistle addressed to the Pisos, in which he treats lightly but acutely the problems of literary history and the principles of style, especially those relating to the drama.

Of the friends and companions of Vergil and Horace, almost all were writers, but few of their works have survived. Augustus himself (63 B.C.-14 A.D.) wrote both verse and prose. Mæcenas too (69-8 B.C.) indulged in poetic trifles, of which one or two are preserved. Asinius Pollio (76 B.C.-5 A.D.) was the author of tragedies and a history of the civil wars. L. Varius Rufus (74-14 B.C.), one of the editors of the *Æneid*, was an epic poet of great reputation among his contemporaries, as well as a writer of tragedies, one of which was highly praised by Quintilian. Æmilius Macer (died 16 B.C.) wrote didactic poems on hunting, etc., while Cornelius Gallus (70-27 B.C.) devoted himself to the love epigram.

Three of the younger poets of the Augustan period are so similar in temperament and in the subjects on which they wrote, as well as in the choice of the elegiac metre (see *ELEGY*), which they brought to its highest perfection, that they should be classed together here—

Tibullus, Propertius, and Ovid. The first two have many points of resemblance with their far greater predecessor Catullus. Like him, they both wrote love poetry, veiling their sweethearts under fictitious names; like him, too, they died in the very flower of their youth. But the love poems of Catullus are sincere and spontaneous, theirs are more self-conscious and artificial. He wrote wholly from the heart, they more from the head. Propertius, with his wealth of imagery and mythic lore, forms the link between the thoroughly self-centred Tibullus and Ovid, whose best work is wholly free from the personal element. The eldest of the three poets of this group, Albius Tibullus (c.54-19 B.C.), was one of a younger group of literary men that gathered around Valerius Messalla, as Vergil and Horace and their friends formed the circle of Mæcenas, some of the elegies of Tibullus are dedicated to Messalla as patron and friend. The first book, as a whole, treats of his love for Delia, the second of his passion for Nemesis. The language is pure and natural, the versification careful and polished; and, though the themes are but few—ideal love as contrasted with the reality, the charms of country life, the horrors of war—yet they are very often relieved by delightful touches of realism, as in the picture of Messalla, returned from the wars, sitting with his cup of wine in the poet's house in the country and describing his campaigns by marking out camps and battlefields on the table with the tip of his finger dipped in wine. Tibullus did not live to publish his poems; to the two books that are certainly his, his editors added a number of elegiac verses by other writers, notably those of Sulpicia, interesting as the work of a woman, and those of a certain Lygdamus, evidently a pseudonym. Sextus Propertius (c.49-15 B.C.) lacked the restraint and purity of diction of Tibullus, but is far broader in his range of subjects and richer in his wealth of imagery and of mythical allusions. He gave promise of becoming a poet of the first rank, but did not live to mature his genius. Like Catullus and Tibullus, he found his inspiration in love, in his case, for a woman, perhaps Hostia, to whom he writes under the name of Cynthia. The latest in order of time of the elegiac poets is P. Ovidius Naso (43 B.C.-17 or 18 A.D.), a native of Sulmo, but early a resident of Rome, where he wrote love poetry with a strong trend to the purely sensual aspect, as in the *Amores*, the subject of which passed under the fictitious name of Corinna. In the *Heroides* we have an early example of the imaginary love letters, which have lately become so popular. Each of these poems purports to be a letter addressed by a mythical heroine, as Penelope, Briseis, Phædra, Medea, to her absent lover. Not long after this he published his *Ars Amatoria* (also called *Ars Amandi*), containing instructions, couched in poetic form, for lovers of both sexes in the art of retaining their conquests, and his *Remedia Amoris*, on the same general theme, but even coarser in tone. To the middle period of his literary activity belong the *Metamorphoses* and the *Fasts*. The former, written wholly in hexameters, show the breadth of Ovid's versatile poetic genius and form a considerable manual of Greek and Roman mythology. The *Fasts* explain in elegiac couplets the religious significance of each day and month—a sort of commentary on the calendar. The work was planned in 12 parts, with a book dedicated to each month, but only the first six were ever

completed, and these were not published until after Ovid's death. While still engaged in writing the *Metamorphoses*, Ovid was overtaken with sudden disaster that wrecked his life and reduced him to desolation and despair. Exactly what caused his downfall is, and probably will always remain, a mystery. Towards the end of 8 B.C. he was suddenly banished from Rome by Imperial orders and commanded to live in the far-distant and wholly uncongenial village of Tomi, on the shores of the Black Sea. Here he miserably passed his remaining years, yearning for Rome and hoping in vain for a reprieve. His poetry now became melancholy; the *Tristia*, in five books, and the *Ibis*, in one book, give but too vivid a picture of his lonely wretchedness. The title *Ibis* was borrowed from that of a famous lampooning poem by Callimachus (q.v.). By a curious coincidence the first word of Ovid's poem is the Latin word *Ibis* (you shall go). Ovid died in A.D. 17, a broken-hearted old man.

The one great prose writer of the Augustan period was Titus Livius (59 B.C.-17 A.D.), of Patavium (Padua), author of a history of Rome (*Ab Urbe Condita Libri*), from the arrival of Æneas in Italy down to Livy's own times. This great work was in 142 books, carrying the story as far as the death of Drusus in 9 B.C. (See DRUSUS, 3.) Livy probably intended to complete 150 books; if so, death prevented the consummation of his plan. Only about a quarter of the work (i.e., books i-x, xxi-xlv) is extant, but we have *pericopæ*, or *outlines*, of the rest. Livy has fairly been called the most eloquent of historians, but he is wholly uncritical. He troubled himself little with original research and had small knowledge of constitutional or military affairs, and his idea of the philosophy of history and of the significance of cause and effect was of the vaguest possible sort. It is, however, decidedly erroneous to say, as Macaulay did, that Livy had no regard for truth. It is but fair to him to point out that he was well aware how unsatisfactory even the best available authorities were. (Consult Morgan, *Addresses and Essays*, New York, 1910.) In consequence he not unnaturally contented himself at times with presenting the current history in adequately artistic form. But in the art of expression and of telling a story in a fascinating style he surpasses all his countrymen. His language is unconventional, though carefully chosen, and forms the first transition to the so-called "silver" Latinity.

Among the minor writers of this epoch several deserve a brief mention. Pompeius Trogus wrote a universal history, with the title *Historia Philippicæ*, in 44 books. This work was abridged in the second century by Justinus, and the abridgment, which is extant, caused the loss of the original. The learned M. Verrius Flaccus met the same fate as Trogus and for the same reason. His encyclopædic lexicon entitled *De Verborum Significatu* was abridged by Sextus Pompeius Festus in the second century, and this in its turn by Paulus Diaconus in the time of Charlemagne. All of the original work and most of the first abridgment are therefore lost. C. Julius Hyginus (c.64 B.C.-17 A.D.), another learned writer, was a freedman of Augustus, who placed him in charge of the Palatine Library. His works treated many subjects, literary and scientific, but all are lost except two books of *Fabulæ* (a school textbook of mythology) and four on astrology; even these, in the

form in which we have them, are not certainly from his hand. (See *HYGINUS*.) We are more fortunate in the case of the architect Vitruvius Pollio, whose work *De Architectura*, in 10 books, is of the greatest value to students of classical architecture, but, like all the lesser works just mentioned, is quite without real literary merit.

IV. *The Silver Age* (Postclassical Period; Spanish Latinity, 17 B.C.–c.130 A.D.). This period may be divided conveniently into three parts: (a) the Claudian era; (b) the Flavian era; (c) the era of literary revival, comprising the reigns of Nerva and Trajan and part of that of Hadrian. The Republican age is now definitely and admittedly at an end, and society, and with it literature, enters upon a new phase. The writers whose works survive become vastly more numerous, but are generally of secondary importance and can be treated only briefly. As several of them in the first century (the two Senecas, Pomponius Mela, Lucan, Columella, Quintilian, Martial) were of Spanish origin, the whole period is often spoken of as that of Spanish Latinity. The accession of Tiberius (14–37 A.D.) marked the growth of despotic power, which crushed all aspirations after freedom and deadened intellectual activity. The Emperor, though an author himself, his literature for political reasons, and men did not dare either to praise the past or record the deeds of the present. (a) L. Annaeus Seneca, the elder (c.54 B.C.–39 A.D.), of Corduba in Spain, really belongs to the end of the Republic, but as his extant works, written towards the end of his life, fall under the Empire, he is best considered here. He was an orator of repute, a great admirer of Cicero, and a rhetorician of distinction. A single volume of *Suasoriae* (school declamations) and 10 books of *Controversiae* (school debates) remain to us in a mutilated form. The brave but unfortunate Prince Germanicus (15 B.C.–19 A.D.), the Emperor's nephew, translated into Latin hexameters the *Phaenomena* of Aratus. C. Velleius Paterculus, an old soldier and a great admirer of Tiberius, published in 30 A.D. a compendium of Roman history, mostly of the Empire, in two books. Valerius Maximus dedicated to Tiberius his *Factorum et Dictorum Memorabilium Libri IX*, a large collection of historical anecdotes. A. Cornelius Celsus was the author of an encyclopaedic work on very diverse subjects, of which eight books on medicine (*De Medicina*) have survived and form our best exposition of the medical science of the Romans. Finally, the Emperor's freedman Phaedrus adapted in Latin *senarii* the fables of Aesop, with many additions of his own. His animals, however, have not the lifelike character of those of Aesop nor the wisdom claimed for them by the author himself. In the reigns of Caligula (37–41 A.D.) and Claudius (41–54 A.D.) literature made no important acquisitions, although grammatical studies and jurisprudence continued to be cultivated. Perhaps to this period belong the *Chorographia* of Pomponius Mela, a geography of the ancient world as known at this time, and the *Historiarum Alexandri Magni Libri X* of Q. Curtius Rufus (see CURTIUS), a somewhat dry but not altogether uninteresting account of the conquests of Alexander the Great. Claudius' court physician, Scribonius Largus, published about 47 A.D. a book of useful medical prescriptions, which is extant. Claudius himself was an industrious writer on Etruscan and Roman an-

tiquities, but we possess only part of one of his speeches before the Senate, discovered in 1524 at Lyons, engraved on bronze tablets, the substance of which is quoted by Tacitus (*Ann.*, xi, 25). The accession of Nero (54–68 A.D.) marked a revival in letters. The greatest writer was L. Annaeus Seneca, the philosopher (4 B.C.–65 A.D.), son of the elder Seneca, mentioned above. Seneca's facility in composition resembled that of Ovid. His philosophy, which was based on that of the Stoics, was more cosmopolitan than Roman and discloses a loftiness of moral view with which the weaknesses of his own life were scarcely in keeping. His style is ornamental and forced, and his sentences disconnected, epigrammatic, and adapted to win applause at recitations. Seneca wrote on a great variety of subjects, both in prose and verse. The most important of his extant works are his philosophical discourses on such subjects as Anger, Clemency, Consolation, the Shortness of Life, etc., and 20 books of "Moral Letters" (*Epistulae Morales*), 124 in all, addressed to his friend Lucilius. He was the author, also, of tragedies, with subjects chiefly drawn from Euripides, of which the best known is the *Medea*. His satirical pamphlet, *Apocolocyntosis Divi Claudii*, written in derision of Claudius after the latter's death, is unique in Latin literature.

Seneca's nephew, M. Annaeus Lucanus (39–65 A.D.), was also imbued with the Stoic philosophy. Though a young man when he was put to death by Nero for his part in Piso's conspiracy, he had already gained a high place as a poet by his epic *Pharsalia*, an account of the civil war between Pompeius and Cæsar, which is to be ranked as a work of genius, though it abounds in exaggeration, wearisome digression, and misplaced learning. Lucan's intimate friend, the poet A. Persius Flaccus (34–62 A.D.), is a far more interesting personality; though he died in his twenties, he left six *Satires* that will always be read with interest and admiration. Persius was full of youthful moral enthusiasm—quite in contrast with his contemporary Petronius Arbiter, who, if he was really, as seems probable, the *arbiter elegantiarum* of Nero, was compelled to put an end to his life in 66 A.D. His *Satiricon* (sc. *Libri*) is a vivacious and well-written satirical romance, the only work of its kind that is left from Roman literature. We possess almost entire the part entitled *Cena Trimalchionis*, the description of a dinner given at the house of Trimalchio, a rich but vulgar upstart. The various characters are cleverly drawn, and the language and conversation of each is in strict keeping with his station. It remains in this period merely to mention L. Junius Moderatus Columella, author of an extensive agricultural work *De Re Rustica*.

(b) The accession of Vespasian (69 A.D.) marked the appearance in literature of a soberer style than was possible amid the frivolous glitter of Nero's court. The greatest writer of this reign was C. Plinius Secundus, or Pliny the Elder (23–79 A.D.), who perished, as a result of his spirit of scientific investigation, in the great eruption of Vesuvius that destroyed Pompeii. He was a voluminous writer, but we have only his extensive storehouse of learning entitled *Historia Naturalis*, which, though mainly a compilation, represents a vast amount of laborious research. It was in the reign of Vespasian also that C. Valerius Flaccus wrote the first part of his poem *Argonautica*—an imitation of the

Greek work of Apollonius Rhodius though most of it was published in later years. The writers of Domitian's reign (81-96 A.D.) were more numerous. There were two epic poets of secondary importance, Silius Italicus (c.25-101 A.D.) and P. Papinius Statius (c.40-96 A.D.). The former was author of a description of the Second Punic War (*Punica*); the latter wrote two mythological poems, *Thebais* and *Achilleis*, and a collection of shorter poems entitled *Silvæ*. All are wanting in originality and inspiration. Not so with the *Epigrams* of M. Valerius Martialis (c.40-104 A.D.), the court poet of Domitian. His 15 books possess greater interest for us than any other works of the period, for the insight they give into the social life of the day. All the frivolity, license, immorality, and servility of the age of Domitian are mirrored in these little sketches. They are remarkable also for their consummate wit and their polish of form and diction. Martial is in one sense the creator of the epigram, for it was he who first gave to it the sting which it now carries. The only prose writer of first importance was M. Fabius Quintilianus (35-95 A.D.), who, after a long and useful life in Rome as a teacher of rhetoric, spent his declining years in the preparation of a great work on the "Training of the Orator" (*Institutio Oratoria*), which has always remained a classic. With ripe judgment founded on experience, Quintilian traces from childhood up the proper education of the future orator. The tenth book, which is devoted to literary criticism and contains a comparison of Greek and Roman writers in various fields, is of especial interest to-day.

Aside from literature as such, perhaps the most scientific writer of all the Romans was Sextus Julius Frontinus (c.40-103 A.D.), who made an honorable record both at Rome, as aqueduct commissioner, and in the field, as governor of Britain. The results of these very diverse experiences are summed up in his *De Aquis Urbis Romæ*, an extensive report on the Roman water supply, and *Strategematon Libri III*, a practical manual of military art.

(c) But it was in the reigns of Nerva and Trajan (96-117 A.D.) that the literary talent of the Empire put forth its noblest efforts. The long restraint to which liberal-minded and independent men had been forced to submit under the preceding reigns was finally broken, and now at last, as under the Republic, they were able freely to express their real feelings. They were naturally embittered by the long enforced silence and by the vivid memory of hateful conditions, but nothing could be nobler than the grim moralizing of a Juvenal and a Tacitus. They do, indeed, draw a sad picture of a corrupt society and an incredibly awful state of public affairs, but when allowance has been made for their bias, they amply show that integrity and virtue could flourish under the most degrading conditions. Cornelius Tacitus (c.55-120 A.D.) occupies a unique place in Roman literature. A keen critic of men and things, he is also an able word artist and the creator of a trenchant style of Latin that no writer ever succeeded in imitating. We are indebted to his *Annales* and his *Historiæ* for our best information of the events of the principal reigns of the first century. His earlier works, the *Germania*, an account of that then little-known country, and the *Agriicola*, a charming and sympathetic biography of his father-in-law, show alike the development of his

literary genius and his own rare qualities of heart and head. The *Dialoqus de Oratoribus* was his earliest work, written while he was still under the influence of Ciceronian studies. The *Satires* of his contemporary D. Junius Juvenalis (c.60-140 A.D.) present in a strong light the moral degradation of Roman society and the righteous indignation of the better-minded men. Juvenal is a true satirist, though lacking in the higher qualities that make a poet. Pliny the Younger, C. Plinius Cæcilius Secundus (62-c.113 A.D.), nephew of Pliny the Elder, has left a collection of delightful *Letters*, which modify for us the harsh picture of society drawn by Juvenal and Tacitus. Those addressed to Trajan, with the Emperor's replies (consult book x), are especially interesting as showing the feeling in regard to the growing sect of the Christians (Consult *Letters*, 96-97.)

V. The Middle Empire (second century, African Latinity, Early Christian Writers, 117-211 A.D.). With Tacitus, Juvenal, and Pliny, Roman literature as an expression of lofty and original genius may be said to have come to an end. Men of ability and learning continued to write, but in general their interest to us is not a purely literary one; it is due to the subjects of which they wrote and the times in which they lived. As the Spanish writers played a prominent part in the literary history of the last period, so in this we find that many of the greatest names are those of Africans (as Fronto, Apuleius, Tertullian), hence it is often designated as the period of African Latinity. See LATIN LANGUAGE, the third paragraph before the division entitled *General Characteristics*.

Under Hadrian (117-138 A.D.) flourished C. Suetonius Tranquillus (c.75-160), author of the *Lives of the Cæsars*, full of interesting bits of information and gossip, with a strong preponderance of scandal; and of a collection of slight biographies of illustrious men, of which we have many valuable fragments. To this period, too, belongs the abridged history of Florus, a work of very subordinate importance. The greatest names of the reign of Antonius Pius (138-161 A.D.) are those of M. Cornelius Fronto (c.100-175 A.D.), whose correspondence with his Imperial pupil Marcus Aurelius is interesting, if monotonous and pedantic; and of Gaius, the jurist (c.110-180 A.D.), whose *Institutiones*, a manual of Roman law, is in great part extant. More interesting are the writers of M. Aurelius' reign (161-180 A.D.). Aulus Gellius laboriously collected all kinds of literary, philological, and antiquarian information, which he published without order or system under the title *Noctes Atticæ*. To us, of course, the work is a valuable storehouse of information, a treasury of curious facts and theories. The best representative of the African-Roman writing is L. Apuleius (born c.125 A.D.), the most original writer since Tacitus. He studied at Carthage, traveled extensively in Greece, practiced law at Rome, and then returned to Africa, where he delivered public lectures on rhetoric and philosophy. His chief work was a long romance entitled *Metamorphoses*, with a fantastic plot. It narrates the strange adventures of a certain Lucius, who was transformed into a donkey. The hand of the rhetorician is visible all through the book. The best-known portion is the well-written story of Cupid and Psyche. The other extant works of Apuleius are of less interest: *Apologia*, his defense on a charge of witchcraft; *Florida*, selec-

tions from his public lectures; and a number of philosophical essays. To this period we owe the earliest literary work of Latin Christianity, the *Octavius* of M. Minucius Felix, a well-written exposition, in dialogue form, of the current arguments against the Christian faith, with a well-sustained refutation.

Under the rule of Commodus (180-192) and Severus (193-211) we have only one writer of importance—Tertullian, of Carthage (c.150-230 A.D.), the fiery defender of Christianity whose sharp attacks on the pagan life and worship must have brought many into the Christian fold. The Bible was already translated into Latin; the oldest versions, rough and literal, are known as *Itala*. In Rome the celebrated jurist Papinian was writing extensively on his own special topic—law—and Acrio was preparing commentaries on Terence and on Horace.

VI. Period of Actual Decline (third to sixth centuries). The writers of the third century are neither numerous nor important from a literary point of view. In the field of law Domitius Ulpianus put forth numerous works under Caracalla (211-217 A.D.) which form the basis of the great *Digest* of Roman law prepared later by order of the Byzantine Emperor Justinian. The grammatical works of Censorinus belong to the same period. Only his *De Die Natali* has survived, a compilation largely from Suetonius, containing some curious information of value to us. The literary activity of St. Cyprian, Bishop of Carthage (c.200-258 A.D.), falls under later reigns. He was a voluminous writer, thoroughly orthodox in his faith, we gain from his works, especially from his *Epistulae*, no little insight into the condition of the various churches of the time. The Christian poet Commodianus occupies a curious place in the story of Latin versification. He is the precursor of the purely accental verse of the early Latin hymns. He writes in hexameters; but the sense of quantity is largely lost, and the lines must be read partly quantitatively, partly by the prose accent. C. Julius Solinus, a compiler of learned information, but without critical judgment or taste, wrote his *Collectanea Rerum Memorabilium* shortly after the middle of the third century. It was an age of devalitized paganism and often very crude Christianity, and many a recent convert "rushed into print" before he really understood the doctrines that he proclaimed. Such was the rhetorician Arnobius, author of a defense of Christianity with the title *Adversus Nationes*. Arnobius' pupil, the rhetorician Lactantius, was of a far higher type of mind; indeed, we should call him a surpassing genius in contrast with the intellectual level of his time. Though a zealous Christian, he loved the pagan writers, and his style is as Ciceronian as was possible in the third century. A number of pagan writers of the time of Diocletian and Constantine (Spartianus, Capitolinus, Trebellius Pollio, Gallicanus, Vopiscus, Lampridius) are grouped under the general name *Scriptores Historiae Augustae* (See AUGUSTAN HISTORY) and have left for us popular accounts of the emperors of the second and third centuries. In contrast with the purely scholastic work of the pagans and the constructive and propagandist writings of the Christian writers, we have now also a poem of real genius, wholly pagan in tone and by an unknown author—the *Pervigilium Veneris*, a charming song in praise of springtime and love.

In the fourth century Christianity became the recognized state religion, but paganism could not be stamped out by law, and many of the most noted writers were still pagans. Thus, the nobleman Avienus as a poet followed the classical models in his translations from the Greek and in his epigrams; and if his pagan poetry is overweighted with rhetoric, that was the fault of his time. D. Magnus Ausonius (c.310-395 A.D.) combined a love of the old Roman literature and a deep knowledge of Latin poetry with skill in versification and neatness and grace of expression. His *Mosella* is one of the most perfect gems in the Latin language. The representative Christian poet was Prudentius (348-c.410 A.D.), who adds to perfect versification originality of subject, for he treats of wholly Christian themes, as the martyrdom of the saints, etc. The last struggle of philosophic—or, rather, reminiscent—paganism is splendidly depicted in the writings of Symmachus (c.345-405 A.D.), one of the most attractive characters in the whole range of Latin literature. The two great theologians of the century are Ambrosius (St. Ambrose; c.340-397 A.D.), Bishop of Milan, and Hieronymus (St. Jerome; 331-420 A.D.). History was represented by Aurelius Victor, who published in 360 A.D. a history of the Cæsars; by Eutropius, author of an *Epitome of Roman History*; and—most important—by Ammianus Marcellinus, the last Latin historian of ancient Rome, a zealous imitator of Tacitus, of whose *Historiae* he intended his own work to be a continuation. A few writers on learned and technical subjects should also be noted: the grammarians Donatus (whose *Ars Grammatica* became the textbook of the Middle Ages), Charisius, and Diomedes, the lexicographer Nonius Marcellus; the Vergilian commentator Servius; the astrologer Firmicus Maternus; and the military writer Vegetius. The passage from the fourth to the fifth century marks the era of the last of the great pagan poets, Claudius Claudianus, author of epic poems and epigrams of high classical finish, often reminding one of Statius. This was the age, also, of St. Augustine (354-430 A.D.), Bishop of Hippo in Africa, author of very numerous theological and moral works, notably the *Confessiones* and the *De Civitate Dei*. Macrobius, while still a pagan, wrote the *Saturnalia*, a mass of notes in literary criticism and antiquarian lore in the style of Gellius' *Noctes Atticae*, dealing especially with the criticism of Vergil, and a commentary on Cicero's *Somnium Scipionis*. The Spanish priest Orosius was the author of a History of the World, from the Creation to 417 A.D., written from the Christian standpoint. Under Theodosius, in 438 A.D., the Imperial edicts from the time of Constantine were collected in the *Codex Theodosianus*. The last great names of the fifth century were Apollinaris Sidonius and Dracontius. The former (c.430-480 A.D.), as Bishop of Clermont in France, published poems and letters; the latter, a Carthaginian, wrote a long didactic poem *De Laudibus Dei*. In the sixth century the ancient Latin literature comes to an end with the great grammar, *Institutiones Grammaticae*, of Priscianus; the philosophical works of Boethius (died 524 A.D.), especially his *De Consolatione Philosophiae*, composed in prison; and the *World-Chronicle* and lesser works of Cassiodorus.

Bibliography. The standard works of reference on Latin literature are Teuffel, *Geschichte*

der römischen Litteratur (5th ed. by Schwabe, Leipzig, 1890; with Eng. trans. by Warr, *History of Roman Literature*, London, 1891-92, still of great value; 6th ed. by Kroll, Skutsch, etc., vols. ii, iii, ib., 1910-13, not yet translated and less good than the 5th ed. because the attempt to control the literature, which is the great merit of the 5th ed., has been abandoned), and Schanz, "Geschichte der römischen Litteratur," in Müller, *Handbuch der klassischen Altertumswissenschaft* (in part 2d ed., but mainly 3d ed., Munich, 1905-14). Schanz's work is by far the most complete and the best. Valuable, but far briefer, are the treatment of Latin literature by Leo and Norden, in *Die griechische und lateinische Literatur und Sprache*, by various hands (3d ed., Leipzig, 1912), and by Norden and Wendland in Gercke and Norden, *Einleitung in die Altertumswissenschaft* (2d ed., ib., 1913). The best modern manuals are those of Simcox (2 vols., New York, 1883), Crutwell (ib., 1888), Mackail (ib., 1895), and Pichon (Paris, 1898); Duff, *A Literary History of Rome* (London, 1909); Leo, *Geschichte der römischen Literatur; Erster Band: Die archaische Literatur* (Berlin, 1913). See also Mayor, *Guide to the Choice of Classical Books* (London, 1898). For suggestive essays on phases of Latin literature, see, besides the works cited in the body of this article, Nisard, *Etudes de la poésie latine et Essais sur les poètes latins de la décadence* (Paris, 1875), Sellar, *Roman Poets of the Republic and Roman Poets of the Augustan Age* (Oxford, 1892); Tyrrell, *Latin Poetry* (Boston, 1893), Nettleship, *Lectures and Essays*, two series (Oxford, 1885, 1895); Moulton, *The Ancient Classical Drama* (2d ed., ib., 1898); Fowler, *Roman Literature* (New York, 1903); Butler, *Post-Augustan Poetry* (Oxford, 1909); Plessis, *La poésie latine* (Paris, 1909); Michaut, *Histoire de la comédie romaine* (ib., 1912). LATIN QUARTER. See QUARTIER LATIN.

LATIN UNION. By the monetary convention of Dec. 23, 1865, France, Belgium, Switzerland, and Italy entered into a treaty for the uniform regulation of coinage in these states. This association of states in a common monetary policy was known as the Latin Union. The French monetary law of 1803 had established both gold and silver as full legal-tender coinage. Under its provisions the two and five franc pieces were exact multiples in weight of the one-franc coin. During the early bimetallic experience the pressure for the exportation of coin fell chiefly upon gold and did not therefore greatly disturb the money circulation of every day. But with the discovery of gold in California and Australia gold fell relatively to silver, and large quantities of silver were exported, as gold was substituted for it in the monetary circulation. The coins first selected for export were naturally the larger five-franc pieces, but as time progressed the smaller coins were drawn upon and the people suffered great inconvenience from the diminution in the volume of small coins. In 1861 a French commission appointed to inquire into the state of the coinage reported in favor of making the small coins tokens, as had been done in a similar situation in the United States in 1853. This proposal was carried out by a law of 1864, which, without reducing the weight of the smaller silver coins, changed the alloy from 0.900 fine to 0.835 fine. This action would have solved the domestic diffi-

culties of French coinage had not perplexities arisen over the acceptance of foreign coin. Belgium, Italy, and Switzerland each had a monetary system based on that of France, and their coins, being equal in weight and fineness, had always been freely accepted in France, as the French coins circulated freely in those countries. Urged by the same fear of loss through the minor coinage, Switzerland had reduced the fineness of the coins to 0.800 and Italy to 0.835 before France acted, while Belgium had taken no steps in the matter. The diversity of value, and the fact that these coins were no longer of full weight and readily convertible into standard coins of the countries having the same system, interfered with their international circulation.

It was primarily for the removal of these difficulties that the monetary convention of 1865 was convoked by France, at the suggestion of Belgium. In the convention Belgium and Switzerland proposed the adoption by the contracting parties of the gold standard, with coinage of all silver pieces as tokens, under rules to be agreed upon. France was not ready for this step and insisted upon the retention of the silver five-franc piece at its old valuation and as full legal tender. The result was a treaty prescribing a uniform weight and fineness for the gold coins and the five-franc silver coin and providing that such coins should have unlimited legal tender in the countries issuing them, and that coins issued by one of the contracting states should be receivable in any quantity which might be offered in payment of public dues in any of the states which were parties to the treaty. So far as the weight and fineness of the coins were concerned, this provision made no change in existing conditions, though the clause providing for the acceptance by any of the states enhanced the value of the coin.

Far more important were the provisions relating to the minor silver coins (2 and 1 franc, 50 and 20 centimes). It was provided that these coins should have a uniform fineness of 0.835, and that they should not be issued by the several countries in excess of six francs per head of the population, and that in the states in which they were issued they should be legal tender to the extent of 50 francs in one payment. The issuing states were required to receive these coins in any amounts in which they might be presented, while each state agreed to accept at the public treasuries such coins issued by the other contracting states in payments not exceeding 100 francs. This defines the scope of the Latin Union and summarizes the conditions which insure the international circulation of the coins. For while it is true that no obligation is imposed upon citizens of France to accept the minor coins of Italy, e.g., yet in effect the practice of the governments controls that of individuals. The weak point in the treaty was the retention of the five-franc silver piece on a par with the gold coinage. If at the time the inconsistency of this privileged position for the five-franc piece attracted little attention, it was perhaps because with the prevailing price of silver there was little probability of its being brought to the mint for coinage, and the question may have appeared an academic rather than a practical one. It is curious to observe that one year after the treaty went into effect the price of silver had fallen sufficiently to make its coinage profitable; so that had no change been made in the law the dearth of small coin

would have been remedied without any legal enactments or treaties. But as the coinage of the minor coins was reserved to the government, it followed that when conditions favored the coinage of silver on private account the mints of the contracting states began to turn out five-franc coins at a rate which in a few years threatened the circulation of gold. During the struggle between Prussia and France the French mints were inactive, but those of Belgium and Italy developed a remarkable activity. France found herself flooded with Belgian and Italian coins after the return of peace. Accordingly measures were taken to check the coinage of silver. By agreement of 1874 the quantities to be coined in the several states were limited, and this agreement was renewed in 1875 and 1876. In the meantime the several states had passed laws authorizing the suspension of coinage of the five-franc piece, and by 1877 it had practically ceased. By this action the countries of the Latin Union definitely adopted gold as the standard of value, though their circulation is charged with a considerable quantity of full legal-tender silver which must be kept at a par with gold. The fact that Belgium in the early seventies issued silver far beyond her needs, and far beyond her ability to redeem at the present value of silver, has had much to do with the successive prolongations of the Latin Union beyond the term of years for which it was originally created. While France has directed the policy of the union with great success, she has had to bear in a measure the burden of her weaker partners.

At the time the union was founded it was deemed possible that other nations would associate themselves with the states composing it, thus preparing the way for an international coinage, but this expectation has proved to be illusory.

Consult: Bamberger, *Die Schicksale des lateinischen Münzbundes* (Berlin, 1885); R. H. I. Palgrave, *Dictionary of Political Economy*, vol. ii (New York, 1900); H. P. Willis, *History of the Latin Monetary Union* (Washington, 1901); Arnauné, *La Monnaie, le crédit et le change* (2d ed., Paris, 1902).

LATINUS. In Hesiod (q.v.), son of Ulysses (q.v.) and Circe, and King of the Tyrsenians. In Vergil's *Æneid* (vii-xii) we find a legendary King of Latium, son of Faunus and the nymph Marica, and father of Lavinia, wife of Æneas. When Æneas reached Italy, Latinus welcomed him and offered him his daughter in marriage. Turnus (q.v.), to whom she had been betrothed, roused the peoples of Italy to war against Æneas. Æneas was victorious, married Lavinia, and, on the death of Latinus, succeeded to the throne of Latium. In earlier writers, Greek and Latin, the story of Latinus assumes many other forms, especially after the legend began to connect Rome with fugitives from Troy. Originally Latinus is the eponym of the Latin race. Consult the article "Latinus," in Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

LATIN VERSIONS. See BIBLE.

LATIN WAY (Lat. *Via Latina*). An ancient road, diverging from the Appian Way about half a mile south of the Porta Capena (in the Servian Wall), at the present church of San Cesario. It followed a course farther inland than the Via Appia and gave direct communication with the interior of the Samnite

territory as far as Venafrum. A short branch led to Tusculum, and at Teanum a crossroad, the Via Hadriana, connected the Latin Way with the Appian Way. Two ancient tombs on the Via Latina, near Rome, have interesting frescoes. Consult: T. Ashby, "Classical Topography of the Roman Campagna," in *British School at Rome, Papers*, vols. iv, v (London, 1907-10), and Baedeker, *Central Italy and Rome* (15th Eng. ed., Leipzig, 1909). See LATIN GATE.

LATITUDE (Lat. *latitudo*, breadth, from *latus*, OLat. *stlatus*, broad) AND **LONGITUDE** (Lat. *longitudo*, length, from *longus*, long; connected with Goth. *laggs*, OHG., Ger. *lang*, AS, Eng. *long*, Skt. *dirgha*, OPers. *drānga*, OChurch Slav *dlǫgŭ*, Lith *ilgas*, long). Geographical terms used in specifying the position of places on the earth's surface. Longitude is the angle at the pole between two great circles drawn on the earth's surface, passing through the poles, and touching respectively the place whose longitude is in question and the place selected as the origin of longitude. Latitude is the angular distance of a place north or south of the equator. The geocentric latitude is determined as follows. In Fig. 1, let *S* be any assumed point on the surface of the earth, *O P Q P* is the section of the earth through the meridian of the place *S*, *O Q* is the plane of the equator; *P P* is the polar axis; and *C* is the centre of the earth. If *T T'* is the tangent to the meridian at *S* and *S C'* is perpendicular to *T T'* at *S*, then the angle *S C' Q* is the latitude of the place *S*. This differs from the *truc* or *geocentric* latitude,

which is the angle *S C Q*, and the difference is 11' 30" at the latitude of 45°. The *geocentric* latitude is used in navigation only in the correction of sights for lunar distances by the old methods. Latitude is reckoned from the equator to the poles, a place on the equator having latitude 0°, and the poles 90° N. and 90° S respectively. Longitude is best measured along the equator from the prime meridian. But as nature has not, as in the case of latitude, supplied us with a fixed starting point, each nation has chosen its own prime meridian, thus, in the United States, in Great Britain and her colonies, in Germany, Holland, and other states, longitude is reckoned from the meridian which passes through Greenwich. The Greenwich meridian also has been taken as the primary meridian in the International Map of the World now in course of construction. In France the prime meridian is that through Paris, etc.; and in many old charts, as well as in German atlases down to a recent date, from Ferro (one of the Canary Isles), the meridian of which (17° 40' W from Greenwich) is the conventional dividing line between the Eastern and Western hemispheres, or from the Madeira Isles. It is reckoned east and west from 0° to 180°, though astronomers reckon from 0° west to 360° west and never use east longitude. It will easily be seen that, if the latitude and longitude of a place be given, its exact position is known, for the latitude confines its position to a circle called a parallel of latitude passing round the

earth at a uniform fixed distance from the equator, and the longitude shows what point of this circle is intersected by the meridian of the place, the place being at the intersection.

The measurement both of latitude and longitude depends upon astronomical observation. The principle on which the more usual methods of finding the latitude depend will be understood from the following considerations: To an observer at the earth's equator the celestial poles are in the horizon, and the highest point of the equator is in the zenith. If now he travel northward over one degree of the meridian, the north celestial pole will appear one degree above the horizon, while the highest point of the equator will decline one degree southward; and so on, until, when he reached the terrestrial pole, the pole of the heavens would be in the zenith, and the equator in the horizon. The same thing is true with regard to the Southern Hemisphere. It thus appears that to determine the latitude of a place we have only to find the altitude of the pole, or the zenith distance of the highest point of the equator (which is the same thing as the complement of its altitude). The altitude of the pole is found most directly by observing the greatest and least altitudes of the polar star (see POLE), or of any circumpolar star (q.v.), and (correction being made for refraction) taking half the sum. The method most usual with navigators and travelers is to observe the meridian altitude of a star whose declination or distance from the equator is known, or of the sun, whose declination at the time may be found from the *Nautical Almanac*; the sum or difference according to the direction of the declination) of the altitude and declination gives the meridian altitude of the equator, which is the colatitude. Other methods of finding the latitude at sea require more or less trigonometrical calculation. For very precise latitude determinations astronomers and geodesists employ an instrument called a zenith telescope, with which the difference of meridional zenith distance can be measured micrometrically for certain pairs of stars. From this difference the latitude can be computed if the declinations of the stars are known. See NAVIGATION.

To understand the determination of longitude by observation, it is necessary to remember that differences of longitude correspond to differences of time. Thus, if a place be in longitude 15° west of Greenwich, its local time will be one hour slow of Greenwich time. Similarly 30° correspond to two hours, etc. (See INTERNATIONAL DATE LINE.) To find the longitude in any place, it is thus only necessary to ascertain how much its local time is fast or slow of Greenwich. On shipboard the navigator uses a chronometer, the error of which in Greenwich mean time and its daily rate of gain or loss are ascertained before leaving port. Anywhere at sea he can find out his local time at any moment by measuring the altitude of the sun with a sextant and making the necessary calculations. This local time he compares with the Greenwich time shown at the same moment by the chronometer, or the international wireless signals sent out by coöperative action from a number of national observatories according to a prearranged system. The difference in hours, multiplied by 15, is then the longitude in degrees. Longitudes on land are determined by astronomers and geodesists on the same principle, only

here the comparison of local with Greenwich time can be made more accurately by direct telegraphic comparison of the standard Greenwich clock with the clock or chronometer at the observing station. If the latter station is very far from Greenwich, its time is usually compared telegraphically, not with Greenwich itself, but with some nearer place whose longitude has already been determined as a national observatory or standard clock on a telegraph circuit. The above methods of determining longitude are so superior in precision to all others that they are practically the only ones now in use. See NAVIGATION.

When applied to a heavenly body, the terms "latitude" and "longitude" have the same relations to the celestial equator and its poles, and to the point on the ecliptic called the equinox, that terrestrial latitude and longitude have to the equator and a first meridian. The corresponding coördinates of a heavenly body relatively to the celestial equator are called its declination (q.v.) and right ascension (q.v.). See DEGREE OF LATITUDE; DEGREE OF LONGITUDE, MAP, NAVIGATION; ASTRONOMY

LATITUDE, VARIATION OF. It was long suspected that terrestrial latitudes might be subject to small changes, and that these might possibly affect the results of ordinary astronomical observations. But in spite of all efforts to detect with certainty the existence of such changes, it was not until the year 1888 that Küstner proved beyond a doubt that latitudes vary by observable amounts. His observations were made in Berlin, and he found that the latitude of that place was less by two-tenths of a second of arc in the spring of 1885 than it had been in the spring of 1884. His result has been abundantly confirmed by subsequent observers.

Until the publication of the work of Küstner in 1888, fundamental astronomy had adopted invariability of latitude as a fact practically established. It was at once evident that all the results of astronomical observations made prior to that date must in consequence be subject to so much error as might be produced by assuming a constancy of latitudes in the discussion of the observations. This was actually shown to be the case by Chandler, of Cambridge, Mass., who in 1891 made an exhaustive analysis of the most reliable latitude determinations then available. Moreover, he reached the conclusion that the motion of the pole, to which is due the variation of latitude, arises from the superposition of two simple motions. One of these is an annual motion in an ellipse whose major and minor axes are respectively about 28 feet and 8 feet long, and whose centre lies on the earth's axis of figure, while the other is a motion in a circle of 15 feet radius and having a period of 428 days, both motions being counterclockwise. The former motion is regarded as being due to the seasonal variation of the precipitation on the earth's surface, and of the atmospheric and oceanic currents; the latter probably arises from the fact that, even were the disturbing agents just mentioned not in operation, the axes of rotation and of figure would not coincide, but would make a small angle with each other. Later investigations have brought to light a third component of the motion, known as the Kimura term from its discoverer, but no satisfactory explanation of its cause has yet been offered.

The importance of a continuous record of the motion of the pole is obvious. The work of securing such a record was undertaken by the International Geodetic Association, which about the end of 1899 inaugurated systematic observations at four stations—in Japan, California, Maryland, and Italy, situated nearly on the same parallel of latitude. Two private observatories also participate in the work voluntarily. The advantage of having the observing stations on the same parallel or very near it—an arrangement first suggested by Fergola, of

has been noticed at all four stations. The reality of this small variation of latitude was first announced by Kimura in 1902, and accordingly the corresponding term in the motion of the pole has been called the Kimura term, to which reference has already been made. Consult Chandler's articles in the *Astronomical Journal* (Cambridge, Mass.), and Albrecht's articles published in the reports of the International Geodetic Association and also, in abridged form, in the *Astronomische Nachrichten* (Kiel). The accompanying chart, copied from the latter

Naples—consists in the possibility of observing just the same stars at all the observing stations, so that the differences of latitude of any station are determined independently of any knowledge of the exact position of the pole on the sky. This is most important, for the positions of the stars are never known with absolute precision, being themselves but the results of fallible human observation. Moreover, the polar motion can be deduced from the latitude differences of the observatories just as well as from the actual latitudes. It is clear that if the pole is tipped towards one of the stations the latitude of that station will be increased, while that of a station situated on the opposite side of the earth will be correspondingly diminished. At times, however, a small but decided increase of latitude

journal, shows the wandering of the pole during the period 1906-11. See PARALLAX.

LATITUDINARIANS. The name sometimes applied to a school of English writers in the seventeenth century who sought to reconcile the Church of England and the Puritan element upon the basis of subordinating differences in doctrine to the broad essentials of religion. See CAMBRIDGE PLATONISTS.

LATIUM, la'shi-um. Originally the name of the broad plateau on the western coast of central Italy, lying southeast of the Tiber, between the Apennines and the sea, near the centre of which rises the isolated Mons Albanus, the crater of an extinct volcano. The central part of this district was known as the Campagna di Roma (q.v.). When Rome became predominant in this
